NAME INDEX

ROMBIE, Michael (edited by Johnson, M. L., and): New Biology 3, *review*, 595
M. F. H.: Appointed assistant conservator of forests, Kenya,
, Sir Adolphe: Nutrition of Athletes, 208
of Sciences of the U.S.S.R.: Resignation of his honorary membership by Sir Henry Dale, 882
gnation of his honorary membership by Dr. H. J. Muller, 882
S.: Recent Work on Osmotic Pressures, Membrane Equilibrium d the Generalized Free Energy of Protein Solutions in the Light the Work of Procter, 670
rof. Douglas P. (Douglass, Prof. Raymond D., and): Elements of mography, *review*, 278
ord: Appointed chairman of the Medical Research Council, 606
Dr. C. C., and Thompson, R.: Ionic Reactions in Liquid Dinitron Tetroxide, 369
Prof. Ruth M., and others: Hormones and Horticulture, *review* y Dr. M. A. H. Tincker, 943
rof. S.: Origin of the Golden Hamster *Cricetus auratus* as a Labora ry Animal, 256
ical Society, Royal: Formation of Divisions in Australia and New land, 606
ld Memorial Fund, 769
, College of: Appointment of J. V. Connolly as professor of aft economics and production, 409
ological Surveys, Association of: Conference on the Geology Mineral Resources of Africa, 971
on of Sir Edward Bailey as honorary president, 971
ntral) Council: R. McChiery seconded to the, 250
entral) Scientific Liaison Office: Appointment of R. McChiery scientific liaison officer in London, 408
South) Association for the Advancement of Science: Report of Oudtshoorn meeting in July 1947, 366
l Botany, National Institute of: Appointment of C. C. Brett as officer of the Official Seed Testing Station, 60
l Research Council: Appointment of Lord Rothschild as rman, 408
l and Horticultural Research Station, Long Ashton: Annual rt for 1947, 884
Association of, and the University of London Institute of on: Series of sessions on the Educational and Social Signific he Land, 920
Fisheries, Ministry of: Bulletin 95, Strawberries, new
lo, Watercress Cultivation (Charles H. Sansom), 58
nt of Prof. T. Dalling as chief veterinary officer, 60
of F. A. Secrett as honorary adviser on vegetable produc
120, Commercial Cultivation of Root Vegetables, new the third edition, 365
W.: Recession of Glaciers, 484
Evidence of Geological Age against Decay of Tin-115 5 by Electron Capture, 413
ua M.: Appointed an assistant in anatomy in the University w, 60
vami: Hindu Psychology, *review* by Mrs. D. M. Wheatley,
nier: Condensation of Water Vapour below 0° C., 921
of D.Sc. of the University of London conferred
ing Unit, 383
N.: Discha [illegible] Photography and Projection (H. K. e), *review*, 758
ouglas A.: Swiney Lectu [illegible] Geology, 920
and Poole, M. J.: Photo [illegible]tegration of Deuterium and m by Thorium C'' γ-Rays, 373
R.: Atomic Energy and Society, 1005
N. de G.: Applicable Mathematics, 582
of. G. C.: Economics and State Control, 646
B.: Rural Education and Welfare in the Middle East, 53
rof. R. G. D.: Towards a Mathematical Sociology, *review*, 352
V. A.: Sound Transmission and Noise, 500
Dr. T. E.: Development of Spark Discharges, 264
r. Gunnar: Re-elected president of the International Association Theoretical and Applied Limnology, 624
kvah: Hydrogen Peroxide and the Indirect Effect of Ionizing adiations, 615
lph A., and Herman, Dr. Robert: Evolution of the Universe,
ntomologists' Society: Directory of Natural History Societies, 647
rican Association for the Advancement of Science: Centenary of the (Dr. F. R. Moulton), 355
rican Association for the Advancement of Science (Chemistry Section): Symposium on Approaches to Tumor Chemotherapy (edited by Forest Ray Moulton), *review* by Dr. I. Hieger, 713
erican Geophysical Union: Election of Prof. Walter H. Bucher as president, 290
American Institute of Physics: Publication of *Physics To-day*, 988
American Philosophical Society: Annual Report for 1947, 37
American Physical Society: Organisation of the Division of Fluid Dynamics, 648
American Plant Life Society: Herbertia, Vols. 13 and 14, 347
Aminoff, D., and Morgan, W. T. J.: Hexosamine Components of the Human Blood Group Substances, 579
Anderson, C. M.: Appointed senior livestock officer, Tanganyika, 138
Anderson, Prof. Esther S. (Lackey, Prof. Earl E., and): Regions and Nations of the World, *review* by H. J. F., 7
Anderson, J. D. C., and Le Fèvre, Prof. R. J. W.: Diazo-Oxides, 459
Anderson, Dr. J. S.: Physical Chemistry of Process Metallurgy, 720
Anderson, P. R., and others: Nairobi, Master Plan for a Colonial Capital, *review*, 432
Andrade, Prof. E. N. da C.: To become honorary librarian to the Royal Society, 250
  Creep of Metals and Recrystallization, 410
  Christian Huygens, *review*, 472
Andrade, Prof. E. N. da C., and Randall, R.F.Y.: Surface Effects with Single Crystal Wires of Cadmium, 890
Andreae, J. H., and others: Absorption and Dispersion of Ultrasonic Waves in Acetic Acid, 993
Andrèsen, Nils, and others: Localization of Alkaline Phosphatase in Yeast, 192
Andrewes, Dr. C. H.: The Prophylaxis of Virus Infections with special reference to the Use of Vaccines, 92
Anglo-American Oil Co., Ltd.: Appointment of Dr. E. J. Boorman as chief chemist, 956
Angus, J., and others: Beta Spectrum of Tritium, 302
Animal Behaviour, Institute for the Study of: Election of officers, 729
Annual Reviews, Inc.: To publish an Annual Review of Psychology, and an Annual Review of Physical Chemistry, 60
Anthony, Lieut.-Colonel H. D.: Science and its Background, *review* by W. L. Sumner, 354
Anthropological Institute, Royal: Report of the Council for 1947–48, 409
Appapillai, Dr. V., and Mailvaganam, Prof. A. W.: Latitude Effect of Penetrating Cosmic Ray Showers, 887
Appleton, Prof. A. B.: Title of emeritus professor of anatomy in the University of London conferred on, 212
Appleton, Sir Edward: Appointed principal and vice-chancellor of the University of Edinburgh, 884
  Awarded the Valdemar Poulsen Gold Medal of the Danish Academy of Technical Sciences, 884
Appleton, Sir Edward, and Beynon, Dr. W. J. G.: Lunar Tidal Oscillations in the Ionosphere, 486
Applied Bacteriology, Society for: Annual General Meeting and Conference, 669
Arber, Muriel A.: Factors Controlling the Atlantic Coastline of Europe, 741
Arden, Dr. T. V., and others: A New Method for the Separation, Detection and Estimation of Inorganic Compounds, 691
Argyle, M. C.: Appointed assistant conservator of forests, Kenya, 956
Armitage, —.: Clay Minerals as Catalysts and Adsorbents, 195
Armstrong, S.: Appointed lecturer in civil engineering in the University of Sheffield, 648
Arnon, Prof. Daniel I.: Localization of Polyphenoloxidase in the Chloroplasts of *Beta vulgaris*, 341
Arrow, G. J.: *Obituary* by K. G. Blair, 687
Arts, Royal Society of: Essay Prize under the Thomas Gray Memorial Trust, 366
Ashby, Prof. Eric: Popular Botany, *review*, 870
  Genetics in the Soviet Union, 912
Ashmolean Museum, Oxford: Exhibition of Air Photography and Archæology, 176
Ashton, E. W. S. (Whittington, R. B., and): Instability in Pipe Flow, 997
Aslib: Twenty-third Annual Conference, 366; (Ivor B. N. Evans), 862
Aslib (Northern Branch): Conference on Organised Information Services, 809
Astbury, N. F.: Anisotropic Silicon Iron, 800
Astbury, Prof. W. T., and others: Studies of the Structure of Synthetic Polypeptides, 596
Asthana, R. P.: Some Fungi of India, 271
Aston, Dr. G. H.: Sound Transmission and Noise, 499, 500
Astronomical Association, British: Retirement of F. M. Holborn from the presidency, 807
  Election of Dr. J. G. Porter as president, 807
Astronomical Union, International: Seventh General Assembly of the, 899
Atkin, D. J.: Seasonal Fluctuations in Plankton Distribution in a Tropical Impounding Reservoir, 803
Atkinson, Dr. F. V.: Appointed to the chair of mathematics at University College, Ibadan, 842; work of, 842
Atkinson, H. F.: Construction of Troughs for use in Chromatography Tanks, 858
Atkinson, Dr. R. d'E.: Stellar Astronomy, *review*, 390
  Comet 1948 I, 809
Atomic Energy Research Establishment, Harwell, 56, 317
Atomic Scientists' Association: Atomic Energy Exhibition—The Atom Train, 267
  Conference on Atomic Energy and Society and Atomic Energy and the Scientist, 690, 1005

NAME INDEX

Atwood, William Henry : A Concise Comparative Anatomy, *review* by Dr. N. B. Eales, 980
Audus, Dr. L. J. : Nicotinic Acid and the Inhibition of Growth by Auxin, 811
Augustinsson, Dr. Klas-Bertil : Cholinesterases, 194
Auluck, F. C. (Kothari, Prof. D. S., and) : Electromagnetic Level-Shift and Effect of Radiation Field, 143
Austin, C. R. : Function of Hyaluronidase in Fertilization, 63
  Number of Sperms required for Fertilization, 534
Australian Council for Scientific and Industrial Research, 808
Australian Journal of Scientific Research, 210, 808
Avery, Jr., George S., and Johnson, Elizabeth Bindloss (with the collaboration of Prof. Ruth M. Addoms and Prof. Betty F. Thomson) : Hormones and Horticulture, *review* by Dr. M. A. H. Tincker, 943
Avery, Prof. O. T. : Elected an honorary member of the Society for General Microbiology, 606
Awbery, J. H. : Velocity of Photons, 461
Axon, H. J. : Systematization of certain Binary Metallic Equilibrium Diagrams, 997

BAAR, Dr. H. S. : Fœtal Hæmoglobin and Erythroblastosis, 190
Bacharach, A. L. : Science and Nutrition, third edition, *review*, 165
  Anti-Vitamins in Food, 986
Badger, Dr. G. M., and others : Synthetic Analgesics, 21
Bagguley, D. M. S., and Griffiths, Dr. J. H. E. : Paramagnetic Resonance in Copper Sulphate—Experimental Investigation, 538
Bagnold, Brigadier R. A. : Coastal Waves, 683
Bailey, Alton E. (edited by) : Cottonseed and Cottonseed Products, *review* by Prof. T. P. Hilditch, 832
Bailey, Sir Donald : Stress Analysis and the Designer, 119
Bailey, Sir Edward : Elected honorary president of the Association of African Geological Surveys, 971
Baird, A. B. : Biological Control of Insects, 308
Baker, Prof. A. L. L. : Awarded the Coopers Hill War Memorial Prize of the Institution of Civil Engineers, 865
Baker, Dr. H. G. : Genetical Structure of Plant Populations, 518
  Prehistoric Flooding in the Somerset Levels, 1008
Balakrishnan, M. S. : Some Fungi of India, 271
Balasubrahmanyam, K. (George, T. K., and) : Awarded jointly a Miller Prize of the Institution of Civil Engineers, 865
Balchin, Nigel : The Nature of Incentives, 557
Balfour-Browne, Prof. Frank : Re-discovery of *Apus cancriformis*, 116
Ball, L. E. : Entry and Careers, 351
Ball, S., and others : Indicator Yellow and Retinene$_1$, 222
Ball, W. V. : Smallholdings for Pleasure and Profit, *review*, 757
Balls, Dr. W. Lawrence : Land-mine Detectors designed at Gaza, 98
Bambah, R. P. : Awarded an Overseas Science Research Scholarship for 1948 by the Royal Commission for the Exhibition of 1851, 100
Bamford, Frank : Poisons, their Isolation and Identification, second edition, *review* by Edgar Rentoul, 8
Bami, H. L., and others : Metachloridine-substituted Aryl Biguanides as possible Antimalarial Compounds, 146
Band, William (Meyer, Lothar, and) : Relation between Fountain Pressure and Heat Current in Helium II, 67
Bannister, Dr. F. A., and Hollingworth, Prof. S. E. : Two New British Minerals, 565
Barakat, N. (Tolansky, Prof. S., and) : New Localized Interference Fringes, 816
Barber, Mary, and others : Destruction of Urinary Glucuronide by Bacteria, 701
Barber, N. F. : Sea Waves and Surf, *review*, 389
  Coastal Waves, 683
Barclay-Smith, Phyllis : *Obituary* of King Ferdinand of Bulgaria, 520
Barendregt, T. J., and others: Excretion of D-Pyrrolidone Carboxylic Acid by Rat and Dog Fed with Tumour Proteins, 732
Barer, Dr. Robert : Phase-Contrast Microscopy of Viruses, 251
Barigozzi, Prof. Claudio : Role of the Y-Chromosome in the Determination of Cell-size in *D. melanogaster*, 30
Barkas, Dr. W. W. : Hysteresis in the Swelling of Gels, 32
Barlee, John : Birds on the Wing, *review* by Frances Pitt, 49
Barnes, Dr. H. F. : Gall Midges of Economic Importance, Vol. 3, Gall Midges of Fruit, *review* by A. D. I., 834
Barnicot, N. A. : Local Action of Calciferol and Vitamin A on Bone, 848
Barnóthy, Prof. J., and Forró, Dr. M. : Awarded the first Eötvös Medal of the Hungarian Academy of Science, 100
Baron, M. (Harper, R., and) : Factorial Analysis of Rheological Measurements on Cheese, 821
Baron, P. : Sound Transmission and Noise, 501
Barraud, P. J. : *Obituary* by Sir Rickard Christophers, 481
Barrell, H., and Marriner, R. : Liquid Surface Interferometry, 529
Barrer, Dr. R. M. : Physical Chemistry of Process Metallurgy, 720
Barron, Dr. Harry : Modern Rubber Chemistry, second edition, *review*, 128
Barrow, Dr. R. F., and Mulcahy, M. F. R. : Excited States of Silver Bromide and Iodide, 336
Barry, —. : Road Research in Scotland, 785
Barry, Dr. Vincent C., and others : Anti-Tubercular Activity of Oxidation Products of Substituted *o*-Phenylene Diamines, 622
Bartholomew, L. St. Clair : Appointed fisheries officer, Uganda, 138
Bartlett, Sir Charles : Appointed a member of the Industrial Health Research Board, 918
Bartlett, Sir Frederic : Appointed a member of the Medical Research Council, 606
  Appointed a member of the Industrial Health Research Board, 918
Bartlett, Prof. M. S. : American War-time Contributions to Statistical Method, *review*, 510
  Determination of Plant Densities, 621
Bartlett, Dr. S., and others : Œstrogens in Grass and their possible Effects on Milk Secretion, 845
Barton, Dr. D. H. R. : Radical Addition Reactions, 182
Barton, Dr. D. H. R., and Klyne, Dr. W. : Identification of '17-Ketosteroid II' as *i*-Androsten-6-ol-17-one, 493
Barton, Lela V., and Crocker, William : Twenty Years of Seed Research at Boyce Thompson Institute for Plant Research, *review*, 594
Barton's Ruling Engine, 446
Barwell, Dr. C. F. : Antigenic Components of *Psittacosis* Virus, 460
Bateman, Dr. J. A. : Genetical Structure of Plant Populations, 517
Bates, Prof. L. F. : Anisotropic Silicon-Iron, 800
  Magnetic Properties of Superconductors, 801
Bawn, Prof. C. E. H. : The Structure and Reactivity of Free Radicals (Tilden Lecture of the Chemical Society), 607
Baxendale, J. H., and George, Philip : A Fourth Order Reaction, 777
Baxter, A. S. (Freeman, Joan M., and) : Short-Range α-Particles from the Disintegration of Sodium, Aluminium and Fluorine by Protons, 696
Bayer Products, Ltd. : 'Fusarex', 843
B.B.C. Quarterly, Vol. 3, No. 1, 425
Beaton, D. M. : Awarded the James Forrest Medal and a Miller Prize of the Institution of Civil Engineers, 865
Beaton, W. G. : Appointed director of veterinary services, Nigeria, 485
Beck, A. H. : The Free Electron *in vacuo*, *review*, 678
Beck, Dr. B. F., and Smedley, Dorée : Honey and your Health, *review* by Dr. Colin G. Butler, 128
Beck, S. (Peacock, Dr. P. R., and) : Induced Adenocarcinoma of the Stomach in Mice, 252
Beckley, V. A. : Protection of Grain against Weevils, 737
Bedford College, London : Appointment of Dr. G. L. Clark as University of London reader in mathematics, 290
Bedichek, Roy : Adventures with a Naturalist, *review* by Frances Pitt, 513
Bedson, P. G. : Awarded the Institution Medal and Premium of £10 of the Institution of Civil Engineers, 865
Beeby, M. H. (Mann, Dr. F. G., and) : A New Synthesis of 2 : 7-Disubstituted-1 : 2 : 3 : 4-tetrahydro-*iso*-quinolines, 337
Beet, Dr. A. E. : Appointed lecturer in fuel technology in the University of Sheffield, 648
Beevers, Dr. C. A., and Stern, F. : Crystal Structure of *d*-Tartaric Acid, 854
Begg, Dr. W. G. A. : Appointed an assistant in anatomy in the University of Glasgow, 956
Beghin, Henri : Cours de mécanique, Tome I, Chapitres I à 18, *review*, 911
Behounek, Prof. Frantisek : *Death* of, 881, *correction*, 954
Bell, Dr. A. E. : Christian Huygens and the Development of Science in the Seventeenth Century, *review* by Prof. E. N. da C. Andrade, 472
Bell, R. (Smith, T. D., and) : Relation between the Brunauer-Emmett-Teller and Harkins-Jura Isotherms, 109
Bell, R. P. : Reaction Kinetics in Solution, *review*, 275
Bell, T. R. D. : *Death* of, 135
Belton, J. G., and others : Anti-Tubercular Activity of Oxidation Products of Substituted *o*-Phenylene Diamines, 622
Bendegom, L. van (Burgt, J. H. van der, and) : The Use of Vegetation to Stabilize Sand Dunes, 803
Bendz, Gerd, and others : The Antibiotic Agent from *Marasmius ramealis*, 61
Benedict, Prof. Ruth : *Obituary* by Dr. Audrey I. Richards, 725
Benedict, R. G., and others : An Automatic Agar Dispenser, 903
Benes, Dr. Eduard : *Death* of, 407
Benes, J., and others : Decay Scheme of ^{181}Hf, 261
Bennett, A. G. : Ophthalmic Optics, 825
Bennett, A. R., and Harrison, D. : Use of the Calyx Burner to determine Combustion Conditions, 371
Bennett, Dr. G. M. : Organic Substances used in Inorganic Analysis, *review*, 48
Bentham, Jeremy : A Fragment on Government and An Introduction to the Principles of Morals and Legislation, *review* by Maurice Bruce, 238
Beranek, Dr. L. L. : Sound Transmission and Noise, 499, 500, 501
Bergey's Manual of Determinative Bacteriology, sixth edition by Robert S. Breed, E. G. D. Murray and A. Parker Hitchens, *review* by Dr. S. T. Cowan, 833
Bergmann, Ernst David : The Chemistry of Acetylene and related Compounds, *review* by R. A. Raphael, 715
Berinzaghi, B., and others : Structure of α-Fagarine, 694
Berkeley, M. J. : Observations, Botanical and Physiological, on the Potato Murrain, *review* by Dr. John Grainger, 239
Berkowitz, N. : Solubility of Bituminous Coal in Alcoholic Potash, 960
Berland, Lucien : Faune de France, 47 ; Hyménoptères tenthredoides, *review*, 49
Berman, Eleanor Davidson : Thomas Jefferson Among the Arts, *review* by F. I. G. Rawlins, 513
Bernal, Prof. J. D. : The Royal Society Scientific Information Conference, Section I, Publication and Distribution of Papers Reporting Original Work, 279
  Waves and Beaches, 684
  The Significance to Special Librarians and Information Officers of the Royal Society's Scientific Information Conference, 863
Bernal, Prof. J. D., and Carlisle, Dr. C. H. : Unit Cell Measurements of Wet and Dry Crystalline Turnip Yellow Mosaic Virus, 139
Bernal, M. J. M. : Elected to a Beit Fellowship for Scientific Research, 100
Bernfeld, Dr. P., and Meutémédian, A. : Isophosphorylase, 297
  Isophosphorylase and the Formation of Branched Polysaccharides, 618
Bernhard, Merrill : Elected president of the Association of Hydrology, 745
Berriman, Dr. R. W. : Recording of Charged Particles of Minimum Ionizing Power in Photographic Emulsions, 992
Berthollet, Claude Louis : Bicentenary of, 882
Bertram, Dr. D. S. : Appointed to the University of London readership in entomology at the London School of Hygiene and Tropical Medicine, 212
Bertram, Dr. D. S. (Kershaw, W. E., and) : Course of Untreated Infections of *Litomosoides carinii* in the Cotton Rat, 149
Bertrand, Prof. A. G. : Determination of Trace Elements in Plants and Animals, 157
Berzelius, Jöns Jakob (1779–1848), 210
Bett, Dr. W. R. : *Obituary* of Dr. C. A. Elsberg, 443
Beveridge, Prof. W. I. B. : The Prophylaxis of Virus Infections with special reference to the Use of Vaccines, 92
  Veterinary Education, 721
Bewley, Dr. W. F. : The Control of Heat and Light in Glasshouses, 584
Bey, Dr. S. L. : Awarded a Telford Premium of the Institution of Civil Engineers, 865
Beynon, Dr. W. J. G. : Evidence of Horizontal Motion in Region F_2 Ionization, 887

Beynon, Dr. W. J. G. (Appleton, Sir Edward, and) : Lunar Tidal Oscillations in the Ionosphere, 486
Bhabha, Prof. H. J. : Awarded the Hopkins Prize for 1939–42 of the Cambridge Philosophical Society, 690
Bhagavantam, Prof. S. : Appointed chief scientific liaison officer of the Indian Scientific Liaison Office in London, 884
Bhagavantam, Prof. S., and Rao, B. Ramachandra : Elastic Constants of Alum Determined by a New Ultrasonic Method; 818
Bhagavantam, Prof. S., and Suryanarayana, D. : Photo-Elastic Effect in Barium Nitrate, 740
Bhattacharya, Dr. S. : A Test for Mutagenicity of Methylcholanthrene, 573
Bickley, Prof. W. G. : Applicable Mathematics, 583
Bigelow, Henry B., and Edmondson, W. T. : Wind Waves at Sea, Breakers and Surf, *review* by N. F. Barber, 389
Biggs, Rosemary : Error in Counting Reticulocytes, 457
Bigwood, E. J., et autres : Un symposium sur les proteines, *review*, 870
Bijl, Dr. J. H. van der : *Death* of, 918
Bijvoet, J. M., and others : Crystal Structure of 'Gammexane', 771
Bikerman, J. J. : Surface Chemistry for Industrial Research, *review* by Dr. A. S. C. Lawrence, 164
Binge, F. W. : Appointed geologist, Kenya, 729
Binkley, W. W., and Wolfram, M. L. : Chromatography of Sugars and related Substances, 1007
Binnie, W. P., and others : Effect of Hydrogen Atoms on Intensities of X-Ray Reflexions, 889
Binstead, H. C. : Ophthalmic Optics, 825
Biological Research Institute, Tihany, 96
Biological Sciences, International Union of : Programme of Symposia, 989
Biological Service in Great Britain : Appointment of Capt. Cyril Diver as head of the, 728, 766
Biology, Institute of.: A Proposed (Dr. J. F. Danielli), 878
B.I.O.S. : Overall Report No. 5, German Motor Roads, 345
Birch, Dr. Arthur J. : Appointed Smithson research fellow of the Royal Society, 956
Bird, R., and others : Absorption and Dispersion of Ultrasonic Waves in Acetic Acid, 993
Bird Observatory : Fair Isle, 989
Bird Preservation, International Committee for : Report of the British Section, 250
  Meeting of the European Continental Section, 422
Birkbeck College, London : Gift from the Nuffield Foundation to equip and staff a Biomolecular Research Laboratory, 211
  Appointment of T. A. Rodger as University of London reader in psychology, 290
  Title of professor emeritus of zoology in the University of London conferred on Prof. H. Gordon Jackson, 729
  Title of University of London reader in zoology conferred on Dr. Vera Fretter, 844
  Appointment of Dr. J. L. B. Cooper to the University of London readership in mathematics, 920
Birkby's, Ltd. : Gift to the University of Leeds of 500–600 plastic mouldings for experimental research in speech training, 212
Bishop, Dr. Ann, and McConnachie, Elspeth W. : Resistance to Sulphadiazine and 'Paludrine' in the Malaria Parasite of the Fowl (*P. gallinaceum*), 541
Bjerknes, Prof. J. : Elected president of the Association of Meteorology, 745
Black, Ellinor I. : Appointed director of the Department of Social Science in the University of Sheffield, 648, 767 ; work of, 767
Black, J. : Awarded the Charles Hawksley Prize of the Institution of Civil Engineers, 865
Blackett, Prof. P. M. S. : Awarded the Nobel Prize for Physics for 1948, 841 ; work of, 841
  Atomic Energy and Society, 1005
Blackler, Helen : *Colpomenia sinuosa* (Mert.) Derb. et Sol. in Scotland, 1001
Blackman, Prof. A. M. : Retirement from the Brunner chair of egyptology in the University of Liverpool, 95 ; work of, 95
Blackman, Prof. G. E. : Recent Developments in the Control of Weeds, 249
Blair, Dr. G. W. Scott : First International Congress on Rheology, 747
Blair, Dr. G. W. Scott, and Caffyn, J. E. : Further Experimental Evidence for the Theory of Quasi-Properties, 368
Blair, K. G. : *Obituary* of G. J. Arrow, 687
Blake, Marion Elizabeth : Ancient Roman Construction in Italy from the Prehistoric Period to Augustus, *review* by Joan Liversidge, 755
Blakeley, Dr. T. H. : Clay Minerals as Catalysts and Adsorbents, 195
Blakemore, F. : Appointed professor of veterinary science at the University of Bristol, 327 ; work of, 327
Blakeslee, Dr. A. F. : Elected a foreign associate of the Paris Academy of Sciences, 920
Blanchard, A. F., and Parkinson, Dr. D. : Physical and Chemical Aspects of Rubber Technology, 205
Blaxter, Dr. K. L. : The Physiology of Lactation, 602
Bledisloe, Lord : Control of Environment in Horticulture, 585
Bliss, Alfred F. : Retinene$_1$ and Indicator Yellow, 661
Blok, Arthur : Third Fleming Memorial Lecture of the Television Society, 485
Bloomfield, Dr. G. F. : Physical and Chemical Aspects of Rubber Technology, 206
Blower, J. H. : Appointed assistant conservator of forests, Tanganyika, 956
Blumfield, C. V. : Awarded a Telford Premium of the Institution of Civil Engineers, 865
Blundell, C. R. K. : Appointed lecturer in geology in the University of Sheffield, 99
Boas-Traube, Dr. S. G., and others : Properties of Ethylene Diamine, 960
Bock, A. de (Van Itterbeek, Prof. A., and) : Sound Velocity and Temperature Change of Molecular Association, 611
Bockris, Dr. J. O'M. : Physical Chemistry of Process Metallurgy, 720, 721
Bodenforschung, Reichsamt der : Geotectonic Map of North-west Germany, 365
Bodet, Jaimes Torres : Elected director general of Unesco, 882 ; work of, 882
Bolas, B. D., and Portsmouth, G. B. : Effect of Carbon Dioxide on Availability of Manganese in Soil producing Manganese Deficiency, 737
Bolton, A. : Appointed plant breeder, Kenya, 366
Bolton, J. G. : Discrete Sources of Galactic Radio Frequency Noise, 141
Bonet-Maury, Dr. P., and Lefort, M. : Formation of Hydrogen Peroxide in Water Irradiated with X- and Alpha-Rays, 381
Bont, Dr. A. F. de : Fish Farming in the Belgian Congo, 998
Book Exchange, United States : Opening of the, 408
Boonstra, Dr. B. B. S. T. : Physical and Chemical Aspects of Rubber Technology, 204
Boorman, Dr. E. J.: Appointed chief chemist of the Anglo-American Oil Co., Ltd., 956
Bordet, Prof. Jules : Elected an honorary member of the Society for General Microbiology, 606
Borger, R. (Cowling, Prof. T. G., and) : Electric Conductivity of the Ionospheric *D*-Region, 143
Bornstein, Dr. J., and Nelson, J. F.: Effect of Hypophysectomy on Glycogen Deposition in Isolated Muscle, 572
Boscott, Dr. R. J. : New Colour and Fluorescence Reactions in the Steroid and Synthetic Œstrogen Series, 577
Boscott, Dr. R. J., and others : Cytochemical Demonstration of Ketosteroids, 572
Boswell, I. I., and others : Voltage Effects in Titanate Polycrystals, 151
Botanical Society of Bengal : To publish a half-yearly list of botanical papers, 769
Bourgeois, Dr. P. : Practical Applications of International Collaboration in Documentation, 864
Bourne, Dr. G. H. : Nutrition of Athletes, 208
  Autoradiography of the Thyroid Gland, 495
Bourne, H. K. : Discharge Lamps for Photography and Projection, *review* by J. N. Aldington, 758
Bowden, Dr. F. P., and Gurton, O. A. : Initiation of Explosions by Grit Particles, 654
Bowen, Ian : Britain's Industrial Survival, *review*, 45
Bowman, Dr. Isaiah : Honorary degree of D.Sc. of the University of Oxford conferred on, 19
Bowman, James : Appointed a member of the Advisory Council for Scientific Research, 690
Bowman, R. E. : A New Ketone Synthesis, 111
Bowtell, J. N., and Jenkins, H. G. : Awarded the Leon Gaster Memorial Premium for 1948 of the Illuminating Engineering Society, 607
Boyland, Dr. E. : Metabolism of Drugs, *review*, 127
Brachet, J., et autres : Un symposium sur les proteines, *review*, 870
Bradbeer, B. F. J., and Hart, Prof. C. A. : Awarded jointly a Telford Premium of the Institution of Civil Engineers, 865
Bradbury, C. H. : Sound Transmission and Noise, 501
Bradford, Dr. S. C. : *Death* of, 807 ; *obituary* by H. T. Pledge, 917
Bradley, L. C., and Kuhn, Dr. H. : Spectrum of Helium-3, 412
Bradley, Dr. W., and others : Metabolism of α : β-Dihydroxy-γ-(2-methylphenoxy) propane ('Myansein'), 257
Brady, Thomas G. (Conway, Prof. Edward J., and) : Source of the Hydrogen Ions in Gastric Juice, 456
Bragg, Sir Lawrence : Entry and Careers, 351
  Elected president of the International Union of Crystallography, 365
  Recent Advances in the Study of the Crystalline State, 399
  Instrumentation and Control, including Electronic Devices, 762
Brailsford, Dr. F. : Magnetic Materials, *review* by L. E. C. H., 513
Braude, R. : Behaviour of Pigs, 938
Bray, Dr. H. G. and others: Metabolism of Aminohydroxybenzoic Acids, 64
Brearley, Harry : *Death* of, 135 ; *obituary* by Dr. C. H. Desch, 288
Brech, E. F. L. : The Anatomy of Co-operation, *review*, 796
Breed, Robert S., and others : Bergey's Manual of Determinative Bacteriology, sixth edition, *review* by Dr. S. T. Cowan, 833
Bremner, J. G. M. : Nickel Plating by Chemical Reduction, 183
Brenchley, Dr. Winifred E. : Retirement as head of the Botany Department of Rothamsted Experimental Station, 727 ; work of, 727
Bretán, Dr. M., and others : Abnormal Serum Protein in Parenchymatous Liver Diseases, 1002
Brett, C. C. : Appointed chief officer of the Official Seed Testing Station, 60
Brian, Dr. P. W., and others : Toxicity of Sulphydryl Compounds to Seeds, 780
Bridgman, P. W., and others (A Symposium by) : Physical Science and Human Values, 751
Briggs, Prof. G. E. : Appointed to the chair of botany in the University of Cambridge, 521 ; work of, 521
Brightman, R. : The Graduate in Industry, *review*, 388
  The Art and Technique of Book Reviewing, 863
  Technical Writing, *review*, 909
Brillouin, M. : Sound Transmission and Noise, 501
Brillouin, Prof. Marcel : *Obituary* by Dr. R. Fürth, 362
Brimble, L. J. F. : Education in and For the Services, 159
  Plant Life in Britain, *review*, 676
Brinsmead, K. (Dunton, C. E., and) : Awarded jointly the Webb Prize of the Institution of Civil Engineers, 865
Bristow, F. J. : Esterification of Phthalic Anhydride with Primary Alcohols at Room Temperature, 1004
British Abstracts (Sir David Chadwick), 578
British Agricultural Bulletin, No. 1, 137
British Archæology, Council for : Report on the Survey and Policy of Field Research in the Archæology of Great Britain, 1, The Prehistoric and Early Historic Ages to the Seventh Century A.D., 883
British Architects, Royal Institute of (Acoustics Group of the Physical Society, in association with the) : International Conference on Noise and Sound Transmission, 59, 501
British Association for the Advancement of Science : Brighton Meeting, 323, 392
  Election of Sir John Russell as president for 1949, 444
  Exhibition of Scientific Instruments, 445
  Newcastle Meeting in 1949, 882
  Election of officers, 882
British Association, Section A (Mathematics and Physics) : Symposium on Coastal Waves, 682
  Symposium on Instrumentation and Control, including Electronic Devices, 761
  Symposium on Magnetism, 799
British Association, Section A (Mathematics), and Section G (Engineering) :
  Joint Discussion on Applicable Mathematics, 582

British Association, Section D (Zoology) : Discussion on Colour and Colour Vision in Animals, 600
  Symposium on Marine Fisheries of Great Britain, 641
British Association, Section E (Geography) : Discussion on Scientific Aspects of Colonial Development, 556
  Symposium on Movements of Population in the British Commonwealth, 718
British Association, Section H (Anthropology) : Discussion on Primitive Techniques, Agriculture and Economic Organisation, 602
British Association, Section I (Physiology) : Discussion on the Changing Aspects of Nutrition, 543
  Discussion on the Transmission of Effects from the Ends of Nerve Fibres, 558
  Discussion on Colour Vision, 639
British Association, Section J (Psychology) : Discussion on the Nature of Incentives, 557
British Association, Section K (Botany) : Symposium on the Genetical Structure of Plant Populations, 517
British Association, Section L (Education) : Discussion on Selection at the University Level, 626
  Discussion on the Young Worker in Industry, 667
British Association, Section M (Agriculture) : Discussion on Control of Environment in Horticulture, 584
British Association, Sections M (Agriculture) and I (Physiology) : Joint Discussion on the Physiology of Lactation, 601
British Association, Sections M (Agriculture), K (Botany) and D (Zoology) : Joint Discussion on Inbreeding and Hybrid Vigour in Crops and Livestock, 642
British Astronomical Association : Retirement of F. M. Holborn from the presidency, 807
  Election of Dr. J. G. Porter as president, 807
British Commonwealth, Association of Universities of the : New name of the Universities Bureau of the British Empire, 648
British Commonwealth, Universities of the: Sixth Congress of the, 99
  Discussion on the Balance of Research and Teaching at Universities, 441
  Discussion on Higher Education in the Colonies, 478
  Discussion on Inter-University Relations and Exchanges, 585
British Commonwealth of Nations Scientific Offices, London : R. McChlery to establish a Central African Scientific Liaison Office in the, 250
  Appointment of R. McChlery as Central African Scientific Liaison Officer, 408
British Commonwealth Scientific Offices in Washington : Dr. W. A. Macfarlane loaned by the Ministry of Fuel and Power to the Department of Scientific and Industrial Research as director of the United Kingdom Scientific Mission in the, 366
British Council : Publication of No. 1 of the *British Agricultural Bulletin*, 137
  Report for the Year ended March 31, 1948, 587
  Financial Aid for Delegates at Conferences, 808
British Drug Houses, Ltd. : Introductory Notes on Chromatography, 1007
British Embassy, Washington : Appointment of E. I. R. MacGregor as assistant civil air attache, 19
British Empire, Universities Bureau of the : To be known as the Association of Universities of the British Commonwealth, 648
British Empire Cancer Campaign : Twenty-fifth Annual Report (Dr. D. A. G. Galton), 664
British Empire Cancer Campaign (Genetical Society of Great Britain and the) : Symposium on the Genetics of Cancer, 514
British Esperantist Scientific Association : Foundation of the, 918
British Film Institute (Scientific Film Association of Great Britain and the) : Second Congress of the International Scientific Film Association, 59, 826
British Institute of Archæology at Ankara : Appointment of Seton Lloyd as director, 250, 327
British Institute of Management: Second Oxford Management Conference, 807
  Issue of *Management Abstracts*, 955
British Iron and Steel Research Association : Conference on the Non-destructive Testing of Castings, 59
  Conference on Foundry Core Bonding Agents, 59
British Jute Trade Research Association : New premises of the, 17
British Mechanical Productions, Ltd. : Polytetrafluorœthylene, 768
British Medical Association : The Training of a Doctor, 311
British Medical Association (Section of Pathology) : Discussion on the Prophylaxis of Virus Infections with special reference to the Use of Vaccines, 92
  Discussion on Recent Advances in our Knowledge of the *Rh* Factor, 515
British Medical Association (Section of Radiology) : Symposium on the Therapeutic Applications of Radioactive Isotopes, 480
British Museum : Retirement of Dr. Sidney Smith from the post of keeper of the Department of Egyptian and Assyrian Antiquities, 645
  Appointment of C. J. Gadd as keeper of the Department of Egyptian and Assyrian Antiquities, 645
British Museum (Natural History) : New exhibit of Protozoa, 19
  Re-opening of the galleries of fossil reptiles, fishes and plants in the Geological Department, 564
  Re-opening of the southern half of the Invertebrate Gallery in the Zoological Department, 648
  Acquisitions, 689
  Appointment of Dr. W. Campbell Smith as deputy chief scientific officer, 844
  Appointment of Dr. Maurice Burton as a senior principal scientific officer (deputy keeper) in the Department of Zoology, 844
British Postgraduate Medical School : Title of professor emeritus of medicine in the University of London conferred on Sir Francis Fraser, 729
British Society for the History of Science : Formation of a Philosophy of Science Group, 59
British Standards Institution : Election of Roger Duncalfe as chairman of the General Council, 884
British Thomson-Houston Co., Ltd. : Summer School in Electrical Engineering, 19
Broekhuysen, Dr. G. J., and Macnae, W. : The Potato Caterpillar Pest (*Agrotis* spec.) of Tristan da Cunha, 225
Broglie, Prof. L. de : Pure Science, Fertile Source of Industrial Progress, 769
Brooks, Prof. F. T. : Retirement from the chair of botany in the University of Cambridge, 521 ; work of, 521
Brooksbank, B. W. L., and others : Destruction of Urinary Glucuronide by Bacteria, 701
Broom, Dr. Robert : Presented *in absentia* with the Neill Prize (1945–47) of the Royal Society of Edinburgh, 100
Broom, Dr. Robert, Naturalist, *review* by Prof. D. M. S. Watson, 795
Brostrøm, K. J., and others : Gamma-Rays from Proton Bombardment of Separated Argon Isotopes, 695
Brown, B. R., and others : Production of Quinolyl and Pyridyl Anions during Decarboxylation, 73
Brown, Dr. C. J., and Corbridge, D. E. C. : Crystal Structure of Acetanilide—Use of Polarized Infra-Red Radiation, 72
Brown, F. G. : Everyman's Mathematics, *review* by Prof. H. T. H. Piaggio, 679
Brown, Eng. Vice-Admiral Sir Harold : Appointed a member of the Scientific Advisory Council to the Minister of Fuel and Power, 57
Brown, J. P., and others : Structure of Citrinin, 72
Brown, S. G. : *Death* of, 250 ; *obituary* by H. Passmore, 361
Brown, Prof. T. Graham : *Obituary* of Dr. J. H. Shaxby, 806
Brown, Wilfred B. D., and Raphael, Winifred : Managers, Men and Morale, *review* by E. F. L. Brech, 796
Bruce, —. : Road Safety and Traffic Flow, 785
Bruce, Maurice : Laws and Constitutions, *review*, 238
Brunt, Prof. D. : Elected Physical Secretary of the Royal Society, 874
Buchanan, G. L., and others : Synthesis of Colchicine Derivatives, 692
Bucher, Prof. Walter H. : Elected president of the American Geophysical Union, 290
Buchthal, Prof. Fritz, and others : Phosphorylation of Myosin by Adenosine Triphosphate, 965
Buck, F. R., and others : Steric Hindrance in Vinyl-Mesitylene, 103
Buck, J. B. : Bioluminescence, 423
Buckley, C. J. : Appointed senior livestock officer, Tanganyika, 138
Buist, Dr. J. M. : Physical and Chemical Aspects of Rubber Technology, 205
Bulletin Analytique (Centre National de le Recherche scientifique), 605
Bullough, W. S. : Practical Zoological Illustrations—Invertebrates, *review*, 834
Bungart, Peter A. : *Death* of, 521
Burch, Dr. C. R. : High Vacua, 937
Burchardt, Dr. F. A. : Appointed director of the Oxford University Institute of Statistics, 990
Burd, Lieut. Oliver : *Death* of, 918
Burden, F. A. (Burgoyne, Dr. J. H., and) : Ethylene Oxide Explosions, 181
Burgers, Prof. J. M., and Florkin, Dr. M. : 'Freedom and Obligations', 783
Burgers, Prof. W. G. : Anisotropic Silicon-Iron, 800
Burgers, Prof. W. G., and others : Inclusions in Aluminium Crystals, 740
Burgoyne, Dr. J. H., and Burden, F. A. : Ethylene Oxide Explosions, 181
Burgt, J. H. van der, and Bendegom, L. van : The Use of Vegetation to Stabilize Sand Dunes, 803
Burhop, Dr. E. H. S. : Atomic Energy and the Scientist, 1006
Burhop, Dr. E. H. S., and Yadav, H. N.: Fast Neutron-Proton Scattering and the Law of Interaction between Nucleons, 738
Burkart, Prof. A., and others : La vegetación de la Argentina, *review* by G. M. Roseveare, 203
Burkitt, M. C. : Ancient Egyptian Materials and Industries, *review*, 429
  French Palæolithic Art, *review*, 511
Burn, G. P. (Harris, E. J., and) : Permeability of Muscle Cells, 929
Burn, Prof. J. H. : Fine Chemicals for Medical Use, 447
  Inaugural address to the Fine Chemicals Group of the Society of Chemical Industry, 728
Burn, Dr. J. L. : Recent Advances in Public Health, *review* by Sir Arthur MacNalty, 47
  Sound Transmission and Noise, 500
Burnett, —. : Road Research in Scotland, 785
Burton, Dr. Maurice : Intuition and Reason, 956
Burra, J. A. N. : Appointed assistant conservator of forests, St. Lucia, 138
Burstall, Dr. F. H., and others : A New Method for the Separation, Detection and Estimation of Inorganic Compounds, 691
Burt, —. : Life-Histories of North American Birds, 522
Burton, Prof. E. F. : *Obituary* by Prof. John Satterly, 880
Burton, Harry E. : *Death* of, 250
Burton, Dr. Maurice : Ecology of Sponges, 73
  Appointed a senior principal scientific officer (deputy keeper) in the Department of Zoology of the British Museum (Natural History), 844
Bush, Raymond : Frost and the Fruitgrower, 584
  Harvesting and Storing Garden Fruit, *review* by Prof. R. H. Stoughton, 981
Bush, Dr. Vannevar : Report of the Carnegie Institution of Washington for the Year ended October 1947, 421
Bushnell, Dr. G. H. S. : Appointed curator of the Museum of Archæology and Ethnology in the University of Cambridge, 328, 445 ; work of, 445
  A South American Anthropological Symposium, *review*, 908
Business and Brotherhood and Res et Caritas : The World as an Economic Entity, *review*, 45
Busk, Dr. Th. : Genetics of Cancer, 515
Busvine, J. R. : Degree of D.Sc. of the University of London conferred on, 212
Butcher, H. C. : Appointed chemist, Federation of Malaya, 447
Butement, F. D. S. : Introduction of Radioactive Tracers into Antisera, 731
Butler, Dr. Colin G. : The Skyscraper Hive (Father M. Dugat), translated by Norman C. Reeves, *review*, 87
  Honey and your Health (Dr. B. F. Beck and Dorée Smedley), *review*, 128
  The Ventilation of Bee-Hives (E. B. Wedmore), *review*, 717
Butler, Dr. J. A. V. : What is Physical Chemistry?, *review*, 125
  Forces between Colloidal Particles, *review*, 315
  Rockefeller Institute for Medical Research, Princeton, 479
Butler, Dr. J. A. V., and others : The Core of the Insulin Molecule, 418
Buxton, Anthony : Travelling Naturalist, *review* by Seton Gordon, 48
Buzzati-Traverso, A., and others : Polyploidy in Bacteria?, 295

CABRERA, Prof. A. L., and others: La vegetación de la Argentine, *review* by G. M. Roseveare, 203

Cady, Prof. Walter G. : Equations in Piezoelectricity, 933
Cady, Prof. W. M., and Zarem, A. M. : Brief Light Pulses using Kerr Cells, 528
Caffyn, J. E. (Blair, Dr. G. W. Scott, and) : Further Experimental Evidence for the Theory of Quasi-Properties, 368.
Cairns, H. J. F., and Lajtha, L. G. : Loss of White Cells in Bone Marrow Culture, 536
Caldwell, Prof. John : The Hatherly Biological Laboratories, University College, Exeter, 505
Cale, G. N., and others : Creep of Metals subjected to Compression Stress, 411
Calman, Dr. W. T. : *Obituary* of Sir D'Arcy Thompson, 93
Calvet, Fernando, and others : Electron Optical Observations on Chromosome Structure in Resting Cells, 305
Cambridge Philosophical Society : Hopkins Prize for 1939–42 awarded to Prof. H. J. Bhabha, 690
Hopkins Prize for 1942–45 awarded to Dr. C. F. Powell, 690
Cambridge University Educational Film Council : Formation and work of, 18
Camerini, U., and others : Observations on Slow Mesons of the Cosmic Radiation, 433
Campbell, A. D. : Appointed veterinary officer, Nigeria, 366
Campbell, C. S., and others : Physical Chemistry of Process Metallurgy, 720
Campbell, J. S. : Appointed agricultural officer, Nigeria, 729
Campbell, Dr. Neil : Fluoranthene Syntheses, 857
Canac, Prof. : Sound Transmission and Noise, 500
Canadian National Research Council : Scholarships for Postgraduate studies, 18
Medical Fellowships awards, 523
Thirty-first Annual Report, 748
Cancer Campaign, British Empire : Twenty-fifth Annual Report (Dr. D. A. G. Galton), 664
Cancer Hospital, Royal : Appointment of Dr. R. A. M. Case as research fellow at the Chester Beatty Research Institute, 607
Cannon, Prof. H. Graham : Undergraduate Zoology, 401
Marine Fisheries of Great Britain, 641
The Life and Work of Charles Darwin, *review*, 831
The Place of Biology in a Curriculum, 1006
Cansdale, G. S. : Appointed superintendent of the Zoological Society's Gardens, 987 ; work of, 987
Cantril, Hadley (Sherif, Muzafer, and) : The Psychology of Ego-Involvements, *review* by Dr. John Cohen, 7
Cappell, Prof. D. F. : Recent Advances in our Knowledge of the *Rh* Factor, 515
Caribbean Research Council : Crop Inquiry Series, No. 4, Root Crops and Legumes, 121
Crop Inquiry Series, No. 5, Vegetables, 121
Crop Inquiry Series No. 6, The Sugar Industry of the Caribbean, 137
Carle, Donald de : British Time, *review* by R. A. Fell, 6
Carlisle, Dr. C. H. (Bernal, Prof. J. D., and) : Unit Cell Measurements of Wet and Dry Crystalline Turnip Yellow Mosaic Virus, 139
Carlisle, S. S. : The Use of Electronic Instruments in Iron and Steel Making, 762
Carlyle, A. A. : Appointed lecturer in physiology in the University of Sheffield, 99
Carmichael, W. : Appointed assistant conservator of forests, Tanganyika, 956
Carne, Philip B. : Persistence of D.D.T. in the Soil, 743
Carnegie Institution of Washington : Report for the Year ended October 1947 (Dr. Vannevar Bush), 421
Carnegie Trust for the Universities of Scotland : Forty-sixth Annual Report, 307
Carnegie United Kingdom Trust : Thirty-fourth Annual Report, 269
Carpenter, Prof. G. D. Hale : Retirement from the Hope professorship of zoology at the University of Oxford, 174 ; work of, 174
Carr, Dr. Francis H. : *Obituary* of C. A. Hill, 840
Carr, Dr. J. G. : Genetics of Cancer, 514
Carr-Saunders, Sir Alexander : Higher Education in the Colonies, 478
Carter, E. J. : Practical Applications of International Collaboration in Documentation, 863
Carter, G. A. : Flowers, Shrubs and Fruit for the Small Garden, *review*, 757
Carter, Dr. G. S. : Colour and Colour Vision in Animals, 600
Cartwright, N. J., and others : Structure of Citrinin, 72
Case, Dr. R. A. M. : Appointed research fellow at the Chester Beatty Research Institute of the Royal Cancer Hospital, 607
Cass Technical Institute : Course of lectures by Dr. B. P. Dudding on Statistical Methods in Industry, 607
Castle, Francis J., and others : An Automatic Agar Dispenser, 903
Catton, W. T. : Coarse Granulocytes in Epithelial Tissues of Teleost Fishes, 894
Caussé, Dr. R., and others : Vestibular Effect of Streptomycin in the Mouse, 929
Cavalli, Dr. L. L., and others : Polypoloidy in Bacteria ?, 295
Cave-Browne-Cave, Wing-Comdr. T. R. : The Young Engineer, 402
Applicable Mathematics, 582
Cawadias, Dr. A. P. : Clinical Endocrinology and Constitutional Medicine, *review*, 512
Central African Council : R. McChlery seconded to the, 250
Central African Scientific Liaison Office : Appointment of R. McChlery as Scientific Liaison Officer in London, 408
Centre National de la Recherche scientifique : Publication of the *Bulletin analytique*, 605
Chadwick, Sir David : The Royal Society Scientific Information Conference, Section 2, Abstracts and Abstract Journals, 282
British Abstracts, 578
Chadwick, Sir James : Appointed a vice-president of the Royal Society, 990
Chak, I. M., and others : *In vitro* Effect of Penicillin on Prothrombin Activity of Bovine Plasma, 930
Chakraborty, C. H., and others : Species Difference in the Biosynthesis of Vitamin C and Response to Diabetogenic Substances, 660
Chakravarty, Dr. H. L. : Extrafloral Glands of Cucurbitaceæ, 576
Chalmers, Dr. J. N. Marshall, and others : Basque Blood Groups, 27
Chambers, Prof. Robert : Blood Capillary Circulation under Normal Conditions and in Traumatic Shock, 835
Chambers, Dr. W. T. : Physical and Chemical Aspects of Rubber Technology, 206
Champion, F. W. : Appointed assistant conservator of forests, Tanganyika, 485
Chapman, Garth, and Newell, Dr. G. E. : Burrowing of the Lugworm, 894
Chapman, Garth (Newell, Dr. G. E., and) : Distribution of Lugworms, 75
Chapman, G. W. : Appointed senior assistant conservator of forests, Cyprus, 485
Chapman, J. W. F. : Appointed assistant conservator of forests, Nigeria, 729
Chapman, Prof. S. : Elected president of the Association of Terrestrial Magnetism and Electricity, 745
Chapman, V. J. : The Stabilization of Sand Dunes by Vegetation, 803
Charing Cross Hospital Medical School : Title of University of London professor of chemical pathology conferred on Dr. Jocelyn Patterson, 990
Charnwood, Lord : Ophthalmic Optics, 825
Chase, A. M. : Bioluminescence, 423
Chatterjee, Dr. D. : *Ustilago microchloae*, a New Record, 703
Chaudron, Prof. G., and others : Intergranular Corrosion of Pure Aluminium in relation to the Behaviour of Grain-Boundaries during Melting, 854
Chavasse, P. : Sound Transmission and Noise, 500, 501
Cheek, Miss E. B. : Appointed biochemist at the Institute of Medical Research, Malaya, 138
Chemical Industry, Society of: Conference on Dust in Industry, 328, 485
Formation of a Fine Chemicals Group, 447
Convention on High Vacua, 523, 936
Chemical Industry, Society of (Fine Chemicals Group) : Inaugural meeting, 728
Chemical Industry, Society of (Nutrition Panel of the Food Group) : Lectures on Manufactured Foods, 956
Chemical Industry, Society of (Society of Public Analysts and other Analytical Chemists and the) : Joint Committee on Vitamin D Assay, 919
Chemical Research Laboratory, Teddington, 90
Report of the Director for the Year 1946, 228
Chemical Society : Vol. 2, No. 1, of *Quarterly Reviews*, 100
Tilden Lecture (Prof. C. E. H. Bawn), 607
Discussion on the Theory and Practice of New Techniques in Separation and Purification, 729
Chemistry, Royal Institute of (Birmingham and Midlands Section) : To establish a Percy Faraday Frankland Memorial Lecture, 809
Chemistry Research Board : Report for the Period 1938–1946, 228
Cherry, E. C. : Applied Electronics, *review*, 126
Chihara, H., and Seki, S. : Volume Change of Hexamethyl Benzene, 773
Childe, Prof. V. Gordon : Primitive Techniques, Agriculture and Economic Organisation, 603
Chimie biologique, Société de : International Congress on Biological Chemistry, 59
Chipman, Prof. J. (Dastur, M. N., and) : Physical Chemistry of Process Metallurgy, 720
Christie, Prof. R. V. : Appointed a member of the Industrial Health Research Board, 918
Christophers, Sir Rickard : *Obituary* of P. J. Barraud, 481
Church, H. F., and Garton, C. G. : Electrical Breakdown of Organic Insulation by Electro-chemical Reactions, 301
City of London School : Science Teaching at the, 767
City and Guilds of London Institute : Report of the Council for 1947, 990
Civil Engineers, Institution of : Conference on Civil Engineering Problems in the Colonies, 18
Conference on Biology and Civil Engineering, 99, 801
Awards for the Session 1947–48, 865
Civil Engineers, Institution of, and others : Series of lectures for schools, 690
Civil Engineers, Institution of (Glasgow and District Association of the), and others : Conference on Road Research, 290, 784
Clapham, Prof. A. R., and Godwin, Prof. H. : Studies of the Post-Glacial History of British Vegetation, 1008
Clark, A. M. : Carbonic Anhydrase in *Arenicola marina*, 191
Clark, Dr. G. L. : Appointed University of London reader in mathematics at Bedford College, 290
Clark, K. A., and Pasternack, D. S. : Elimination of Water from Wet Crude Oil, 483
Clark, Dr. N. O. : A Study of Mechanically Produced Foam for Combating Petrol Fires, 158
Clark, Dr. R. E. D. : Blinking, 970
Clark, Prof. W. E. Le Gros : *Obituary* of Prof. F. Weidenreich, 805
Clay, Dr. S. : The Behaviour of Seeds, *review*, 594
Clayton, B. C. : Appointed an advisory officer at the Research Station of the Board of Greenkeeping Research, 328
Clegg, —. : Selection at the University Level, 627
Clegg, Dr. Hugh : The Art and Technique of Book Reviewing, 863
Clemesen, J. : Genetics of Cancer, 515
Clemo, Prof. G. R., and Daglish, A. F. : Structure of the Pigment of *Chromobacterium iodinum*, 776
Clemo, Prof. G. R., and others : Synthesis of *l*-Sparteine, 296
Clemo, Prof. G. R., and Swan, G. A. : Structure of Ketoyobyrine, 693
Clerkin, P. L. : Dairy Bacteriology, 669
Cleveland Museum of Natural History : Television programmes of the, 18
Cleveland Seismological Observatory, 211
Coblans, Dr. Herbert (compiled by) : A Bibliography of Chemical Research in South Africa, 1910–1939, *review*, 391
Cockcroft, A. L., and others : Beta Spectrum of Tritium, 302
Cockcroft, Sir John : Awarded the James Alfred Ewing Medal for 1947 of the Institution of Civil Engineers, 865
Coco-nut Research Scheme : Annual Report for 1944, 409
Codrington, Prof. K. de B. : Inaugural address as professor of Indian archæology in the University of London, 727
Cohan, Dr. L. H. : Physical and Chemical Aspects of Rubber Technology, 205

Cohen, Dr. Georges N., and Cohen-Bazire, Germaine : Fermentation of Pyruvate, β-Hydroxybutyrate and of C_4-dicarboxylic Acids by some Butyric Acid-forming Organisms, 578
Cohen, Dr. John : The Psychology of Ego-Involvements (Muzafer Sherif and Hadley Cantril), *review*, 7
  Principles and Practice of the Rorschach Personality Test (W. Mons), *review*, 87
  International Congress on Mental Health, 441
Cohen-Bazire, Germaine (Cohen, Dr. Georges N., and) : Fermentation of Pyruvate, β-Hydroxybutyrate and of C_4-dicarboxylic Acids by some Butyric Acid-forming Organisms, 578
Coleman, C. F. : Awarded an Overseas Science Research Scholarship for 1948 by the Royal Commission for the Exhibition of 1851, 100
Coleman, E. H., and others : Spectrum of Iodine Oxide (IO) in Flames, 108
Colin, Georges, et autres : Le caoutchouc, *review* by W. P. Fletcher, 678
College of Aeronautics : Appointment of J. V. Connolly as professor of aircraft economics and production, 409
College of the Pharmaceutical Society : To be reconstituted and renamed the School of Pharmacy, University of London, 663
College of Physicians of Philadelphia : Alvarenga Prize for 1948 awarded to Dr. Melvin H. Knisely, 290
Collie, C. H., and others : Photodisintegration of the Deuteron, 185
Collinge, B. : Reduction of Dead Times in Geiger-Müller Counters, 853
Collins, F. D., and others : Indicator Yellow and Retinene$_1$, 222
Collins, George B. (edited by) : Microwave Magnetrons, *review* by Prof. J. T. Randall, 591
Collins, R. D., and Newby, M.P. : Determination of Mixing of Gas Streams by the Infra-Red Gas Analyser, 224
Colonial Microbiological Research Institute, Trinidad, 14 ; (Prof. J. L. Simonsen), 498
Colonial Service : Appointments and Promotions, 138, 366, 447, 485, 729, 956
Columbia University (Statistical Research Group) : Selected Techniques of Statistical Analysis for Scientific and Industrial Research and Production and Management Engineering (edited by Churchill Eisenhart, Millard W. Hastay and W. Allen Wallis), *review* by Prof. M. S. Bartlett, 510
Combes, Prof. Raoul : Elected to the Section of Botany of the Paris Academy of Sciences, 176
Comfort, Alex. : Distribution of Shell Porphyrins in Mollusca, 851
Commonwealth (British), Universities of the: Sixth Congress of the, 99
  Discussion on the Balance of Research and Teaching at the Universities, 441
  Discussion on Higher Education in the Colonies, 478
  Discussion on Inter-University Relations and Exchanges, 585
Commonwealth (British), Association of Universities of the : New name of the Universities Bureau of the British Empire, 648
Commonwealth Fund : Fellowships, 844
Commonwealth of Nations Scientific Offices, British : Appointment of R. McChlery as Central African scientific liaison officer in London, 408
Commonwealth Plant Breeders : Informal meeting at the School of Agriculture, Cambridge, 175
Conalty, M. L., and others : Anti-Tubercular Activity of Oxidation Products of Substituted *o*-Phenylene Diamines, 622
Conant, James B. : On Understanding Science, *review* by Prof. Herbert Dingle, 552
Condon, Dr. E. U. : Atomic Energy and Society, 1005
Congress, Library of, Washington : Opening of the United States Book Exchange, 408
Conn, Dr. G. K. T., and Donovan, B. : Anomalous Magneto-Resistance Effects in Bismuth, 336
Connolly, J. V. : Appointed professor of aircraft economics and production at the College of Aeronautics, 409
Consden, Dr. R. : Partition Chromatography on Paper, its Scope and Application, 359
  Chromatography for General Chemical Analysis, 1007
Consden, Dr. R., and Gordon, Dr. A. H. : Effect of Salt on Partition Chromatograms, 180
Constable, D. H. : Appointed soil survey officer, Trinidad, 138
Constable, W. G. : Cleaning and Care of the National Gallery Pictures, 166
Conway, Prof. Edward J., and Brady, Thomas G. : Source of the Hydrogen Ions in Gastric Juice, 456
Cook, Dr. A. H., and others : Antibiotics produced by Fungi, and a New Phenomenon in Optical Resolution, 61
Cook, Prof. J. W. : Chemical Synthesis Made Easy, *review*, 202
Cook, Prof. J. W., and others : Synthetic Analgesics, 21
  Synthesis of Colchicine Derivatives, 692
Cook, Prof. Mercer : Education in Haiti, 975
Cooke, R. G. : Structure of Dunnione, 178
Cookson, Isabel C. : Plant Microfossils from the Lignites of the Kerguelen Archipelago, 309
Coombs, D. S. : Awarded an Overseas Science Research Scholarship for 1948 by the Royal Commission for the Exhibition of 1851, 100
Coombs, Dr. R. R. A. : Recent Advances in our Knowledge of the *Rh* Factor, 516
Cooper, H. D. : Physical and Chemical Aspects of Rubber Technology, 204
Cooper, Dr. J. L. B. : Appointed to the University of London readership in mathematics at Birkbeck College, 920
Cooper, Dr. L. H. N., and Steven, G. A. : Marine Fish Cultivation, 378
Cooper, W. : Radical Reactivity in the Initiation Reaction of the Polymerization of Styrene, 897
  Peroxide Catalysed Vinyl Polymerization, 927
Cooper, W. T. : Appointed assistant secretary (editorial) of the Institute of Fuel, 485
Copeland, Dr. Edwin Bingham : Genera Filicum, the Genera of Ferns, *review* by Prof. I. Manton, 314
Copernicus, Nicolas, 445
Copley, Dr. George Novello : Velocity of Photons, 461
Corbridge, D. E. C. (Brown, Dr. C. J., and) : Crystal Structure of Acetanilide—Use of Polarized Infra-Red Radiation, 72
Corson, Dr. J. F. : *Obituary* of Dr. J. W. S. Macfie, 805
Coster, H. P. : Electric Conductivity of Rocks at High Temperatures, 270
Cottier, Dr. W. : Biological Control of Insects, 308
Cotton Research Station, Trinidad (Genetics Department) : Final Report on the Evolution of Gossypium (J. B. Hutchinson, R. A. Silow and S. G. Stephens), *review* by E. Lord, 716
Cottrell, Dr. A. H., and Gibbons, D. F. : Thermal Hardening of Cadmium Crystals, 488
Coulson, Prof. C. A. : Wave Mechanics in Physics, Chemistry and Biology, 504
County Surveyors' Society (Scottish Branch), and others : Conference on Road Research, 290, 784
Courant, R. : Studies and Essays presented to, on his 60th Birthday, January 8, 1948, *review*, 391
Courrier, Prof. Robert : Elected a 'secrétaire perpétuel' of the Paris Academy of Sciences, 174 ; work of, 174
Cowan, Dr. S. T. : Classification of Bacteria, *review*, 833
Coward, Dr. Katherine H. : The Biological Standardization of the Vitamins, second edition, *review* by Prof. S. K. Kon and Dr. P. White, 202
Cowie, J. R. : *Death* of, 250 ; *obituary* by Dr. S. Whitehead, 326
Cowling, Prof. T. G. : Cosmic Rays and Nuclear Physics (Prof. L. Jánossy), *review*, 513
Cowling, Prof. T. G., and Borger, R. : Electric Conductivity of the Ionospheric *D*-Region, 143
Cox, Prof. E. G. : Semiconductors and their Applications, 624
Cox, Prof. E. G., and others : Crystal Structure of Nitronium Perchlorate, 259
Cox, Dr. H. Roxbee : Appointed a member of the Scientific Advisory Council to the Minister of Fuel and Power, 57
Cox, S. F., and others : Antibiotics produced by Fungi, and a New Phenomenon in Optical Resolution, 61
Cox, S. M. : An Elementary Kinetic Theory of Dilute Silica Glass, 939
  A Kinetic Approach to the Theory of the Strength of Glass, 947

Crank, J. : The Differential Analyser, *review* by John Womersley, 85
Cranston, Dr. John A. : Rational Approach to Chemical Principles, *review* by Dr. J. A. V. Butler, 125
Crawford, Dr. T. : Appointed University of London professor of pathology at St. George's Hospital Medical School, 290
Creamer, Prof. Walter J. : Elements of Electrical Engineering, *review* by Prof. J. Greig, 753
Cremer, Dr. L. : Sound Transmission and Noise, 501
Crocker, William (Barton, Lela V., and) : Twenty Years of Seed Research at Boyce Thompson Institute for Plant Research, *review*, 594
Crombie, Dr. A. C. : Science and Philosophy, *review*, 46
Crombie, J. and J. : Gift of £250 to the University of Leeds for the Textile Department, 212
Crombie, L., and others : Total Synthesis of some Pyrethrins, 222
Crompton, John: The Hunting Wasp, *review* by Dr. V. B. Wigglesworth, 758
Croney, D. : Detonation in Liquid Explosives, 490
Croney, D., and Lewis, W. A. : the Effects of Vegetation on the Settlement of Roads, 803
Crosby, J. L. : Genetical Structure of Plant Populations, 517
Crowfoot, Dr. Dorothy, and Dunitz, Dr. J. D. : Structure of Calciferol, 608
Crowther, J. G. : The World Federation of Scientific Workers, 644
Crowther, R. W. : Appointed veterinary officer, Cyprus, 138
Crozier, Sir Thomas : *Obituary*, 561
Cruickshank, Allan D.: Wings in the Wilderness, *review* by Frances Pitt, 431
Cruickshank, Dr. Robert : Appointed to the chair of bacteriology at St. Mary's Hospital Medical School, 607
Crump, Lettice M. (Kalmus, Dr. H., in collaboration with) : Genetics, *review*, 717
Crystallography, International Union of : First General Assembly and Congress, 365 ; (Dr. H. Lipson), 838
  Election of officers, 365
Csapó, Dr. A. : Actomyosin Content of the Uterus, 218
Csefkó, I., and others : Histamine—Heparin—Thrombin Chain Mechanism, 257
Cullen, Dr. William : *Death* of, 288 ; *obituary* by Dr. S. W. Smith, 560
Cullwick, Prof. E. G. : Appointed to the Watson-Watt chair of electrical engineering at University College, Dundee, 920
Cummins, J. E. : The Significance to Special Librarians and Information Officers of the Royal Society's Scientific Information Conference, 863
Cundall, Leonard : Appointed a lecturer in the Department of Education of the International Wool Secretariat, 564
Cunningham, Dr., and McLeod, —. : Dairy Bacteriology, 670
Curie, Adam :, The Nature of Incentives, 558
Curnow, D. H., and others : Œstrogens in Grass and their possible Effects on Milk Secretion, 845
Curran, Dr. S. C., and others : Beta Spectrum of Tritium, 302
Currie, Prof. G. A. : Honorary degree of doctor of laws of the University of Aberdeen conferred on, 99
  The Balance of Research and Teaching at Universities, 441
Cuthbertson, Dr. W. F. J. : Recent Developments in Microbiological Assay, 157
Cutting, C. V. : Appointed analytical chemist, Tung Experimental Station, Nyasaland, 485

DACIE, J. V. : Appointed to the University of London readership in hæmatology at the Postgraduate Medical School of London, 564
Dadson, R. S. : Sound Transmission and Noise, 500
Daglish, A. F. (Clemo, Prof. G. R., and) : Structure of the Pigment o *Chromobacterium iodinum*, 776
Daglish, C., and Wokes, Dr. Frank : Hydrojuglone and Apparent Vitamin C in Walnuts, 179
Dainton, Dr. F. S., and Ivin, K. J. : Reversibility of the Propagation Reaction in Polymerization Processes and its Manifestation in the Phenomenon of a 'Ceiling Temperature', 705
Dale, C. R. : Appointed a member of the Industrial Health Research Board 918

NAME INDEX

Dale, Sir Henry : Elected president of the Royal Society of Medicine, 96
  Transmission of Effects from the Ends of Nerve Fibres, 558
  Resignation of his honorary membership of the Academy of Sciences of the U.S.S.R., 882
  Atomic Energy and the Scientist, 1006
Dales, R. Phillips : Occurrence of *Acanthocephalus ranae* Schrank. in Great Britain, 1001
Daley, P. A. : Appointed assistant conservator of forests, Nigeria, 485
Dalgaard, Jörgen B. : Tracer Phosphatase Determination in Tissue Sections, 811
Dalgaard-Mikkelsen, Sv., and others : A Hyaluronidase Unit, 221
Dalgliesch, Dr. Charles E., and others : Studies of the Structure of Synthetic Polypeptides, 596
Dalling, Prof. T. : Appointed chief veterinary officer to the Ministry of Agriculture and Fisheries, 60
Dalton, H. : Control of Intestinal Microflora, 227
Dam, Prof. Henrik (Granados, Humberto, and) : Testicular Hypoplasia and Epididymal Cysts in the Syrian Hamster, 297
Dammerman, K. W. : The Fauna of Krakatau, 1883–1933, *review*, 552
Dams (Large), International Commission on : Congress in Sweden (Dr. Norman Davey), 544
Dance, J. B., and Norris, D. J. : Structure of Abraded Surfaces, 71
Daniel, Dr. Vera : Physical Properties of Substances of High Permittivity, 245
Danielli, Dr. J. F. : Cytological Research and Biophysics, *review*, 753
  A Proposed Institute of Biology, 878
Danielli, Dr. J. F., and others : Cytochemical Demonstration of Ketosteroids, 572
Danielsson, Carl-Erik : Molecular Weight of Malt-Amylase, 525
Danish Academy of Technical Sciences : Valdemar Poulsen Gold Medal awarded to Sir Edward Appleton, 884
Danjon, Dr. André : Elected a member of the Section of Astronomy of the Paris Academy of Sciences, 366
Dannatt, Prof. C. W., and Ellingham, Dr. H. J. T. : Physical Chemistry of Process Metallurgy, 720
Darcy, D. A. : Elected to a Beit Memorial Fellowship for Medical Research, 212
Dare, Edith G. : The Human Milk Bank, 439
Darlington, Dr. C. D. : Genetics of Cancer, 514
  Genetical Structure of Plant Populations, 518
  Groundnut Breeding, 621
Darlington, Dr. C. D. (edited by) : The Fruit and the Soil (Collected edition of the John Innes Leaflets), 791
Darmon, S. E., and others : Studies of the Structure of Synthetic Polypeptides, 596
Dart, Prof. Raymond A. : A (?) Promethean *Australopithecus* from Makapansgat Valley, 375
Dartnall, Dr. H. J. A. : Indicator Yellow and Retinene$_1$, 222
Darwin, Charles (Jean Rostand), *review* by Prof. H. Graham Cannon, 831
Darwin, Sir Charles : High Vacua, 936
Darwin, Sir Francis (1848–1925), 248
Das, S. : Delayed Neutrons, 853
Das, Dr. S. M. : British Folliculinidæ (Ciliata, Heterotricha), 534
  Nervous Mechanism in Tunicata, 963
  Receptor Organs in Tunicata, 1000
Dastur, M. N., and Chipman, Prof. J. : Physical Chemistry of Process Metallurgy, 720
Davey, Dr. Norman : International Commission on Large Dams—Congress in Sweden, 544
David, Prof. W. T. : *Obituary* by Prof. H. H. Evans, 15
Davidson, Dr. J. W. : Higher Education in the Colonies, 479
Davidson (William) of Aberdeen, the First Scots Professor of Chemistry (Prof. John Read), 954
Davies, D. V. : Appointed University of London professor of anatomy at St. Thomas's Hospital Medical School, 290
Davies, Dr. G. R., and others : A New Method for the Separation, Detection and Estimation of Inorganic Compounds, 691
Davies, Martin : Appointed a deputy keeper of the National Gallery, London, 409
Davies, Prof. S. J. : Applicable Mathematics, 583
Davis, Tenney L. (edited by) : Chymia, Annual Studies in the History of Chemistry, Vol. 1, *review*, 278
Davison, —., and others : Chemical Ciphering, 562
Davison, D. C. : Awarded an Overseas Science Research Scholarship for 1948 by the Royal Commission for the Exhibition of 1851, 100
Dawes, Dr. Edwin A. : Production of Indole by *Escherichia coli*, 229
Dawson, R. M. C. : Elected to a Beit Memorial Fellowship for Medical Research, 212
Day, Dr. T. D. : Influence of Hydrogen Ions and Neutral Salts upon the Hydration of Interstitial Connective Tissue, 152
Deacon, Dr. G. E. R. : Coastal Waves, 682
Deane, Phyllis : The Measurement of Colonial National Incomes, *review* by D. Randal Wightman, 431
Dee, A. A. (Oliphant, Prof. M. L., and) : *Obituary* of Prof. S. W. J. Smith, 519
Deer, Dr. W. A. : Awarded the Dr. W. S. Bruce Memorial Prize, 212
Defrise, Dr. Pierre : Visages de la mathématique, *review* by Prof. H. T. H. Piaggio, 638
Delacour, Jean : Birds of Malaysia, *review* by Frances Pitt, 49
Demerec, Dr. M. : Genetics of Cancer, 514
Dennell, Dr. Ralph : Appointed to the chair of experimental zoology at the University of Manchester, 645 ; work of, 645
Dennis, R. W. G., and Sandwith, N. Y. : Æcidia of Barley Rust in Britain, 461
Denton, Dr. Derek A. : Renal Regulation of the Extracellular Fluid, 618
Dervichian, D. G., et autres : Un symposium sur les proteines, *review*, 870
Desch, Dr. C. H. : *Obituary* of H. Brearley, 288
Desnuelle, P., et autres : Un symposium sur les proteines, *review*, 870
Desreux, V., et autres : Un symposium sur les proteines, *review*, 870
Destouches, Dr. Jean-Louis : Relation between the Masses of Mesons, 451
Dethier, Prof. Vincent G. : Chemical Insect Attractants and Repellents, *review* by Dr. V. B. Wigglesworth, 550
Deulofeu, Dr. V., and others : Structure of α-Fagarine, 694
Deutsch, Adam, and others : Phosphorylation of Myosin by Adenosine Triphosphate, 965
Deutsche Hydrographische Zeitschrift, Vol. 1, No. 1, 364 ; Vol. 1, No. 2–3, 842 ; Vol. 1, No. 4, 842
Deutsche Physikalische Gesellschaft in der Britischen Zone : Autumn Meeting, 60
Devons, S., and Hereward, H. G. : Proton Bombardment of Fluorine, 331
Devonshire, Dr. A. S. : Physical Properties of Substances of High Permittivity, 246, 247
Dickinson, Dr. Sydney, and Keay, Margaret A. : Growth of *Phytophthora infestans* (Mont.) de Bary on Artificial Media, 32
Dieu, H., et autres : Un symposium sur les proteines, *review*, 870
Digby, Adrian : Primitive Techniques, Agriculture and Economic Organisation, 602
Dilworth, C. C., and others : Processing Thick Emulsions for Nuclear Research, 102
Dingemanse, Dr. Elizabeth, and others : '17-Ketosteroid II' Isolated from Urine—its Reaction with Hydrochloric Acid, 492
Dingle, Prof. Herbert : Presented with the James Scott Prize for 1948 of the Royal Society of Edinburgh, 100
  The Nature of Scientific Philosophy, 100
  On Understanding Science, *review*, 552
  Some Reflexions on the History of Science, 564
Dingwall, Dr. E. J. : Local Genii of British Folk-Belief, *review*, 388
  'Hillbilly' Folk-Lore, *review*, 474
Dinsmore, Dr. R. P. : Physical and Chemical Aspects of Rubber Technology, 206
  Presented with the Colwyn Medal of the Institution of the Rubber Industry, 211
Diringer, Dr. David : The Alphabet, *review* by Sir John Myres, 82
Diver, Capt. Cyril : Genetical Structure of Plant Populations, 518
  Appointed head of the Biological Service in Great Britain, 728, 766 ; work of, 766
Dixey, Dr. F. : Elected president of the Association of African Geological Surveys, 971
Dmochowski, Dr. L. : Genetics of Cancer, 514
Dodgson, M. C. H. : Physical Nature of Mouse Brain, 253
Doig, Peter : An Outline of Stellar Astronomy, second edition, *review* by Dr. R. d'E. Atkinson, 390
Doljanski, Dr. L. : *Death* of, 841
Dollan, Sir Patrick : Road Safety and Traffic Flow, 785
Donald, D. A. : Appointed senior agricultural officer, British Solomon Islands Protectorate, 485
Donald, D. E., and others : Etiology of Grass Disease, 116
Donald, G. M. S., and others : Synthetic Analgesics, 21
Donald, Dr. H. P. : Inbreeding and Hybrid Vigour in Crops and Livestock, 643
Donald, Dr. K. W. : Awarded a Rockefeller Travelling Fellowship in Medicine, 290
Donovan, B. (Conn, Dr. G. K. T., and) : Anomalous Magneto-Resistance Effects in Bismuth, 336
Dormer, Dr. K. J. : Some Geometrical Considerations regarding Imbricate Æstivation, 653
Douglas, Dr. A. E., and Rank, Prof. D. H. : Polarization of the Raman Line of the Totally Symmetric Vibration of Stannic Chloride, 453
Douglas, Mrs. A. M. B. : Structure of Co_2Al_9, 565
Douglas, R. W. : Some Aspects of the Nature and Constitution of Glass, 939
Douglass, Prof. Raymond D., and Adams, Prof. Douglas P. : Elements of Nomography, *review*, 278
Dow, J. S. : *Obituary*, 444
Downs, D., and others : 'Knock' in Internal Combustion Engines, 893
Drake, Dr. Charles H. : Pathogenicity of *Aspergillus nidulans*, 98
Drake, Carl J., and Salmon, J. T. : A Second *Xenophyes* from New Zealand, 919
Drake, R. Murdin : *Death* of, 841
Dresden, D. : Site of Action of D.D.T. and Cause of Death after Acute D.D.T. Poisoning, 1000
Dresel, Elisabeth I. B. : Passage of Hæmoglobin from Blood into Eggs of *Daphnia*, 736
Dresel, E. M., and others : Properties of Ethylene Diamine, 960
Drury, Dr. A. N. : Appointed a member of the Industrial Health Research Board, 918
Dryden, I. G. C. : Extraction of Bright Coals by Anhydrous Ethylene Diamine, 959
Dryden, I. G. C., and others : Properties of Ethylene Diamine, 960
Dryden, J. S., and Jackson, Prof. Willis: Dielectric Behaviour of Methyl Palmitate—Evidence of Resonance Absorption, 656
D'Silva, D. W. : Appointed assistant conservator of forests, British Honduras, 366
D'Silva, Dr. J. L. : Appointed to the University of London chair of physiology at London Hospital Medical College, 99, 210
DuBridge, L. A., and others (A Symposium by) : Physical Science and Human Values, 751
Dubuc, Gabriel (Trombe, Félix, et) : Le centre préhistorique de Gantles-Montespan (Haute-Garonne), *review* by M. C. Burkitt, 511
Dubuisson, M., et autres : Un symposium sur les proteines, *review*, 870
Dudding, Dr. B. P. : Course of lectures on Statistical Methods in Industry at the Sir John Cass Technical Institute, 607
Duewell, H., and others : Colouring Matters of the Aphididæ, 759
Dugat, Father M. : The Skyscraper Hive, translated by Norman C. Reeves, *review* by Dr. Colin G. Butler, 87
Duggle, D. M. : Appointed assistant conservator of forests, Gold Coast, 956
Dummer, G. W. A. : Aids to Training—The Design of Radar Synthetic Training Devices for the R.A.F., 989
Dunbar, Lieut. James M. : Bacteriophage Typing of Untypable *Salmonella typhi* Organisms, 851
Duncalfe, Roger : Elected chairman of the General Council of the British Standards Institution, 884
Duncan, Prof. W. J. : Tables of Supersonic Flow around Yawing Cones, *review*, 432
Dungey, J. W., and Hoyle, F. : Origin of Cosmic Rays, 888
Dunitz, Dr. J. D. (Crowfoot, Dr. Dorothy, and): Structure of Calciferol, 608
Dunlop Rubber Co.,: Exhibition and demonstration at the Conference of Rubber Technology, 206, 211

Dunn, E. : A Method of Distinguishing between Young and Old Colorado Beetles, 75

Dunn, George, and others : Structure of the Antibacterial Compound, Aspergillic Acid, 779

Dunsheath, Dr. Percy : The Graduate in Industry, 125 ; *review* by R. Brightman, 388

Electricity, a Giant Harnessed (Christmas Lectures at the Institution of Electrical Engineers), 990

Dunton, C. E., and Brinsmead, K. : Awarded jointly the Webb Prize of the Institution of Civil Engineers, 865

Dushman, Dr. Saul : High Vacua, 936

Duval, Prof. C. : Automatic Gravimetric Analysis in Inorganic Chemistry, 157

Duykaerts, Prof. G. : Absorptiometric Methods in Chemical Analysis, 157

Dyer, Prof. W. E. : Higher Education in the Colonies, 479

Dymond, E. G. : Appointed reader in natural philosophy in the University of Edinburgh, 60

Dyson, J. : An Optical Analogue of X-Ray and Electron Diffraction Patterns, 140

Dyson, W. G. : Appointed assistant conservator of forests, Kenya, 956

EALES, Dr. N. B. : Elementary Zoology in the United States, *review*, 980

Eastham, Alfred : Retirement as chief officer of the Official Seed Testing Station, 60

Eastman, Dr. E. D., and Rollefson, Prof. G. K. : Physical Chemistry, *review* by Dr. J. A. V. Butler, 125

Eckersley, T. L. : Observations of Scatter Clouds, 24

Economic and Social Research, National Institute of : Annual Report for 1946–47, 197

Edge, Dr. W. L. : Appointed reader in mathematics in the University of Edinbugh, 60

Edgell, Prof. Beatrice : *Death* of, 288 ; *obituary*, 363

Edmonds, E. A. : Appointed geologist, Gold Coast, 956

Edmondson, W. T. (Bigelow, Henry B., and): Wind Waves at Sea, Breakers and Surf, *review* by N. F. Barber, 389

Education, Institute of : Establishment at Reading of an, 842

Education, Ministry of : Pamphlet No. 12, UNESCO and a World Society, 787

Edwards, Ltd., Francis : Catalogue No. 692 of Maps and Atlases of the British Isles, 920

Edwards, Dr. J. T. : Awarded the Order of the Nile (3rd Class) by the Egyptian Government, 138

Veterinary Education—Developments at Cambridge, 721

Edwards and Co., Ltd., W. : High-Vacuum Equipment, 729

Egerton, Sir Alfred : Appointed a member of the Scientific Advisory Council to the Minister of Fuel and Power, 57

Retirement as Physical Secretary of the Royal Society, 874

Eggleton, Dr. Philip : Nutrition of Athletes, 207

Egyptian Government : Order of the Nile (3rd Class) awarded to Dr. J. T. Edwards, 138

Eilers, H., and others : Chemical and Physical Investigations on Dairy Products, *review* by H. D. K., 87

Einstein, his Life and Times (Philipp Frank), *review* by Prof. G. C. McVittie, 591

Einzig, Dr. Paul : New Light on the Origin of Money, 983

Eisenhart, Churchill, and others (edited by) : Selected Techniques of Statistical Analysis for Scientific and Industrial Research and Production and Management Engineering (Statistical Research Group, Columbia University), *review* by Prof. M. S. Bartlett, 510

Electric Lamp Manufacturers' Association : Exhibits at the Darkness into Daylight Exhibition to be incorporated in the permanent collection on Illumination at the Science Museum, 564

Electrical Engineers, Institution of : Election of officers for 1948–49, 100

Regulations for the Electrical Equipment of Buildings, Revised Section 8, 447

Christmas Lectures (Dr. P. Dunsheath), 990

Electrical Engineers, Institution of, and others : Series of lectures for schools, 690

Electrochemical Society, Inc. (Electronics Division) : Symposium on Luminescence, 290

Eley, Dr. D. D. : Phthalocyanines as Semi-conductors, 819

Ellenby, Dr. C. : Resistance to the Potato-Root Eelworm, 704

Ellingham, Dr. H. J. T. (Dannatt, Prof. C. W., and): Physical Chemistry of Process Metallurgy, 720

Elliott, Dr. D. F. : Studies in the Synthesis and Isolation of Threonine, 657

Conversion of DL-Serine into Inactive Cystine, 658

Elliott, Ltd., H. J. : 'E-MIL' Laboratory Glassware, 974

Elliott, M., and others : Total Synthesis of some Pyrethrins, 222

Elliott, T. J., and others : Metabolism of $\alpha:\beta$-Dihydroxy-γ-(2-methylphenoxy) propane ('Myanesin'), 257

Ellis, Carleton, and Swaney, M. W. : Soilless Growth of Plants, second edition, *review* by W. E. B., 717

Ellis, Sir Charles : Appointed a member of the Scientific Advisory Council to the Minister of Fuel and Power, 57

Ellis, D. G. : Appointed assistant conservator of forests, Nigeria, 485

Ellis, J. C. B. : The Feeding of Farm Livestock, second edition, *review* by E. T. Halnan, 432

Ellis, William J. : Method for obtaining Wool Roots for Histochemical Examination, 957

Elmhirst, R. : Retirement from the directorship of the Millport Marine Laboratory, 688 ; work of, 688

Death of, 807 ; *obituary* by Prof. C. M. Yonge, 917

Elsberg, Dr. C. A. : *Obituary* by Dr. W. R. Bett, 443

Emeléus, Prof. H. J. : The Impact of Radioactivity on Inorganic Chemistry, 212

Emery, W. B., and Walker, A. D. : Chemical Assay of Streptomycin B (Mannosido-Streptomycin), 525

Emödi, Dr. B. S. : Clay Minerals as Catalysts and Adsorbents, 196

Empire Council of Mining and Metallurgical Institutions : Fourth Empire Mining and Metallurgical Congress, 606

Emsley, H. H. : Ophthalmic Optics, 825

Eötvös, Baron Roland von (1848–1919), 135; Collection illustrating the work of, arranged at the Science Museum, London, 176

Epicurus Up to Date, *review* by Prof. A. D. Ritchie, 757

Eppelsheimer, D. S. (Hames, F. A., and) : Some New Ferromagnetic Manganese Alloys, 968

Erdol und Kohle : First issue of, 409

Errera, M., et autres : Un symposium sur les proteines, *review*, 870

Escher, Prof. B. G. : Elected president of the Association of Vulcanology, 745

Escreet, H. J. : The British Gas Industry, 440

Esperantist Scientific Association, British : Foundation of the, 918

Essen Louis: Degree of D.Sc. of the University of London conferred on, 19

Estimates for the Session 1947–48, Select Committee on : Fifth Report, 547

Euler, Prof. U. S. v. : Assay of *nor*Adrenalin and Adrenalin in Extracts of Nerves and Tissues, 570

European Meteorological Telecommunications Panel : First meeting of the, 135

Evans, A. B. Agard : Practical Applications of International Collaboration in Documentation, 864

Evans, Prof. G. T. R. : Radium 1898–1948, 606

Evans, Ivor B. N. : Twenty-third Annual Conference of ASLIB, 862

Evans, Prof. M. G. : Appointed to the chair of physical chemistry in the University of Manchester, 485

Evans, Prof. M. G., and Gergely, J. : Structure of the Dinitrososulphite Ion, 770

Evans, Prof. R. H. : *Obituary* of Prof. W. T. David, 15

Evans, Dr. Ulick R. : An Introduction to Metallic Corrosion, *review* by Dr. J. C. Hudson, 316

Evans, Dr. Ulick R., and Wanklyn, J. N. : Evolution of Hydrogen from Ferrous Hydroxide, 27

Everard, K. B., and Sutton, Dr. L. E. : Electric Dipole Moments of some Styrenes, 104

Everdell, Dr. M. H. : Variation of Standard Electrode Potentials with Temperature, 995

Evers, Dr. N. : The Importance of Physical Chemistry in Pharmacy, 789

Ewens, Dr. R. V. G., and others : Trimethyl-platinum Derivatives, 693

Ewer, Dr. T. K. : Anti-Vitamins in Food, 986

Ewing, Dr. A. C. : The Definition of Good, *review* by F. I. G. Rawlins, 944

Exhibition of 1851, Royal Commission for the : Award of Overseas Science Research Scholarships for 1948, 100

Eyring, H. (Johnson, F. H., and) : Bioluminescence, 423

FAGE, Prof. Louis (Sewell, Dr. R. B. Seymour, and) : Minimum Oxygen Layer in the Ocean, 949

Fagg, Bernard : Dimple-Based Pottery from Central Kavirondo, Kenya Colony (M. D. Leakey, the late W. E. Owen and L. S. B. Leakey), *review*, 834

Fahim, Hussein Ahmad : Action of Oxalyl Chloride on the Aromatic Hydrocarbons, 526

Fair Isle Bird Observatory, 989

Fairman, H. W. : Appointed to the Brunner chair of egyptology in the University of Liverpool, 95 ; work of, 95

Fairthorne, R. A. : Applicable Mathematics, 583

Fano, Prof. G. : Irrationality of the General Cubic Threefold, 563

Fanshawe, D. B. : Appointed senior assistant conservator of Forests, British Guiana, 366

Faraday Society : Discussion on the Physical Chemistry of Process Metallurgy, 212, 719

General Discussion on Swelling and Shrinking, *review*, 638

Farmer, T. H., and others : Antibiotics produced by Fungi, and a New Phenomenon in Optical Resolution, 61

Farquhar, J. D. : Appointed assistant conservator of forests, Tanganyika, 956

Fastier, F. N. : Elected to a Beit Memorial Fellowship for Medical Research, 212

Faulkner, Mrs. Joan M. : Appointed a member of the Industrial Health Research Board, 918

Fawcett, Prof. C. B. : Movements of Population in the British Commonwealth, 718

Fawcett, Dr. E. W. M. : High Vacua, 937

Fawcett, Sir Luke : Appointed a member of the Industrial Health Research Board, 918

Fazekas de St. Groth, Dr. S. : Viropexis, the Mechanism of Influenza Virus Infection, 294

Fearon, Prof. W. R. : Tryptochrome, a Pigment derived from Tryptophan; 338

Feast, M. W. : Emission Schumann—Runge O_2 Bands, 214

Feather, Prof. N. : Properties of a Hypothetical di-Neutron, 213

Isotopic Assignment of the α-Activity of Samarium, 412

Fechner, Gustav Th. (Selections from) : Religion of a Scientist, edited and translated by Walter Lowrie, *review* by A. D. R., 203

Feigl, Dr. Fritz : Qualitative Analysis by Spot Tests, Inorganic and Organic Applications, third English edition, translated by Prof. Ralph E. Oesper, *review* by Prof. J. R. Partington, 474

Feldberg, Dr. W. : Transmission of Effects from the Ends of Nerve Fibres, 559

Fell, R. A. : Distribution of Time in Britain, *review*, 6

Clocks and Watches, *review*, 163

Feng, Dr. T. P., and others : Electrical Potential Change accompanying the Development of Rigor in Iodoacetate-Poisoned Muscle, 962

Fermor, Sir Lewis : Elected *Correspondant etranger* of the Société Géologique de France, 250

Ferdinand of Bulgaria, King : *Obituary* by Phyllis Barclay-Smith, 520

Ferguson, Prof. T. : Appointed a member of the Industrial Health Research Board, 918

Feuer, G., and others : Effect of Drugs on Actin, 217

Fibiger (Johannes), Professor in the University of Copenhagen : The Danish Cancer Researcher (Prof. Knud Secher), *review* by Dr. P. R. Peacock, 162

Fiddes, Dr. : Road Safety and Traffic Flow, 785

Fiddes, John : Appointed assistant lecturer in physics in the University of Sheffield, 99

Field, R. A., and others : Hæmophilia in Dogs, 136

Field Studies, Council for the Promotion of : Formal opening o fthe Flatford Mill Field Centre, 100

Findlay, Prof. Alexander: Chemistry in the Service of Man, seventh edition, *review*, 128
  A Hundred Years of Chemistry, second edition, *review* by Prof. John Read, 946
Findlay, Dr. G. W. M.: The Prophylaxis of Virus Infections with special reference to the Use of Vaccines, 92
Finlayson, H. H.: Antiquity of Man in Australia, 256
Finlayson, T. C., and Townend, F. S.: The British Gas Industry, 440
Finney, D. J.: Transformation of Frequency Distributions, 898
Fischer, Dr. A., and others: Abnormal Serum Protein in Parenchymatous Liver Diseases, 1002
Fischer, F. P., and others: Tabulæ Biologicæ, Vol. 22, Oculus, Pars I, *review* by Dr. E. N. Willmer, 910
Fisher, Prof. R. A.: Inbreeding and Hybrid Vigour in Crops and Livestock, 642
  Awarded the Darwin Medal for 1948 of the Royal Society, 807, 874
Fisher, Prof. R. A., and Martin, V. C.: Genetics of Style-Length in *Oxalis*, 533
FitzGerald, Dr. Oliver, and Murphy, Philip: Role of Gastric Urease, 896
Fitzgerald, Prof. Walter: Population Policy in Great Britain, *review*, 635
Flatford Mill Field Centre of the Council for the Promotion of Field Studies: Formal opening of the, 100
Fleisch, Prof. A.: The Changing Aspects of Nutrition, 544
Fleming, Sir Alexander: Elected an honorary member of the Society for General Microbiology, 606
  Title of professor emeritus of bacteriology in the University of London conferred on, 729
Fleming, Sir Arthur: *Obituary* of Sir Clifford Paterson, 325
  The Young Worker in Industry, 667
Fleming, J.: Appointed inspector of plants and produce, Nigeria, 138
Fleming, N.: Sound Transmission and Noise, 501
Fleming, R. F., and Peczenik, Dr. O.: Alkaline Phosphatase and Tumour Inhibition, 338
Fletcher, E.: Appointed a member of the Advisory Council for Scientific Research, 690
Fletcher, W. P.: Physical Properties of Rubber, *review*, 678
Fleure, Prof. H. J.: Evolution in Mankind, *review*, 352
  The Corresponding Societies and the Community, 406
  Demography between the Two World Wars, *review*, 428
Flexner, Dr. Louis B.: Pre-Natal Physiology, 1004
Flick, C. S.: Ophthalmic Optics, 826
Florey, Sir Howard: Appointed a member of the Medical Research Council, 606
Florijn, Dr. E., and Smits, G.: Aneurin-Pyrophosphate Content of Red and White Blood Corpuscles in the Rat and in Man, 220
Florkin, Dr. M. (Burgers, Prof. J. M., and): 'Freedom and Obligations', 783
Flynn, Prof. T. T.: Retirement from the chair of zoology at Queen's University, Belfast, 135; work of, 135
Földi, M.: The 'Renal Threshold', 337
Folley, Dr. S. J.: The Physiology of Lactation, 601
Folley, Dr. S. J., and others: Œstrogens in Grass and their possible Effects on Milk Secretion, 845
Food Investigation Board: Report on Food Investigation 1940–46, 466
Foot, C. H. (Taylor, Dr. C. B., and): Growth of Bacteria from Water, 670
Ford, E.: Marine Fisheries of Great Britain, 641
  Appointed director of the Millport Marine Laboratory, 688; work of, 688
Ford, Hugh: Degree of D.Sc. (Eng.) of the University of London conferred on, 729
Foreign Office: List of German scientific and technical periodicals, 808
Forel, Auguste Henri: Centenary of the birth of, 327
Forest Products Research Laboratory: Special Report No. 7, Elasticity of Wood and Plywood, 826
Forest Research Institute of Sweden: Reports of the, Vol. 36, 271
Forestry Commission: Forest Operations Series, No. 2, Establishment of Hardwoods, 97
  Leaflet No. 19, Elm Disease, 196
  Booklet No. 2, Dedication of Private Woodlands, 364
Forró, Dr. M. (Barnóthy, Prof. J., and): Awarded the first Eötvös Medal of the Hungarian Academy of Science, 100
Forsyth, Dr. W. G. C., and Webley, Dr. D. M.: A Method for Studying the Carbohydrate Metabolism of Micro-organisms, 150
Fort, Prof. Tomlinson: Finite Differences and Difference Equations in the Real Domain, *review* by L. M. M.-T., 391
Foss, M. E., and others: Trimethylplatinum Derivatives, 693
Foster, Dr. C. L.: Appointed to the University of London readership in biology at St. Mary's Hospital Medical School, 564
Foster, George M., assisted by Ospina, Gabriel: Empire's Children—The People of Tzintzunzan, 270
Foulkes, R. A.: Mechanics minus Mathematics, *review*, 754
Fourman, Dr. L. P. R.: Awarded a Rockefeller Travelling Fellowship in Medicine, 290
Fox, Prof. H. Munro: Carbon Monoxide Affinity of Chlorocruorin and Hæmoglobin, 20
  Apus and a Rare Cladoceran in Britain, 116
  The Royal Society Scientific Information Conference, Section 4, Reviews and Annual Reports, 286
Fraenkel, Dr. G.: Appointed professor of entomology in the University of Illinois, 288
Francis, D. A.: Appointed assistant conservator of forests, Gold Coast, 729
Frank, Philipp: Einstein, his Life and Times, *review* by Prof. G. C. McVittie, 591
Frankel, O. H.: Genetical Structure of Plant Populations, 518
Frankl, Dr. E. K.: Stress Analysis and the Designer, 119
Franklin (Benjamin) as Printer and Publisher (W. E. Lingelbach), 96
Franklin, R.: Awarded a Miller Prize of the Institution of Civil Engineers, 865
Fraser, Sir Francis: Title of professor emeritus of medicine in the University of London conferred on, 729
Frear, Prof. Donald E. H. (compiled by): A Catalogue of Insecticides and Fungicides, Vol. I, Chemical Insecticides, *review*, 354
reeman, Dr. G. G., and Morrison, Dr. R. I.: Trichothecin, an Antifungal Metabolic Product of *Trichothecium roseum* Link, 30
Freeman, Joan M., and Baxter, A. S.: Short-Range α-Particles from the Disintegration of Sodium, Aluminium and Fluorine by Protons, 696
Freeman, S. M., and Weissenberg, K.: Some New Rheological Phenomena and their Significance for the Constitution of Materials, 320
Fretter, Dr. Vera: Title of University of London reader in zoology conferred on, 844
Frey-Wyssling, Prof. A.: Submicroscopic Morphology of Protoplasm and its Derivatives, translated by Prof. J. J. Hermans and M. Hollander, *review* by Dr. J. Danielli, 753
Friedenwald, J. S., and others: Tabulæ Biologicæ, Vol. 22, Oculus, Pars I, *review* by Dr. E. N. Willmer, 910
Fries, Lisbeth: Mutations induced in *Coprinus fimetarius* (L.) by Nitrogen Mustard, 846
Fries, Dr. Nils, and Kihlman, Bengt: Fungal Mutations, obtained with Methyl Xanthines, 573
Frisch, Prof. O.: Therapeutic Applications of Radioactive Isotopes, 480
Fritsch, Prof. F. E.: Title of emeritus professor of botany in the University of London conferred on, 212
  Obituaries of Prof. Friedrich Oltmanns and Prof. Adolf Pascher, 287
  Retirement from the chair of botany at Queen Mary College, 562; work of, 562
  Tenth International Limnological Congress, Zurich, 623
  In receipt of a Proof copy of Prof. Geitler's revision of the Cyanophyceæ in the "Naturliche Pflanzenfamilien", 956
Froeschel, Dr. Paul: Appointed professor of plant physiology at Ghent State University, 689; work of, 689
Frölich, Dr. H., and others: Decay and Capture of Slow Mesons in Dielectrics, 450
Frozen Foods Consultative Group: Objects and terms of reference, 522
Fry, D. W., and others: A Travelling-Wave Linear Accelerator for 4-MeV. Electrons, 859
Fryer, Sir John: *Death of*, 841; *obituary* by C. T. Gimingham, 986
Fuel, Institute of: Appointment of W. T. Cooper as assistant secretary (editorial), 485
Fuel, Institute of (Institute of Petroleum and the): Conference on Modern Applications of Liquid Fuels, 328, 951
Fuel and Power, Minister of: Appointment of members of the Scientific Advisory Council, 57
Fuel and Power, Ministry of: Loan of Dr. W. A. Macfarlane to the Department of Scientific and Industrial Research as director of the United Kingdom Scientific Mission in the British Commonwealth Scientific Offices in Washington, 366
Fuel Research Station, Woolwich: Calorimeter Building for Domestic Heating Research at the (Dr. A. C. Monkhouse), 133

Galley, W.: Appointed agricultural officer, Uganda, 956
Galton, Dr. D. A. G.: British Empire Cancer Campaign, 664
Gamow, Dr. G.: The Evolution of the Universe, 680
  Mixed Types of Stellar Populations, 816
Ganapati, Dr. P. N.: Cultivation of *Trypanosoma cruzi* in the Developing Chick Embryo, 963
Gane, M.: Appointed assistant conservator of forests, Tanganyika, 485
Gardner, William: Chemical Synonyms and Trade Names, fifth edition, revised by Edward I. Cooke, *review*, 278
Garner, Prof. Clifford S., and others: The Rare-Earth Elements and their Compounds, *review*, 278
Garner, Prof. F. H.: Appointed a member of the Scientific Advisory Council to the Minister of Fuel and Power, 57
  Use of Liquid Fuels—Conference at Birmingham, 951
Garstang, Prof. W.: Marine Fisheries of Great Britain, 641
Garton, C. G. (Church, H. F., and): Electrical Breakdown of Organic Insulation by Electro-chemical Reactions, 301
Garwood, Dr. F.: Road Safety and Traffic Flow, 785
Gas Engineers, Institution of: Eighty-fifth Annual Meeting, 440
Gatenby, Prof. J. Brontë, and Moussa, Tohamy A. A.: Methylene Blue as a Vital Stain for the Golgi Apparatus, 736
Gaumann, Prof. Ernst: Elected *correspondant* for the Section of Botany of the Paris Academy of Sciences, 920
Gavin, M. R.: Process Heating in Industry, *review*, 637
Gay, Helen, and others: Enzymatic Degradation of Ribonucleoproteins of Chromosomes, Nucleoli and Cytoplasm, 814
Gaydon, Dr. A. G., and others: Spectrum of Iodine Oxide (IO) in Flames, 108
Geering, Q. A. (Wright, D. W., and): Biology and Control of the Pea Moth, 309
Geitler, Prof.: Proof copy of the revision of the Cyanophyceæ in the "Naturliche Pflanzenfamilien" sent to Prof. F. E. Fritsch, 956
Genders, Roy: I Bought a Farm, *review*, 8
General Microbiology, Society for: Election of honorary members, 606
  Officers and committee for 1948–49, 606
Genetical Society of Great Britain and the British Empire Cancer Campaign: Symposium on the Genetics of Cancer, 514
Geodesy and Geophysics, International Union of: Eighth General Assembly of the (Prof. J. Proudman), 744
Geographical Society, Royal: Air Transport and Geography, 58
Geophysica, Nos. 1 and 2, 919

George, Dr. E. P. : Origin of Cosmic Ray Stars, 333
George, Philip (Baxendale, J. H., and) : A Fourth Order Reaction, 777
George, T. K., and Balasubrahmanyam, K. : Awarded jointly a Miller Prize of the Institution of Civil Engineers, 865
Georgiev, Alexander M. : The Electrolytic Capacitor, *review*, 911
Gerendás, Dr. M., and others : Histamine—Heparin—Thrombin Chain Mechanism, 257
Gergely, J. (Evans, Prof. M. G., and) : Structure of the Dinitrososulphite Ion, 770
Gerheim, Earl B. : Staphylococcal Coagulation and Fibrinolysis, 732
German Hydrographic Journal, 364, 842
German Hygienists and Microbiologists : Conference at Stuttgart, 250
Gerrard, J. A. F. : Appointed geophysicist, Uganda, 366
Ghosh, A., and others : Decay Scheme of ^{181}Hf, 261
Giacomini, Prof. A. : Sound Transmission and Noise, 500
Gibb, Sir Claude : Appointed a member of the Industrial Health Research Board, 918
Gibbons, D. F. (Cottrell, Dr. A. H., and) : Thermal Hardening of Cadmium Crystals, 488
Gibson, Prof. C. S., and others : Trimethyl-platinum Derivatives, 693
Gibson, Q. H., and Harrison, Prof. D. C. : Hæmoglobin—Methæmoglobin Mixtures, 258
Gilbert, E. W. : The Boundaries of Local Government Areas, 884
Giles, A. R. : Appointed land surveyor, Hong Kong, 447
Gill, E. W. B. : Frictional Electrification of Sand, 568
Gillett, C. R. E. : Appointed director of the Institute of Education, Reading, 842
Gillman, H. : Appointed senior agricultural officer, Tanganyika, 729
Gils, Dr. G. E. van (Homans, L. N. S., and) : Physical and Chemical Aspects of Rubber Technology, 206
Gimingham, C. H. : Degree of Ph.D. of the University of Aberdeen conferred on, 99
Gimingham, C. T. : *Obituary* of Sir John Fryer, 986
Girdwood, Dr. R. H. : Awarded a Rockefeller Travelling Fellowship in Medicine, 290
Giri, K. V., and others : *In vitro* Effect of Penicillin on Prothrombin Activity of Bovine Plasma, 930
Glanville, Dr. W. H. : Road Materials and Methods of Road Construction, 784
Glaser, Prof. Walter : Maxwell's 'Fish Eye' as an Ideal Electron Lens, 455
Glasgow, Philippa Marion : Awarded a Science Research Scholarship of the Royal Institution, 100
Glasgow Art Galleries and Museum : Habitat Booklet on Animals of Australia, 990
Glasoe, Prof. G. N., and Lebacqz, Prof. J. V. (edited by): Pulse Generators, *review* by Prof. J. T. Randall, 754
Glass, Dr. D. V. : Appointed to the University of London chair of sociology at the London School of Economics and Political Science, 212, 326 ; work of, 326
Glass, International Commission on : First post-war meetings, 648
Glass, International Commission on, and the Society of Glass Technology : Symposium on some Aspects of the Nature and Constitution of Glass, 938
Glass Technology, Society of (International Commission on Glass and the) : Symposium on some Aspects of the Nature and Constitution of Glass, 938
Glasstone, Prof. Samuel : The Elements of Physical Chemistry, third printing, *review* by Dr. J. A. V. Butler, 125
Glendenin, L. E. (Marinsky, J. A., and) : Proposal to give Element 61 the name Promethium, 175
Glock, Dr. Gertrude E., and others : Pharmacology of some *bis*-Trimethyl Ammonium Compounds, 113
Godwin, Prof. H. (Clapham, Prof. A. R., and) : Studies of the Post-Glacial History of British Vegetation, 1008
Goldsbrough, Prof. G. R. : Retirement from the chair of mathematics at King's College, Newcastle-upon-Tyne, 604 ; work of, 604
Goldschmidt, H. J. : A New Carbide in Chromium Steels, 855
Goldschmidt, P. : Elected first president of the International Institute of Welding, 119
Gondet, I., and others : Vestibular Effect of Streptomycin in the Mouse, 929
Goode, A. R. : Awarded a Miller Prize of the Institution of Civil Engineers, 865
Gooderham, W. J. : Soap-Film Apparatus for the Continuous Analysis of Coal Gas, 157
Goodeve, Sir Charles : Appointed a member of the Scientific Advisory Council to the Minister of Fuel and Power, 57
  Physical Chemistry of Process Metallurgy, 719
Goodeve, Sir Charles, and Jack, K. H. : Physical Chemistry of Process Metallurgy, 720
Goodstein, R. L. : A Text-Book of Mathematical Analysis, *review* by Prof. L. M. Milne-Thomson, 353

Gray, J. D. Allan, and Lambert, R. A.: Bacteriostatic Action of Oximes, 733
Gray, T. J. : Application of Measurements of Semi-conductivity to Heterogeneous Reactions, 260
Graymore, Dr. John : The Sommelet Reaction, 154
Greathead, W. R., and Hawkins, R. D. : Awarded jointly a Telford premium of the Institution of Civil Engineers, 865
Green, Dr. A. E. : Appointed to the chair of applied mathematics at King's College, Newcastle-upon-Tyne, 445 ; work of, 445
Green, John : Resignation from the Departments of Biochemistry and Medicine in the University of Glasgow to become lecturer in clinical chemistry in the University of Aberdeen, 956
Greenfield, Dr. A. D. M. : Appointed to the Dunville chair of physiology at Queen's University, Belfast, 55 ; work of, 55
Greenkeeping Research, Board of : Appointment of B. C. Clayton and V. D. O. Smyth as advisory officers at the Research Station, 328
Greenshields, F. (Mackenzie, E. F. W., and) : The Influence of Algal Growth on certain Aspects of Civil Engineering Design, 803
Greenwood, Dr. A. W. : Genetics of Cancer, 514
Greenwood, N. N. : Awarded an Overseas Science Research Scholarship for 1948 by the Royal Commission for the Exhibition of 1851, 100
Greig, Prof. J. : The Engineer's Approach to Electricity and Magnetism, *review*, 753
Greinacher, Dr. H. : Awarded the Theodor Kocher Prize by the University of Berne, 990
Gresham's School : Twenty-sixth Report of the Natural History Society, 484
Griffith, A. L. : Appointed temporary forest officer, Zanzibar, 447
Griffiths, Dr. J. H. E. (Bagguley, D. M. S., and) : Paramagnetic Resonance in Copper Sulphate—Experimental Investigation, 538
Griffiths, Prof. Lois Wilfred : Introduction to the Theory of Equations, second edition, *review*, 87
Grigson, Sir Wilfrid : *Death* of, 954
Grime, G. : Road Safety and Traffic Flow, 785
Grioli, G. : Precession of an Unsymmetrical Top, 365
Grodzinski, P. : A Ruling Engine used by Sir John Barton, and its Products 446
Grønvold, Fredrik : Crystal Structure of Uranium Oxide (U$_3$O$_8$), 70
Grønvold, Fredrik, and Haraldsen, Prof. Haakon : Oxidation of Uranium Dioxide (UO$_2$), 69
Gross, Dr. F. : Marine Fish Cultivation, 378
Gross, Dr. P., and others : Physical Chemistry of Process Metallurgy, 720
Grubb, R. : Correlation between Lewis Blood Group and Secretor Character in Man, 933
Grubb, Parsons and Co., Sir Howard : Catalogue of Astronomical Instruments, 176
Grumell, Dr. E. S. : Appointed a member of the Scientific Advisory Council to the Minister of Fuel and Power, 57
Grunenwaldt, Dr. : Sound Transmission and Noise, 500, 501
Guest, N. J. : Appointed geologist, Tanganyika, 956
Guggenheim, Prof. E. A. : Physical Chemistry of Process Metallurgy, 721
Guha, Prof. P. C., and others : Metachloridine-substituted Aryl Biguanide as possible Antimalarial Compounds, 146
Gunn, Dr. D. L. : Application of Insecticides from the Air, 308
Gunn, J. C. : Appointed to the Cargill chair of natural philosophy in th University of Glasgow, 956
Guppy, Dr. Henry : *Death* of, 250
Gurney, H. C. H. : Degree of D.Sc. (Eng.) of the University of Londo conferred on, 729
Gurton, O. A. (Bowden, Dr. F. P., and) : Initiation of Explosions by Gr Particles, 654
Gustafson, Prof. A. F. : Using and Managing Soils, *review* by Dr. E. W Russell, 758
Guth, Dr. E. : Physical and Chemical Aspects of Rubber Technology, 204
Guy's Hospital Medical School : Title of University of London reader i experimental pathology conferred on Dr. P. A. I. Gorer, 844

HACKING, J. : Appointed a member of the Scientific Advisory Counc to the Minister of Fuel and Power, 57
Haddow, Prof. A. : Genetics of Cancer, 514
Haddow, Prof. A., and others : Effects upon Tumours of various Halo alkylarylamines, 824
Haines, Dr. Magnus : Pregnancy Test using the Male Toad, 416
Halban, Dr. H., and others : Photodisintegration of the Deuteron, 185

Haldane, T. Graeme N. : Elected president of the Institution of Electrical Engineers for 1948–49, 100
  Means and Ends, 972
Hall, Dr. David A. : A Modified Ionophoresis Apparatus, 105
  A Natural Precursor of the Folic Acid Complex, 178
Hall, David W. (Sanderson, Dr. Ann R., and) : The Cytology of the Honey Bee, *Apis mellifica* L., 34
Hall, E. O. : Awarded an Overseas Science Research Scholarship for 1948 by the Royal Commission for the Exhibition of 1851, 100
Hall, James Doyle : Industrial Applications of Infrared, *review* by M. R. Gavin, 637
Hall, Prof. John S. (edited by) : Radar Aids to Navigation, *review* by Dr. R. L. Smith-Rose, 633
Hall, Victor E. (edited by): Annual Review of Physiology, Vol. 10, *review*, 429
Halliday, E. C., and others : Artificial Stimulation of Rain, 921
Halnan, E. T. : The Feeding of Farm Livestock (J. C. B. Ellis), second edition, *review*, 432
Halsbury, Lord : Sound Transmission and Noise, 501
Hames, F. A., and Eppelsheimer, D. S. : Some New Ferromagnetic Manganese Alloys, 968
Hamilton, Alexander, and others : The Federalist, or the New Constitution, *review* by Maurice Bruce, 238
Hammick, Dr. D. Ll., and others : Production of Quinolyl and Pyridyl Anions during Decarboxylation, 73
Hamoir, G., et autres : Un symposium sur les proteines, *review*, 870
Hampton, Dr. W. M. : Symposium on Searchlights, 424
Hanna, R. C. : Polarization of Annihilation Radiation, 332
Hansford, G. B. : Tropical Fungi, 212
Haraldsen, Prof. Haakon (Grønvold, Fredrik, and) : Oxidation of Uranium Dioxide (UO_2), 69
Harbans, S. (Ray, Dr. H. N., and) : Effect of Pantothenic Acid on the Infection of *Trypanosoma evansi* in Rats, 849
Hardie, H. G. M. : Degree of Ph.D. of the University of Aberdeen conferred on, 99
Harding, J. R. : South African Museums, 861
Hardy, Prof. A. C. : Appointed a vice-president of the Royal Society, 990
Hardy, Eric : The Palestine Flora, 286
Hare, Prof. R. : The Prophylaxis of Virus Infections with special reference to the Use of Vaccines, 92
Haresnape, J. R. : Clay Minerals as Catalysts and Adsorbents, 195
Harper, R., and Baron, M. : Factorial Analysis of Rheological Measurements on Cheese, 821
Harper, Dr. S. H., and others : Total Synthesis of some Pyrethrins, 222
Harris, Prof. D. T. : Title of emeritus professor of physiology in the University of London conferred on, 212
  Retirement from the University of London chair of physiology at the London Hospital Medical College, 407; work of, 407
Harris, E. D., and Lindsey, A. J. : Vibrating Electrodes in Polarography, 413
Harris, E. J., and Burn, G. P. : Permeability of Muscle Cells, 929
Harris, J. D. : Awarded a Miller Prize of the Institution of Civil Engineers, 865
Harris, Dr. L. J. : Anti-Vitamins in Food, 985
Harris, N. : Appointed senior geologist, Uganda, 485
Harrison, D. (Bennett, A. R., and) : Use of the Calyx Burner to determine Combustion Conditions, 371
Harrison, Prof. D. C. (Gibson, Q. H., and) : Hæmoglobin—Methæmoglobin Mixtures, 258
Hart, Prof. C. A. (Bradbeer, B. F. J., and) ; Awarded jointly a Telford Premium of the Institution of Civil Engineers, 865
Hart, Group-Capt. I. B. : Education in and For the Services, 159
Hart, S. B. : Awarded a Miller Prize of the Institution of Civil Engineers, 865
Hart, T. J. : West African Sea-Fisheries, 38
Hartley, Dr. Harold : The British Gas Industry, 440
Hartogh-Katz, S. Lore, and others : '17-Ketosteroid II' Isolated from Urine—its Reaction with Hydrochloric Acid, 492
Hartridge, Prof. H. : Recent Advances in Colour Vision, 403
  The Physiology of Lactation, 601
  Colour Vision, 639
  Ophthalmic Optics, 826
Harvard College, Cambridge, Mass. : First General Assembly and Congress of the International Union of Crystallography, 365
Harvard University : War-time Radio Research at, *review* by Dr. John Lamb, 83
Harvard University (Electronics Training Staff of the Cruft Laboratory of) : Electronic Circuits and Tubes, *review* by E. C. Cherry, 126
Harvard University (Radio Research Laboratory Staff of) : Very High-Frequency Techniques, *review* by Dr. John Lamb, 83
Harvey, Clare : Relation between the Volume and Fructose Content of Human Semen, 812
Harvey, Clare (Jackson, Margaret Hadley, and) : Variations in Spermatogenesis of Oligospermic Men, 67
Harvey, E. Newton : Bioluminescence, 423
Harvie, R. B. R.-S, and others : A Travelling-Wave Linear Accelerator for 4-MeV. Electrons, 859
  A Proposed New Form of Dielectric-loaded Wave-Guide for Linear Electron Accelerators, 890
Harwood, M. G. : Physical Properties of Substances of High Permittivity, 247
Haskell, G. M. L.: Inbreeding and Hybrid Vigour in Crops and Livestock, 642
Haslewood, Dr. G. A. D., and others : Destruction of Urinary Glucuronide by Bacteria, 701
Hast, Prof. Nils : Production of Extremely Thin Metal Films by Evaporation on to Liquid Surfaces, 892
Hastay, Millard W., and others (edited by) : Selected Techniques of Statistical Analysis for Scientific and Industrial Research and Production and Management Engineering (Statistical Research Group, Columbia University), *review* by Prof. M. S. Bartlett, 510
Haswell, J. Eric : Horology, the Science of Time Measurement and the Construction of Clocks, Watches and Chronometers, *review* by R. A. Fell, 163
Hatherly Biological Laboratories, University College, Exeter (Prof. John Caldwell), 505
Hatwaine, V. G., and others : Species Difference in the Biosynthesis of Vitamin C and Response to Diabetogenic Substances, 660
Hauman, Prof. L., and others : La vegetación de la Argentina, *review* by G. M. Roseveare, 203
Hawkins, P. J. (Janz, Dr. G. J., and) : Reaction of Cyanogen and related Compounds with Butadiene, 28
Hawkins, R. D. (Greathead, W. R., and) : Awarded jointly a Telford Premium of the Institution of Civil Engineers, 865
Hawkins, T. H. : National Institute of Industrial Psychology, 382
  Larder of the Red-backed Shrike, 504
  Children as Naturalists (Margaret M. Hutchinson), *review*, 595
  Unesco and a World Society, 787
  Training the Worker, *review*, 797
  Education in Haiti, 975
  The National Foundation for Adult Education, 1009
Haworth, Sir Norman : To retire from the Mason chair of chemistry in the University of Birmingham, 16 ; work of, 16
Haworth, Prof. R. D., and others : Constitution of Conessine, 22
Hay, R. J. : Degree of Ph.D. of the University of Aberdeen conferred on, 99
Hayes, H. T. : Appointed fisheries officer, Gold Coast, 366
Hayes, Prof. K. A. : Servo Mechanisms, 763
Hayes, T. R. : Appointed assistant director of agriculture, Uganda, 366
Haynes, Dr. L. J. : Elected to a Beit Memorial Fellowship for Medical Research, 212
Hazell, J. R. T. : Appointed geologist, Nigeria, 485
Health, Ministry of : Report for the Year ended March 31, 1947, 586
Healy, A. J. : Biology and its relation to Soil Erosion and Soil Conservation, 803
Heaton, Dr. T. B., and Robinson, G. M. : Biological Properties of a Substance Isolated from Wheat Middlings and of Hydroxymethylfurfuraldehyde, 570
Hechter, Dr. Oscar, and Solomon, Sidney : Spreading Phenomenon and Inflammation, 701, *erratum*, 809
Hedgran, A., and others : Decay Scheme of ^{181}Hf, 261
Hemming, Francis : Rules of Zoological Nomenclature, 708
Hemming, James : Entry and Careers, 349
Henderson, Sir Hubert : The Price System, 402
Henderson, Prof. W. J., and others : A Magnetic Resonance Accelerator for Electrons, 699
Hendry, A. W. : Appointed to the University of London readership in civil engineering at King's College, 990
Hercus, Prof. E. O. : The Proof of Wien's Law, 143
Herdan, Dr. G. : Physical Periodicity of the Periodic Table of the Elements in the Light of Statistical Theory, 215
Hereward, H. G. (Devons, S., and) : Proton Bombardment of Fluorine, 331
Herington, Dr. E. F. G. : Process Chemistry for the Chemist, *review*, 550
Herlant, Dr. Marc : Experimental Hydronephrosis studied by the Colchicine Method, 251
Herman, Renée, and Herman, Louis : Afterglow of the Balmer Spectrum of Hydrogen, 261
Herman, Dr. Robert (Alpher, Ralph A., and) : Evolution of the Universe, 774
Heston, Dr. W. E. : Genetics of Cancer, 514
Hetherington, R. le Geyt (Melville, F. R., and) : Awarded jointly a Telford Premium of the Institution of Civil Engineers, 865
Hewitt, F. J., and others : Artificial Stimulation of Rain, 921
Heyningen, Dr. W. E. van : Inhibition of Aerobic Sporing Bacilli by Hæmatin, 114
Hickinbottom, Dr. Wilfred John : Reactions of Organic Compounds, second edition, *review*, 164
Hickling, Dr. A., and Wilson, W. H. : Limiting Diffusion Currents at Wire Electrodes, 489
Hieger, Dr. I. : Anti-Cancer Drugs, *review*, 713
Highet, J. : Appointed lecturer in sociology in the University of Glasgow, 60
Hilditch, Prof. T. P. : Cotton Seed, a Pioneer Crop and an Example, *review*, 832
Hill, Prof. A. Bradford : Appointed a member of the Industrial Health Research Board, 918
Hill, Prof. A. V. : Awarded the Copley Medal for 1948 of the Royal Society, 807, 872
Hill, A. W., and Salisbury, E. J. (edited by): Index Kewensis Plantarum Phanerogamarum, Supplementum 10, 1936–1940, *review* by Prof. J. R. Matthews, 909
Hill, C. A. : *Obituary* by Dr. Francis H. Carr, 840
Hill, Sir George : *Obituary* by Sir John Myres, 725
Hill, J. M. (Shepherd, L. R., and) : Decay of Barium-139, 566
Hills, G. F. S. : The Formation of the Continents by Convection, *review* by Prof. H. H. Read, 981
Hinton, Dr. J. J. C. : Parboiling Treatment of Rice, 913
Hirsch, P. B., and Kellar, the late Dr. J. N. : Surface Layers of Crystals, 609
Hirst, Prof. E. L. : Awarded the Davy Medal for 1948 of the Royal Society, 807, 873
Hiscox, E. R. : Dairy Bacteriology, 670
History of Science, British Society for the : Formation of a Philosophy of Science Group, 59
Hitchens, A. Parker, and others : Bergey's Manual of Determinative Bacteriology, sixth edition, *review* by Dr. S. T. Cowan, 833
Hjort, Prof. Johan : *Death* of, 726 ; *obituary* notices by Dr. E. S. Russell and H. G. Maurice, 764
Hoare, Dr. C. A. : *Obituary* of Dr. C. W. Wenyon, 840
Hobson, Dr. William : Appointed to the chair of social and industrial medicine in the University of Sheffield, 648
Hocart, Prof. R. J. : *Obituary* of Prof. Jacques de Lapparent, 134
Hockenhull, Donald : Inhibition of some Respiratory Enzyme Systems by Derivatives of Sulphuric Acid, 813
  Inhibition of a Succinic Aerodehydrogenase System by Surface-active Agents, 850
Hodge, Prof. W. V. D., and Pedoe, Dr. D. : Methods of Algebraic Geometry, *review* by Dr. J. A. Todd, 6
Hodsman, H. J. : The British Gas Industry, 440
Hoff-Jørgensen, Dr. E. : Yeast and Rickets, 575
Hofmeyr, Rt. Hon. J. H. : *Death* of, 918
Hogg, A. R. : Sidereal Variations of Cosmic Rays, 613
Hogreffe, Dr. G. : Genetics of Cancer, 514
Holborn, F. M.: Retirement from the presidency of the British Astronomical Association, 807

Holbourn, Dr. A. H. S. : The Fundamental Colour Sensation, 26
Hole, N., and others : Decay Scheme of ^{181}Hf, 261
Hollings, Dr. H. : Appointed a member of the Scientific Advisory Council to the Minister of Fuel and Power, 57
Hollingworth, Prof. S. E. (Bannister, Dr. F. A., and) : Two New British Minerals, 565
Hollis-Hallett, A. C. : Awarded an Overseas Science Research Scholarship for 1948 by the Royal Commission for the Exhibition of 1851, 100
Holloway, J. W. T. : Appointed senior livestock officer, Tanganyika, 138
Holman, W. I. M. (Wiegand, Chr., and) : Synthesis of Derivatives of N-Methyl-2-Pyridone from Nicotinic Acid and Nicotinamide, 659
Holmes, P. E. B., and others : Interaction between Curare and the Potassium Ion at the Motor End Plate, 217
Holmstrom, Dr. J. E. : The Royal Society Scientific Information Conference, Section 3, Indexing and other Library Services, 284
Holt, S. J. (Margetts, A. R., and) : Marine Fisheries of Great Britain, 641
Holttum, E. E. : A Revised Classification of Leptosporangiate Ferns, *review* by Prof. I. Manton, 314
Homans, L. N. S., and Gils, Dr. G. E. van : Physical and Chemical Aspects of Rubber Technology, 206
Hooijer, Dr. D. A. : Evolution of the Dentition of the Orang-utan, 306
Hope, Lieut.-Colonel C. E. G. : Everything about the Dog, *review*, 677
Hopkins, R. J. : Life-History of *Splachnidium rugosum*, 75
Hora, Dr. S. L. : Elected president of the Zoological Society of India, 60
  Appointed an honorary member of " 's Lands Plantentuin," 100
Horning, Dr. E. S. : Pathology of Tumours, *review*, 315
Horton, Dr. Frank : Title of professor emeritus of physics in the University of London conferred on, 19
Horváth, Dr. J. (Krámli, Dr. A., and) : Microbiological Oxidation of Sterols, 619
Hoselitz, Dr. K. : Anisotropic Silicon-Iron, 800
Hospital Physicists Association : To found a Dr. Douglas Edward Lea Memorial Lecture, 100
Hougen, Prof. Olaf A., and Watson, Prof. Kenneth M. : Chemical Process Principles, Part 2, Thermodynamics ; Part 3, Kinetics and Catalysis, *review* by Dr. E. F. G. Herington, 550
Hough, Derek Allan : Appointed general secretary of the Institute of Petroleum, 290
Hough, J. M. : Interpretation of Data from Electrical Resistivity Geophysical Surveys, 187, 970
Hough, James S. : Appointed research demonstrator in botany in the University of Sheffield, 648
Hough, L., and others : Application of Paper Partition Chromatography to the Separation of the Sugars and their Methylated Derivatives on a Column of Powdered Cellulose, 448
Houssay, Prof. B. A., and Martínez, Dr. C. : Alloxan Diabetes in Dogs with Renal Pedicles Clamped, 571
Howard, Eliot : Territory in Bird Life, new edition, *review* by Frances Pitt, 595
Howard, Frank A. : Buna Rubber, *review* by Dr. C. W. Long, 637
Howie, Dr. J. W. : The Changing Aspects of Nutrition, 543, 769
Hoy, W. A. (Rowlands, A., and) : Dairy Bacteriology, 670
Hoyle, F. : Condensation of Interstellar Material into Stars, 233
Hoyle, F. (Dungey, J. W., and) : Origin of Cosmic Rays, 888
Hsu, C. H., and others : Electrical Potential Change accompanying the Development of Rigor in Iodoacetate-Poisoned Muscle, 962
Hubbard, Clifford L. B. : Dogs in Britain, *review* by Brian Vesey-Fitzgerald, 553
Hubinont, Pierre O. : An Antigen related to the *AB O* System, 457
Huby, R., and others : Decay and Capture of Slow Mesons in Dielectrics, 450
Hudson, Dr. J. C. : Corrosion of Metals, *review*, 316
Hughes, F. E. : Appointed conservator of forests, Gold Coast, 729
Hughes, G. K., and others : Alkaloids of the Australian Rutaceæ, 223
Hughes, G. M. (Pringle, J. W. S., and) : Transmission of Effects from the Ends of Nerve Fibres, 560
Human, J. P. E., and others : Colouring Matters of the Aphididæ, 759
Humphreys, Prof. A. R. : Higher Education in the Colonies, 479
Humphreys, H. R. : Sound Transmission and Noise, 500
Hungarian Academy of Science : Eötvös Medal, 100
Hussey, Prof. Russell C. : Historical Geology, the Geologic History of North America, second edition, *review*, 946
Hutchings, F. G. B. : The Training of the Information Officer, 863
Hutchinson, G. W. : Ionization in Liquid and Solid Argon, 610
Hutchinson, J. B., and others : The Evolution of Gossypium, *review* by E. Lord, 716
Hutchinson, Margaret M. : Children as Naturalists, *review* by T. H. Hawkins, 595
Hutchison, S. A. (Lominski, Dr. Iwo R. W., and) : A Simple Technique for the Differential Staining of Lignified Cell Walls, 415
Hutchison, T. S. : Cold Working of Aluminium at Low Temperatures, 374
Hutt, F. B., and others : Hæmophilia in Dogs, 136
Hutton, Prof. J. H. : Primitive Techniques, Agriculture and Economic Organisation, 603
Huus, T., and others : Gamma-Rays from Proton Bombardment of Separated Argon Isotopes, 695
Huxley, Dr. Julian : Elected *correspondant* for the Section of Anatomy and Zoology of the Paris Academy of Sciences, 19
  German Scientific Text-books, 562
Huygens, Christian, *review* by Prof. E. N. da C. Andrade, 472
Hynek, Dr. J. A. : Giant Binary Stars and the Mass-Luminosity Law, 815

IBISON, A. : Clay Minerals as Catalysts and Adsorbents, 196
Ignatowicz, S. : Physical Chemistry of Process Metallurgy, 721
Ikin, Elizabeth W., and others : Basque Blood Groups, 27
Illuminating Engineering Society : Report on Searchlights, 424
  Leon Gaster Memorial Premium for 1948 awarded to J. N. Bowtell and H. G. Jenkins, 607
Imms, Dr. A. D. : Insect Natural History, *review* by Dr. V. E. Wigglesworth, 5
Imperial College of Science and Technology : Retirement of Sir Richard Southwell from the rectorship, 16
  International exchange of students, 60
  Third Commemoration Day Lecture (Prof. Herbert Dingle), 564
  Appointment of Dr. Dennis Gabor to the Mullard readership in electronics, 844
  Fourteenth Annual Report of the Vacation Work Scheme, 955
  Appointment of Dr. W. F. Jepson to the University of London readership in applied entomology, 956
Imperial College of Tropical Agriculture: Appointment of Sir Frank Stockdale as chairman of the governing body, 250
Ince, Sir Godfrey : The Firm as a Working Unit, 383
Indian Council of Scientific and Industrial Research : Establishment of an Indian Scientific Liaison Office in London, 884
  Appointment of Dr. S. Bhagavantam as Chief Scientific Liaison Officer, 884
Indian Educational Service : Retirement of Prof. P. C. Mahalanobis from the, 689
Indianj ournal of Dairy Science, No. 1, 864
Industrial Co-operative Research Associations : Conference of, 645
Industrial Health Research Board : Appointment of new members, 918
Industrial Psychology, National Institute of (T. H. Hawkins), 382
  Report on Psychology at Work, 382
Infield, Henrik F. : Co-operative Communities at Work, *review*, 45
Information Services, Standing Committee on (Royal Society), 955
Ingerslev, Dr. : Sound Transmission and Noise, 500
Ingersoll, H. G., and Johnson, A. A. : Ionic Exchange and Fibre Contraction, 225
Inglis, J. S. S., and others : Etiology of Grass Disease, 116
Ingram, M., and McGaughey, C. A. : Microflora of the Rumen of the Sheep, 533
Innes (John) Horticultural Institution : Annual Report for 1947, 347
  Appointment of Dr. D. Lewis as head of the Genetics Department, 605
Innes (John) Horticultural Institution (Prof. R. H. Stoughton), 791
Innes, R. : Shortage of Scientific Textbooks in Cambridge, 209, 416
Institut International des Sciences théoriques : Eddington Prize of 50,000 Belgian francs, 690
International Association of Navigation Congresses, Permanent : Formation of a British National Committee, 606
International Association for Theoretical and Applied Limnology : Tenth Congress at Zurich, 623
International Astronomical Union : Seventh General Assembly of the, 899
International Commission on Large Dams—Congress in Sweden (Dr. Norman Davey), 544
International Commission on Glass : First post-war meetings, 648
International Commission on Glass and the Society of Glass Technology : Symposium on some Aspects of the Nature and Constitution of Glass, 938
International Committee for Bird Preservation : Report of the British Section, 250
  Meeting of the European Continental Section, 422
International Council of Scientific Unions : Annual Meeting of the Executive Committee, 648
International Institute of Welding : Formation of the, 119
  Election of P. Goldschmidt as first president, 119
International Meteorological Organisation : First meeting of the Meteorological Telecommunications Panel for the European Region, 135
International Office for Nature Protection : Resignation of Dr. J. H. Westermann from the post of acting director, 485
International Scientific Film Association : Second Congress, 59 ; (Michael Michaelis), 826
International Union of Biological Sciences : Programme of Symposia, 989
International Union of Crystallography : First General Assembly and Congress, 365
  Election of officers, 365
  First Meeting of the (Dr. H. Lipson), 838
International Union of Geodesy and Geophysics : Eighth General Assembly of the (Prof. J. Proudman), 744
International Wool Secretariat : Further gift of £10,000 to the University of Leeds for completion of the equipment for the new Wool Research Laboratories, 212
  Appointment of Leonard Cundall as a lecturer in the Department of Education, 564
Irish Chemical Association : Summer School on Recent Advances in various branches of Chemistry, 137
  Election of officers for 1948–49, 564
Iron and Steel Research Association, British : Conference on the Non-destructive Testing of Castings, 59
  Conference on Foundry Core Bonding Agents, 59
Irving, Dr. H., and Williams, R. J. P. : Order of Stability of Metal Complexes, 746
Irving, Prof. J. T. : Changes in the Incisor Teeth and Incisal Alveolar Bone of Rats in Hypervitaminosis A and Avitaminosis A, 377
Isaacs, Dr. A. : Awarded a Rockefeller Travelling Fellowship in Medicine, 290
Isaacs, Dr. Susan : Childhood and After, *review* by Dr. O. L. Zangwill, 871
  Obituary, 881
Istituto Geografico Polare : Formation of the, 98
Italian Polar Research Institute : Formation of the, 98
Iterson, F. K. Th. van : Plasticity in Engineering, *review* by G. D. S. MacLellan, 679
Ivin, K. J. (Dainton, Dr. F. S., and) : Reversibility of the Propagation Reaction in Polymerization Processes and its Manifestation in the Phenomenon of a 'Ceiling Temperature', 705
Iyer, B. H., and others : Metachloridine-substituted Aryl Biguanides as possible Antimalarial Compounds, 146

JACK, K. H. (Goodeve, Sir Charles, and) : Physical Chemistry of Process Metallurgy, 720
Jacks, G. V. : Soil Conservation, 13
Jackson, Prof. Cecil (Krynauw, Dr. R. A., and) : Presence of a Parasitic Agent in various Intracranial Tumours of Man, 147
Jackson, D. L. C., and Reid, W. S. : Degradation of a Vinylidene Chloride Copolymer in Solution, 29

Jackson, Prof. H. Gordon : Title of professor emeritus of zoology in the University of London conferred on, 729
Jackson, Dr. L. C. : Low Temperature Physics, revised second edition, *review* by Dr. D. Shoenberg, 510
Jackson, Margaret Hadley, and Harvey, Clare : Variations in Spermatogenesis of Oligospermic Men, 67
Jackson, Prof. Willis (Dryden, J. S., and) : Dielectric Behaviour of Methyl Palmitate—Evidence of Resonance Absorption, 656
Jacob, J., et autres : Un symposium sur les proteines, *review*, 870
Jacobs, P. W. M. : Elected to a Beit Fellowship for Scientific Research, 100
Jagoe, R. B. : Appointed senior botanist, Federation of Malaya, 366
James, Dr. A. T. : Elected to a Beit Memorial Fellowship for Medical Research, 212
James, Dr. J. C. : Appointed a lecturer in chemistry in the University of Glasgow, 60
James, T. C. : Appointed geologist, Tanganyika, 729
James, Dr. W. O. : Herbs and Drugs, *review*, 636
Jamieson, Mary, and others : Toxicity of Sulphydryl Compounds to Seeds, 780
Jánossy, Prof. L. : Cosmic Rays and Nuclear Physics, *review* by Prof. T. G. Cowling, 513
Janz, Dr. G. J., and Hawkins, P. J. : Reaction of Cyanogen and related Compounds with Butadiene, 28
Jarrijon, André, et autres : Le caoutchouc, *review* by W. P. Fletcher, 678
Jay, John, and others : The Federalist, or the New Constitution, *review* by Maurice Bruce, 238
Jefferson, Prof. Geoffrey : Appointed a member of the Medical Research Council, 606
Jefferson (Thomas) Among the Arts (Eleanor Davidson Berman), *review* by F. I. G. Rawlins, 513
Jeffrey, Dr. G. A., and others : Crystal Structure of Nitronium Perchlorate, 259
Jeffreys, Prof. Harold : Awarded a Royal Medal for 1948 by the Royal Society, 807, 873
    Lead Isotopes and the Age of the Earth, 822
    The Figure of the Earth, 915
Jenden, D. J., and others : Interaction between Curare and the Potassium Ion at the Motor End Plate, 217
Jenkins, H. G. (Bowtell, J. N., and) : Awarded the Leon Gaster Memorial Premium for 1948 of the Illuminating Engineering Society, 607
Jenkins, H. L. : Physical and Chemical Aspects of Rubber Technology, 204
Jensen, Prof. Alfred : Applied Engineering Mechanics, *review* by R. A. Foulkes, 754
Jensen, Aage Bohus : Activation of Unfertilized Sea Urchin Eggs by Trypsin, 931
Jepson, Dr. W. F. : Appointed to the University of London readership in applied entomology at the Imperial College of Science and Technology, 956
Jewkes, Prof. John : Ordeal by Planning, 42
Jobling, A. : Viscosity-Volume Relation for Ether, 620
Johannesson, Prof. Alexander : Origin of Language, 902
Johns, R. : Appointed deputy director of agriculture (regional), Nigeria, 729
Johnson, A. A. (Ingersoll, H. G., and) : Ionic Exchange and Fibre Contraction, 225
Johnson, Dr. A. W., and others : Colouring Matters of the Aphididæ, 759
Johnson, E. A. G. : Awarded a Telford Premium of the Institution of Civil Engineers, 865
Johnson, Elizabeth Bindloss (Avery, Jr., George S., and) : Hormones and Horticulture, *review* by Dr. M. A. H. Tincker, 943
Johnson, F. H., and Eyring, H. : Bioluminescence, 423
Johnson, Dr. Martin : Science and the Meanings of Truth, *review* by Dr. A. C. Crombie, 46
Johnson, M. L., and Abercrombie, Michael (edited by) : New Biology 3, *review*, 595
Johnson, Matthey and Co. : Catalogue of Chemical Compounds of the Precious and other Metals, 138
Johnston, Prof. T. Baillie : Title of emeritus professor of anatomy in the University of London conferred on, 212
Joly, M., et autres : Un symposium sur les proteines, *review*, 870
Jonas, Rudolf : Fahrten in Island, *review*, 513
Jones, Dr. A. E. : *Obituary*, 15
Jones, A. S., and others : Sulphur-containing Steroid Derivatives, 857
Jones, Prof. F. Llewellyn : Properties of Slow Electrons in Gases, *review*, 276
Jones, Dr. F. L., and Kreidl, Dr. N. J. : Some Aspects of the Nature and Constitution of Glass, 939
Jones, G. I. : Mexican Village Life, 270
    Primitive Techniques, Agriculture and Economic Organisation, 603
Jones, Dr. G. O. : Some Aspects of the Nature and Constitution of Glass, 939
Jones, Sir Harold Spencer : Astronomical Navigation Tables, Vol. A, Latitudes 0°–4° North and South (prepared by H.M. Nautical Almanac Office on behalf of the Air Ministry), *review*, 7
    Appointed president and chairman of the Society for Visiting Scientists, 844
Jones, J. G., and Wilson, Dr. A. J. C. : X-Ray Diffraction Effect shown by some Specimens of Chrysotile, 334
Jones, Dr. J. K. N., and others : Application of Paper Partition Chromatography to the Separation of the Sugars and their Methylated Derivatives on a Column of Powdered Cellulose, 448
Jones, Prof. R. V. : High Vacua, 937
Jones, S., and others : Photo-electric Star-following Telescopes, 144
Jones, Dr. W. G. M. : A Synthesis of Pteridine, 524
Jones, Prof. W. Neilson : Title of emeritus professor of botany in the University of London conferred on, 212
Judges, A. V. : Appointed University of London professor of history of education at King's College, 290
Jullander, Ingvar : Treatment of Paper with Silicon Esters, 300
Jurand, Dr. Arthur : Effect of 5-Alkyl (Benzyl) Derivatives of 2-Thio-4-Methyl-Uracil on the Thyroid Gland and the Bone Marrow in Rabbits, 896

Keen, Dr. B. A. : The Agricultural Development of the Middle East, 53
    Land and Poverty in the Middle East, 53
Keilin, Joan, and Schmid, K. : Crystallization of Whale Myoglobin, 496
Keith, Sir Arthur : A New Theory of Human Evolution, *review* by Prof. H. J. Fleure, 352
Kellar, the late Dr. J. N. (Hirsch, P. B., and) : Surface Layers of Crystals, 609
Keller, A., and Körösy, Dr. F. : Volatile Cuprous and Silver Salts of Fatty Acids, 580
Kelly, Dr. C. D., and others: Arctic Aerobiology, 2, Preliminary Report on Fungi and Bacteria isolated from the Air in 1947, 379
Kelsey, W. Eric : The Spell of the Honey Bee, *review*, 8
Kemp, Prof. T. : Genetics of Cancer, 515
Kendall, —, and others : Chemical Ciphering, 562
Kendall, Prof. James I. : Microscopic Anatomy of Vertebrates, third edition, *review* by Dr. P. D. F. Murray, 430
Kennedy, G. T., and others : Steric Hindrance in Vinyl-Mesitylene, 103
Kennedy, Gilbert Y. : Appointed research worker in the Department of Pathology of the University of Sheffield under the auspices of the British Empire Cancer Campaign, 99
Kenneth, Dr. J. H. : Mosquitoes and Malaria, 227
Kenny, A. W., and Maton, W. R. E. : Preparation of Pure Iron-59 of High Specific Activity, 567
Kent, P. J. C., and others : Physical Chemistry of Process Metallurgy, 720
Kenyon, Brigadier H. : Education in and For the Services, 159
Kermack, Doris M. : Blood System of the Gut of *Arenicola marina*, 576
Kermack, Dr. W. O. : Appointed to the chair of biological chemistry in the University of Aberdeen, 604 ; work of, 604
Kerr, Dr., and others : Dairy Bacteriology, 669
Kerr, Lynda M. H., and Levvy, Dr. G. A. : Sex and Organ Specificity in the Response of β-Glucuronidase to Extrinsic Agents, 219
Kershaw, W. E., and Bertram, Dr. D. S. : Course of Untreated Infections of *Litomosoides carinii* in the Cotton Rat, 149
Khan, Mohd. Abdur Rahman : Further References to Cosmic Phenomena in the Kitab Al-Muntazan of Ibn Al-Jauzi, and a few in Tarikh-E-Rahat Afza, 289
Kidd, D. A., and King, Dr. F. E. : Preparation of Phthalyl-L-Glutamic Acid, 776
Kihlman, Bengt (Fries, Dr. Nils, and) : Fungal Mutations obtained with Methyl Xanthines, 573
Kilburn, T. (Williams, Prof. F. C., and) : Electronic Digital Computers, 487
Killick, Prof. Esther M. : Appointed a member of the Industrial Health Research Board, 918
King, Dr. A. J. : Sound Transmission and Noise, 499, 500
King, Dr. F. E., and others : Benziminazole Analogues of Pteroic and Pteroylglutamic Acids, 153
King, Dr. F. E. (Kidd, D. A., and) : Preparation of Phthalyl-L-Glutamic Acid, 776
King, J. A., and others : Artificial Stimulation of Rain, 921
King, Dr. J. A. (Pidgeon, Prof. L. M., and) : Physical Chemistry of Process Metallurgy, 720
King, J. G. M. : Appointed director of livestock and agricultural services, Basutoland, 447
King, T. Summerfield : Appointed lecturer in anatomy in the University of Sheffield, 99
King's College, London : Appointment of A. V. Judges as University of London professor of history of education, 290
    Appointment of Dr. W. C. Price to the University of London readership in experimental physics, 564
    Title of professor emeritus of civil engineering in the University of London conferred on Prof. C. H. Lobban, 729
    Appointment of A. W. Hendry to the University of London readership in civil engineering, 990
King's College, Newcastle-upon-Tyne : Appointment of Dr. A. E. Green to the chair of applied mathematics, 445
    Appointment of Dr. W. W. Rogosinski to the chair of pure mathematics, 445
    Retirement of Prof. G. R. Goldsbrough from the chair of mathematics, 604
King's College Hospital Medical School : Appointment of C. H. Gray to the University of London chair of chemical pathology, 99
    Appointment of Dr. H. A. Magnus to the University of London chair of morbid anatomy, 99
Kingsbury, J. E. : *Death* of, 841
Kingwill, D. G., and others : Artificial Stimulation of Rain, 921
Kinnear, N. B. : *Obituary* of Dr. P. R. Lowe, 443
Kipfer, —. : Sound Transmission and Noise, 500
Kirk, Dudley : Europe's Population in the Inter-War Years, *review* by Prof. H. J. Fleure, 428
Kirke, H. L. : Sound Transmission and Noise, 499

Revista Medica de Valparaiso, No. 1, 137
Revue generale du Caoutchouc : To be more readily obtained in Great Britain, 138
Rey, Prof. M. : Physical Chemistry of Process Metallurgy, 721
Reynolds, D. H. B. : Awarded a Telford Premium of the Institution of Civil Engineers, 865
Reynoldson, Dr. T. B. : British Species of *Polycelis* (Platyhelminthes), 620
Rhodes, D. H. : Appointed fisheries officer, Uganda, 366
Ricardo, Sir Harry : Appointed a member of the Scientific Advisory Council to the Minister of Fuel and Power, 57
Richard, Dr. Otto : Variation in Morphological and Biochemical Characteristics of Anærobic Butyric Acid Bacteria, 463
Richards, Dr. Audrey I. : *Obituary* of Prof. Ruth Benedict, 725
Richards, B. D. : Awarded a Telford Premium of the Institution of Civil Engineers, 865
Richards, R. E., and Tomlinson, Dr. M. L. : Structure of O-Trimethylbrazilone, 693
Richardson, Dr. F. D. : Physical Chemistry of Process Metallurgy, 719, 721
Richardson, K. C. : The Physiology of Lactation, 601
Richardson, Prof. L. R. : Density of the Blackfish Petrosal, 150
Richardson, U. F. : Veterinary Protozoology, *review* by Dr. G. Lapage, 756, 884
Rickard, C. G., and others : Hæmophilia in Dogs, 136
Ride, Prof. Lindsay Tasman : Appointed vice-chancellor of the University of Hong Kong, 956
Riesz, Prof. F. : Elected a *correspondant* for the Section of Geometry of the Paris Academy of Sciences, 138
Riha, J. K. : Zeme Krásná (The Beautiful Earth), *review* by J. G. F. D., 49
Riley, Dr. D. P. : Appointed to the Dewar Research Fellowship in the Davy Faraday Laboratory of the Royal Institution, 176
Riley, Dr. D. P., et autres : Un symposium sur les proteines, *review*, 870
Rishbeth, Mrs. K. : Parthenogenetic Paternity in Central Australia, *review*, 276
Ritchie, Prof. A. D. : Epicurus Up to Date, *review*, 757
Ritson, D. M., and others : Observations on Slow Mesons of the Cosmic Radiation, 433
Rivlin, R. S. : Physical and Chemical Aspects of Rubber Technology, 204
Roach, J. O. : Selection at the University Level, 626
Road Research Laboratory of the Department of Scientific and Industrial Research, and others : Conference on Road Research, 290
Robb, J. C. : Degree of Ph.D. of the University of Aberdeen conferred on, 99
Roberts, Prof. Arthur (edited by) : Radar Beacons, *review* by Dr. R. L. Smith-Rose, 633
Roberts, T. D. M. (Lowenstein, Dr. Otto, and) : Oscillographic Analysis of the Gravity and Vibration Responses from the Labyrinth of the Thornback Ray (*Raja clavata*), 852
Robertson, —. : Road Research in Scotland, 785
Robertson, A. : Tetrahydrofuran Hydroperoxide, 153
Robertson, Prof. A., and others : Structure of Citrinin, 72
  Etiology of Grass Disease, 116
Robertson, F. C. Ford : The Influence of Vegetation on Floods, 803
Robertson, Dr. G. Scott : Agriculture and the World Food Problem, 406
Robertson, Prof. J. Monteath, and others : Effect of Hydrogen Atoms on Intensities of X-Ray Reflexions, 889
Robertson, R. H. S. : Clay Minerals as Catalysts and Adsorbents, 195
Robertson, Thomas : Human Ecology, the Science of Social Adjustment, *review* by Prof. T. S. Simey, 755
Robinson, G. M. (Heaton, Dr. T. B., and) : Biological Properties of a Substance Isolated from Wheat Middlings and of Hydroxymethylfurfuraldehyde, 570
Robinson, H. W. : Retirement as librarian to the Royal Society, 875
Robinson, J. B. D. : Appointed chemist, Department of Science and Agriculture, Barbados, 729
Robinson, Sir Robert : Physical and Chemical Aspects of Rubber Technology, 206
  Structure and Biogenesis of Emetine, 524
  Anniversary Address to the Royal Society, 872
  Elected president of the Royal Society for 1949, 882
Robinson, Sir Robert, and Stephen, A. M. : Synthesis of Vomipyrine, 177
Rockefeller Foundation : Review of the work of the, for 1947, 273
Rockefeller Institute for Medical Research, Princeton (Dr. J. A. V. Butler), 479
Rodger, Alec : The Nature of Incentives, 558
Rodger, T. A. : Appointed University of London reader in psychology at Birkbeck College, 290
Rodger, Dr. T. Ferguson : Appointed to the chair of psychological medicine in the University of Glasgow, 363 ; work of, 363
Rodin, S. : Awarded the James Prescott Joule Medal and a Miller Prize of the Institution of Civil Engineers, 865
Rodriguez, Antonio E. : An Approximate Equation of State, 304
Rogan, Dr. J. M. : Appointed a member of the Industrial Health Research Board, 918
Rogosinski, Dr. W. W. : Appointed to the chair of pure mathematics at King's College, Newcastle-upon-Tyne, 445 ; work of, 445
Rollefson, Prof. G. K. (Eastman, Dr. E. D., and) : Physical Chemistry, *review* by Dr. J. A. V. Butler, 125
Rollin, Noble : Sun-Bathing by Birds, 843
Ropp, R. S. de : Action of Streptomycin on Plant Tumours, 459
Rorive-Boute, Mme C. (Pourbaix, Dr. M. J. N., and) : Physical Chemistry of Process Metallurgy, 720
Rosenberg, R. L., and others : Decay and Capture of Slow Mesons in Dielectrics, 450
Rosenfeld, Prof. L. : Nuclear Forces, *review* by Prof. M. H. L. Pryce, 907
Rosenquist, E. A. : Appointed botanist, Malaya, 366
Roseveare, G. M. : Vegetation of the Argentine, *review*, 203
Ross, Alan G. (Percival, Dr. E. G. V., and) : The Cellulose of Marine Algæ, 895
Ross, Dr. Marion A. S., and Zajac, Barbara : Range-Energy and other Relations for Electrons in Kodak Nuclear Plates, 923
Ross (Ronald) Jubilee, 50
Ross, W. A. : Recent Developments in Insecticides, 308
Ross, Dr. W. C. J., and others : Effects upon Tumours of various Haloalkylarylamines, 824
Rossem, Dr. A. van : Physical and Chemical Aspects of Rubber Technology, 205
Rostand, Jean : Charles Darwin, *review* by Prof. H. Graham Cannon, 831
Roth, L. : Quasi-Abelian Functions, *review*, 593
Rothamsted Experimental Station : Report for 1946, 267
  Retirement of Dr. Winifred E. Brenchley as head of the Botany Department, 727
Rothschild, Lord: Appointed chairman of the Agricultural Research Council, 408
Roussy, Prof. Gustave : *Death* of, 726
Rovery, M., et autres : Un symposium sur les proteines, *review*, 870
Rowland, H. A. : Centenary of the birth of, 841
Rowland, Dr. S. J., and others : Œstrogens in Grass and their possible Effects on Milk Secretion, 845
Rowlands, A., and Hoy, W. A. : Dairy Bacteriology, 670
Rowlinson, J. S. : Heat Capacity of Methanol Vapour, 820
Royal Aeronautical Society : Formation of Divisions in Australia and New Zealand, 606
  Kronfeld Memorial Fund, 769
Royal Anthropological Institute : Report of the Council for 1947–48, 409
Royal Cancer Hospital : Appointment of Dr. R. A. M. Case as research fellow at the Chester Beatty Research Institute, 607
Royal College of Surgeons : Presentation of his portrait in oils to Sir John Parsons, 407
Royal Commission for the Exhibition of 1851 : Award of Overseas Science Research Scholarships for 1948, 100
Royal Geographical Society : Air Transport and Geography, 58
Royal Institute of British Architects (Acoustics Group of the Physical Society, in association with the) : International Conference on Noise and Sound Transmission, 59
Royal Institute of Chemistry (Birmingham and Midlands Section) : To establish a Percy Faraday Frankland Memorial Lecture, 809
Royal Institution : Award of a Science Research Scholarship to Miss Philippa Marion Glasgow, 100
  Appointment of Dr. D. P. Riley to the Dewar Research Fellowship in the Davy Faraday Laboratory, 176
Royal Meteorological Society : Series of Popular Lectures, 844
Royal Observatory, Greenwich : Expedition to Mombasa to observe the Solar Eclipse of November 1, 521
  Report of the Astronomer Royal to the Board of Visitors, 540
Royal Photographic Society : Annual Exhibition of the, 788
  Series of Christmas Lectures, 920
Royal Society : Prof. E. N. da C. Andrade to become honorary librarian, 250
  Scientific Information Conference, 279
  Summary of the recommendations of the Scientific Information Conference, 447
  Empire Scientific Conference, June–July 1946, Report, *review* by R. B., 679
  Royal Medals for 1948 awarded to Prof. Harold Jeffreys and Prof. James Gray, 807, 873
  Copley Medal for 1948 awarded to Prof. A. V. Hill, 807, 872
  Rumford Medal for 1948 awarded to Prof. F. E. Simon, 807, 872
  Davy Medal for 1948 awarded to Prof. E. L. Hirst, 807, 873
  Darwin Medal for 1948 awarded to Prof. R. A. Fisher, 807, 874
  Hughes Medal for 1948 awarded to Sir Robert Watson-Watt, 807, 874
  Anniversary Address by Sir Robert Robinson, 872
  Retirement of Sir Alfred Egerton as Physical Secretary, 874
  Election of Prof. D. Brunt as Physical Secretary, 874
  Retirement of H. W. Robinson as librarian, 875
  Election of officers for 1949, 882
  Formation of a Standing Committee on Information Services, 955
  Appointment of Dr. Arthur J. Birch as Smithson research fellow, 956
  Appointment of Sir Thomas Merton, Sir Edward Salisbury, Sir James Chadwick and Prof. A. C. Hardy as vice-presidents, 990
Royal Society of Arts : Essay Prize under the Thomas Gray Memorial Trust, 366
Royal Society of Edinburgh : James Scott Prize for 1948 presented to Prof. Herbert Dingle, 100
  Neill Prize (1945–47) presented *in absentia* to Dr. Robert Broom, 100
  Patronage of H.M. the Queen accorded to the, 409
  Election of officers for 1948–49, 729
Royal Society of Medicine : Election of Sir Henry Dale as president, 96
Royal Society of New South Wales : Medal of the Society awarded to Prof. W. L. Waterhouse, 956
Royal Society of South Africa : Special Publication, Robert Broom Commemorative Volume (edited by Alex L. du Toit), *review* by Prof. D. M. S. Watson, 795
Royal Technical College, Glasgow : Conference on Road Research, 290, 784

Rubber Industry, Institution of the : Conference on Rubber Technology, 204, 211
  Colwyn Medal presented to Dr. R. P. Dinsmore, 211
Rumball, Group-Capt. C. A. : Nutrition of Athletes, 208
Rundle, Prof. R. E. : Crystal Structure of β-Starch from X-Ray Fibre Diagrams, 107
Ruse, Prof. H. S. : Applicable Mathematics, 583
Rushman, Dr. D. F. : Physical Properties of Substances of High Permittivity, 246
Russell, Dr. E. W. : Students' Handbook to Fertilisers and Soils (L. T. Lowe), *review*, 8
  Reclamation of the Land, *review*, 475
  Using and Managing Soils (Prof. A. F. Gustafson), *review*, 758
  Obituary of Prof. Johan Hjort, 764
Russell, Jr., Horace, and others : The Rare-Earth Elements and their Compounds, *review*, 278
Russell, H. N., and others: Physical Science and Human Values, 751
Russell, Sir John : Elected president of the British Association for the Advancement of Science for 1949, 444, 882; work of, 444
  Control of Environment in Horticulture, 585
  Inbreeding and Hybrid Vigour in Crops and Livestock, 642
Ruyssen, Prof. R., and Loos, R. : Electrokinetic Potentials of Aged Barium Sulphate Crystals, 741
Ryle, M., and Smith, F. G. : A New Intense Source of Radio-Frequency Radiation in the Constellation of Cassiopeia, 462
  Origin of Fluctuating Galactic Noise, 858
Ryman, Brenda E., and others : Metabolism of Aminohydroxybenzoic Acids, 64
Ryves, B. H. : Bird Life in Cornwall, *review* by Frances Pitt, 7

SAAL, R. N. J., and others : Chemical and Physical Investigations on Dairy Products, *review* by H. D. K., 87
Sahni, Prof. Birbal : The Technique of Casting Coins in Ancient India, 266
Said, Prof. Husein : Effect of Phosphorus on the Hydrolysis and Absorption of Sucrose by Plant Cells, 496
Salisbury, Sir Edward : Appointed a vice-president of the Royal Society, 990
Salisbury, Sir Edward (edited by Hill, A. W., and): Index Kewensis Plantarum Phanerogamarum, Supplementum 10, 1936–1940, *review* by Prof. J. R. Matthews, 909
Salmon, J. T. (Drake, Carl J., and) : A Second *Xenophyes* from New Zealand, 919
Salomon, Dr. G., and others : Physical and Chemical Aspects of Rubber Technology, 206
Salt, Dr. F. E. : Clay Minerals as Catalysts and Adsorbents, 195
Salvetti, A. (Le Bras, Dr. J., and) : Physical and Chemical Aspects of Rubber Technology, 205
Sanders, H. : Appointed assistant conservator of forests, Nigeria, 485
Sanderson, Dr. Ann R., and Hall, David W. : The Cytology of the Honey Bee, *Apis mellifica* L., 34
Sandoz Products, Ltd. : Gift of £300 a year to the University of Leeds to provide a scholarship, 212
Sandwith, N. Y. (Dennis, R. W. G., and) : Æcidia of Barley Rust in Britain, 461
Sanger, Dr. F. : Elected to a Beit Memorial Fellowship for Medical Research, 212
  Some Peptides from Insulin, 491
Sanger, Ruth, and others : *Rh* Genes Allelomorphic to *D*, 292
Sansom, Charles H. : Watercress Cultivation (Ministry of Agriculture Bulletin 136), 58
Sansome, Dr. F. W. : Appointed professor of botany in the University College in Nigeria, 327 ; work of, 327
  The Genetics of Garden Plants (M. B. Crane and W. J. B. Lawrence), third edition, *review*, 595
Sargent, Prof. C. S. : Silva of North America, 884
Sarkar, S. N. : Isolation from Argemone Oil of Dihydrosanguinarine and Sanguinarine—Toxicity of Sanguinarine, 265
Satow, Graham : The Firm as a Working Unit, 383
Satterly, Prof. John : *Obituary* of Prof. E. F. Burton, 880
Savage, Mrs. E. J. : *Obituary* by Prof. Lily Newton, 766
Savic, P. : Influence of Reactive Feedback Networks on the Response of Galvanometers, 569
Saxe, R. F., and Meek, Prof. J. M. : Development of Spark Discharges, 263
Saxton, Dr. J. A. : Microwave Techniques, *review*, 868
Sayce, Dr. L. A. : Appointed superintendent of the Light Division of the National Physical Laboratory, 987 ; work of, 987
Sayce, R. U. : Investigation of Folk-Life in Britain and Abroad, 403
  Primitive Techniques, Agriculture and Economic Organisation, 602
Sayre, D. (Pepinsky, Prof. R., and) : Quantitative Electron-Density Contour Delineation in the Electronic Fourier Synthesizer for Crystal Structure Analysis, 22
Schaeffer, W. D. (Smith, Dr. W. R., and) : Physical and Chemical Aspects of Rubber Technology, 204
Schenk, Dr. Max : Werkstoff Aluminium und seine anodische Oxydation, *review* by H. W. L. Phillips, 715
Schmid, K. (Keilin, Joan, and) : Crystallization of Whale Myoglobin, 496
Schmidt, W. H., and others : An Automatic Agar Dispenser, 903
Schoch, Dr. A. : Sound Transmission and Noise, 501
Schofield, R. K., and Penman, Dr. H. L. : The Principles Governing Transpiration by Vegetation, 803
School of Agriculture, Cambridge : Informal meeting of Commonwealth Plant Breeders, 175
School of Oriental and African Studies : Appointment of Dr. Sidney Smith to the University of London chair of ancient Semitic languages and civilizations, 19
Schulman, Dr. J. H. (McRoberts, T. S., and) : Role of the Hydroxyl Group in the Gelation of Aluminium Soaps in Hydrocarbons, 101
Schuster, Sir George : Appointed treasurer of the Medical Research Council, 606
Schwabacher, Herta : Effect of Sputum on Streptomycin, 339
Schwarz, E. : New Photoconductive Cells, 614
Science Museum, London : Collection illustrating the work of Baron Roland von Eötvös, 176
  Exhibits in the Darkness into Daylight Exhibition to be incorporated in the permanent collection on illumination, 564
  Loan by R. Meyrick of a Portable Barometer made by Daniel Quare, 919
Science Progress, Vol. 36, No. 144, October 1948, 843
Science and Technology in China : New bulletin issued by the Natural Science Society of China, 17
Scientific Advisory Council to the Minister of Fuel and Power : Appointment of members, 57
Scientific Film Association of Great Britain (Sciences Committee) : Conference on the Film in Scientific Research, 250
Scientific Film Association of Great Britain and the British Film Institute : Second Congress of the International Scientific Film Association, 59, 826
Scientific Film Association, International : Second Annual Congress (Michael Michaelis), 826
Scientific Instrument Manufacturers' Association of Great Britain : Exhibition of scientific instruments at the British Association at Brighton, 445
  Exhibition of scientific instruments at Copenhagen, 837
Scientific Instrument Manufacturers' Association (Electronics Group) : Symposium on Applications of Electronics to Research and Industry, 485, 769
Scientific Policy, Advisory Council on : Annual Report, 628
Scientific Research, Advisory Council for : Appointment of James Bowman, E. Fletcher and Dr. H. W. H. Warren as members, 690
Scientific Research, Brussels, National Foundation for : Twentieth Annual Report, 365
Scientific Unions, International Council of : Annual Meeting of the Executive Committee, 648
Scientific Workers, World Federation of: First General Assembly (J. G. Crowther), 644
Scientific and Industrial Research, Department of : Report of the Chemistry Research Board for 1938–1946, 228
  Loan of Dr. W. A. Macfarlane by the Ministry of Fuel and Power to the, as director of the United Kingdom Scientific Mission in the British Commonwealth Scientific Offices in Washington, 366
  Radio Research Special Report No. 17, Fundamental Principles of Ionospheric Transmission, 465
Scientific and Industrial Research, Department of (Road Research Organisation), and others : Conference on Road Research, 290, 784
Scientific Societies, South-Eastern Union of : Annual Congress, 78
Scott, Dr. J. R., and Whorlow, R. W.: Physical and Chemical Aspects of Rubber Technology, 205
Scott, W. J. O. : Awarded a Telford Premium of the Institution of Civil Engineers, 865
Scottish Accident Prevention Council, and others : Conference on Road Research, 290, 784
Scottish Council (Development and Industry) : Report on Chemical Industries in Scotland, 39
  Final Report of the Committee on Plastics, 1009
Scottish Marine Biological Association : Re-appointment of Prof. C. M. Yonge as a director, 956
Searle, D. L. : Appointed geologist, Kenya, 729
Secher, Prof. Knud : The Danish Cancer Researcher, Johannes Fibiger, Professor in the University of Copenhagen, *review* by Dr. P. R. Peacock, 162
Secrett, F. A. : Resignation as honorary adviser to the Ministry of Agriculture and Fisheries on vegetable production, 290
  Horticultural Crops in their Relationship to Water, 584
Seed Testing Station, Official : Retirement of Alfred Eastham as chief officer, 60
  Appointment of C. C. Brett as chief officer, 60
Seki, S. (Chihara, H., and) : Volume Change of Hexamethyl Benzene, 773
Sell, George : Appointed editor of the publications of the Institute of Petroleum, 290
Sellei, Dr. C., and others : Abnormal Serum Protein in Parenchymatous Liver Diseases, 1002
Series, G. W. (Kuhn, Dr. H., and) : Fine Structure of the Hydrogen α-Line, 373
Seshappa, Dr. G. : Nomenclature of the British Littorinidæ, 702
Severi, Prof. Francesco : Funzioni quasi-abeliane, *review* by L. Roth, 593
Sewell, Dr. R. B. Seymour, and Fage, Prof. Louis : Minimum Oxygen Layer in the Ocean, 949
Sexton, C. G. : Awarded the Indian Premium of the Institution of Civil Engineers, 865
Shackleton, Dr. R. M. : Appointed to the George Herdman chair of geology at the University of Liverpool, 55 ; work of, 55
Shapley, H., and others; Physical Science and Human Values, 751
Sharpe, M. E. : Biochemical Characteristics of Group *L* Streptococci, 670
Sharpey-Schafer, E. P. : Appointed to the University of London chair of medicine at St. Thomas's Hospital Medical School, 212
Shaxby, Dr. J. H. : *Obituary* by Prof. T. Graham Brown, 806
Shaw, John (Raper, Dr. Richard, and) : Amino-Acids in the Hæmolymph of the Dragon-fly Nymph, *Aeschna cyanea*, 999
Sheldon, Dr. J. H. : The Social Medicine of Old Age—Report of an Inquiry in Wolverhampton, 466
Shepherd, L. R., and Hill, J. M. : Decay of Barium-139, 566
Sheppard, E., and others : Study of the Action of Ultra-violet Light on Urease by means of the Ultracentrifuge, 370
Sheppard, Dr. S. E. : *Obituary* by Dr. C. E. K. Mees, 952
Sherif, Muzafer, and Cantril, Hadley : The Psychology of Ego-Involvements, *review* by Dr. John Cohen, 7
Sherriff, C. S. : Road Research in Scotland, 784
Shoemaker, Prof. James Sheldon : Vegetable Growing, *review* by Prof. R. H. Stoughton, 910
Shoenberg, Dr. D. : Low Temperature Physics, *review*, 510
  Magnetic Properties of Superconductors, 800
Shope, Dr. Richard E. : Appointed associate director of the Merck Institute for Therapeutic Research, 564
Shoppee, Prof. C. W. : The Sommelet Reaction, 619

Shoppee, Prof. C. W., and others : Cytochemical Demonstration of Ketosteroids, 572
Short, W., and others : Synthesis of *l*-Sparteine, 296
Shriner, R. L. (edited by) : Organic Syntheses, Vol. 27, *review* by J. R., 278
Shulov, Dr. A. : A Nemestrinid Parasite of *Schistocerca gregaria* (Forsk.), 255
Siegel, Benjamin M., and others : Electron Optical Observations on Chromosome Structure in Resting Cells, 305
Sierpinski, Prof. W. : Elected a *correspondant* for the Section of Geometry of the Paris Academy of Sciences, 138
Signals Research and Development Establishment, Christchurch, 803
Sikkema, C. P. : Disintegration of Nitrogen by Fast Neutrons, 698
Silberman, L., and others : Nairobi, Master Plan for a Colonial Capital, *review*, 432
Sillars, Dr. R. W. : Semiconductors and their Applications, 625
Silow, R. A., and others : The Evolution of Gossypium, *review* by E. Lord, 716
Simey, Prof. T. S. : Human Ecology, *review*, 755
Simon, Prof. F. E. : Awarded the Rumford Medal for 1948 of the Royal Society, 807, 872
Simonsen, Prof. J. L. : The Colonial Microbiological Research Institute, Trinidad, 498
Simpson, Sylvia A., and others : Œstrogens in Grass and their possible Effects on Milk Secretion, 845
Sinclair, Dr. H. M. : The Changing Aspects of Nutrition, 543
Singh, Nazar, and others : Constitution of Conessine, 22
Skinner, Dr. H. A., and Springall, Dr. H. D. : Definitions of Bond-Energy in Physical Chemistry, 343
Skinner, W. E. A. : Awarded the Bayliss Prize of the Institution of Civil Engineers, 865
" 's Lands Plantentuin" : Appointment of Dr. S. L. Hora as an honorary member of, 100
Sloan, A. W. : Appointed lecturer in physiology in the University of Glasgow, 60
Slurzberg, Morris, and Osterheld, William : Essentials of Radio, *review* by W. R., 945
Smedley, Dorée (Beck, Dr. B. F., and) : Honey and your Health, *review* by Dr. Colin G. Butler, 128
Smeed, Dr. R. J. : Road Safety and Traffic Flow, 785
Smekal, Prof. A. : Some Aspects of the Nature and Constitution of Glass, 939
Smiles, J., and others : Ultra-Violet Microscopy of Living Malignant Cells, 650
Smith, A. : Appointed principal agricultural education officer, Gold Coast, 729
Smith, Dr. Alexander : *Death* of, 288
Smith, Sir Ewart : The Contribution of Instruments to Industrial Progress, 761
Smith, Dr. E. Lester : Presence of Cobalt in the Anti-Pernicious Anæmia Factor, 144
Smith, Dr. E. W. : Plans and a People—a Dynamic Science of Men in the Service of Africa, 482
Smith, F. : The Development and Design of Cooled-Anode Valves, 767
Smith, F., and others : Sulphur-containing Steroid Derivatives, 857
Smith, F. G. (Ryle, M., and) : A New Intense Source of Radio-Frequency Radiation in the Constellation of Cassiopeia, 462
  Origin of Fluctuating Galactic Noise, 858
Smith, Dr. J. D. : Symbiotic Micro-organisms of Aphids and Fixation of Atmospheric Nitrogen, 930
Smith, J. R. : Awarded a Miller Prize of the Institution of Civil Engineers, 865
Smith, Dr. Kenneth M., and others : Specific Crystalline Protein and Nucleoprotein from a Plant Virus having Insect Vectors, 88
Smith, Margaret McL. (Walker, F. T., and) : Seaweed Culture, 31
Smith, M. J. H. (Linnell, Prof. W. H., and) : N. Acridyl-(5)-Alanines as Antibacterial Substances, 735
Smith, Dr. R. A. : Semiconductors and their Applications, 625
Smith, R. B. : Appointed agricultural officer, Trinidad, 729
Smith, Dr. Sidney : Appointed to the University of London chair of ancient Semitic languages and civilizations at the School of Oriental and African Studies, 19
  Retirement from the post of keeper of the Department of Egyptian and Assyrian Antiquities at the British Museum, 645
Smith, Dr. S. W. : *Obituary* of Dr. William Cullen, 560
Smith, Prof. S. W. J. : *Death* of, 326 ; *obituary* by Prof. M. L. Oliphant and A. A. Dee, 519
Smith, T. : Retirement as superintendent of the Light Division of the National Physical Laboratory, 987 ; work of, 987
Smith, T. D., and Bell, R. : Relation between the Brunauer—Emmett—Teller and Harkins—Jura Isotherms, 109
Smith, W. : Appointed agricultural officer, Gold Coast, 956
Smith, Dr. W. Campbell : Appointed deputy chief scientific officer in the British Museum (Natural History), 844
Smith, W. O. Lester : The School in a Progressive Society, 405
  Selection at the University Level, 626
Smith, Dr. W. R., and Schaeffer, W. D. : Physical and Chemical Aspects of Rubber Technology, 204
Smith, Sir William Wright : Elected president of the Royal Society of Edinburgh for 1948–49, 729
Smith-Rose, Dr. R. L. : Radar, Beacons and Navigation by Radio, *review*, 633
Smithers, Prof. D. : Genetics of Cancer, 515
Smithsonian Institution : Annual Report, 79
Smits, G. (Florijn, Dr. E., and) : Aneurin-Pyrophosphate Content of Red and White Blood Corpuscles in the Rat and in Man, 220
Smulders, J. (Lison, Dr. L., and) : Discriminating 'Athrocytes' in the Recticulo-endothelial System, 65
Smullin, Louis D., and Montgomery, Prof. Carol G. (edited by) : Microwave Duplexers, *review* by Dr. J. A. Saxton, 868
Smyth, V. D. O. : Appointed an advisory officer at the Research Station of the Board of Greenkeeping Research, 328
Smythe, Eric : The Organisation and Working of a Newspaper's Press-cutting Library and the Mechanics of Storage, 863
Snow, F. S. : Applicable Mathematics, 582
Soal, S. G. : The Experimental Situation in Psychical Research, *review*, 432
Sobey, Instructor-Capt. F. C. : Education in and For the Services, 159
Social and Economic Research, Interdepartmental Committee on : Report of the, 905
Sociedad Medica de Valparaiso : Publication of No. 1 of the *Revista Medica de Valparaiso*, 137
Société Géologique de France : Election of Sir Lewis Fermor as *correspondant etranger*, 250
Solomon, Sidney (Hechter, Dr. Oscar, and) : Spreading Phenomenon and Inflammation, 701, *erratum*, 809
Someren, Dr. Vernon D. van : River Research in East Africa, 784
Sondes Place Research Institute, Dorking (MacTaggart and Evans, Ltd.), 484
Sorsby, Arnold, and others : Tabulæ Biologicæ, Vol. 22, Oculus, Pars I, *review* by Dr. E. N. Willmer, 910
Soumini, C. K. (Ramakrishnan, T. S., and) : Some Fungi of India, 271
South African Association for the Advancement of Science : Report of the Oudtshoorn meeting in July 1947, 366
South-Eastern Union of Scientific Societies : Annual Congress, 78
Southwell, Sir Richard : Retirement from the rectorship of the Imperial College of Science and Technology, 16
  Applicable Mathematics, 583
Spangenberg, Prof. Karl R. : Vacuum Tubes, *review* by A. H. Beck, 678
Sparkes, F. N. : Materials used in making Concrete, 785
Sparrow, Dr. Arnold H. : Relative X-Ray Sensitivity of Metaphase and Interphase Chromosomes, 651
Spaulding, F. T., and others: Physical Science and Human Values, 751
Speakman, Dr. J. C. : Crystal Structures of the Acid.Salts of some Monocarboxylic Acids, 695
Special Libraries and Information Bureaux, Association of : Twenty-third Annual Conference, 366 ; (Ivor B. N. Evans), 862
Special Libraries and Information Bureaux, Association of (Northern Branch) : Conference on Organised Information Services, 809
Spectacle Makers, Worshipful Company of : Optical Convention, 825
Speidel, C. C. : Cinematograph Films of Living Cells, 249
Spence, Lewis : The Minor Traditions of British Mythology, *review* by Dr. E. J. Dingwall, 388
Spensley, P. C., and others : Benziminazole Analogues of Pteroic and Pteroylglutamic Acids, 153
Spiller, D. : Truncated Log-Normal and Root-Normal Frequency Distributions of Insect Populations, 530
Spring, Prof. F. S., and others : Structure of the Antibacterial Compound, Aspergillic Acid, 779
Springall, Dr. H. D. (Skinner, Dr. H. A., and) : Definitions of Bond-Energy in Physical Chemistry, 343
Squire, F. A. : Entomological Aspects of 'Swollen Shoot' of Cacao, 743
Sreemulanathan, H., and others : Deodorization of Shark Liver Oil, 494
St. Anthony's College, Oxford : Foundation of, 482
St. Bartholomew's Hospital Medical College : Title of professor emeritus of medicine in the University of London conferred on Sir Francis Fraser, 729
St. George's Hospital Medical School : Appointment of Dr. T. Crawford as University of London professor of pathology, 290
St. Joseph, Dr. J. K. : Air Photography and Archæology, 96
St. Mary's Hospital Medical School : Appointment of Dr. R. T. Williams as University of London professor of biochemistry, 290
  Appointment of Dr. C. L. Foster to the University of London readership in biology, 564
  Appointment of Dr. Robert Cruickshank to the chair of bacteriology, 607
  Title of professor emeritus of bacteriology in the University of London conferred on Sir Alexander Fleming, 729
St. Thomas's Hospital Medical School : Appointment of E. P. Sharpey-Schafer to the University of London chair of medicine, 212
  Appointment of D. V. Davies as University of London professor of anatomy, 290
Stacey, Prof. M., and Webb, Dr. M. : Some Components of the Lytic System of Gram-Positive Micro-organisms, 11
Stafford, G. H. : A High-Pressure Hydrogen-filled Ionization Chamber, 771
Stafford, Dr. R. L. : Physical and Chemical Aspects of Rubber Technology, 205
Stallybrass, Dr. W. T. S. : The Balance of Research and Teaching at Universities, 441
Stammers, Surgeon-Lieut. F. M. G., and Whitfield, Lieut.-Comdr. F. G. Sarel : Toxicity of D.D.T., 120
Stamp, Prof. L. Dudley : Appointed to the University of London chair of social geography at the London School of Economics and Political Science, 564
Stanbury, S. W. : Elected to a Beit Memorial Fellowship for Medical Research, 212
Stanley, J. R. : Awarded a special prize of £50 by the Institution of Civil Engineers, 865
Stanley-Jones, D. : Pulsating Stars and Nuclear Energy, 934
Stanworth, J. E. : Some Aspects of the Nature and Constitution of Glass, 939
Starnecki, B. (McPetrie, Dr. J. S., and): Low-Level Atmospheric Ducts, 818
State University, Ghent : Appointment of Dr. Paul Froeschel to the chair of plant physiology, 689
Stauffer, R. A. : High Vacua, 937
Stebbing, Prof. E. P. : The Indian Forest Service, 129
  Elm Disease, 196
  Afforestation for Bengal, 424
Steelman, John R. : Science and Public Policy, 673
Steers, J. A. : A Picture Book of the Whole Coast of England and Wales, *review* by L. D. S., 638
Stein, Gabriel, and Weiss, Dr. Joseph : Deamination of Amino-Acids by X-Rays, 184
Steindorff, K., and others : Tabulæ Biologicæ, Vol. 22, Oculus, Pars I, *review* by Dr. E. N. Willmer, 910
Stenger, V. A. (Kolthoff, Prof. I. M., and) : Volumetric Analysis, second edition, Vol. 2, *review*, 128
Stenton, Sir Frank : Appointed chairman of the Institute of Education, Reading, 842
Stephen, A. M. (Robinson, Sir Robert, and) : Synthesis of Vomipyrine, 177
Stephen, J. M. L., and others : The Core of the Insulin Molecule, 418
Stephen, J. M. L. (Phillips, D. M. P., and) : Chromatography of Dinitrophenyl Amino-acids and Peptides, 152
Stephens, S. G. : A Simple Apparatus for Adding Seitz-Filtered Components Aseptically to Embryo Culture Media, 932

Stephens, S. G., and others : The Evolution of Gossypium, *review* by E. Lord, 716
Stephenson, George (1781–1848), 247
Stephenson, Dr. Marjory : Elected president of the Society for General Microbiology for 1948–49, 606
Death of, 954
Sterland, E. G. : Variation of Ground-Levels on Coe Fen, Cambridge, 532
Stern, F. (Beevers, Dr. C. A., and) : Crystal Structure of *d*-Tartaric Acid, 854
Stern, Colonel F. C. : Genetical Structure of Plant Populations, 517
Stern, Dr. Kurt G., and others : Electron Optical Observations on Chromosome Structure in Resting Cells, 305
Stevels, Dr. J. M. : Some Aspects of the Nature and Constitution of Glass, 939
Steven, G. A. : Report on the Sea Fisheries of Sierra Leone, 38
Marine Fisheries of Great Britain, 641
Steven, G. A. (Cooper, Dr. L. H. N., and) : Marine Fish Cultivation, 378
Stevens, Dr. G. W. W. : Selective Development of Fission Tracks in an Electron-sensitive Emulsion, 526
Stevens, W. L. : Appointed professor of mathematical statistics at the University of Sao Paulo, 56 ; work of, 56
Steward, Julian H. (edited by) : Handbook of South American Indians, Vol. 3, The Tropical Forest Tribes ; Vol. 4, The Circum-Caribbean Tribes, *review* by Dr. G. H. S. Bushnell, 908
Stewart, Dr. Donald : Appointed a member of the Industrial Health Research Board, 918
Stewart, J. D. : Degree of Ph.D. of the University of Aberdeen conferred on, 99
Stewart (Sir Halley) Trust : Course of lectures on the Atomic Age, 523
Stiles, Dr. W. S. : Colour Terminology, 54
Ophthalmic Optics, 826
Stockdale, Sir Frank : Appointed chairman of the governing body of the Imperial College of Tropical Agriculture, 250
Some Biological Aspects of Colonial Development, 476
Stocks, Mrs. J. L. : Selection at the University Level, 626
Stoker, Dr. : The Prophylaxis of Virus Infections with special reference to the Use of Vaccines, 92
Stoneley, Dr. R. : Re-elected president of the Association of Seismology, 744
Stoner, Dr. H. B. : Awarded a Rockefeller Travelling Fellowship in Medicine, 290
Stoughton, Prof. R. H. : The John Innes Horticultural Institution, 791
Vegetable Growing, *review*, 910
Fruit Growing and Storage, *review*, 981
Strangeways, T. G. : Appointed senior agricultural officer, Hong Kong, 485
Stratton, Dr. F., and Renton, P. H. : *Rh* Genes Allelomorphic to *D*, 293
Straub, Dr. F. B., and others : Effect of Drugs on Actin, 217
Strehlow, T. G. H. : Aranda Traditions, *review* by Mrs. K. Rishbeth, 276
Strickland, A. H. : Estimation of Insect Populations in the Field, 308
Strijk, B., and others : Crystal Structure of 'Gammexane', 771
Strøm, Dr. Kaare Münster : A Concentration of Uranium in Black Muds, 922
Strong, Prof. L. C. : Genetics of Cancer, 514
Strzemienski, Dr. K. : Soil Phosphate Uptake as Influenced by Phosphatic Fertilizer, 932
Sturtevant, Prof. A. H. : Evolution of the Gene, 136
Süe, Dr. Pierre : Dix ans d'application de la radioactivité artificielle, *review* by Prof. F. A. Paneth, 509
Sugar Research Foundation : Fourth Intermediate Prize Award, 769
Sully, A. H., and others : Creep of Metals subjected to Compression Stress, 411
Sumner, W. L. : Science in relation to History, *review*, 354
Sunman, W. O. : Appointed assistant director of agriculture, Kenya, 485
Sunvic Controls, Ltd. : Hot-wire Vacuum Switches, 97
Supply, Ministry of : Radioactive and Stable Isotopes for Research Purposes, 786
Suryanarayana, D. (Bhagavantam, Prof. S., and) : Photo-Elastic Effect in Barium Nitrate, 740
Surgeons, Royal College of : Presentation of his portrait in oils to Sir John Parsons, 407
Sutcliffe, R. : Laboratory Glassware Production, 974
Sutherland, Dr. G. B. B. M., and others : Studies of the Structure of Synthetic Polypeptides, 596
Sutton, A. G. A. : Appointed Government geologist, Mines Department, Trinidad, 447
Sutton, Dr. L. E. (Everard, K. B., and) : Electric Dipole Moments of some Styrenes, 104
Sverdrup, Prof. H. U. : Re-elected president of the Association of Physical Oceanography, 745
Svoboda, Antonin : Computing Mechanisms and Linkages, *review* by John Womersley, 85
Swaine, William : Ophthalmic Optics, 825
Swainger, Dr. K. H. : Work-Hardening under Complex Stresses, 532
Swallow, Dr. J. C. : High Vacua, 936
Swan, G. A. (Clemo, Prof. G. R., and) : Structure of Ketoyobyrine, 693
Swaney, M. W. (Ellis, Carleton, and) : Soilless Growth of Plants, second edition, *review* by W. E. B., 717
Swedish Institute of Forest Research : Reports of the, Vol. 36, 271
Swepstone, H. E. : Eggs from Every Cage, *review* by T. E. Whittle, 475
Symes, E. O. : Appointed fisheries development officer, Nigeria, 366
Symington, R. B. : Appointed agricultural officer, Northern Rhodesia, 485
Szalay, Prof. A. : Thorium and Uranium Content of the Velence Mountains, Hungary, 454

TAMM, Carl Olof : Soil-Improving Measures Tried on a Poor Site, 271
Tang, Peisung : Rhythmic Respiration in the Sea Urchin, 189
Tanner, E. M. : Steric Hindrance in Vinyl-Mesitylene, 103
Tansley, Dr. K. : Colour Vision, 640
Tate, G. H. H. : Kangaroos, 989
Taylor, Dr. C. B. : Factors affecting the Bacterial Population of Lake Waters, 669
Taylor, Dr. C. B., and Foot, C. H. : Growth of Bacteria from Water, 670
Taylor, Dr. D. B., and others : Interaction between Curare and the Potassium Ion at the Motor End Plate, 217
Taylor, Dr. F. Sherwood : A Guide to the Astrolabe, *review*, 46
Obituary of G. H. Gabb, 806
Taylor, J. : Errors of Treatment Comparisons when Observations are Missing, 262
Taylor, K. : Appointed geologist, Uganda, 956
Taylor, M. E. R. : Appointed assistant conservator of forests, British Guiana, 729
Taylor, S. F.: Awarded a Rockefeller Travelling Fellowship in Medicine, 290
Teknik Dergi, No. 1, 563
Telecommunications Research Committee : Report on the Fundamental Research Problems of Telecommunications, 58
Television Society : Third Fleming Memorial Lecture (Arthur Blok), 485
Teorell, Prof. Torsten : Membrane Electrophoresis in relation to Bioelectrical Polarization Effects, 961
Textile Institute : Awards of National Certificates in Textiles, 648
Thackeray, Dr. A. D. : An Attempt to Detect the Magnetic Field of a White Dwarf, 483
Theilheimer, W. : Synthetic Methods of Organic Chemistry, Vol. I, translated from the German by Hans Wynberg, *review* by Prof. J. W. Cook, 202
Thewlis, B. H., and others : Production of Quinolyl and Pyridyl Anions during Decarboxylation, 73
Thibaud, Prof. J. : Behaviour of a Particle of Very Small Size in a Magnetic Field, 329
Thirion, Pierre, et autres : Le caoutchouc, *review* by W. P. Fletcher, 678
Thirmulachar, M. J. : Some Fungi of India, 271
Thoday, Prof. D. : *Obituary* of Prof. B. E. Livingston, 94
Thomas, Prof. Brinley : Movements of Population in the British Commonwealth, 718
Thomas, J. H. (McDowell, Chas. A., and) : Mechanism of the Oxidation of Gaseous Formaldehyde, 367
Thomas, K. M., and others : Some Fungi of India, 271
Thomas, W. J. : Appointed lecturer in agricultural economics in the University of Leeds, 844
Thompson, Alan (edited by) : Your Smallholding, *review*, 757
Thompson, Sir D'Arcy : *Obituaries* by Dr. W. T. Calman, 93, Sir John Myres, 94
Thompson, Prof. F. C.: The Technique of Casting Coins in Ancient India, 266
Thompson, Dr. H. W. : Methods based upon Infra-red and Ultra-violet Measurements, 157
Thompson, R. (Addison, Dr. C. C., and) : Ionic Reactions in Liquid Dinitrogen Tetroxide, 369
Thompson, R. W. S. : Awarded a Telford Premium of the Institution of Civil Engineers, 865
Thompson, Dr. Thomas Gordon : Presented with the Alexander Agassiz Gold Medal and honorarium for 1948 by the United States National Academy of Sciences, 954 ; work of, 954
Thompson (Boyce) Institute for Plant Research: Twenty Years of Seed Research at (Lela V. Barton and William Crocker), *review*, 594
Thomson, Prof. Betty F., and others : Hormones and Horticulture, *review* by Dr. M. A. H. Tincker, 943
Thomson, Sir George : Atomic Energy and Society, 1005
Thomson, J. C. : *Obituary* of O. H. Latter, 726
Thomson, J. J. : Cathode Rays, 98
Thorpe, B. J. : Awarded a Telford Premium of the Institution of Civil Engineers, 865
Thorpe, Dr. W. H. : Elected president of the Institute for the Study of Animal Behaviour, 729
Thorpe, Dr. W. V., and others : Metabolism of Aminohydroxybenzoic Acids, 64
Thring, M. W. : Application of Dynamic Similarity to Metal Structures with Elastic and Plastic Flow, 193
Tiedema, T. J., and others : Inclusions in Aluminium Crystals, 740
Tierney, Michael : Nolan Laboratory for chemical technology, and the Ryan Laboratory for final years honours chemistry, at University College, Dublin, opened by, 768
Tilton, L. W. (Wood, Dr. L. A., and) : Physical and Chemical Aspects of Rubber Technology, 205
Times, The : The Course of Nature through the Year, *review* by Frances Pitt, 512
Tincker, Dr. M. A. H. : Ten Years' Progress in Horticultural Science, *review*, 943
Tiselius, Prof. Arne : Awarded the Nobel Prize for Chemistry for 1948, 766
Tiselius, Prof. A., et autres : Un symposium sur les proteines, *review*, 870
Tissières, A. : Reconstruction of Laccase from its Protein and Copper, 340
Tizard, Sir Henry : The Passing World, 392
Selection at the University Level, 627
Todd, Prof. A. R., and others : Colouring Matters of the Aphididæ, 759
Todd, Dr. J. A. : Algebraic Geometry, *review*, 6
Toit, Alex. L. du (edited by) : Special Publication of the Royal Society of South Africa, Robert Broom Commemorative Volume, *review* by Prof. D. M. S. Watson, 795
Tolansky, Prof. S. : Awarded the Charles Vernon Boys Prize of the Physical Society, 523
Current Investigations with Multiple-Beam Interferometry, 523
Tolansky, Prof. S., and Barakat, N.: New Localized Interference Fringes, 816
Tomlinson, J. : Physical Chemistry of Process Metallurgy, 721
Tomlinson, Dr. M. L. (Richards, R. E., and) : Structure of O-Trimethylbrazilone, 693
Toms, A. H. : The Effect of Vegetation on the Stabilization of Artificial Slopes, 803
Tordai, Dr. L. (Ward, Dr. A. F. H., and) : Activities of Associating Solutes, 494
Torkington, P.: A General Solution for the Force Constants of Polyatomic Molecules, 370, 607
Torrey, Prof. Henry C., and Whitmer, Prof. Charles A. : Crystal Rectifiers, *review* by Dr. J. A. Saxton, 868
Tosic, Dr. J., and Mitchell, Dr. R. L. : Concentration of Cobalt by Micro-organisms and its relation to Cobalt Deficiency in Sheep, 502
Toushek, Bruno : Appointed a Nuffield fellow in physics in the University of Glasgow, 60
Townend, F. S. (Finlayson, T. C., and) : The British Gas Industry, 440
Townsend, Sir John : Electrons in Gases, *review* by Prof. F. Llewellyn Jones, 276

Toy, Dr. F. C. : Elected president of the Institute of Physics, 120
Trade, Board of : Distribution in Industry, 829
Transport, Ministry of, and others : Conference on Road Research, 290, 784
Tranter, T. C. : Low-Order Detonation in Solid High Explosives, 335
Treacy, P. B. : Awarded an Overseas Science Research Scholarship for 1948 by the Royal Commission for the Exhibition of 1851, 100
  Nuclear Isomeric Transitions of Short Periods, 186
Treanor, Rev. P. J. : A New Heterochromatic Fabry-Perot Fringe System Applicable to the Interferometry of Absorption Spectra, 885
Treloar, Dr. L. R. G., and Naylor, Dr. R. F. : Physical and Chemical Aspects of Rubber Technology, 204
Trevan, Dr. J. W., and others : Pharmacology of some *bis*-Trimethyl Ammonium Compounds, 113
Trinity College, Cambridge : Research Studentships and Dominion and Colonial Exhibitions, 990
Trist, P. J. O. : Land Reclamation, *review* by Dr. E. W. Russell, 475
Trombe, Félix, et Dubuc, Gabriel : Le centre préhistorique de Ganties-Montespan (Haute-Garonne), *review* by M. C. Burkitt, 511
Trudeau, Edward Livingston (1848–1915), 522
Trueman, Dr. A. E. : Geology To-day and To-morrow, 400
  Appointed chairman of the University Grants Committee, 607
Trumpy, Prof. B. : University of Bergen, 707
Truter, M. R., and others : Crystal Structure of Nitronium Perchlorate, 259
Tuck, J. L. (Kaiser, T. R., and) : Air-Cored Synchrotron, 616
Tucker, D. G. : Degree of D.Sc. (Eng.) of the University of London conferred on, 212
Tung Experimental Station, Nyasaland : Appointment of C. V. Cutting as analytical chemist, 485
Turkish Technical Review, No. 1, 563
Turner, Prof. W. E. S. : Some Aspects of the Nature and Constitution of Glass, 938
Turrill, Dr. W. B. : Plant Communities, *review*, 387
  Genetical Structure of Plant Populations, 517
  British Plant Life, *review* by L. J. F. Brimble, 676
  Flowering Earth (Donald Culross Peattie), *review*, 679
Tuttle, Emerson : Fifty Prints, *review* by Frances Pitt, 431
Twomey, D., and others : Anti-Tubercular Activity of Oxidation Products of Substituted o-Phenylene Diamines, 622

UDVARDY, M. D. F., and others : Histamine—Heparin—Thrombin Chain Reaction, 257
Uganda Forestry Department : Annual Report for the Year 1946, 136
Uitée, Dr. A. J., and others : Physical and Chemical Aspects of Rubber Technology, 206
UNESCO : Election of Jaime Torres Bodet as director general, 882
UNESCO (Cairo Science Co-operation Office of) : List of scientific papers published in the Middle East, 176
UNESCO and a World Society (Ministry of Education, Pamphlet No. 12), 787
Ungar, Dr. J., and Muggleton, P. : Aluminium Phosphate as Precipitant of Agglutinable and Non-Agglutinable Strains of *H. pertussis*, 734
Ungerson, Colonel B. : Psychology at Work, 383
Unione Matematica Italiana : Third National Congress, 18
United Dairies, Ltd. : Documentary film called The Milky Way produced by Wallace Productions, Ltd., 955
United Kingdom Scientific Mission in the British Commonwealth Scientific Offices in Washington : Dr. W. A. Macfarlane loaned by the Ministry of Fuel and Power to the Department of Scientific and Industrial Research as director of the, 366
United Nations : Survey of the Technical Assistance available for Economic Development in the United Nations and the Specialized Agencies, 842
United Nations (Food and Agriculture Organisation of the) : Soil Conservation, an International Study, 13
  Fourth Annual Conference, 728
United States Book Exchange : Opening of the, 408
United States National Academy of Sciences : Presentation of the Alexander Agassiz Gold Medal and honorarium for 1948 to Dr. Thomas Gordon Thompson, 954
United States National Research Council Committee on Growth (University of Wisconsin and the) : Symposium on the Chemistry, Metabolism and Biological Effect of Steroid Hormones, 176
United States Scientific Mission to Japan, 954
Universities of the British Commonwealth: Sixth Congress of the, 99
  Discussion on the Balance of Research and Teaching at Universities, 441
  Discussion on Higher Education in the Colonies, 478
  Discussion on Inter-University Relations and Exchanges, 585
Universities of the British Commonwealth, Association of : New name of the Universities Bureau of the British Empire, 648
Universities Bureau of the British Empire : To be known as the Association of Universities of the British Commonwealth, 648
Universities Quarterly : Symposium on Entry and Careers, 349
University of Aberdeen : Honorary degree of doctor of laws conferred on Dr. G. A. Currie, Lord Dudley Gordon and Sir John Boyd Orr, 99
  Degree of Ph.D. conferred on C. H. Gimingham, N. Grassie, H. G. M. Hardie, R. J. Hay, Shih-Chen Liang, Muriel Mackay, A. McLaren, C. R. Masson, Gargestwari Narayana Subba Rao, J. C. Robb, J. D. Stewart, R. B. Whyte and G. W. Youngson, 99
  Appointment of Dr. W. O. Kermack to the chair of biological chemistry, 604
  Degree of Ph.D. conferred on G. F. Walker, 809
  Degree of M.D. conferred on H. McL. Raffan, 809
University of Bergen (Prof. B. Trumpy), 707
University of Berne : Theodor Kocher Prize awarded to Dr. H. Greinacher, 990
University of Birmingham : Retirement of Sir Norman Haworth from the Mason chair of chemistry, 16
  Appointment of Prof. H. W. Melville to the Mason chair of chemistry, 17
  Appointment of Dr. K. Mather to the chair of genetics, 17
  Conference on Modern Applications of Liquid Fuels (Institute of Petroleum and the Institute of Fuel), 328
University of Bristol : Appointment of F. Blakemore as professor of veterinary science, 327
  Annual Report for 1947 of the Agricultural and Horticultural Research Station, Long Ashton, 884
University of Cambridge : Report of the Head of the Department of Engineering for the year 1946–47, 117
  Appointment of Dr. G. H. S. Bushnell as curator of the Museum of Archæology and Ethnology, 328, 445
  Retirement of Prof. F. T. Brooks from the chair of botany, 521
  Appointment of Prof. G. E. Briggs to the chair of botany, 521
University of Edinburgh : Appointment of E. G. Dymond as reader in natural philosophy, 60
  Appointment of Dr. W. L. Edge as reader in mathematics, 60
  Appointment of Dr. Alexander Nelson as reader in botany, 60
  Appointment of Dr. E. G. V. Percival as reader in chemistry, 60
  Appointment of Sir Edward Appleton as principal and vice-chancellor, 884
University of Glasgow: Appointment of Prof. G. M'Creath Wyburn as regius professor of anatomy, 56
  Appointment of Dr. J. C. James as lecturer in chemistry, 60
  Appointment of Mrs. Rhoda M. Ainley as an assistant in anatomy, 60
  Appointment of J. Highet as lecturer in sociology, 60
  Appointment of A. W. Sloan as lecturer in physiology, 60
  Appointment of Bruno Toushek as a Nuffield fellow in physics, 60
  Appointment of Mrs. Jean A. Wapshaw as a part-time assistant in biochemistry, 60
  Appointment of A. Williams as lecturer in geology, 60
  Appointment of Dr. T. Ferguson Rodger to the chair of psychological medicine, 363
  Appointment of George Lightbody Montgomery to the chair of pathology, 363
  Re-appointment of Prof. C. M. Yonge as a director of the Scottish Marine Biological Association, 956
  Appointment of Dr. Angus Macphail as lecturer in public health, 956
  Appointment of Dr. W. G. A. Begg as an assistant in anatomy, 956
  Resignation of John Green from the Departments of Biochemistry and Medicine, 956
  Resignation of Dr. J. D. Morrison from the Department of Chemistry, 956
  Appointment of J. C. Gunn to the Cargill chair of natural philosophy, 956
University of Hong Kong : Appointment of Prof. Lindsay Tasman Ride as vice-chancellor, 956
University of Illinois : Appointment of Dr. G. Fraenkel as professor of entomology, 288
University of Leeds : Gift of £40,500 from the Wool Industries Surplus Cloth Corporation, Ltd., to establish a research chair of wool textile engineering, 212
  Further gift of £10,000 from the International Wool Secretariat to complete the equipment for the new Wool Research Laboratories, 212
  Gift of 1000 dollars from the Ella Sachs Plotz Foundation for equipment for the Department of Biochemistry, 212
  Gift of £250 from J. and J. Crombie of Aberdeen for the Textile Department, 212
  Gift of £2,126 from the Leeds Public Dispensary and Hospital for rheumatism research, 212
  Gift of £300 a year from Sandoz Products, Ltd., for a scholarship, 212
  Presentation to the Department of Education by Birkby's, Ltd., of 500–600 plastic mouldings for experimental research in speech training, 212
  Conference on Dust in Industry (Society of Chemical Industry), 328
  Appointment of W. J. Thomas as lecturer in agricultural economics, 844
  Appointment of Dr. A. D. Walsh as lecturer in inorganic and physical chemistry, 844
University of Liverpool : Appointment of Dr. R. M. Shackleton to the George Herdman chair of geology, 55
  Retirement of Prof. A. M. Blackman from the Brunner chair of egyptology, 95
  Appointment of H. W. Fairman to the Brunner chair of egyptology, 95
University of London : Appointment of Dr. G. C. McVittie to the University chair of mathematics at Queen Mary College, 19, 56
  Appointment of Dr. Sidney Smith to the University chair of ancient Semitic languages and civilizations at the School of Oriental and African Studies, 19
  Title of professor emeritus of physics in the University conferred on Dr. Frank Horton, 19
  Title of professor emeritus of chemistry in the University conferred on Prof. T. S. Moore, 19
  Degree of D.Sc. conferred on Dr. Adrien Albert, Louis Essen and A. E. J. Went, 19
  Appointment of Dr. J. L. D'Silva to the University chair of physiology at the London Hospital Medical College, 99, 210
  Appointment of C. H. Gray to the University chair of chemical pathology at King's College Hospital Medical School, 99
  Appointment of Dr. H. A. Magnus to the University chair of morbid anatomy at King's College Hospital Medical School, 99
  Appointment of Dr. D. V. Glass to the University chair of sociology at the London School of Economics and Political Science, 212, 326
  Appointment of E. P. Sharpey-Schafer to the University chair of medicine at St. Thomas's Hospital Medical School, 212
  Appointment of Dr. D. S. Bertram to the University readership in entomology at the London School of Hygiene and Tropical Medicine, 212
  Appointment of Dr. F. L. Warren to the University readership in biochemistry at University College, London, 212, 407
  Title of emeritus professor of anatomy in the University conferred on Prof. A. B. Appleton, 212
  Title of emeritus professor of medicine in the University conferred on Prof. O. L. V. de Wesselow, 212
  Title of emeritus professor of botany in the University conferred on Prof. F. E. Fritsch, 212
  Title of emeritus professor of physiology in the University conferred on Prof. D. T. Harris, 212, 407
  Title of emeritus professor of anatomy in the University conferred on Prof. T. Baillie Johnston, 212

  Title of emeritus professor of botany in the University conferred on Prof. W. Neilson Jones, 212
  Degree of D.Sc. conferred on J. R. Busvine and on D. G. Tucker, 212
  Appointment of Dr. T. Crawford as University professor of pathology at St. George's Hospital Medical School, 290
  Appointment of D. V. Davies as University professor of anatomy at St. Thomas's Hospital Medical School, 290
  Appointment of A. V. Judges as University professor of history of education at King's College, London, 290
  Appointment of Dr. R. T. Williams as University professor of biochemistry at St. Mary's Hospital Medical School, 290
  Appointment of Dr. G. L. Clark as University professor of mathematics at Bedford College, 290
  Appointment of T. A. Rodger as University reader in psychology at Birkbeck College, 290
  Appointment of Prof. L. Dudley Stamp to the University chair of social geography at the London School of Economics and Political Science, 564
  Appointment of J. V. Dacie to the University readership in hæmatology at the Postgraduate Medical School of London, 564
  Appointment of Dr. C. L. Foster to the University readership in biology at St. Mary's Hospital Medical School, 564
  Appointment of Dr. W. C. Price to the University readership in experimental physics at King's College, London, 564
  College of the Pharmaceutical Society to be reconstituted and renamed the School of Pharmacy, University of London, 663
  Inaugural address of Prof. K. de B. Codrington as professor of Indian archæology, 727
  Title of professor emeritus in the University conferred on Sir Alexander Fleming, Sir Francis Fraser, Prof. H. Gordon Jackson and Prof. C. H. Lobban, 729
  Degree of D.Sc. conferred on Elsie M. Widdowson, 729
  Degree of D.Sc. (Eng.) conferred on Hugh Ford, H. C. H. Gurney and Harry Walker, 729
  Appointment of Dr. Dennis Gabor to the Mullard readership in electronics at the Imperial College of Science and Technology, 844
  Title of University reader in zoology conferred on Dr. Vera Fretter, 844
  Title of University reader in experimental pathology conferred on Dr. P. A. I. Gorer, 844
  Title of University reader in zoology conferred on Dr. G. E. Newell, 844
  Degree of D.Sc. conferred on E. J. Popham, 844
  Appointment of Dr. J. L. B. Cooper to the University readership in mathematics at Birkbeck College, 920
  Appointment of Dr. B. J. Lloyd-Evans to the Kennedy chair of mechanical engineering at University College, 956
  Appointment of Dr. W. F. Jepson to the University readership in applied entomology at the Imperial College of Science and Technology, 956
  Appointment of A. W. Hendry to the University readership in civil engineering at King's College, London, 990
  Title of University professor of chemical pathology conferred on Dr. Jocelyn Patterson, 990
  Degree of D.Sc. conferred on E. R. Leonard, 990
University of London Institute of Archæology : Report on Survey and Policy of Field Research in the Archæology of Great Britain, I, The Prehistoric and Early Historic Ages to the Seventh Century A.D., 883
University of London Institute of Education (Association of Agriculture and the) : Series of sessions on the Educational and Social Significance of the Land, 920
University of Manchester : Discussion on Meteors, 328
  Appointment of Prof. M. G. Evans to the chair of physical chemistry, 485
  Appointment of Dr. Ralph Dennell to the chair of experimental zoology, 645
University of Oxford : Honorary degree of D.Sc. conferred on Dr. Isaiah Bowman and on Prof. Linus Pauling, 19
  Conference on the Education of the Young Worker, 159
  Retirement of Prof. G. D. Hale Carpenter from the Hope professorship of zoology, 174
  Appointment of Dr. G. C. Varley to the Hope professorship of zoology, 174
  Gift of £1,250,000 from an anonymous Frenchman for the foundation of St. Anthony's College, 482
  Honorary degree of D.Sc. conferred on Prof. R. W. Wood, 523
University of Oxford Institute of Statistics : Appointment of Dr. F. A. Burchardt as director, 990
University of St. Andrews : Complimentary dinner given to Prof. John Read by the Chemical Society of the, 729
University of Sao Paulo : Appointment of W. L. Stevens as professor of mathematical statistics, 56
University of Sheffield : Gift of £600 per annum for seven years from S. C. Goodwin to provide a Fellowship for postgraduate work in engineering or metallurgy, 99
  Appointment of C. R. K. Blundell as lecturer in geology, 99
  Appointment of T. Summerfield King as lecturer in anatomy, 99
  Appointment of A. A. Carlyle as lecturer in physiology, 99
  Appointment of John Fiddes as assistant lecturer in physics, 99
  Appointment of Gilbert Y. Kennedy as research worker in the Department of Pathology under the auspices of the British Empire Cancer Campaign, 99
  Appointment of Dr. William Hobson to the chair of social and industrial medicine, 648
  Appointment of Ellinor I. Black as director of the Department of Social Studies, 648, 767
  Appointment of S. Armstrong as lecturer in civil engineering, 648
  Appointment of Dr. A. E. Beet as lecturer in fuel technology, 648
  Appointment of A. W. Nicholls as assistant lecturer in glass technology, 648
  Appointment of P. H. Price as research assistant to the professor of fuel technology, 648
  Appointment of James S. Hough as research demonstrator in botany, 648
  Appointment of P. Wright as Glass Delegacy research fellow, 648
University of Wisconsin and the U.S. National Research Council Committee on Growth : Symposium on the Chemistry, Metabolism and Biological Effects of Steroid Hormones, 176
University of the Witwatersrand : Nuclear Physics Exhibition, 606
University College of North Wales, Bangor : Appointment of Dr. Stanley Peat to the chair of chemistry, 95
  Appointment of D. E. Littlewood to the chair of mathematics, 174
University College, Dublin : Opening of the Nolan Laboratory for chemical technology, 768
  Opening of the Ryan Laboratory for final years honours chemistry, 768
  New Chemical Laboratories at (Prof. T. S. Wheeler), 1007
  Appointment of Prof. E. G. Cullwick to the Watson-Watt chair of electrical engineering, 920
University College, Exeter : The Hatherly Biological Laboratories (Prof. John Caldwell), 505
University College, Ibadan : Appointment of Dr. F. V. Atkinson to the chair of mathematics, 842
University College, London : Appointment of Dr. F. L. Warren to the University of London readership in biochemistry, 212
  Courses in Photoelasticity, 485
  Appointment of Dr. B. J. Lloyd-Evans to the Kennedy chair of mechanical engineering, 956
University College, Nigeria : Appointment of Dr. F. W. Sansome as professor of botany, 327
University College, Nottingham : To receive a charter granting full university status, 100
University Grants Committee : Appointment of Dr. A. E. Trueman as chairman, 607
Ursell, F. (Longuet-Higgins, M. S., and) : Sea Waves and Microseisms, 700
Uttley, Dr. A.: Servo Mechanisms, 764
Uttley, Dr. A., and others: Photo-electric Star-following Telescopes, 144
Uvarov, Dr. B. P. : Locusts and Grasshoppers, 308

VAARAMA, Dr. Antero: Cryptic Polyploidy and Variation of Chromosome Number in *Ribes nigrum*, 782
Vaidya, Dr. W. M., and others : Spectrum of Iodine Oxide (IO) in Flames, 108
Valentine, Dr. D. H. : Genetical Structure of Plant Populations, 518
Vallancien, B., and others : Vestibular Effect of Streptomycin in the Mouse, 929
Van den Bosch, Dr. Clara : The Very Rare *Rh* Genotype *Ryr* (*CdE/cde*) in a Case of Erythroblastosis fœtalis, 781
Van Itterbeeck, Prof. A., and Bock, A. de : Sound Velocity and Temperature Change of Molecular Association, 611
Van Voorhis, Prof. S. N. (edited by) : Microwave Receivers, *review* by Dr. J. A. Saxton, 868
Vandeplassche, Prof. M., and Paredis, Dr. F. : Preservation of the Fertilizing Capacity of Bull Semen in the Genital Tract of the Cow, 813
Vargha, Prof. L. : Red Lead as a Selective Oxidant, 927
Varley, Dr. G. C. : Appointed to the Hope professorship of zoology at the University of Oxford, 174 ; work of, 174
Varma, Dr. S. P., and Weyl, Prof. W. A. : Some Aspects of the Nature and Constitution of Glass, 939
Vaughan, N. B. (edited by) : The Journal of the Institute of Metals, Vol. 72, 1946, *review*, 638
Vazquez-Lopez, Dr. E. : Innervation of the Adenohypophysis, 458
Veale, Douglas : Inter-University Relations and Exchanges, 585
Veersen, Dr. G. J. van : Physical and Chemical Aspects of Rubber Technology, 206
Vegard, Prof. L. : Thickness and Height of the Sodium Layer Responsible for the Strong Yellow Line in Twilight, 300
Vegard, Prof. L., and Kvifte, G. : The Green Auroral Line as an Initiator of Phosphorescence in Condensed Systems, 967
Veld, Leonora G. Huis in't, and others : '17-Ketosterolo II' Isolated from Urine—its Reaction with Hydrochloric Acid, 492
Vendrely, R., et autres : Un symposium sur les proteines, *review*, 870
Verde, A. Dalla : Le grandi linee di trasmissione d'energia, calcolazione elettrica, *review* by C. W. Marshall, 277
Verdoorn, Dr. Frans : Appointed director of the Los Angeles State and County Arboretum, 807 ; work of, 807
Verel, D. : Elected to a Beit Memorial Fellowship for Medical Research, 212
Verwey, E. J. W., and Overbeek, J. Th. G., with the collaboration of Nes, K. van : Theory of the Stability of Lyophobic Colloids, *review* by Dr. J. A. V. Butler, 315
Vesey-Fitzgerald, Brian : The Canine Cult, *review*, 553
Vesey-Fitzgerald, Brian (edited by) : The Book of the Dog, *review* by Lieut.-Colonel C. E. G. Hope, 677
Vevers, Dr. G. M. : Retirement as superintendent of the Zoological Society of London, 727 ; work of, 727
Vick, Dr. F. A. (Grattidge, W., and) : Semiconductors and their Applications, 624
Vincent, J. M. (Morton, R. K., and) : Influence of Time and Temperature of Storage on Dye-Reduction Tests in Milk, 415
Visconti di Modrone, Dr. N., and others : Polyploidy in Bacteria ?, 295
Visher, Prof. Stephen Sargent : Scientists Starred 1903–1943 in 'American Men of Science', *review*, 595
Visiting Scientists, Society for : Extension of facilities and membership for scientific workers in the United Kingdom, 365
  Appointment of officers, 844
Vitagliano, Giovanna, and Nicola, Marina de : Ribonucleic Acid Supply and Phosphatase Distribution during the Spermatogenesis of *Asellus aquaticus*, 965
Vloten, G. W. van, and others : Crystal Structure of 'Gammexane', 771
Vogel, Dr. Theodore : Sound Transmission and Noise, 500
Vorster, J. A. : Soil Erosion and some Problems connected with its Control, 803
Vouk, V. : Projected Area of Convex Bodies, 330
Vowles, P. F. : Entry and Careers, 351

WAARDEN, M. van der, and others: Chemical and Physical Investigations on Dairy Products, *review* by H. D. K., 87

Wach, Joachim : Sociology of Religion, *review* by A. D. R., 128
Waddington, Prof. C. H. : Large-scale Evolution, *review*, 979
Waddington, R. J. S. : Appointed senior inspector of mines, Tanganyika, 138
Wadman, W. H., and others : Application of Paper Partition Chromatography to the Separation of the Sugars and their Methylated Derivatives on a Column of Powdered Cellulose, 448
Wadsworth, K. D. (Palin, D. E., and) : Structure of Carbon Monofluoride, 925
Wagman, J., and others : Study of the Action of Ultra-violet Light on Urease by means of the Ultracentrifuge, 370
Waldron, M. B. (Raynor, Dr. G. V., and) : Structure of Co_2Al_9, 566
Walker, A. D. (Emery, W. B., and) : Chemical Assay of Streptomycin *B* (Mannosido-Streptomycin), 525
Walker, C. A.: Appointed assistant conservator of forests, Nigeria, 956
Walker, F. T., and Smith, Margaret McL.: Seaweed Culture, 31
Walker, G. F. : Degree of Ph.D. of the University of Aberdeen conferred on, 809
Walker, Harry : Degree of D.Sc. (Eng.) of the University of London conferred on, 729
Walker, T., and others : Synthetic Analgesics, 21
Walkey, O. R. : The Solar Apex, 920
  Distance of Canopus, 989
Walkinshaw, W., and others : A Travelling-Wave Linear Accelerator for 4-MeV. Electrons, 859
Wallace Productions, Ltd. : Documentary film for United Dairies, Ltd., called The Milky Way, 955
Wallis, W. Allen, and others (edited by) : Selected Techniques of Statistical Analysis for Scientific and Industrial Research and Production and Management Engineering (Statistical Research Group, Columbia University), *review* by Prof. M. S. Bartlett, 510
Wallmark, Gösta, and others : The Antibiotic Agent from *Marasmius ramealis*, 61
Walsh, Dr. A. D. : Appointed lecturer in inorganic and physical chemistry in the University of Leeds, 844
Walsh, Dr. A. D., and others : 'Knock' in Internal Combustion Engines, 893
Walter, R. (Kamienski, M., and) : Tables of Uranus for the Period 4000 B.C.–A.D. 3000, 446
Walton, A. B.: Appointed conservator of forests, Federation of Malaya, 138
Walton, G. A. : Incidence of Malaria in Tropical Africa, 114
Walton, W. H. : Feret's Statistical Diameter as a Measure of Particle Size, 329
Wang, H., and others : Fluoranthene Syntheses, 857
Wang, M. H. : Internal Pair Conversion, 264
Wang, Dr. Y. L. (Levenbook, L., and) : Succinic Acid in the Blood of the Larva of *Gastrophilus intestinalis*, 731
Wanklyn, J. N. (Evans, Dr. U. R., and) : Evolution of Hydrogen from Ferrous Hydroxide, 27
Wapshaw, Mrs. Jean A. : Appointed a part-time assistant in biochemistry in the University of Glasgow, 60
Ward, Dr. A. F. H., and Tordai, Dr. L. : Activities of Associating Solutes, 494
Ward, W. H. : The Effect of Vegetation on the Settlement of Structures, 803
Wardlaw, Prof. C. W. : Vascular Wilt Disease of Oil Palms in Nigeria, 850
  Infectious Chlorosis of Bananas in the Cameroons, 894
Wardrop, A. B., and others : Fine Structure of Cell Walls in Fresh Plant Tissues, 957
Waring, Dr. H. : The Pigmentary Effector System, *review*, 84
Warren, Dr. F. L. : Appointed to the University of London readership in biochemistry at University College, London, 212
  Higher Education in the Colonies, 479
Warren, Dr. H. W. H. : Appointed a member of the Advisory Council for Scientific Research, 690
Warriner, Dr. Doreen : Land and Poverty in the Middle East, 53
Waterhouse, Capt. D. F. (McCullough, Major R. N., and) : Tests of Mosquito Repellents, 249
Waterhouse, Prof. W. L. : Awarded the Medal of the Royal Society of New South Wales, 956
Waters, Dr. W. A. : Radical Addition Reactions, 183
  The Chemistry of Free Radicals, second edition, *review* by George Porter, 390
Watkins, W. M., and Wormall, Prof. A. : Inactivation of Complement by Nitrogen Mustard, 535
Watson, Prof. D. M. S. : Dr. Robert Broom, Naturalist, *review*, 795
Watson, Prof. Kenneth M. (Hougen, Prof. Olaf A., and) : Chemical Process Principles, Part 2, Thermodynamics ; Part 3, Kinetics and Catalysis, *review* by Dr. E. F. G. Herington, 550
Watson, Robert : The Man and the Job, 382
Watson, W. F., and Livingston, Robert : Concentration Quenching of Fluorescence in Chlorophyll Solutions, 452
Watson-Watt, Sir Robert : Awarded the Hughes Medal for 1948 of the Royal Society, 807, 874
Webb, L. J., and others : Alkaloids of the Australian Rutaceæ, 223
Webb, M., and others : Sulphur-containing Steroid Derivatives, 857
Webb, Dr. M. (Stacey, Prof. M., and) : Some Components of the Lytic System of Gram-Positive Micro-organisms, 11
Webley, Dr. D. M. (Forsyth, Dr. W. G. C., and) : A Method for Studying the Carbohydrate Metabolism of Micro-organisms, 150
Wedderburn, Dr. J. H. M. : *Death* of, 726
Wedmore, E. B. : The Ventilation of Bee-Hives, *review* by Dr. C. G. Butler, 717
Weibull, Dr. W. : Electrical Resistance of Wires with Large Strains, 966
Weidenreich, Dr. Franz : Papers on Human Evolution, 484
  Obituary by Prof. W. E. LeGros Clark, 805
Weintroub, S. : Mechanical Foam for Fighting Petrol Fires, 158
  From Radium to the Atomic Bomb, *review*, 239
Weiss, D. E. : A New Method for the Preparation of Adsorbents for Chromatography, 372
Weiss, Dr. Joseph (Stein, Gabriel, and) : Deamination of Amino-Acids by X-Rays, 184
Weissenberg, K. (Freeman, S. M., and) : Some New Rheological Phenomena and their Significance for the Constitution of Materials, 320
Welch, F. V., and others : Ultra-Violet Microscopy of Living Malignant Cells, 650
Welcher, Prof. Frank J. : Organic Analytical Reagents, *review* by Dr. G. M. Bennett, 48
Welding, Institute of : Election of honorary officers for 1948–49, 60
Welding, International Institute of : Formation of the, 119
  Election of P. Goldschmidt as first president, 119
Wells, G. P. : Thixotropy, and the Mechanics of Burrowing in the Lugworm (*Arenicola marina* L.), 652
Welsh, Prof. D. A. : *Death* of, 521
Welsh, D. H. : Appointed principal of schools, Agricultural Department, Nigeria, 366
Wenger, Prof. P. E. : At the International Congress on Analytical Chemistry, 157
Went, A. E. J. : Degree of D.Sc. of the University of London conferred on, 19
Went, Prof. F. W. (Zechmeister, Dr. L., and) : Some Stereochemical Aspects in Genetics, 847
Wenyon, Dr. C. M. : *Death* of, 726 : *obituary* by Dr. C. A. Hoare, 840
Werner, Dr. A. E. A.: Appointed research chemist at the National Gallery, London, 250
Wernick, Dr. S. : Electrolytic Polishing and Bright Plating of Metals, *review*, 834
Wesselow, Prof. O. L. V. de : Title of emeritus professor of medicine in the University of London conferred on, 212
West, Dr. D. J. : Hallucinations, 447
West, Robert C. : Cultural Geography of the Tarascan Area, Mexico, 728
Westcott, Dr. C. H. : Mechanism of Nuclear Physics Counters, *review*, 551
Westermann, Dr. J. H. : Resignation from the post of acting director of the International Office for Nature Protection, 485
Weston, F. : Appointed assistant conservator of forests, Uganda, 956
Weyl, Prof. W. A. (Varma, Dr. S. P., and) : Some Aspects of the Nature and Constitution of Glass, 939
Whalley, W. B., and others : Structure of Citrinin, 72
Wharton, R. H. : Appointed medical entomologist, Federation of Malaya, 447
Wheatley, Mrs. D. M. : Psychology and Mysticism, *review*, 592
Wheelan, J. H. : Appointed assistant conservator of forests, Gold Coast, 729
Wheeler, Prof. R. E. Mortimer : To serve as adviser to the Government of Pakistan in setting up a department for the exploration and preservation of ancient sites and in forming a museum at Karachi, 956
Wheeler, R. W., and others : 'Knock' in Internal Combustion Engines, 893
Wheeler, Prof. T. S. : Elected president of the Irish Chemical Association for 1948–49, 564
  New Chemical Laboratories at University College, Dublin, 1007
Whitaker, Sir Cuthbert : History and Compilation of *Whitaker's Almanack*, 863
White, Dr. J., and collaborators : Clay Minerals as Catalysts and Adsorbents, 196
White, Prof. L. W. Thornton, and others : Nairobi, Master Plan for a Colonial Capital, *review*, 432
White, Dr. P. (Kon, Prof. S. K., and) : Biological Standardization of Vitamins, *review*, 202
Whitehead, Dr. S. : *Obituary* of J. R. Cowie, 326
Whitehead, Dr. S., and Radley, Dr. W. G. : Interpretation of Data from Electrical Resistivity Geophysical Surveys, 187
Whitfield, Lieut.-Comdr. F. G. Sarel (Stammers, Surgeon-Lieut. F. M. G., and) : Toxicity of D.D.T., 120
Whitmer, Prof. Charles A. (Torrey, Prof. Henry C., and) : Crystal Rectifiers, *review* by Dr. J. A. Saxton, 868
Whittington, R. B., and Ashton, E. W. S. : Instability in Pipe Flow, 997
Whittle, T. E. : Egg-Laying Battery Management, *review*, 475
Whorlow, R. W. (Scott, Dr. J. R., and) : Physical and Chemical Aspects of Rubber Technology, 205
Whyte, —. : Road Safety and Traffic Flow, 785
Whyte, R. B. : Degree of Ph.D. of the University of Aberdeen conferred on, 99
Widdowson, Elsie M. : Degree of D.Sc. of the University of London conferred on, 729
Wieberdink, A. : Anomalous Magnetic Behaviour of Nickel-Iron at High Frequencies, 527
Wiedling, Sten : A Simple Method for Direct Comparison of the Depressant Effect of the Barbiturates on the Respiration and Circulation, 1003
Wiegand, Chr., and Holman, W. I. M.: Synthesis of Derivatives of N-Methyl-2-Pyridone from Nicotinic Acid and Nicotinamide, 659
Wiehe, P. O. : Appointed plant pathologist, Nyasaland, 138
Wiener, Dr. A. S. : Genetic Transmission of Two Rare Blood-Group Genes, 735
Wigglesworth, Dr. V. B. : Natural History of British Insects, *review*, 5
  Recent Developments in Insecticides, 308
  Bioluminescence, 423
  Chemical Stimuli and Insect Behaviour, *review*, 550
  The Hunting Wasp (John Crompton), *review*, 758
Wightman, D. Randal : Colonial National Incomes, *review*, 431
Wilcher, Lewis : Higher Education in the Colonies, 478
Wilcox, R. : Appointed inspector of mines, Malaya, 138
Wildt, Rupert : Constitution of the Planets, 345
Williams, A. : Appointed lecturer in geology in the University of Glasgow, 60
Williams, A. Fowler : Purity of Diphenylene Oxide (Dibenzofuran), 925
Williams, Bernard : Higher Education in the Colonies, 479
Williams, Prof. F. C., and Kilburn, T. : Electronic Digital Computers, 487
Williams, Herbert E. : Cyanogen Compounds, second edition, *review* by Prof. J. R. Partington, 430
Williams, R. J. P. (Irving, Dr. H., and) : Order of Stability of Metal Complexes, 746
Williams, Dr. R. Tecwyn : Detoxication Mechanisms, *review* by Dr. E. Boyland, 127
  Appointed University of London professor of biochemistry at St. Mary's Hospital Medical School, 290
Williams, Dr. S. E. : Shape of Pulses of Radio-frequency Radiation from the Sun, 108
Williams, Dr. T. I. : Chromatography, 157
  Drugs from Plants, *review* by Dr. W. O. James, 636
Williams, Major W. W. : Coastal Waves, 683
Williamson, Donald I. : Occurrence of *Talorchestia brito* on the Coast of Northumberland, 295

Williamson, Kenneth : The Atlantic Islands, *review* by Seton Gordon, 4
Williamson, K. B. : Bioluminescence, 768
Willis, Dr. G. M. : Physical Chemistry of Process Metallurgy, 721
Willis, Prof. R. A. : Pathology of Tumours, *review* by Dr. E. S. Horning, 315
Willmer, Dr. E. N. : Colour Vision, 640
  Encyclopædia of Eyes, *review*, 910
Willmott, J. C. : Absorption of Magnesium Oxide in the Infra-Red Region, 996
Willoughby, G., and others : Creep of Metals subjected to Compression Stress, 411
Wilmott, A. J. : Genetical Structure of Plant Populations, 518
Wilson, Dr. A. J. C. (Jones, J. G., and) : X-Ray Diffraction Effect shown by some Specimens of Chrysotile, 334
Wilson, R., and others : Photodisintegration of the Deuteron, 185
Wilson, Colonel T. U. : Road Research in Scotland, 784
Wilson, Dr. W. : The Cathode Ray Oscillograph in Industry, third edition, *review* by L. E. C. H., 391
Wilson, W. H. (Hickling, Dr. A., and): Limiting Diffusion Currents at Wire Electrodes, 489
Witt, G. E. : Active Psychology and the Welfare and Progress of Man, *review*, 758
Wolwod, A. J., and Linggood, Dr. F. V. : Production of Riboflavin and Allied Substances during the Growth of *C. diphtheriæ*, 219
Wokes, Dr. Frank, and Nunn, Gordon : Vitamin C in Potatoes, 900
Wokes, Dr. Frank (Daglish, C., and) : Hydrojuglone and Apparent Vitamin C in Walnuts, 179
Wolcott, Robert H., and Powell, Prof. Eugene F. : Laboratory Guide in Animal Biology, second edition, *review* by Dr. N. B. Eales, 980
Wolf, J. : Germicidal Properties of Tar Acids present in Producer Gas Tars, 670
Wolfhard, H. G., and Parker, W. G. : Emissivity of Small Particles in Flames, 259
Wolfram, M. L. (Binkley, W. W., and): Chromatography of Sugars and related Substances, 1007
Wolfson, H. : Semiconductors and their Applications, 625
Womersley, John : Numerical Methods, *review*, 85
Wood, Dr. E. C. : Statistical Aspects of Chemical Analysis, 157
Wood, Dr. L. A., and Tilton, L. W. : Physical and Chemical Aspects of Rubber Technology, 205
Wood, Prof. R. W. : Spontaneous Deformation of Crystals, 523
  Honorary degree of D.Sc. of the University of Oxford conferred on, 523
Wood, Dr. W. A., and Rachinger, W. A. : Strength of Metals, 891
Woodward, Prof. R. B. : Biogenesis of the Strychnos Alkaloids, 155
Woodward, R. H., and others (edited by) : LORAN, Long Range Navigation, *review* by Dr. R. L. Smith-Rose, 633
Wool Industries Surplus Cloth Corporation, Ltd. : Gift of £40,500 to the University of Leeds for the establishment of a research chair of wool textile engineering, 212
Wool Secretariat, International: Further gift of £10,000 to the University of Leeds for completion of the equipment for the new Wool Research Laboratories, 212
  Appointment of Leonard Cundall as a lecturer in the Department of Education, 564
Woolley, R. v. d. R. : Galactic Noise, 249
World Federation for Mental Health, 808
World Federation of Scientific Workers : First General Assembly of the (J. G. Crowther), 644
Wormall, Prof. A. (Watkins, W. M., and) : Inactivation of Complement by Nitrogen Mustard, 535
Worthington, Dr. E. B. : Middle East Science, 53
  Research Services in East Africa, 554
Wright, Barbara A. : Low-Angle X-Ray Diffraction Pattern of Collagen, 23
Wright, D. W., and Geering, Q. A. : Biology and Control of the Pea Moth, 309
Wright, Prof. E. M. : Difference—Differential Equations, 334
Wright, Dr. N. C. : Animal Industry in the Middle East, 53
Wright, P. : Appointed Glass Delegacy research fellow in the University of Sheffield, 648
Wright, Dr. W. D. : Colour Vision, 640
  Ophthalmic Optics, 825
Wright, Dr. W. D. (Lord, Dr. Mary P., and) : Eye Movements during Monocular Fixation, 25 ; *erratum*, 100
Wunderly, C., et autres : Un symposium sur les proteines, *review*, 870
Wyburn, Prof. G. M'Creath: Appointed regius professor of anatomy in the University of Glasgow, 56 ; work of, 56
Wyckoff, Dr. Ralph W. G. : Multiplication of Bacteriophage, 649

YADAV, H. N. (Burhop, Dr. E. H. S., and): Fast Neutron-Proton Scattering and the Law of Interaction between Nucleons, 738
Yannaquis, N., and others : Intergranular Corrosion of Pure Aluminium in relation to the Behaviour of Grain-Boundaries during Melting, 854
Yeates, G. K. : Bird Haunts in Northern Britain, *review* by Frances Pitt, 911
Yin, Dr. H. C. : Phosphorylase in Plastids, 928
Yonge, Prof. C. M. : *Obituary* of Richard Elmhirst, 917
  Re-appointed a director of the Scottish Marine Biological Association, 956
Yost, Prof. Don M., and others : The Rare-Earth Elements and their Compounds, *review*, 278
Young, A. J. : Instrumentation and Control in Industry, 761
Youngson, G. W. : Degree of Ph.D. of the University of Aberdeen conferred on, 99
Yuill, John L. : Production of *i*-Erythritol by *Aspergillus niger*, 652

ZAIMIS, Dr. E. J. (Paton, Dr. W. D. M., and) : Clinical Potentialities of certain Bisquaternary Salts causing Neuromuscular and Ganglionic Block, 810
Zajac, Barbara (Ross, Dr. Marion A. S., and) : Range-Energy and other Relations for Electrons in Kodak Nuclear Plates, 923
Zangwill, Dr. O. L. : The Mind of the Child, *review*, 871
Zarem, A. M. (Cady, Prof. W. M., and) : Brief Light Pulses using Kerr Cells, 528
Zechmeister, Dr. L., and Went, Prof. F. W. : Some Stereochemical Aspects in Genetics, 847
Zoological Society of India : Election of members of the Executive Council, 60
Zoological Society of London : Retirement of Dr. G. M. Vevers as superintendent, 727
  Appointment of G. S. Cansdale as superintendent of the Society's Gardens, 987
Zuckerman, Prof. S. : Appointed a member of the Scientific Advisory Council to the Minister of Fuel and Power, 57
Zwicky, Dr. F. : Morphological Astronomy, 627

TITLE INDEX

A*B O* Systems : An Antigen related to the (Pierre O. Hubinont), 457
Abbreviations, 81
Abnormal Serum Protein in Parenchymatous Liver Diseases (Dr. A. Fischer, Dr. C. Sellei and Dr. M. Bretán), 1002
Abnormality in Ciliates : Induced and Spontaneous (Dr. Ll. Lloyd), 188
Abraded Surfaces : Structure of (J. B. Dance and D. J. Norris), 71
Abroad : Investigation of Folk-Life in Britain and (R. U. Sayce), 403
Absence of Carcinogenic Activity of Benzene Hexochloride ('Gammexane'), (Dr. J. W. Orr), 189
Absorption of Magnesium Oxide in the Infra-Red Region (J. C. Willmott), 996
Absorption of Sucrose by Plant Cells : Effect of Phosphorus on the Hydrolysis and (Prof. Husein Said), 496
Absorption of Ultrasonic Waves in Acetic Acid (J. M. M. Pinkerton), 106
Absorption and Dispersion of Ultrasonic Waves in Acetic Acid (Dr. John Lamb, J. H. Andreae and R. Bird), 993
Absorption Spectra : A New Heterochromatic Fabry-Perot Fringe System applicable to the Interferometry of (Rev. P. J. Treanor), 885
Abstammungslehre : Neuere Probleme der (Dr. Bernhard Rensch), 562 ; *review* by Prof. C. H. Waddington, 979
Abstracts : French, 605
Academic and Professional Incentives, 977
Acanthocephalus ranae Schrank. in Great Britain : Occurrence of (R. Phillips Dales), 1001
Acaulopage dichotoma in Britain : An Aquatic Predaceous Fungus (Mrs. M. Peach), 148
Accelerator for Electrons : A Magnetic Resonance (Prof. W. J. Henderson, H. LeCaine and R. Montalbetti), 699
Accelerator for 4-MeV. Electrons : A Travelling-Wave Linear (D. W. Fry, R. B. R.-S. Harvie, L. B. Mullett and W. Walkinshaw), 859
Accommodation for Adult Education (National Foundation for Adult Education Supplement on), 1009
Acetanilide : Crystal Structure of—Use of Polarized Infra-Red Radiation (Dr. C. J. Brown and D. E. C. Corbridge), 72
Acetic Acid : Absorption of Ultrasonic Waves in (J. M. M. Pinkerton), 106
  Absorption and Dispersion of Ultrasonic Waves in (Dr. John Lamb, J. H. Andreae and R. Bird), 994
Acetylene and related Compounds : The Chemistry of (Ernst David Bergmann), *review* by R. A. Raphael, 715
Acid Salts of some Monocarboxylic Acids : Crystal Structures of the (Dr. J. C. Speakman), 695
Acids (Fatty) : Volatile Cuprous and Silver Salts of (A. Keller and Dr. F. Körösy), 580
N. Acridyl-(5)-Alanines as Antibacterial Substances (Prof. W. H. Linnell and M. J. H. Smith), 735
Actin : Effect of Drugs on (Dr. F. B. Straub, G. Feuer and I. Lajos), 217
Action of D.D.T. and Cause of Death after Acute D.D.T. Poisoning : Site of (D. Dresden), 1000
Action of Ultra-violet Light on Urease : Study of the, by means of the Ultra-centrifuge (Dr. A. D. McLaren, E. Sheppard and J. Wagman), 370
Activation of Unfertilized Sea Urchin Eggs by Trypsin (Aage Bohus Jensen), 931
Active Psychology and the Welfare and Progress of Man (G. E. Witt), *review*, 758
Actomyosin Content of the Uterus (Dr. Á. Csapó), 218
Adenocarcinoma of the Stomach in Mice : Induced (Dr. P. R. Peacock and S. Beck), 252
Adenohypophysis : Innervation of the (Dr. E. Vazquez-Lopez), 458
Adenosine Triphosphate : Phosphorylation of Myosin by (Prof. Fritz Buchthal, Adam Deutsch, Gustav G. Knappeis and Agnete Munch-Petersen), 965
  Effect of, on Monolayers of Myosin (Agnete Munch-Petersen), 537
Administration : Educational, 941
Administration and Anthropology, 482
Adrenalin : Assay of *nor*Adrenalin and, in Extracts of Nerves and Tissues (Prof. U. S. v. Euler), 570
Adsorbents : Clay Minerals as Catalysts and (Clay Minerals Group of the Mineralogical Society Discussion on), 195
  A New Method for the Preparation of, for Chromatography (D. E. Weiss), 372
Adsorption by Montmorillonite, and its relation to Surface Adsorption (Dr. D. M. C. MacEwan), 935
Adventitious Root Formation by Fungal Metabolic Products : Stimulation of (Dr. M. A. Mostafa and M. S. Naim), 575
Adventures with a Naturalist (Roy Bedichek), *review* by Frances Pitt, 513
Æcidia of Barley Rust in Britain (R. W. G. Dennis and N. Y. Sandwith), 461
Aeration: Effects of, on Bracken and Heather Grown in Nutrient Solution (L. W. Poel), 115
Aerobic Sporing Bacilli : Inhibition of, by Hæmatin (Dr. W. E. van Heyningen), 114
Aerobiology : Arctic, 2, Preliminary Report on Fungi and Bacteria Isolated from the Air in 1947 (Dr. S. M. Pady, Dr. C. D. Kelly and Prof. Nicholas Polunin), 379
Aeschna cyanea: Amino-Acids in the Hæmolymph of the Dragon-fly Nymph (Dr. Richard Raper and John Shaw), 999
Æstivation (Imbricate): Some Geometrical Considerations regarding (Dr. K. J. Dormer), 653
Afforestation for Bengal (Prof. E. P. Stebbing), 424
Africa : Geology and Mineral Resources of (Association of African Geological Surveys Conference on), 971
Africa (East) : Fertilizer Manufacture in, 522
  Marconi Transmitters for, 248
  Research Services in (Dr. E. B. Worthington), 554
  River Research in (Dr. Vernon D. van Someren), 784
Africa (South), 1910–1939 : A Bibliography of Chemical Research in (compiled by Dr. Herbert Coblans), *review*, 391
Africa (Tropical) : Incidence of Malaria in (G. A. Walton), 114
African Agriculture : Mechanization of, 366
African (South) Museums (J. R. Harding), 861
African (West) Sea-Fisheries (T. J. Hart), 38
Afterglow : Nitrogen (Dr. S. K. Mitra), 774
Afterglow of the Balmer Spectrum of Hydrogen (Renée Herman and Louis Herman), 261
Agar Dispenser : An Automatic (W. H. Schmidt, M. D. Reeves, Francis J. Castle and R. G. Benedict), 903
Agassiz (Alexander) Gold Medal and honorarium for 1948 of the United States National Academy of Sciences presented to Dr. Thomas Gordon Thompson, 954
Age of the Earth : Lead Isotopes and the (Prof. Harold Jeffreys), 822
Agglutinable and Non-Agglutinable Strains of *H. pertussis* : Aluminium Phosphate as Precipitant of (Dr. J. Ungar and P. Muggleton), 734
Agglutinin (Anti-S) : A Further Example of the (Dr. M. M. Pickles), 66
Agricultural Development of the Middle East (Dr. B. A. Keen), 53
Agriculture (African) : Mechanization of, 366
Agriculture and Economic Organisation : Primitive Techniques, (British Association, Section H (Anthropology), Discussion on), 602
Agriculture and the World Food Problem (Dr. G. Scott Robertson), 406
Air : Application of Insecticides from the (Dr. D. L. Gunn), 308
Air (Free) : Velocity of Sound in (J. M. A. Lenihan), 656
Air Photography and Archæology (Kodak, Ltd., Exhibition), 96, 176
Air Routes, 58
Air Transport and Geography (Royal Geographical Society), 58
Air-Cored Synchrotron (T. R. Kaiser and J. L. Tuck), 616
Alaska Peninsula (south of the) : Earthquakes on May 14 and May 17, 211 ; Earthquake on June 27, 248
Albania : Earthquake in the region of Skadar on August 27, 768
Alcoholic Potash : Solubility of Bituminous Coal in (N. Berkowitz), 960
Alcohols (Primary) : Esterification of Phthalic Anhydride with, at Room Temperature (F. J. Bristow), 1004
Algæ (Marine) : The Cellulose of (Dr. E. G. V. Percival and Alan G. Ross), 895
Algebraic Geometry : Methods of (Prof. W. V. D. Hodge and Dr. D. Pedoe), *review* by Dr. J. A. Todd, 6
Aliphatic Long-Chain Esters and Ketones in Paraffin Wax and *n*-Hexacosane: Dielectric Relaxation-Times of Solid Solutions of (R. J. Meakins), 994
Alkaline Earth Ion Concentrations by Rennet Action: Measurement of (Prof. G. T. Pyne), 925
Alkaline Phosphatase in Yeast: Localization of (Dr. Walter J. Nickerson, Edith J. Krugelis and Nils Andrèsen), 192
Alkaline Phosphatase and Tumour Inhibition (R. F. Fleming and Dr. O. Peczenik), 338
Alkaloids (Strychnos) : Biogenesis of the (Prof. R. B. Woodward), 155
Alkaloids of the Australian Rutaceæ (G. K. Hughes, Dr. F. N. Lahey, Dr. J. R. Price and L. J. Webb), 223
5-Alkyl (Benzyl) Derivatives of 2-Thio-4-Methyl-Uracil on the Thyroid Gland and the Bone Marrow in Rabbits : Effect of (Dr. Arthur Jurand), 896
Allelomorphic to *D* : *Rh* Genes (Dr. R. R. Race, Ruth Sanger and Sylvia D. Lawler), 292 ; (Dr. F. Stratton and P. H. Renton), 293
Allelomorphs: Multiple, in Colour Vision (Dr. R. W. Pickford), 684
Alloxan Diabetes in Dogs with Renal Pedicles Clamped (Prof. B. A. Houssay and Dr. C. Martinez), 571
Alloys (Ferromagnetic Manganese) : Some New (F. A. Hames and D. S. Eppelsheimer), 968
α-Activity of Samarium : Isotopic Assignment of the (Prof. N. Feather), 412
α-Particles: Short Range, from the Disintegration of Sodium, Aluminium and Fluorine by Protons (Joan M. Freeman and A. S. Baxter), 696
Alpha-Rays : Formation of Hydrogen Peroxide in Water irradiated with X- and (Dr. P. Bonet-Maury and M. Lefort), 381
Alphabet : The (Dr. David Diringer), *review* by Sir John Myres, 82
Alsos, the Failure in German Science (Prof. Samuel A. Goudsmit), *review* by Prof. N. F. Mott, 3
Alternating-Current Power Transmission, *review* by C. W. Marshall, 277
Alum : Elastic Constants of, determined by a New Ultrasonic Method (Prof. S. Bhagavantam and B. Ramachandra Rao), 818
Aluminium : The Anodizing of, *review* by H. W. L. Phillips, 715
  Cold Working of, at Low Temperatures (T. S. Hutchison), 374
  Werkstoff, und seine anodische Oxydation (Dr. Max Schenk), *review* by H. W. L. Phillips, 715
Aluminium (Pure) : Intergranular Corrosion of, in relation to the Behaviour of Grain-Boundaries during Melting (Prof. G. Chaudron, Dr. P. Lacombe and N. Yannaquis), 854
Aluminium, Copper, Silver and Gold : Hydride and Deuteride Bands of (Bengt E. Nilsson), 109
Aluminium and Fluorine : Short-Range α-Particles from the Disintegration of Sodium, by Protons (Joan M. Freeman and A. S. Baxter), 696
Aluminium Crystals : Inclusions in (W. May, T. J. Tiedema and Prof. W. G. Burgers), 740
Aluminium Phosphate as Precipitant of Agglutinable and Non-Agglutinable Strains of *H. pertussis* (Dr. J. Ungar and P. Muggleton), 734

Aluminium Soaps in Hydrocarbons : Role of the Hydroxyl Group in the Gelation of (T. S. McRoberts and Dr. J. H. Schulman), 101
Alvarenga Prize for 1948 of the College of Physicians of Philadelphia awarded to Dr. Melvin H. Knisely, 290
Amaryllids : Science of the, 347
America (North) : Silva of (Prof. C. S. Sargent), 884
'American Men of Science' : Scientists Starred 1903–1943 in (Prof. Stephen Sargent Visher), *review*, 595
American War-time Contributions to Statistical Method, *review* by Prof. M. S. Bartlett, 510
American (North) Birds : Life-Histories of (—. Burt), 522
American (South) Anthropological Symposium, *review* by Dr. G. H. S. Bushnell, 908
American (South) Indians : Handbook of (edited by Julian H. Steward), Vol. 3, The Tropical Forest Tribes ; Vol. 4, The Circum-Caribbean Indians, *review* by Dr. G. H. S. Bushnell, 908
Amino-Acids : Deamination of, by X-Rays (Gabriel Stein and Dr. Joseph Weiss), 184
Amino-Acids in the Hæmolymph of the Dragon-fly Nymph, *Aeschna cyanea* (Dr. Richard Raper and John Shaw), 999
Amino-Acids and Peptides (Dinitrophenyl): Chromatography of (D. M. P. Phillips and J. M. L. Stephen), 152
p-Aminobenzoic Acid a Growth-Factor for certain Brewer's Yeasts (Cyril Rainbow), 572
Aminohydroxybenzoic Acids : Metabolism of (Dr. H. G. Bray, Brenda E. Ryman and Dr. W. V. Thorpe), 64
Ammonium Compounds (*bis*-Trimethyl) : Pharmacology of some (Dr. Gertrude E. Glock, G. A. Mogey and Dr. J. W. Trevan), 113
Anæmia Factor (Anti-Pernicious) : Presence of Cobalt in the (Dr. E. Lester Smith), 144
Anærobic Butyric Acid Bacteria : Variation in Morphological and Biochemical Characteristics of (Dr. Otto Richard), 463
Analgesics : Synthetic (Dr. G. M. Badger, Prof. J. W. Cook, G. M. S. Donald, J. D. P. Graham and T. Walker), 21
Analgesics, Narcotics and similar Drugs : Use of Rotifera for testing (R. H. Marriott, S. Morris and Y. Larthe), 189
Analyser : The Differential (J. Crank), *review* by John Womersley, 85
Analyses of Optical Spectra : Atomic Energy Levels as derived from the, Vol. 1, Section 1, The Spectra of Hydrogen, Deuterium, Helium, Lithium, Beryllium, Boron, Carbon, Nitrogen, Oxygen and Fluorine (Charlotte E. Moore), *review* by A. G. G., 391
Analysis : Factorial, of Rheological Measurements on Cheese (R. Harper and M. Baron), 821
  Inorganic; Organic Substances used in, *review* by Dr. G. M. Bennett, 48
  Qualitative, by Spot Tests, Inorganic and Organic Applications (Dr. Fritz Feigl), third English edition, translated by Prof. Ralph E. Oesper, *review* by Prof. J. R. Partington, 474
  Semimicro Qualitative Organic (Nicholas D. Cheronis and John B. Entrikin), *review*, 164
  Volumetric (Prof. I M. Kolthoff and V. A. Stenger), second edition, Vol. 2, *review*, 128
Anatomy : A Concise Comparative (William Henry Atwood), *review* by Dr. N. B. Eales, 980
  Vertebrate; An Introduction to (Harold Madison Messer), revised edition, *review* by Dr. N. B. Eales, 980
Anatomy at the University of Glasgow, 56
Anatomy of Co-operation, *review* by E. F. L. Brech, 796
Anatomy of Vertebrates : Microscopic (Prof. James I. Kendall), third edition, *review* by Dr. P. D. F. Murray, 430
Ancient Egyptian Materials and Industries (A. Lucas), third edition, *review* by M. C. Burkitt, 429
Ancient India : The Technique of Casting Coins in (Prof. F. C. Thompson), 266
Ancient Roman Construction in Italy from the Prehistoric Period to Augustus (Marion Elizabeth Blake), *review* by Joan Liversidge, 755
i-Androsten-6-ol-17-one : Identification of '17-Ketosteroid II' as (Dr. D. H. R. Barton and Dr. W. Klyne), 493
Anethole : Addition of Maleic Anhydride to (Prof. M. Lora-Tamayo), 969
Aneurin-Pyrophosphate Content of Red and White Blood Corpuscles in the Rat and in Man (Dr. E. Florijn and G. Smits), 220
Angina Pectoris : Blood Pressure and its Disorders, including (Dr. John Plesch), second edition, *review*, 593
Anhydrous Ethylene Diamine : Extraction of Bright Coals by (I. G. C. Dryden), 959
Animal Biology : Laboratory Guide in (Robert H. Wolcott and Prof. Eugene F. Powell), second edition, *review* by Dr. N. B. Eales, 980
Animal Colour Changes and their Neurohumours (George Howard Parker), *review* by Dr. H. Waring, 84
Animal Industry in the Middle East (Dr. N. C. Wright), 53
Animal Reproduction and Artificial Insemination : Physiology and Pathology of (International Congress on the), 138
Animals : Colour and Colour Vision in (British Association, Section D (Zoology), Discussion on), 600
Animals of Australia (Glasgow Art Galleries and Museum Habitat Booklet on), 990
Animals and the Land : Wild (F. Howard Lancum), *review* by Seton Gordon, 85
Anisotropic Permanent Magnet Alloys : Recent Advances in (D. A. Oliver), 799
Anisotropic Silicon-Iron (N. F. Astbury), 800
Annihilation Radiation : Polarization of (R. C. Hanna), 332
Annual Register : The, for the Year 1947 (edited by Ivison S. Macadam, assisted by Hugh Latimer), *review*, 49
Annual Review of Physical Chemistry (Annual Reviews, Inc.), 60
Annual Review of Physiology (edited by Victor E. Hall), Vol. 10, *review*, 429
Annual Review of Psychology (Annual Reviews, Inc.), 60
Anodische Oxydation : Werkstoff Aluminium und seine (Dr. Max Schenk), *review* by H. W. L. Phillips, 715
Anodizing of Aluminium, *review* by H. W. L. Phillips, 715
Anomalous Magnetic Behaviour of Nickel-Iron at High Frequencies (A. Wieberdink), 527 ; (Prof. R. Kronig), 528
Anomalous Magneto-Resistance Effects in Bismuth (Dr. G. K. T. Conn and B. Donovan), 336
Antagonism between Basic Compounds (Spermine, Streptomycin) and Basic Bactericidal Substances (Prof. L. Massart), 779
Anthropological Symposium : A South American, *review* by Dr. G. H. S. Bushnell, 908
Anthropology : Administration and, 482
Anti-*S* Agglutinin : A Further Example of the (Dr. M. M. Pickles), 66
Antibacterial Compound, Aspergillic Acid : Structure of the (George Dunn, G. T. Newbold and Prof. F. S. Spring), 779
Antibacterial Substances : N. Acridyl-(5)-Alanines as (Prof. W. H. Linnell and M. J. H. Smith), 735
Antibiotic Activity of Growth-Factor Analogues, 356
Antibiotic Agent from *Marasmius ramealis* (Gerd Bendz, Gösta Wallmark and Karin Öblom), 61
Antibiotics produced by Fungi, and a New Phenomenon in Optical Resolution (Dr. A. H. Cook, S. F. Cox and T. H. Farmer), 61
Anti-Cancer Drugs, *review* by Dr. I. Hieger, 713
Antifungal Metabolic Product of *Trichothecium roseum* Link : Trichothecin, an (Dr. G. G. Freeman and Dr. R. I. Morrison), 30
Antigen related to the *AB O* Systems : An (Pierre O. Hubinont), 457
Antigenic Components of *Psittacosis* Virus (Dr. C. F. Barwell), 460
Antimalarial Compounds : Metachloridine-substituted Aryl Biguanides as possible (H. L. Bami, B. H. Iyer and Prof. P. C. Guha), 146
Anti-Pernicious Anæmia Factor : Presence of Cobalt in the (Dr. E. Lester Smith), 144
Antisera : Introduction of Radioactive Tracers into (F. D. S. Butement), 731
Anti-Shrink Treatments on the Friction between Wool Fibres : Influence of some (Joel Lindberg and Dr. Nils Gralén), 112
Antiquity of Man in Australia (H. H. Finlayson), 256
Anti-Tubercular Activity of Oxidation Products of Substituted *o*-Phenylene Diamines (Dr. Vincent C. Barry, J. G. Belton, M. L. Conalty and D. Twomey), 622
Anti-Vitamins in Food (Nutrition Society Discussion on), 985
Ants : Neurotic Behaviour in (Derek Wragge Morley), 74
Aphididæ : Colouring Matters of the (H. Duewell, J. P. E. Human, Dr. A. W. Johnson, Dr. S. F. MacDonald and Prof. A. R. Todd), 759
Aphids : Symbiotic Micro-organisms of, and Fixation of Atmospheric Nitrogen (Dr. J. D. Smith), 930
Apparatus for Adding Seitz-Filtered Components Aseptically to Embryo Culture Media : A Simple (S. G. Stephens), 932
Apparent Colours of Surfaces of Small Subtense (W. E. Knowles Middleton), 486
Applicable Mathematics (British Association, Section A (Mathematics) and Section G (Engineering), Joint Discussion on), 582
Application of Science : Balance between the Pursuit and, 385
Applications of Infrared : Industrial (James Doyle Hall), *review* by M. R. Gavin, 637
Apus and a Rare Cladoceran in Britain (Prof. H. Munro Fox), 116
Apus cancriformis : Re-discovery of (Prof. Frank Balfour-Browne), 116
Aquatic Predaceous Fungus, *Acaulopage dichotoma*, in Britain (Mrs. M. Peach), 148
Aqueous Solution : Oxidation of Ferrous Ions in, by X- and γ-Radiation (N. Miller), 448
Aranda Traditions (T. G. H. Strehlow), *review* by Mrs. K. Rishbeth, 276
Archaeology : Air Photography and (Kodak, Ltd., Exhibition), 96, 176
Archaeology of Great Britain : Survey and Policy of Field Research in the, 1, The Prehistoric and Early Historic Ages to the Seventh Century A.D. (Council for British Archaeology, University of London Institute of Archaeology, Report on), 883
Arctic Aerobiology, 2, Preliminary Report on Fungi and Bacteria isolated from the Air in 1947 (Dr. S. M. Pady, Dr. C. D. Kelly and Prof. Nicholas Polunin), 379
Arctic Ice, 988
Area of Convex Bodies : Projected (V. Voux), 330
Arenicola marina : Blood System of the Gut of (Doris M. Kermack), 576
  Carbonic Anhydrase in (A. M. Clark), 191
Arenicola marina L. : Thixotropy and the Mechanics of Burrowing in the Lugworm (G. P. Wells), 652
Argemone Oil : Isolation from, of Dihydrosanguinarine and Sanguinarine —Toxicity of Sanguinarine (S. N. Sarkar), 265
Argentina : La vegetación de la (Prof. L. Hauman, Prof. A. Burkart, Prof. L. R. Parodi and Prof. A. L. Cabrera), *review* by G. M. Roseveare, 203
Argentina (Salta Province of) : Earthquake on August 25, 768
Argentine : Vegetation of the, review by G. M. Roseveare, 203
Argon (Liquid and Solid) : Ionization in (G. W. Hutchinson), 610
Argon in the Earth's Surface Materials : Relative Abundances of Potassium and (Prof. J. H. J. Poole), 775
Argon Isotopes : Gamma-Rays from Proton Bombardment of Separated (K. J. Brostrøm, T. Huus and Dr. J. Koch), 695
Aromatic Hydrocarbons : Action of Oxalyl Chloride on the (Hussein Ahmad Fahim), 526
Art of Writing, *review* by Sir John Myres, 82
Arthropods (Terrestrial) : Astaxanthin in Insects and other (Prof. C. Manunta), 298
Artificial Human Insemination (Report of a Commission appointed by the Archbishop of Canterbury), 790
Artificial Insemination : Physiology and Pathology of Animal Reproduction and (International Congress on the), 138
Artificial Stimulation of Rain (J. A. King, E. C. Halliday, F. J. Hewitt and D. G. Kingwill), 921
Aryl Biguanides as possible Antimalarial Compounds: Metachloridine-substituted (H. L. Bami, B. H. Iyer and Prof. P. C. Guha), 146
Asellus aquaticus : Ribonucleic Acid Supply and Phosphatase Distribution during the Spermatogenesis of (Giovanna Vitagliano and Marina de Nicola), 965
Aspergillic Acid : Structure of the Antibacterial Compound (George Dunn, G. T. Newbold and Prof. F. S. Spring), 779
Aspergillus nidulans : Pathogenicity of (Dr. Charles H. Drake), 98
Aspergillus niger : Production of *i*-Erythritol by (John L. Yuill), 652
Assay of *nor*Adrenalin and Adrenalin in Extracts of Nerves and Tissues (Prof. U. S. v. Euler), 570
Assay of Streptomycin *B* (Mannosido-Streptomycin) : Chemical (W. B. Emery and A. D. Walker), 525
Associating Solutes : Activities of (Dr. A. F. H. Ward and Dr. L. Tordai), 494
Association of Points on a Lattice : Random (P. V. Krishna Iyer), 333
Assyriology at the British Museum, 645
Astaxanthin in Insects and other Terrestrial Arthropods (Prof. C. Manunta), 298

l'Astrolabe : Traité de (Henri Michel), *review* by Dr. F. Sherwood Taylor, 46
Astronomical Instruments : Catalogue of (Sir Howard Grubb, Parsons and Co.), 176
Astronomical Navigation Tables, Vol. A, Latitudes 0°–4° North and South (prepared by H. M. Nautical Almanac Office on behalf of the Air Ministry), *review* by Sir Harold Spencer Jones, 7
Astronomy : Morphological (Dr. F. Zwicky), 627
  Stellar; An Outline of (Peter Doig), second edition, *review* by Dr. R. d'E. Atkinson, 390
Athletes : Nutrition of (Nutrition Society Conference on), 207
'Athrocytes': Discriminating, in the Reticulo-endothelial System (Dr. L. Lison and J. Smulders), 65
Atlantic Coastline of Europe : Factors Controlling the (Muriel A. Arber), 741
Atlantic Islands : The (Kenneth Williamson), *review* by Seton Gordon, 4
Atmosphere (Free) : Distribution of Ice-Particle Nuclei in the (H. P. Palmer), 568
Atmospheric Ducts : Low-Level (Dr. J. S. McPetrie and B. Starnecki), 818
Atmospheric Nitrogen: Symbiotic Micro-organisms of Aphids and Fixation of (Dr. J. D. Smith), 930
Atom Bomb : The Search for the German, *review* by Prof. N. F. Mott, 3
Atom Train : Atomic Energy Exhibition—The, 267
Atomic Age : Sir Halley Stewart Trust course of lectures on the, 523
Atomic Bomb : From Radium to the, *review* by S. Weintroub, 239
Atomic Energy (Dr. R. R. Nimmo), *review* by S. Weintroub, 239
Atomic Energy Exhibition—The Atom Train, 267
Atomic Energy Levels as derived from the Analyses of Optical Spectra, Vol. I, Section I, The Spectra of Hydrogen, Deuterium, Helium, Lithium, Beryllium, Boron, Carbon, Nitrogen, Oxygen and Fluorine (Charlotte E. Moore), *review* by A. G. G., 391
Atomic Energy and the Scientist (Atomic Scientists' Association Conference on), 1005
Atomic Energy and Society (Atomic Scientists' Association Conference on), 1005
Atomic Nucleus : Forces inside the, *review* by Prof. M. H. L. Pryce, 907
Atomic Pile at Harwell : New, 56
Atomic and Molecular Energy-Levels : Excitation Probability Functions of (R. W. Nicholls), 487
Atomic and Planetary Properties : Parallelism between (B. Liebowitz), 409
Atypical Growth, Abnormal Mitosis, Polyploidy and Chromosome Fragmentation induced by Hexachlorocyclohexane (Dontcho Kostoff), 845
Aural Sensitivity and Heart Beats (Dr. Robert W. Lawson), 782
Auroral Line : The Green, as an Initiator of Phosphorescence in Condensed Systems (Prof. L. Vegard and G. Kvifte), 967
Austenite-Martensite Transformation : Influence of Low Temperatures on the Mechanism of the (Dr. Jozef Mazur), 184
Australia : Animals of (Glasgow Art Galleries and Museum Habitat Booklet on), 990
  Antiquity of Man in (H. H. Finlayson), 256
  Central; Parthenogenetic Paternity in, *review* by Mrs. K. Rishbeth, 276
Australian Rutaceae : Alkaloids of the (G. K. Hughes, Dr. F. N. Lahey, Dr. J. R. Price and L. J. Webb), 223
Australopithecus from Makapansgat Valley : A (?) Promethean (Prof. Raymond A. Dart), 375
Automatic Agar Dispenser (W. H. Schmidt, M. D. Reeves, Francis J. Castle and R. G. Benedict), 903
Autoradiography of the Thyroid Gland (Dr. Geoffrey H. Bourne), 495
Auxin : Nicotinic Acid and the Inhibition of Growth by (Dr. L. J. Audus), 811
Avitaminosis A : Changes in the Incisor Teeth and Incisal Alveolar Bone of Rats in Hypervitaminosis A and (Prof. J. T. Irving), 377

BACILLI (Aerobic Sporing) : Inhibition of, by Haematin (Dr. W. E. van Heyningen), 114
Bacteria : Classification of, *review* by Dr. S. T. Cowan, 833
  Destruction of Urinary Glucuronide by (Mary Barber, B. W. L. Brooksbank and Dr. G. A. D. Haslewood), 701
  Polyploidy in (A. Buzzati-Traverso, Dr. N. Visconti di Modrone and Dr. L. L. Cavalli), 295
  Anaerobic Butyric Acid; Variation in Morphological and Biochemical Characteristics of (Dr. Otto Richard), 463
Bacteria isolated from the Air in 1947 : Arctic Aerobiology, 2, Preliminary Report on Fungi and (Dr. S. M. Pady, Dr. C. D. Kelly and Prof. Nicholas Polunin), 379
Bactericidal Substances (Basic) : Antagonism between Basic Compounds (Spermine, Streptomycin) and (Prof. L. Massart), 779
Bacteriology (Determinative): Bergey's Manual of, sixth edition by Robert S. Breed, E. G. D. Murray and A. Parker Hitchens, *review* by Dr. S. T. Cowan, 833
Bacteriophage : Multiplication of (Dr. Ralph W. G. Wyckoff), 649
Bacteriophage Typing of Untypable *Salmonella typhi* Organisms (Lieut. James M. Dunbar), 851
Bacteriostatic Action of Oximes (J. D. Allan Gray and R. A. Lambert), 733
Balance between the Pursuit and Application of Science, 385
Balance of Research and Teaching at the Universities (Universities of the British Commonwealth Discussion on), 441
Balmer Spectrum of Hydrogen : Afterglow of the (Renée Herman and Louis Herman), 261
Bananas in the Cameroons : Infectious Chlorosis of (Prof. C. W. Wardlaw), 894
Barbiturates : A Simple Method for Direct Comparison of the Depressant Effect of the, on the Respiration and Circulation (Sten Wiedling), 1003
Barium-139 : Decay of (L. R. Shepherd and J. M. Hill), 566
Barium Nitrate : Photo-Elastic Effect in (Prof. S. Bhagavantam and D. Suryanarayana), 740
Barium Sulphate Crystals (Aged) : Electrokinetic Potentials of (Prof. R. Ruyssen and R. Loos), 741
Barium and Strontium Titanates at 10,000 Mc./s. : Dielectric Properties of Mixed (Dr. J. G. Powles), 655, *erratum*, 690
Barley Rust in Britain : Æcidia of (R. W. G. Dennis and N. Y. Sandwith), 461
Barometer : Portable (Loaned by R. Meyrick to the Science Museum), 919
Basic Bactericidal Substances : Antagonism between Basic Compounds (Spermine, Streptomycin) and (Prof. L. Massart), 779
Basic Compounds (Spermine, Streptomycin) and Basic Bactericidal Substances : Antagonism between (Prof. L. Massart), 779
Basque Blood Groups (Dr. J. N. Marshall Chalmers, Elizabeth W. Ikin and Dr. A. E. Mourant), 27
Battery Management : Egg-Laying, *review* by T. E. Whittle, 475
Bayliss Prize of the Institution of Civil Engineers awarded to W. E. A. Skinner, 865
Beaches : Waves and (Prof. J. D. Bernal), 684
Beacons : Radar (edited by Prof. Arthur Roberts), *review* by Dr. R. L. Smith-Rose, 633
Bee (Honey), *Apis mellifica* L. : The Cytology of the (Dr. Ann R. Sanderson and David W. Hall), 34
  The Spell of the (W. Eric Kelsey), second edition, *review*, 8
Bee-Hives : The Ventilation of (E. B. Wedmore), *review* by Dr. C. G. Butler, 717
Behaviour in Ants : Neurotic (Derek Wragge Morley), 74
Behaviour of Grain-Boundaries during Melting : Intergranular Corrosion of Pure Aluminium in relation to the (Prof. G. Chaudron, Dr. P. Lacombe and N. Yannaquis), 854
Behaviour of a Particle of Very Small Size in a Magnetic Field (Prof. J. Thibaud), 329
Behaviour of Pigs (R. Braude), 938
Behaviour of Seeds, *review* by Dr. S. Clay, 594
Beilby Memorial Awards, 769
Beit Fellowships for Medical Research, 212
Beit Fellowships for Scientific Research, 100
Belgian Congo : Fish Farming in the (Dr. A. F. de Bont), 998
Bengal : Afforestation for (Prof. E. P. Stebbing), 424
Benzene Hexachloride : Insecticidal Power and Microscopical Structure of Residual Films of (A. J. Musgrave), 296
Benzene Hexachloride ('Gammexane') : Absence of Carcinogenic Activity of (Dr. J. W. Orr), 189
  see also under 'Gammexane'
Benziminazole Analogues of Pteroic and Pteroylglutamic Acids (Dr. F. E. King, P. C. Spensley and Dr. R. H. Nimmo-Smith), 153
Beryllium : Photodisintegration of Deuterium and, by Thorium C″ γ-Rays (D. L. Allan and M. J. Poole), 373
Beta Spectrum of Tritium (Dr. S. C. Curran, J. Angus and A. L. Cockcroft), 302
Beta vulgaris : Localization of Polyphenoloxidase in the Chloroplasts of (Prof. Daniel I. Arnon), 341
Bibliography of Chemical Research in South Africa, 1910–1939 (compiled by Dr. Herbert Coblans), *review*, 391
Biguanides as possible Antimalarial Compounds : Metachloridine-substituted Aryl (H. L. Bami, B. H. Iyer and Prof. P. C. Guha), 146
Binary Metallic Equilibrium Diagrams : Systematization of certain (H. J. Axon), 997
Biochemical Characteristics of Anaerobic Butyric Acid Bacteria : Variation in Morphological and (Dr. Otto Richard), 463
Bioelectrical Polarization Effects : Membrane Electrophoresis in relation to (Prof. Torsten Teorell), 961
Biogenesis of Emetine : Structure and (Sir Robert Robinson), 524
Biogenesis of the Strychnos Alkaloids (Prof. R. B. Woodward), 155
Biologicae : Tabulae, Vol. 22, Oculus, Pars I (K. Steindorff, F. P. Fischer, J. S. Friedenwald, Arnold Sorsby), *review* by Dr. E. N. Willmer, 910
Biological Aspects of Colonial Development : Some (Sir Frank Stockdale), 476
Biological Chemistry : International Congress on (Société de Chimie biologique), 59 ; *review*, 870
Biological Chemistry at Aberdeen, 604
Biological Control of Insects (A. B. Baird), 308 ; (Dr. W. Cottier), 308 ; (Dr. R. H. Le Pelley), 308
Biological Control of Weeds by means of Insects (Dr. D. Miller), 308
Biological Effects of Steroid Hormones : Chemistry, Metabolism and (University of Wisconsin and the U.S. National Research Council Committee on Growth Symposium on), 176
Biological Properties of a Substance isolated from Wheat Middlings and of Hydroxymethylfurfuraldehyde (Dr. T. B. Heaton and G. M. Robinson), 570
Biological Service in Great Britain, 728, 766
Biological Standardization of the Vitamins (Dr. Katharine H. Coward), second edition, *review* by Prof. S. K. Kon and Dr. P. White, 202
Biologist : Professional Status of the, 867
Biology : Animal; Laboratory Guide in (Robert H. Wolcott and Prof. Eugene F. Powell), second edition, *review* by Dr. N. B. Eales, 980
  New, 3 (edited by M. L. Johnson and Michael Abercrombie), *review*, 595
  Wave Mechanics in Physics, Chemistry and (Prof. C. A. Coulson), 504
Biology in a Curriculum : The Place of (Prof. H. Graham Cannon), 1006
Biology and Civil Engineering (Institution of Civil Engineers Conference on), 99, 801
Biology and Control of the Pea Moth (D. W. Wright and Q. A. Geering), 309
Bioluminescence (Section of Biology of the New York Academy of Sciences Conference on), 423
Bioluminescence (K. B. Williamson), 768
Biophysics : Cytological Research and, *review* by Dr. J. Danielli, 753
Biosynthesis of Vitamin C and Response to Diabetogenic Substances : Species Difference in the (Prof. M. C. Nath, C. H. Chakraborty, V. G. Hatwaine and Kusum S. Laul), 660
Bird Haunts in Northern Britain (G. K. Yeates), *review* by Frances Pitt, 911
Bird Life : Territory in (Eliot Howard), new edition, *review* by Frances Pitt, 595
Bird Life in Cornwall (B. H. Ryves), *review* by Frances Pitt, 7
Bird Pictures, *review* by Frances Pitt, 431
Birds : Sun-Bathing by (Noble Rollin), 843
  North American; Life-Histories of (—, Burt), 522
Birds of Brewery Creek (Malcolm Macdonald), *review* by Frances Pitt, 49
Birds of Malaysia (Jean Delacour), *review* by Frances Pitt, 49
Birds on the Wing (John Barlee), *review* by Frances Pitt, 49
Birefringence and Orientation-rate of the Leptones of Protoplasm (Dr. Hans H. Pfeiffer), 419
Bismuth : Anomalous Magneto-Resistance Effects in (Dr. G. K. T. Conn and B. Donovan), 336

Bisquaternary Salts causing Neuromuscular and Ganglionic Block : Clinical Potentialities of certain (Dr. W. D. M. Paton and Dr. E. J. Zaimis), 810
Bituminous Coal in Alcoholic Potash : Solubility of (N. Berkowitz), 960
Black Muds : A Concentration of Uranium in (Dr. Kaare Münster Strøm), 922
Blackfish Petrosal : Density of the (Prof. L. R. Richardson), 150
Blackout Indices : Photographic Evaluation of (Dr. Robert W. Lawson), 531
Blinking (Dr. R. E. D. Clark), 970 ; (Dr. Robert W. Lawson), 970
Blood : Decarboxylation of Oxalacetate by (Peter M. Nossal), 36
  Passage of Haemoglobin from, into Eggs of *Daphnia* (Elisabeth I. B. Dresel), 736
  The *Rh* Factor of (P. L. Mollison), 515
Blood of the Larva of *Gastrophilus intestinalis* : Succinic Acid in the (L. Levenbook and Dr. Y. L. Wang), 731
Blood Capillary Circulation under Normal Conditions and in Traumatic Shock (Prof. Robert Chambers), 835
Blood Corpuscles of the Hen : Life-Span of Red and White (J. Ottesen), 730
Blood Corpuscles in the Rat and in Man : Aneurin-Pyrophosphate Content of Red and White (Dr. E. Florijn and G. Smits), 220
Blood Group (Lewis) : Correlation between, and Secretor Character in Man (R. Grubb), 933
Blood-Group Genes : Genetic Transmission of Two Rare (Dr. A. S. Wiener), 735
Blood Group Substances (Human) : Hexosamine Components of the (D. Aminoff and W. T. J. Morgan), 579
Blood Groups : Basque (Dr. J. N. Marshall Chalmers, Elizabeth W. Ikin and Dr. A. E. Mourant), 27
Blood Pressure and its Disorders, including Angina Pectoris (Dr. John Plesch), second edition, *review*, 593
Blood System of the Gut of *Arenicola marina* (Doris M. Kermack), 576
Bolivia : Earthquake in Sucre on March 27, 138
Bond-Energy in Physical Chemistry : Definitions of (Dr. H. A. Skinner and Dr. H. D. Springall), 343 ; (Dr. L. H. Long), 344
Bonding Agents : Foundry Core (British Iron and Steel Research Association Conference on), 59
Bone : Local Action of Calciferol and Vitamin A on (N. A. Barnicot), 848
Bone Marrow in Rabbits : Effect of 5-Alkyl (Benzyl) Derivatives of 2-Thio-4-Methyl-Uracil on the Thyroid Gland and the (Dr. Arthur Jurand), 896
Bone Marrow Culture : Loss of White Cells in (H. J. F. Cairns and L. G. Lajtha), 536
Book of the Dog (edited by Brian Vesey-Fitzgerald), *review* by Lieut.-Colonel C. E. G. Hope, 677
Books : Recent Scientific and Technical, Supp. iii, July 31 ; Supp. iii, August 28 ; Supp. iii, September 25 ; Supp. iii, October 30 ; Supp. ii, November 27 ; Supp. iii, December 25
Botany : Popular, *review* by Prof. E. Ashby, 870
Botany at Cambridge, 521
Botany in Nigeria, 327
Botany at Rothamsted, 727
Boundaries of Local Government Areas (E. W. Gilbert), 884
Bovine Plasma : *In vitro* Effect of Penicillin on Prothrombin Activity of (I. M. Chak, J. F. Pereira and K. V. Giri), 930
Boys (Charles Vernon) Prize of the Physical Society awarded to Prof. S. Tolansky, 523
Bracken and Heather Grown in Nutrient Solution : Effects of Aeration on (L. W. Poel), 115
Brain (Mouse) : Physical Nature of (M. C. H. Dodgson), 253
Branched Polysaccharides : Isophosphorylase and the Formation of (Dr. P. Bernfeld and A. Meutémédian), 618
Breakers and Surf: Wind Waves at Sea, (Henry B. Bigelow and W. T. Edmondson), *review* by N. F. Barber, 389
Brewer's Yeasts : *p*-Aminobenzoic Acid a Growth-Factor for certain (Cyril Rainbow), 572
Brewery Creek : Birds of (Malcolm Macdonald), *review* by Frances Pitt, 49
Bright Plating of Metals : Electrolytic Polishing and (Dr. S. Wernick), *review*, 834
Britain: Æcidia of Barley Rust in (R. W. G. Dennis and N. Y. Sandwith), 461
  Apus and a Rare Cladoceran in (Prof. H. Munro Fox), 116
  An Aquatic Predaceous Fungus, *Acaulopage dichotoma*, in (Mrs. M. Peach), 148
  Distribution of Industry in, 829
  Distribution of Time in, *review* by R. A. Fell, 6
  Dogs in (Clifford L. B. Hubbard), *review* by Brian Vesey-Fitzgerald, 553
  Establishment of Hardwoods in, 97
  Health of the People of (Dr. G. Lapage), 586
  Laminaria ochroleuca De La Pylaie Growing on the Coast of (Mary Parke), 295
  Maps of (Ordnance Survey), 57
  Motor Industry in (Political and Economic Planning, Broadsheet No. 284), 646
  National Parks in, 631
  Plant Life in, *review* by L. J. F. Brimble, 676
  Scientific and Technical Manpower in, 469
  Television Development in, 427
  Women as a Labour Force in, 605
  Northern; Bird Haunts in (G. K. Yeates), *review* by Frances Pitt, 911
    see also under Great Britain
Britain 1951 : Festival of, 645
Britain and Abroad : Investigation of Folk-Life in (R. U. Sayce), 403
Britain's Industrial Survival (Ian Bowen), *review*, 45
British Commonwealth : Movements of Population in the (British Association, Section E (Geography), Symposium on), 718
British Commonwealth : Sixth Congress of the Universities of the, 99, 441, 478, 585
British Flora : Study of the (Prof. J. R. Matthews), 405
British Folk-Belief : Local Genii of, *review* by Dr. E. J. Dingwall, 388
British Folliculinidæ (Ciliata, Heterotricha), (Dr. S. M. Das), 534
British Gas Industry (H. J. Hodsman), 440
British Insects : Natural History of, *review* by Dr. V. B. Wigglesworth, 5
British Littorinidæ : Nomenclature of the (Dr. G. Seshappa), 702
British Minerals : Two New (Dr. F. A. Bannister and Prof. S. E. Hollingworth), 565
British Mythology: The Minor Traditions of (Lewis Spence), *review* by Dr. E. J. Dingwall, 388
British Plant Life (Dr. W. B. Turrill), *review* by L. J. F. Brimble, 676
British Psychology : Present-day Trends in (Prof. Rex Knight), 404
British Somaliland : Report on the General Survey of, 137
British Species of *Polycelis* (Platyhelminthes), (Dr. T. B. Reynoldson), 620
British Standard 904 : 1948, Dimensions of Instrument Jewels, revised edition, 843
British Time (Donald de Carle), *review* by R. A. Fell, 6
British Trade Unionism (Six Studies by P. E. P.), *review*, 511
British Universities : The Problems facing (Nuffield College Statement on), 349, 470
British Vegetation : Studies of the Post-Glacial History of (Prof. A. R. Clapham and Prof. H. Godwin), 1008
Broadcasting : Wave-lengths for, 562
Brood-size in the Robin : Clutch and (David Lack), 250
Bruce (Dr. W. S.) Memorial Prize awarded to Dr. W. A. Deer, 212
Brunauer-Emmett-Teller and Harkins-Jura Isotherms : Relation between (T. D. Smith and R. Bell), 109
Bull Semen in the Genital Tract of the Cow : Preservation of the Fertilizing Capacity of (Prof. M. Vandeplassche and Dr. F. Paredis), 813
Buna Rubber (Frank A. Howard), *review* by Dr. C. W. Long, 637
Burrowing in the Lugworm (*Arenicola marina* L.) : Thixotropy, and the Mechanics of (G. P. Wells), 652
Burrowing of the Lugworm (Garth Chapman and Dr. G. E. Newell), 894
Butadiene : Reaction of Cyanogen and related Compounds with (Dr. G. J. Janz and P. J. Hawkins), 28
Butyric Acid Bacteria (Anærobic) : Variation in Morphological and Biochemical Characteristics of (Dr. Otto Richard), 463
Butyric Acid-forming Organisms : Fermentation of Pyruvate, β-Hydroxybutyrate and of C_4-dicarboxylic Acids by some (Dr. Georges N. Cohen and Germaine Cohen-Bazire), 578

C. DIPHTHERIÆ : Production of Riboflavin and Allied Substances during the Growth of (A. J. Woiwod and Dr. F. V. Linggood), 219
Cacao : Entomological Aspects of 'Swollen Shoot' of (F. A. Squire), 743
Cadmium : Surface Effects with Single Crystal Wires of (Prof. E. N. da C. Andrade and R. F. Y. Randall), 890
Cadmium Crystals : Thermal Hardening of (Dr. A. H. Cottrell and D. F. Gibbons), 488
Calciferol : Structure of (Dr. Dorothy Crowfoot and Dr. J. D. Dunitz), 608
Calciferol and Vitamin A : Local Action of, on Bone (N. A. Barnicot), 848
Calculus : Modern Operational (Dr. N. W. McLachlan), *review* by Prof. L. M. Milne-Thomson, 945
  The Uniform, *review* by Prof. L. M. Milne-Thomson, 353
Calorimeter Building for Domestic Heating Research at the Fuel Research Station, Greenwich (Dr. A. C. Monkhouse), 133
Calyx Burner to determine Combustion Conditions : Use of the (A. R. Bennett and D. Harrison), 371
Cambridge : Shortage of Scientific Text-books in (R. Innes), 209
Cameroons : Infectious Chlorosis of Bananas in the (Prof. C. W. Wardlaw), 894
Cancer : Genetics of (Genetical Society of Great Britain and the British Empire Cancer Campaign Symposium on), 514
Canine Cult : The, *review* by Brian Vesey-Fitzgerald, 553
Canopus : Distance of (O. R. Walkey), 989
Caoutchouc : Le (George Colin, André Jarrijon et Pierre Thirion), *review* by W. P. Fletcher, 678
Capacitor : The Electrolytic (Alexander M. Georgiev), *review*, 911
Capillary Circulation : Blood, under Normal Conditions and in Traumatic Shock (Prof. Robert Chambers), 835
Capital (Colonial) : Nairobi, Master Plan for a (Prof. L. W. Thornton White, L. Silberman and P. R. Anderson), *review*, 432
Capture of Slow Mesons in Dielectrics : Decay and (Dr. H. Fröhlich, R. Huby, R. Kolodziejski and R. L. Rosenberg), 450
Carbide in Chromium Steels : A New (H. J. Goldschmidt), 855
Carbohydrate Metabolism of Micro-organisms : A Method for Studying the (Dr. W. G. C. Forsyth and Dr. D. M. Webley), 150
Carbon Dioxide : Effect of, on Availability of Manganese in Soil producing Manganese Deficiency (B. D. Bolas and G. B. Portsmouth), 737
Carbon Monofluoride : Structure of (D. E. Palin and K. D. Wadsworth), 925
Carbon Monoxide Affinity of Chlorocruorin and Hæmoglobin (Prof. H. Munro Fox), 20
Carbonic Anhydrase in *Arenicola marina* (A. M. Clark), 191
Carcinogenic Action of Urethane in Mice : Some Unusual Findings on the (Prof. R. L. Noble and M. Jean Millar), 253
Carcinogenic Activity of Benzene Hexachloride ('Gammexane'): Absence of (Dr. J. W. Orr), 189
Care of the National Gallery Pictures : Cleaning and (W. G. Constable), 166
Careers : Entry and (*Universities Quarterly* Symposium on), 349
Caribbean : Crops of the, 121
  Sugar Industry of the (Caribbean Research Council, Crop Inquiry Series, No. 6), 137
Cassiopeia : A New Intense Source of Radio-Frequency Radiation in the Constellation of (M. Ryle and F. G. Smith), 462
Casting Coins in Ancient India : The Technique of (Prof. F. C. Thompson), 266
Castings : Non-destructive Testing of (British Iron and Steel Research Association Conference on), 59
Catalysts and Adsorbents : Clay Minerals as (Clay Minerals Group of the Mineralogical Society Discussion on), 195
Caterpillar Pest (*Agrotis* spec.) of Tristan da Cunha : The Potato (Dr. G. J. Broekhuysen and W. Macnae), 225
Cathode Ray Oscillograph in Industry (Dr. W. Wilson), third edition, *review* by L. E. C. H., 391
Cathode Rays (J. J. Thomson), 98
Cause of Death after Acute D.D.T. Poisoning : Site of Action of D.D.T. and (D. Dresden), 1000
Cavity Magnetron : The, *review* by Prof. J. T. Randall, 591
'Ceiling Temperature' : Reversibility of the Propagation Reaction in Polymerization Processes and its Manifestation in the Phenomenon of a (Dr. F. S. Dainton and K. J. Ivin), 705

Celebes Sea : Earthquake on June 21, 248
Celestial Bodies and Gravitation : Magnetism of (J. Mariani), 612
Cell Division in Micro-organisms : Enzymatic Control of (Dr. Walter J. Nickerson), 241
Cell Walls (Lignified) : A Simple Technique for the Differential Staining of (Dr. Iwo R. W. Lominski and S. A. Hutchison), 415
Cell Walls in Fresh Plant Tissues : Fine Structure of (Dr. R. D. Preston, A. B. Wardrop and Dr. E. Nicolai), 959
Cell-size in *D. melanogaster* : Role of the Y-Chromosome in the Determination of (Prof. Claudio Barigozzi), 30
Cells : Living; Cinematograph Films of (C. C. Speidel), 249
  Living Malignant; Ultra-Violet Microscopy of (Dr. R. J. Ludford, J. Smiles and F. V. Welch), 50
  Muscle; Permeability of (E. J. Harris and G. P. Burn), 929
  Resting; Electron Optical Observations on Chromosome Structure in (Fernando Calvet, Benjamin M. Siegel and Dr. Kurt G. Stern), 305
  White; Loss of, in Bone Marrow Culture (H. J. F. Cairns and L. G. Lajtha), 536
Cellulose (Powdered) : Application of Paper Partition Chromatography to the Separation of the Sugars and their Methylated Derivatives on a Column of (L. Hough, Dr. J. K. N. Jones and W. H. Wadman), 448
Cellulose of Marine Algæ (Dr. E. G. V. Percival and Alan G. Ross), 895
Cellulose in the Wall of *Valonia ventricosa* : An Electron Microscope Study of (Dr. R. D. Preston, Dr. E. Nicolai, Dr. R. Reed and A. Millard), 665
Central Australia: Parthenogenetic Paternity in, *review* by Mrs. K. Rishbeth, 276
Centre préhistorique de Gantles-Montespan (Haute-Garonne) : Le (Félix Trombe et Gabriel Dubuc), *review* by M. C. Burkitt, 511
Centrifuge : Study of the Action of Ultra-violet Light on Urease by Means of the (Dr. A. D. McLaren, E. Sheppard and J. Wagman), 370
Cephalic Sutures in Trinucleidæ and Harpedidæ : Indications of (Dr. Archie Lamont), 376
Chain Reaction : Histamine—Heparin—Thrombin (Dr. M. Gerendás, I. Csefkó and M. D. F. Udvardy), 257
Changes: Short-Period, in the F Region of the Ionosphere (G. H. Munro), 886
Changes in the Incisor Teeth and Incisal Alveolar Bone of Rats in Hypervitaminosis A and Avitaminosis A (Prof. J. T. Irving), 377
Charged Particles of Minimum Ionizing Power in Photographic Emulsions : Recording of (Dr. R. W. Berriman), 992
Cheese : Factorial Analysis of Rheological Measurements on (R. Harper and M. Baron), 821
Chemical Analysis (General) : Chromatography for (Dr. R. Consden), 1007
Chemical Assay of Streptomycin *B* (Mannosido-Streptomycin), (W. B. Emery and A. D. Walker), 525
Chemical Ciphering (Gordon, Kendall and Davison), 562
Chemical Industries in Scotland (Scottish Council on Industry Report on), 39
Chemical Insect Attractants and Repellents (Prof. Vincent G. Dethier), *review* by Dr. V. B. Wigglesworth, 550
Chemical Names, Formulæ and Ciphers, 562
Chemical Prevention of Potato Dry Rot Disease, 843
Chemical Principles : Rational Approach to (Dr. John A. Cranston), *review* by Dr. J. A. V. Butler, 125
Chemical Process Principles (Prof. Olaf A. Hougen and Prof. Kenneth M. Watson), Part 2, Thermodynamics ; Part 3, Kinetics and Catalysis, *review* by Dr. E. F. G. Herington, 550
Chemical Reduction : Nickel Plating by (J. G. M. Bremner), 183
Chemical Research in South Africa, 1910–1939 : A Bibliography of (compiled by Dr. Herbert Coblans), *review*, 391
Chemical Stimuli and Insect Behaviour, *review* by Dr. V. B. Wigglesworth, 550
Chemical Synonyms and Trade Names (William Gardner), fifth edition, revised by Edward I. Cooke, *review*, 278
Chemical Synthesis Made Easy, *review* by Prof. J. W. Cook, 202
Chemical Transmitters : Reaction of Effector Cells to (Dr. B. Minz), 254
Chemical and Physical Investigations on Dairy Products (H. Eilers, R. N. J. Saal and M. van der Waarden), *review* by H. D. K., 87
Chemicals for Medical Use : Fine (Prof. J. H. Burn), 447
Chemist : Process Chemistry for the, *review* by Dr. E. F. G. Herington, 550
Chemistry : Chymia, Annual Studies in the History of (edited by Tenney L. Davis), Vol. I, *review*, 278
  Recent Advances in various branches of (Irish Chemical Association Summer School on), 137
  Analytical; International Congress on, 156
  Applied Surface, *review* by Dr. A. S. C. Lawrence, 164
  Biological; International Congress on (Société de Chimie biologique), 59
  A Hundred Years of (Prof. Alexander Findlay), second edition, *review* by Prof. John Read, 946
  Inorganic; The Impact of Radioactivity on (Prof. H. J. Emeléus), 212
  Laboratory Organic, *review*, 164
  Organic; Synthetic Methods of (W. Theilheimer), Vol. I, translated from the German by Hans Wynberg, *review* by Prof. J. W. Cook, 202
  Physical (Dr. E. D. Eastman and Prof. G. K. Roolefson), *review* by Dr. J. A. V. Butler, 125
  Physical (A. J. Mee), third edition, *review* by Dr. J. A. V. Butler, 125
  Physical; Annual Review of (Annual Reviews, Inc.), 60
  Physical; Definitions of Bond-Energy in (Dr. H. A. Skinner and Dr. H. D. Springall), 343 ; (Dr. L. H. Long), 344
  Physical; The Elements of (Prof. Samuel Glasstone), third printing, *review* by Dr. J. A. V. Butler, 125
  Physical; What is, *review* by Dr. J. A. V. Butler, 125
  Preparative Organic; Newer Methods of, translated and revised from the German, *review*, 164
  Process, for the Chemist, *review* by Dr. E. F. G. Herington, 550
  Modern Rubber (Dr. Harry Barron), second edition, *review*, 128
  Specialization and Culture in (Prof. John Read), 399
  Surface, for Industrial Research (J. J. Bikerman), *review* by Dr. A. S. C. Lawrence, 164
Chemistry of Acetylene and related Compounds (Ernst David Bergmann), *review* by R. A. Raphael, 715
Chemistry of Free Radicals (Dr. W. A. Waters), second edition, *review* by George Porter, 390
Chemistry in the Service of Man (Prof. Alexander Findlay), seventh edition, *review*, 128
Chemistry at the University of Birmingham, 16
Chemistry at the University College of North Wales, Bangor, 95
Chemistry and Biology: Wave Mechanics in Physics, (Prof. C. A. Coulson), 504
Chemistry and Chemical Technology at University College, Dublin, 768
Chemistry, Metabolism and Biological Effects of Steroid Hormones (University of Wisconsin and the U.S. National Research Council Committee on Growth Symposium on), 176
Chemistry Research, 1938 to 1946, 91
Chemotherapy (Tumor) : Approaches to (American Association for the Advancement of Science, Chemistry Section, Symposium on), edited by Forest Ray Moulton, *review* by Dr. I. Hieger, 713
Chick Embryo (Developing) : Cultivation of *Trypanosoma cruzi* in the (Dr. P. N. Ganapati), 963
Child : The Mind of the, *review* by Dr. O. L. Zangwill, 871
Childhood and After (Dr. Susan Isaacs), *review* by Dr. O. L. Zangwill, 871
Children : Empire's—The People of Tzintzunzan (George M. Foster, assisted by Gabriel Ospina), 270
Children as Naturalists (Margaret M. Hutchinson), *review* by T. H. Hawkins, 595
Chile : Medical Progress in, 137
China : Earthquake in Sikang Province on May 25, 211
Chlorocruorin and Hæmoglobin : Carbon Monoxide Affinity of (Prof. H. Munro Fox), 20
Chlorophyll Solutions : Concentration Quenching of Fluorescence in (W. F. Watson and Robert Livingston), 452
Chloroplasts of *Beta vulgaris* : Localization of Polyphenoloxidase in the (Prof. Daniel I. Arnon), 341
Chlorosis of Bananas in the Cameroons : Infectious (Prof. C. W. Wardlaw), 894
Cholinesterases (Dr. Klas-Bertil Augustinsson), 194
Chromatograms (Partition) : Effect of Salt on (Dr. R. Consden and Dr. A. H. Gordon), 180
Chromatography : Introductory Notes on (British Drug Houses, Ltd.), 1007
  A New Method for the Preparation of Adsorbents for (D. E. Weiss), 372
  Rapid R_F Measurement in (D. M. P. Phillips), 29
  Paper, of the Noble Metals (Michael Lederer), 776
  Paper Partition; Application of, to the Separation of the Sugars and their Methylated Derivatives on a Column of Powdered Cellulose (L. Hough, Dr. J. K. N. Jones and W. H. Wadman), 448
  Partition, on Paper, its Scope and Application (Dr. R. Consden), 359
  Partition, on Starch of Ribonucleosides (Peter Reichard), 662
Chromatography of Dinitrophenyl Amino-acids and Peptides (D. M. P. Phillips and J. M. L. Stephen), 152
Chromatography for General Chemical Analysis (Dr. R. Consden), 1007
Chromatography of Sugars and related Substances (W. W. Binkley and M. L. Wolfram), 1007
Chromatography Tanks : Construction of Troughs for Use in (H. F. Atkinson), 858
Chromium Steels : A New Carbide in (H. J. Goldschmidt), 855
Chromobacterium iodinum : Structure of the Pigment of (Prof. G. R. Clemo and A. F. Daglish), 776
Y-Chromosome: Role of the, in the Determination of Cell-size in *D. melanogaster* (Prof. Claudio Barigozzi), 30
Chromosome Fragmentation Induced by Hexachlorocyclohexane : Atypical Growth, Abnormal Mitosis, Polyploidy and (Dontcho Kostoff), 845
Chromosome Number in *Ribes nigrum* : Cryptic Polyploidy and Variation of (Dr. Antero Vaarama), 782
Chromosome Structure in Resting Cells : Electron Optical Observations on (Fernando Calvet, Benjamin M. Siegel and Dr. Kurt G. Stern), 305
Chromosomes (Metaphase and Interphase) : Relative X-Ray Sensitivity of (Dr. Arnold H. Sparrow), 651
Chromosomes, Nucleoli and Cytoplasm : Enzymatic Degradation of Ribonucleoproteins of (Dr. Berwind P. Kaufmann, Margaret McDonald and Helen Gay), 814
Chrysotile : X-Ray Diffraction Effect shown by some Specimens of (J. G. Jones and Dr. A. J. C. Wilson), 334
Chymia, Annual Studies in the History of Chemistry (edited by Tenney L. Davis), Vol. I, *review*, 278
Ciliates : Induced and Spontaneous Abnormality in (Dr. Ll. Lloyd), 188
Cinematograph Films of Living Cells (C. C. Speidel), 249
Circulation : A Simple Method for Direct Comparison of the Depressant Effect of the Barbiturates on the Respiration and (Sten Wiedling), 1003
  Blood Capillary, under Normal Conditions and in Traumatic Shock (Prof. Robert Chambers), 835
Citrinin : Structure of (J. P. Brown, N. J. Cartwright, Prof. A. Robertson and S. B. Whalley), 72
Civil Engineering : Biology and (Institution of Civil Engineers Conference on), 99, 801
Civil Engineering Problems in the Colonies (Institution of Civil Engineers Conference on), 18
Cladoceran in Britain : Apus and a Rare (Prof. H. Munro Fox), 116
Classification of Bacteria, *review* by Dr. S. T. Cowan, 833
Classification of Leptosporangiate Ferns : A Revised (E. E. Holttum), *review* by Prof. I. Manton, 314
Clay Minerals as Catalysts and Adsorbents (Clay Minerals Group of the Mineralogical Society Discussion on), 195
Cleaning and Care of the National Gallery Pictures (W. G. Constable), 166
Clinical Endocrinology and Constitutional Medicine (Dr. A. P. Cawadias), *review*, 512
Clinical Potentialities of Certain Bisquaternary Salts causing Neuromuscular and Ganglionic Block (Dr. W. D. M. Paton and Dr. E. J. Zaimis), 810
Clocks and Watches, *review* by R. A. Fell, 163
Clouds (Scatter) : Observations of (T. L. Eckersley), 24
Clutch and Brood-size in the Robin (David Lack), 250
Coal (Bituminous) : Solubility of, in Alcoholic Potash (N. Berkowitz), 960
Coals (Bright) : Extraction of, by Anhydrous Ethylene Diamine (I.G.C. Dryden), 959
Coast of Britain : *Laminaria ochroleuca* De La Pylaie Growing on the (Mary Parke), 295

of England and Wales : A Picture Book of the Whole (J. A. Steers), *review* by L. D. S., 638
Coast of Northumberland : Occurrence of *Talorchestia brito* on the (Donald I. Williamson), 295
Coastal Waves (British Association, Section A (Mathematics and Physics), Symposium on), 682
Cobalt : Concentration of, by Micro-organisms and its relation to Cobalt Deficiency in Sheep (Dr. J. Tosic and Dr. R. L. Mitchell), 502
  Presence of, in the Anti-Pernicious Anaemia Factor (Dr. E. Lester Smith), 144
Cobalt Deficiency in Sheep : Concentration of Cobalt by Micro-organisms and its relation to (Dr. J. Tosic and Dr. R. L. Mitchell), 502
Co_2Al_9 : Structure of (Mrs. A. M. B. Douglas), 565 ; (Dr. G. V. Raynor and M. B. Waldron), 566
Cocoa Disease in the Gold Coast, 689
Coe Fen, Cambridge : Variation of Ground-Levels on (E. G. Sterland), 532
Cognition : Nature and, *review* by Dr. R. Fürth, 509
Coiba Island : Earthquake on July 20, 768
Coins in Ancient India : The Technique of Casting (Prof. F. C. Thompson), 266
Colchicine Derivatives : Synthesis of (G. L. Buchanan, Prof. J. W. Cook, Dr. J. D. Loudon and J. MacMillan), 692
Colchicine Method : Experimental Hydronephrosis studied by the (Dr. Marc Herlant), 251
Cold Working of Aluminium at Low Temperatures (T. S. Hutchinson), 374
Cold-worked Metals : X-Ray Line Broadening in (M. S. Paterson and Dr. E. Orowan), 991
Collagen : Low-Angle X-Ray Diffraction Pattern of (Barbara A. Wright), 23
Colloidal Particles : Forces between, *review* by Dr. J. A. V. Butler, 315
Colloids (Lyophobic) : Theory of the Stability of (E. J. W. Verwey and J. Th. G. Overbeek, with the collaboration of K. van Nes), *review* by Dr. J. A. V. Butler, 315
Colonial Capital: Nairobi, Master Plan for a (Prof. L. W. Thornton White, L. Silberman and P. R. Anderson), *review*, 432
Colonial Development : Aspects of, 547
  Some Biological Aspects of (Sir Frank Stockdale), 476
  Scientific Aspects of (British Association, Section E (Geography), Discussion on), 556
Colonial Exhibitions : Research Studentships and Dominion and (Trinity College, Cambridge), 990
Colonial Medical Research Fellowships, 607
Colonial National Incomes : The Measurement of (Phyllis Deane), *review* by D. Randal Wightman, 431
Colonies : Civil Engineering Problems in the (Institution of Civil Engineers Conference on), 18
  Higher Education in the (Universities of the British Commonwealth Discussion on), 99, 478
Colorado Beetles : A Method of Distinguishing between Young and Old (E. Dunn), 75
Colour and Colour Vision in Animals (British Association, Section D (Zoology), Discussion on), 600
Colour and Fluorescence Reactions in the Steroid and Synthetic Œstrogen Series : New (Dr. R. J. Boscott), 577
Colour Changes: Animal, and their Neurohumours (George Howard Parker), *review* by Dr. H. Waring, 84
Colour Sensation : The Fundamental (Dr. A. H. S. Holbourn), 26
Colour Terminology : Report on (Colour Group of the Physical Society), 54
Colour Vision (British Association, Section I (Physiology), Discussion on), 639
  Multiple Allelomorphs in (Dr. R. W. Pickford), 684
  Recent Advances in (Prof. H. Hartridge), 403
  Human, and Granit's Theory (Dr. R. W. Pickford), 414
Colour Vision in Animals : Colour and (British Association, Section D (Zoology), Discussion on), 600
Colouring Matters of the Aphididae (H. Duewell, J. P. E. Human, Dr. A. W. Johnson, Dr. S. F. MacDonald and Prof. A. R. Todd), 759
Colours of Surfaces of Small Subtense : Apparent (W. E. Knowles Middleton), 486
Colpomenia sinuosa (Mert.) Derb. et Sol. in Scotland (Helen Blackler), 1001
Colwyn Medal of the Institution of the Rubber Industry presented to Dr. R. P. Dinsmore, 211
Combustion Conditions : Use of the Calyx Burner to determine (A. R. Bennett and D. Harrison), 371
Comet 1948 I (Dr. R. d'E. Atkinson), 809
Commandant's House at Margidunum (Dr. Felix Oswald), 78
Commercial Cultivation of Root Vegetables (Ministry of Agriculture and Fisheries Bulletin No. 120), new revision of the third edition, 365
Commonwealth (British) : Movements of Population in the (British Association, Section E (Geography), Symposium on), 718
  Sixth Congress of the Universities of the, 99, 441, 478, 585
Commonwealth Entomological Conference : Fifth, 99, 308
Commonwealth Mycological Conference : Fourth, 60
Communities at Work : Co-operative (Henrik F. Infield), *review*, 45
Community : The Corresponding Societies and the (Prof. H. J. Fleure), 406
Comparative Anatomy : A Concise (William Henry Atwood), *review* by Dr. N. B. Eales, 980
Comparative Pathology : International Congress of (Fifth meeting in Istanbul), 844
Compensators : Tilted-Plate (F. Record), 454
Complement : Inactivation of, by Nitrogen Mustard (W. H. Watkins and Prof. A. Wormall), 535
Complex Stresses : Work-Hardening under (Dr. K. H. Swainger), 532
Compounds (Inorganic) : A New Method for the Separation, Detection and Estimation of (T. V. Arden, Dr. F. H. Burstall, Dr. G. R. Davies, J. A. Lewis and Prof. R. P. Linstead), 691
Compression Stress : Creep of Metals subjected to (A. H. Sully, G. N. Cale and G. Willoughby), 411
Computing Mechanisms and Linkages (Antonin Svoboda), *review* by John Womersley, 85
Concentration of Cobalt by Micro-organisms and its relation to Cobalt Deficiency in Sheep (Dr. J. Tosic and Dr. R. L. Mitchell), 502
Concentration Quenching of Fluorescence in Chlorophyll Solutions (W. F. Watson and Robert Livingston), 452
Condensation of Interstellar Material into Stars (F. Hoyle), 233
Condensation of Water Vapour below 0° C. (E. M. Fournier D'Albe), 921
Condensed Systems: The Green Auroral Line as an Initiator of Phosphorescence in (Prof. L. Vegard and G. Kvifte), 967
Conessine : Constitution of (Prof. R. D. Haworth, J. McKenna and Nazar Singh), 22
Conferences : Financial Aid for Delegates at (British Council), 808
Connective Tissue (Interstitial) : Influence of Hydrogen Ions and Neutral Salts upon the Hydration of (Dr. T. D. Day), 152
Conservation of Pictures : Scientific Method in the, 161
Constellation of Cassiopeia : A New Intense Source of Radio-Frequency Radiation in the (M. Ryle and F. G. Smith), 462
Constitution (New) : The Federalist, or the (Alexander Hamilton, James Madison and John Jay), *review* by Maurice Bruce, 238
Constitution of Conessine (Prof. R. D. Haworth, J. McKenna and Nazar Singh), 22
Constitution of Glass : Some Aspects of the Nature and (International Commission on Glass and the Society of Glass Technology Symposium on), 938
Constitution of Materials : Some New Rheological Phenomena and their Significance for the (S. M. Freeman and K. Weissenberg), 320
Constitution of the Planets (Rupert Wildt), 345
Constitutional Medicine : Clinical Endocrinology and (Dr. A. P. Cawadias), *review*, 512
Constitutions : Laws and, *review* by Maurice Bruce, 238
Consumer in relation to Non-Competitive Industry (Herbert Morrison), 807
Continents : The Formation of the, by Convection (G. F. S. Hills), *review* by Prof. H. H. Read, 981
Contour Delineation in the Electronic Fourier Synthesizer for Crystal Structure Analysis : Quantitative Electron-Density (Prof. R. Pepinsky and D. Sayre), 22
Contractile Vacuoles : Osmoregulatory Capacity of (Dr. J. A. Kitching), 149
Control : Instrumentation and, including Electronic Devices (British Association, Section A (Physics), Symposium on), 761
Control of Weeds : Recent Developments in the (Prof. G. E. Blackman), 249
Convalescence : Metabolic Aspects of (Transactions of the Fifteenth Meeting of the Conference on), 157
Convection : The Formation of the Continents by (G. F. S. Hills), *review* by Prof. H. H. Read, 981
Conversion of DL-Serine into Inactive Cystine (Dr. D. F. Elliott), 658
Convex Bodies : Projected Area of (V. Voux), 330
Cooled-Anode Valves : The Development and Design of (F. Smith), 767
Co-operation : The Anatomy of, *review* by E. F. L. Brech, 796
Co-operative Communities at Work (Henrik F. Infield), *review*, 45
Coopers Hill War Memorial Prize of the Institution of Civil Engineers awarded to Prof. A. L. L. Baker, 865
Copenhagen Exhibition : Scientific Instruments at the, 837
Copley Medal for 1948 of the Royal Society awarded to Prof. A. V. Hill, 807, 872
Copolymer in Solution : Degradation of a Vinylidene Chloride (D. L. C. Jackson and W. S. Reid), 29
Copper : Reconstruction of Laccase from its Protein and (A. Tissières), 340
Copper Sulphate : Paramagnetic Resonance in—Experimental Investigation (D. M. S. Bagguley and Dr. J. H. E. Griffiths), 538 ; Theory (Prof. M. H. L. Pryce), 539
Copper, Silver and Gold : Hydride and Deuteride Bands of Aluminium, (Bengt E. Nilsson), 109
Coprinus fimetarius (L.) : Mutations induced in, by Nitrogen Mustard (Lisbeth Fries), 846
Core of the Insulin Molecule : The (Dr. J. A. V. Butler, D. M. P. Phillips and J. M. L. Stephen), 418
Cornwall: Bird Life in (B. H. Ryves), *review* by Frances Pitt, 7
Corresponding Societies and the Community (Prof. H. J. Fleure), 406
Corrosion : Intergranular, of Pure Aluminium in relation to the Behaviour of Grain-Boundaries during Melting (Prof. G. Chaudron, Dr. F. Lacombe and N. Yannaquis), 854
  Metallic; An Introduction to (Dr. Ulick R. Evans), *review* by Dr. J. C. Hudson, 316
Corrosion of Metals, *review* by Dr. J. C. Hudson, 316
Cosmic Phenomena in the Kitak Al-Muntazam of Ibn Al-Jauzi, and a few in Tarikh-E-Rahat Afza : Further References to (Mohd. Abdur Rahman Khan), 289
Cosmic Radiation : Observations on the Production of Mesons by (Dr. G. P. S. Occhialini and Dr. C. F. Powell), 168
  Observations on Slow Mesons of the (U. Camerini, H. Muirhead, Dr. C. F. Powell and D. M. Ritson), 433
Cosmic Ray Showers (Penetrating) : Latitude Effect of (Dr. V. Appapillai and Prof. A. W. Mailvaganam), 887
Cosmic Ray Stars : Origin of (Dr. E. P. George), 333
Cosmic Rays : Origin of (J. W. Dungey and F. Hoyle), 888
  Sidereal Variations of (A. R. Hogg), 613
Cosmic Rays and Nuclear Physics (Prof. L. Jánossy), *review* by Prof. T. G. Cowling, 513
Cotton : Taxonomy and Evolution of, *review* by E. Lord, 716
Cotton Rat : Course of Untreated Infections of *Litomosoides carinii* in the (W. E. Kershaw and Dr. D. S. Bertram), 149
Cottonseed and Cottonseed Products (edited by Alton E. Bailey), *review* by Prof. T. P. Hilditch, 832
Councils and their Schools (P. E. P. Broadsheets on), 941
Counters : Electron and Nuclear (Prof. Serge A. Korff), fourth printing, *review* by Dr. C. H. Westcott, 551
Cow : Preservation of the Fertilizing Capacity of Bull Semen in the Genital Tract of the (Prof. M. Vandeplassche and Dr. F. Paredis), 813
Creep of Metals subjected to Compression Stress (A. H. Sully, G. N. Cale and G. Willoughby), 411
Creep of Metals and Recrystallization (Prof. E. N. da C. Andrade), 410
Crops of the Caribbean, 121
Crops and Livestock : Inbreeding and Hybrid Vigour in (British Association, Sections M (Agriculture), K (Botany), and D (Zoology), joint Discussion on), 642
Cryptic Polyploidy and Variation of Chromosome Number in *Ribes nigrum* (Dr. Antero Vaarama), 782
Crystal Rectifiers (Prof. Henry C. Torrey and Prof. Charles A. Whitmer), *review* by Dr. J. A. Saxton, 868

Crystal Structure of Acetanilide—Use of Polarized Infra-Red Radiation (Dr. C. J. Brown and D. E. C. Corbridge), 72
Crystal Structure of 'Gammexane' (G. W. van Vloten, Ch. A. Kruissink, B. Strijk and J. M. Bijvoet), 771
Crystal Structure of Nitronium Perchlorate (Prof. E. G. Cox, Dr. G. A. Jeffrey and M. R. Truter), 259
Crystal Structure of *B*-Starch from X-Ray Fibre Diagrams (Prof. R. E. Rundle), 107
Crystal Structure of *d*-Tartaric Acid (Dr. C. A. Beevers and F. Stern), 854
Crystal Structure of Uranium Oxide (U_3O_8), (Fredrik, Grønvold), 70
Crystal Structure Analysis: Quantitative Electron-Density Contour Delineation in the Electronic Fourier Synthesizer for (Prof. R. Pepinsky and D. Sayre), 22
Crystal Structures: X-Rays and the Eigen-Vibrations of (Sir C. V. Raman), 23
Crystal Structures of the Acid Salts of some Monocarboxylic Acids (Dr. J. C. Speakman), 695
Crystal Wires of Cadmium : Surface Effects with Single (Prof. E. N. da C. Andrade and R. F. Y. Randall), 890
Crystalline Protein and Nucleoprotein from a Plant Virus: Specific, having Insect Vectors (Dr. Roy Markham, Dr. R. E. F. Matthews and Dr. Kenneth M. Smith), 88
Crystalline State : Recent Advances in the Study of the (Sir Lawrence Bragg), 399
Crystalline Turnip Yellow Mosaic Virus : Unit Cell Measurements of Wet and Dry (Prof. J. D. Bernal and Dr. C. H. Carlisle), 139
Crystallization of Whale Myoglobin (Joan Kellin and K. Schmid), 496
Crystals : Spontaneous Deformation of (Prof. R. W. Wood), 523
  Surface Layers of (P. B. Hirsch and the late Dr. J. N. Kellar), 609
  X-Ray Scattering by Thermal Vibrations in (Dr. Kathleen Lonsdale), 216
Cubic Threefold : Irrationality of the General (Prof. G. Fano), 563
Cucurbitaceae : Extrafloral Glands of (Dr. H. L. Chakravarty), 576
Culex molestus under Sterile Conditions : Growth of (E. P. Lichtenstein), 227
Cultivation of Root Vegetables : Commercial (Ministry of Agriculture and Fisheries Bulletin No. 120), new revision of the third edition, 365
Cultural Geography of the Tarascan Area, Mexico (Robert C. West), 728
Cultural and Spiritual Progress of Mankind, 589
Culture Collections of Micro-organisms, 447
Culture Media (Embryo) : A Simple Apparatus for Adding Seitz-Filtered Components Aseptically to (S. G. Stephens), 932
Cuprous and Silver Salts of Fatty Acids : Volatile (A. Keller and Dr. F. Körösy), 580
Curare and the Potassium Ion at the Motor End Plate : Interaction between (P. E. B. Holmes, D. J. Jenden and Dr. D. B. Taylor), 217
Curriculum : The Place of Biology in a (Prof. H. Graham Cannon), 1006
Cyanogen Compounds (Herbert E. Williams), second edition, *review* by Prof. J. R. Partington, 430
Cyanogen and related Compounds with Butadiene : Reaction of (Dr. G. J. Janz and P. J. Hawkins), 28
Cystine (inactive) : Conversion of DL-Serine into (Dr. D. F. Elliott), 658
Cysts in the Syrian Hamster : Testicular Hypoplasia and Epididymal (Humberto Granados and Prof. Henrik Dam), 297
Cytochemical Demonstration of Ketosteroids (Dr. R. J. Boscott, Anita M. Mandl, Dr. J. F. Danielli and Dr. C. W. Shoppee), 572
Cytochemistry of the Gonadotropic Hormones (Anthony G. Everson Pearse), 651
Cytological Research and Biophysics, *review* by Dr. J. Danielli, 753
Cytology of the Honey Bee, *Apis mellifica* L. (Dr. Ann R. Sanderson and David W. Hall), 34
Cytoplasm : Enzymatic Degradation of Ribonucleoproteins of Chromosomes, Nucleoli and (Dr. Berwind P. Kaufmann, Margaret McDonald and Helen Gay), 814

D-REGION (Ionospheric): Electric Conductivity of the (Dr. D. F. Martyn), 142 ; (Prof. T. G. Cowling and R. Borger), 143
Dairy Products : Chemical and Physical Investigations on (H. Eilers, R. N. J. Saal and M. van der Waarden), *review* by H. D. K., 87
Dairy Science : Indian (Prof. H. D. Kay), 864
Danish Cancer Researcher, Johannes Fibiger, Professor in the University of Copenhagen (Prof. Knud Secher), *review* by Dr. P. R. Peacock, 162
Daphnia : Passage of Haemoglobin from Blood into Eggs of (Elisabeth I. B. Dresel), 736
Darkness into Daylight Exhibition at the Science Museum : Exhibits to be incorporated in the permanent collection on Illumination, 564
Darwin Medal for 1948 of the Royal Society awarded to Prof. R. A. Fisher, 807, 874
Data from Electrical Resistivity Geophysical Surveys : Interpretation of (Dr. S. Whitehead and Dr. W. G. Radley), 187 ; (J. M. Hough), 187, 970
Davy Medal for 1948 of the Royal Society awarded to Prof. E. L. Hirst, 807, 873
Daylight: Darkness into (Exhibits at the Science Museum to be incorporated in the permanent collection on Illumination), 564
D.D.T. : Site of Action of, and Cause of Death after Acute D.D.T. Poisoning (D. Dresden), 1000
  Toxicity of (Surgeon-Lieut. F. M. G. Stammers and Lieut.-Comdr. F. G. Sarel Whitfield), 120
D.D.T. in the Soil : Persistence of (Philip B. Carne), 743
D.D.T. Poisoning (Acute) : Site of Action of D.D.T. and Cause of Death after (D. Dresden), 1000
Dead Times in Geiger-Müller Counters : Reduction of (B. Collinge), 853
Deamination of Amino-Acids by X-Rays (Gabriel Stein and Dr. Joseph Weiss), 184
Death after Acute D.D.T. Poisoning : Site of Action of D.D.T. and Cause of (D. Dresden), 1000
Decarboxylation : Production of Quinolyl and Pyridyl Anions during (B. R. Brown, Dr. D. Ll. Hammick and B. H. Thewlis), 73
Decarboxylation of Oxalacetate by Blood (Peter M. Nossal), 36
Decay of Barium-139 (L. R. Shepherd and J. M. Hill), 566
Decay of Tin-115 to Indium-115 by Electron Capture : Evidence of Geological Age against (Dr. L. H. Ahrens), 413
Decay Scheme of ^{181}Hf (J. Benes, A. Ghosh, A. Hedgran and N. Hole), 262
Decay and Capture of Slow Mesons in Dielectrics (Dr. H. Fröhlich, R. Huby R. Kolodziejski and R. L. Rosenberg), 450
Dedication of Private Woodlands (Forestry Commission Booklet No. 2), 364
Deep-Sea Expedition : The Swedish (Prof. Hans Pettersson), 324
Definition of Good (Dr. A. C. Ewing), *review* by F. I. G. Rawlins, 944
Definitions of Bond-Energy in Physical Chemistry (Dr. H. A. Skinner and Dr. H. D. Springall), 343 : (Dr. L. H. Long), 344
Deformation of Crystals : Spontaneous (Prof. R. W. Wood), 523
Degradation of a Vinylidene Chloride Copolymer in Solution (D. L. C. Jackson and W. S. Reid), 29
Delayed Neutrons (S. Das), 853
Delegates at Conferences : Financial Aid for (British Council), 808
Demography between the Two World Wars, *review* by Prof. H. J. Fleure, 428
Density of the Blackfish Petrosal (Prof. L. R. Richardson), 150
Dentition of the Orang-utan : Evolution of the (Dr. D. A. Hooijer), 306
Deodorization of Shark Liver Oil (P. K. Mathew, Prof. P. V. Nair, T. A. Ramakrishnan and H. Sreemulanathan), 494
Depressant Effect of the Barbiturates on the Respiration and Circulation : A Simple Method for Direct Comparison of the (Sten Wiedling), 1003
Derivatives of N-Methyl-2-Pyridone from Nicotinic Acid and Nicotinamide : Synthesis of (Chr. Wiegand and W. I. M. Holman), 659
Designer : Stress Analysis and the (Institute of Physics, Stress Analysis Group, Discussion on), 119
Destruction of Urinary Glucuronide by Bacteria (Mary Barber, B. W. L. Brooksbank and Dr. G. A. D. Haslewood), 701
Destruction and Rehabilitation of an Island Fauna, *review*, 552
Detection and Estimation of Inorganic Compounds : A New Method for the Separation, (T. V. Arden, Dr. F. H. Burstall, Dr. G. R. Davies, J. A. Lewis and Prof. R. P. Linstead), 691
Determination of Mixing of Gas Streams by the Infra-Red Gas Analyser (R. D. Collins and M. P. Newby), 224
Determination of Plant Densities (E. J. Machin), 257 ; (Prof. M. S. Bartlett), 621
Detonation in Liquid Explosives (D. Croney), 490
Detonation in Solid High Explosives : Low-Order (T. C. Tranter), 335
Detoxication Mechanisms (Dr. R. Tecwyn Williams), *review* by Dr. E. Boyland, 127
Deuteride Bands of Aluminium, Copper, Silver and Gold : Hydride and (Bengt E. Nilsson), 109
Deuterium and Beryllium : Photodisintegration of, by Thorium C″ γ-Rays (D. L. Allan and M. J. Poole), 373
Deuteron : Photodisintegration of the (R. Wilson, C. H. Collie and Dr. H. Halban), 185
Developing Embryo of the Stick Insect : Utilization of Mineral Constituents of the Egg-shell by the (A. Moscona), 62
Development of Science in the Seventeenth Century : Christian Huygens and the (Dr. A. E. Bell), *review* by Prof. E. N. da C. Andrade, 472
Development of Spark Discharges (R. F. Saxe and Prof. J. M. Meek), 263 ; (Dr. T. E. Allibone), 264
Developments in Forestry : Modern, 974
Diabetogenic Substances : Species Difference in the Biosynthesis of Vitamin C and Response to (Prof. M. C. Nath, C. H. Chakraborty, V. G. Hatwaine and Kusum S. Laul), 660
Diameter: Feret's Statistical, as a Measure of Particle Size (W. H. Walton), 329
Diazo-Oxides (J. D. C. Anderson and Prof. R. J. W. Le Fèvre), 449
Dibenzofuran : Purity of Diphenylene Oxide (A. Fowler Williams), 925
C_4-dicarboxylic Acids: Fermentation of Pyruvate, *β*-Hydroxybutyrate and of, by some Butyric Acid-forming Organisms (Dr. Georges N. Cohen and Germaine Cohen-Bazire), 578
Dielectric Behaviour of Methyl Palmitate—Evidence of Resonance Absorption (J. S. Dryden and Prof. Willis Jackson), 656
Dielectric Properties of Mixed Barium and Strontium Titanates at 10,000 Mc./s. (Dr. J. G. Powles), 655, *erratum*, 690
Dielectric Properties of Titanates at Ultra-high Frequencies (Dr. J. G. Powles), 614
Dielectric Relaxation-Times of Solid Solutions of Aliphatic Long-Chain Esters and Ketones in Paraffin Wax and *n*-Hexacosanes (R. J. Meakins), 994
Dielectric-loaded Wave-Guide for Linear Electron Accelerators : A Proposed New Form of (R. B. R.-Shersby-Harvie), 890
Dielectrics : Decay and Capture of Slow Mesons in (Dr. H. Fröhlich, R. Huby, R. Kolodziejski and R. L. Rosenberg), 450
N-Diethylaminoethylphenothiazine, a Specific Inhibitor of Pseudocholinesterase (Dr. J. J. Gordon), 146
Difference Equations in the Real Domain : Finite Differences and (Prof. Tomlinson Fort), *review* by L. M. M.-T., 391
Difference-Differential Equations (Prof. E. M. Wright), 334
Differential Analyser : The (J. Crank), *review* by John Womersley, 85
Differential Staining of Lignified Cell Walls : A Simple Technique for the (Dr. Iwo R. W. Lominski and S. A. Hutchinson), 415
Diffraction from the Ionosphere and the Fading of Radio Waves (J. A. Ratcliffe), 9
Diffraction Patterns (X-Ray and Electron): An Optical Analogue of (J. Dyson), 140
Diffusion Currents at Wire Electrodes : Limiting (Dr. A. Hickling and W. H. Wilson), 489
Digital Computers : Electronic (Prof. F. C. Williams and T. Kilburn), 487
Dihydrosanguinarine and Sanguinarine : Isolation from Argemone Oil of—Toxicity of Sanguinarine (S. N. Sarkar), 265
α : *β*-Dihydroxy-*γ*-(2-methyl-phenoxy) propane ('Myanesin'): Metabolism of (E. L. Graves, T. J. Elliott and Dr. W. Bradley), 257
Dimple-Based Pottery from Central Kavirondo, Kenya Colony (M. D. Leakey, the late W. E. Owen and L. S. B. Leakey), *review* by Bernard Fagg, 834
Dinitrogen Tetroxide (Liquid) : Ionic Reactions in (Dr. C. C. Thomas and R. Thompson), 369
Dinitrophenyl Amino-acids and Peptides : Chromatography of (D. M. P. Phillips and J. M. L. Stephen), 152
Dinitrososulphite Ion : Structure of the (Prof. M. G. Evans and J. Gergely), 770

Diphenylene Oxide (Dibenzofuran) : Purity of (A. Fowler Williams), 925
Dipole Moments of some Styrenes : Electric (K. B. Everard and Dr. L. E. Sutton), 104
Directory of Natural History Societies (Amateur Entomologists' Society), 647
Discharge Lamps for Photography and Projection (H. K. Bourne), *review* by J. N. Aldington, 758
Discrete Sources of Galactic Radio Frequency Noise (J. G. Bolton), 141
Discriminating 'Athrocytes' in the Recticulo-endothelial System (Dr. L. Lison and J. Smulders), 65
Diseases: Venereal (Dr. John Marshall), second edition, *review* by Dr. T. E. Osmond, 86
  Virus; Immunity to, 92
Diseases of Mushroom Cultivation (Mushroom Growers' Association, Bulletins 11 and 12, and Leaflet 3, on), 289
Disintegration of Nitrogen by Fast Neutrons (C. P. Sikkema), 698
Disintegration of Sodium, Aluminium and Fluorine by Protons : Short-Range α-Particles from the (Joan M. Freeman and A. S. Baxter), 696
Dispersion of Ultrasonic Waves in Acetic Acid : Absorption and (Dr. John Lamb, J. H. Andreae and R. Bird), 993
Distinguishing between Young and Old Colorado Beetles : A Method of (E. Dunn), 75
Distribution of Lugworms (Dr. G. E. Newell and Garth Chapman), 75
Distributions of Insect Populations : Truncated Log-Normal and Root-Normal Frequency (D. Spiller), 530
Disulphides (Organic) : Photolysis of (Dr. L. E. Lyons), 1004
Doctor : The Training of a (British Medical Association), 311
Dog : The Book of the (edited by Brian Vesey-Fitzgerald), *review* by Lieut.-Colonel C. E. G. Hope, 677
Dog Fed with Tumour Proteins : Excretion of D-Pyrrolidone Carboxylic Acid by Rat and (Prof. F. Kögl, T. J. Barendregt and A. J. Klein), 732
Dogs : Haemophilia in (F. B. Hutt, C. G. Rickard and R. A. Field), 136
Dogs in Britain (Clifford L. B. Hubbard), *review* by Brian Vesey-Fitzgerald, 553
Dogs with Renal Pedicles Clamped : Alloxan Diabetes in (Prof. B. A. Houssay and Dr. C. Martinez), 571
Domain (Real) : Finite Differences and Difference Equations in the (Prof. Tomlinson Fort), *review* by L. M. M.-T., 391
Domestic Heating Research at the Fuel Research Station, Greenwich : Calorimeter Building for (Dr. A. C. Monkhouse), 133
Dominican Republic (north-east coast of) : Earthquake on April 21, 138
Dominion and Colonial Exhibitions : Research Studentships and (Trinity College, Cambridge), 990
Dragon-fly Nymph, *Aeschna cyanea* : Amino-Acids in the Haemolymph of the (Dr. Richard Raper and John Shaw), 999
Drosophila melanogaster : Role of the Y-Chromosome in the Determination of Cell-size in (Prof. Claudio Barigozzi), 30
Drugs : Anti-Cancer, *review* by Dr. I. Hieger, 713
  Effect of, on Actin (Dr. F. B. Straub, G. Feuer and I. Lajos), 217
  Herbs and, *review* by Dr. W. O. James, 636
  Metabolism of, *review* by Dr. E. Boyland, 127
  Use of Rotifera for Testing Analgesics, Narcotics and similar (R. H. Marriott, S. Morris and Y. Larthe), 189
Drugs from Plants (Dr. Trevor Illtyd Williams), *review* by Dr. W. O. James, 636
Dunnione : Structure of (R. G. Cooke), 178
Dust in Industry (Society of Chemical Industry Conference on), 328, 485
Dye-Reduction Tests in Milk : Influence of Time and Temperature of Storage on (R. K. Morton and J. M. Vincent), 415
Dynamic Similarity to Metal Structures with Elastic and Plastic Flow : Application of (M. W. Thring), 193

EARTH: The Beautiful (Zeme Krásná), (J. K. Riha), *review* by J. G. F. D., 49
  The Figure of the (Prof. Harold Jeffreys), 915
  Flowering (Donald Culcross Peattie), *review* by Dr. W. B. Turrill, 679
  Lead Isotopes and the Age of the (Prof. Harold Jeffreys), 822
Earth History, *review* by Prof. H. H. Read, 981
Earth's Surface Materials : Relative Abundances of Potassium and Argon in the (Prof. J. H. J. Poole), 775
Earthquake
  in the region of Skadar, Albania, on August 27, 768
  south of the Alaska Peninsula on June 27, 248
  in the Salta Province of Argentina on August 25, 768
  in Sucre, Bolivia, on March 27, 138
  in the Celebes Sea on June 21, 248
  in Sikang Province, China, on May 25, 211
  on Coiba Island on July 20, 768
  off the north-east coast of the Dominican Republic on April 12, 138
  off the coast of Guatemala on April 12, 138
  off the northern coast of Honduras on June 27, 248
  in Iran on October 5, 647
  in Italy on August 22, 768
  at Apulia, south Italy, on August 18, 768
  at Orda Nova, south Italy, on August 21, 768
  at San Sepolcro, Italy, on June 13, 248
  near Jan Mayen Island on August 30, 768
  in Fukui, Japan, on June 28, 248
  near the southern coast of Honshu, Japan, on June 15, 248
  off the southern coast of Kamchatka on March 23, 138
  on the Island of Levkas, Greece, on June 30, 248
  off the west coast of New Guinea on March 1, 138
  near the New Hebrides on May 23, 211
  in New Zealand on May 23, 211
  in Peru on May 28, 211
  in southern Peru on May 11, 211
  off the south-west coast of Peru on July 20, 768
  off the north-west coast of Luzon, Philippine Islands, on March 3, 138
  in Portugal on August 22, 768
  in the Samoan Islands region on June 29, 249
  at Palermo, Sicily, on May 24, 211
  in the Solomon Islands region on June 18, 248
  in Transcaucasia on June 29, 248
  in the region of Alasehir, Turkey, on August 10, 768
  near Sivrice, Turkey, on August 18, 768
  off the west coast of Oregon, United States, on May 25, 211
Earthquakes
  during March and April, 138 ; during May, 211 ; during June, 248 ; during July and August, 768
  south of the Alaska Peninsula on May 14 and May 17, 211
  near the coast of Guatemala on July 16, 768
  in Japan on June 28, 57
  (swarm of) in the Karlsruhe, Rasstat, Lauterbourg area during June, 249
  registered in New Zealand during June, 690
  near Oporto, Portugal, on April 12, 13 and 15, 768
East Africa : Fertilizer Manufacture in, 522
  Marconi Transmitters for, 248
  Research Services in (Dr. E. B. Worthington), 554
  River Research in (Dr. Vernon D. van Someren), 784
Eclipse : Solar, of November 1, 521
Ecology : Human, the Science of Social Adjustment (Thomas Robertson), *review* by Prof. T. S. Simey, 755
Ecology of Sponges (Dr. Maurice Burton), 73
Economic Entity : The World as an (Business and Brotherhood and Res et Caritas), *review*, 45
Economic Organisation : Primitive Techniques, Agriculture and (British Association, Section H (Anthropology), Discussion on), 602
Economic Recovery : Essays on, *review*, 45
Economic Research in Great Britain : Social and, 905
Economic Survey : World (P.E.P. Broadsheet No. 283), 467
Economic and State Control (Prof. G. C. Allen), 646
Eddington Prize of the Institut International des Sciences théoriques, 690
Education: Adult; Accommodation for (National Foundation for Adult Education Supplement on), 1009
  Adult; The National Foundation for (T. H. Hawkins), 1009
  Adult; Voluntary Agencies in (National Foundation for Adult Education Supplement on), 1009
  Higher, in the Colonies (Universities of the British Commonwealth Discussion on), 99, 478
  Medical, 311
  Rural, and Welfare in the Middle East (H. B. Allen), 53
  University, in Nottingham (Prof. H. T. H. Piaggio), 240
  Veterinary (Prof. W. I. B. Beveridge), 721
  Veterinary—Developments at Cambridge (Dr. James T. Edwards), 721
  Vocational; Principles and Practices of (Prof. Arthur B. Mays), *review* by T. H. Hawkins, 797
Education in Haiti (T. H. Hawkins), 975
Education in and For the Services, 159
Educational Administration, 941
Eelworm (Potato-Root) : Resistance to the (Dr. C. Ellenby), 704
Effect of Radiation Field : Electromagnetic Level-Shift and (Prof. D. S. Kothari and F. C. Auluck), 143
Effect of Sputum on Streptomycin (Herta Schwabacher), 339
Effector Cells : Reaction of, to Chemical Transmitters (Dr. B. Minz), 254
Effects from the Ends of Nerve Fibres : Transmission of (British Association Section I (Physiology), Discussion on), 558
Egg (Hen's) : Permeability of the Membranes of the (Prof. N. Kilssiunis), 77
Egg Membranes of *Locustana pardalina* Walk. : Pore Canals in the (J. J. Matthée), 226
Egg-Laying Battery Management, *review* by T. E. Whittle, 475
Egg-shell : Utilization of Mineral Constituents of the, by the Developing Embryo of the Stick Insect (A. Moscona), 62
Eggs from Every Cage (H. E. Swepstone), *review* by T. E. Whittle, 475
Eggs of *Daphnia* : Passage of Hæmoglobin from Blood into (Elisabeth I. B. Dresel), 736
Ego-Involvements : The Psychology of (Muzafer Sherif and Hadley Cantril), *review* by Dr. John Cohen, 7
Egyptian Materials and Industries : Ancient (A. Lucas), third edition, *review* by M. C. Burkitt, 429
Egyptology in the University of Liverpool, 95
Eigen-Vibrations of Crystal Structures : X-Rays and the (Sir C. V. Raman), 23
Einstein Enigma : The, *review* by Prof. G. C. McVittie, 591
Elastic Constants of Alum Determined by a New Ultrasonic Method (Prof. S. Bhagavantam and B. Ramachandra Rao), 818
Elastic and Plastic Flow : Application of Dynamic Similarity to Metal Structures with (M. W. Thring), 193
Elasticity of Wood and Plywood (Forest Products Research Laboratory, Special Report No. 7), 826
Electric Conductivity of the Ionospheric *D*-Region (Dr. D. F. Martyn), 142 ; (Prof. T. G. Cowling and R. Borger), 143
Electric Conductivity of Rocks at High Temperatures (H. P. Coster), 270
Electric Dipole Moments of some Styrenes (K. B. Everard and Dr. L. E. Sutton), 104
Electric Discharge Lamps : Installing of (Institution of Electrical Engineers Regulations for the Electrical Equipment of Buildings, Revised Section 8), 447
Electrical Breakdown of Organic Insulation by Electro-chemical Reactions (H. F. Church and C. G. Garton), 301
Electrical Engineer : Power Supply and the, 972
Electrical Engineering : Elements of (Prof. Walter J. Creamer), *review* by Prof. J. Greig, 753
  Summer School in (British Thomson-Houston Co., Ltd.), 19
Electrical Potential Change accompanying the Development of Rigor in Iodoacetate-Poisoned Muscle (Y. M. Liu, C. H. Hsu and Dr. T. P. Feng), 962
Electrical Resistance of Wires with Large Strains (Dr. W. Weibull), 966
Electrical Resistivity Geophysical Surveys : Interpretation of Data from (Dr. S. Whitehead and Dr. W. G. Radley), 187 ; (J. M. Hough), 187, 970
Electricity, a Giant Harnessed (Dr. P. Dunsheath Christmas Lectures at the Institution of Electrical Engineers), 990
Electricity and Magnetism : The Engineer's Approach to, *review* by Prof. J. Greig, 753
Electrification of Sand : Frictional (E. W. B. Gill), 568
Electro-chemical Reactions : Electrical Breakdown of Organic Insulation by (H. F. Church and C. G. Garton), 301
Electrode Potentials (Standard) : Variation of, with Temperature (Dr. M. H. Everdell), 995

Electrodes : Vibrating, in Polarography (E. D. Harris and A. J. Lindsey), 413
  Wire; Limiting Diffusion Currents at (Dr. A. Hickling and W. H. Wilson), 489
Electrokinetic Potentials of Aged Barium Sulphate Crystals (Prof. R. Ruyssen and R. Loos), 741
Electrolytic Capacitor (Alexander M. Georgiev), *review*. 911
Electrolytic Polishing and Bright Plating of Metals (Dr. S. Wernick), *review*, 834
Electromagnetic Level-Shift and Effect of Radiation Field (Prof. D. S. Kothari and F. C. Auluck), 143
Electron *invacuo* : The Free, *review* by A. H. Beck, 678
Electron Accelerators : A Proposed New Form of Dielectric-loaded Wave-Guide for Linear (R. B. R.-Shersby-Harvie), 890
Electron Capture : Evidence of Geological Age against Decay of Tin-115 to Indium-115 by (Dr. L. H. Ahrens), 413
Electron Diffraction Patterns : An Optical Analogue of X-Ray and (J. Dyson), 140
Electron Lens : Maxwell's 'Fish Eye' as an Ideal (Prof. Walter Glaser), 455
Electron Microscope Study of Cellulose in the Wall of *Valonia ventricosa* (Dr. R. D. Preston, Dr. E. Nicolai, Dr. R. Reed and A. Millard), 665
Electron Optical Observations on Chromosome Structure in Resting Cells (Fernando Calvet, Benjamin M. Siegel and Dr. Kurt G. Stern), 305
Electron and Nuclear Counters (Prof. Serge A. Korff), fourth printing, *review* by Dr. C. H. Westcott, 551
Electron-Density Contour Delineation in the Electronic Fourier Synthesizer for Crystal Structure Analysis : Quantitative (Prof. R. Pepinsky and D. Sayre), 22
Electron-sensitive Emulsion : Selective Development of Fission Tracks in an (Dr. G. W. W. Stevens), 526
Electronic Applications of Germanium, 982
Electronic Circuits and Tubes (Electronics Training Staff of the Cruft Laboratory, Harvard University), *review* by E. C. Cherry, 126
Electronic Devices : Instrumentation and Control, including (British Association, Section A (Physics), Symposium on), 761
Electronic Digital Computers (Prof. F. C. Williams and T. Kilburn), 487
Electronic Fourier Synthesizer for Crystal Structure Analysis : Quantitative Electron-Density Contour Delineation in the (Prof. R. Pepinsky and D. Sayre), 22
Electronics : Applications of, to Research and Industry (Electronics Group of the Scientific Instrument Manufacturers' Association Symposium on), 485, 769
  Applied, *review* by E. C. Cherry, 126
Electrons : A Magnetic Resonance Accelerator for (Prof. W. J. Henderson, H. LeCaine and R. Montalbetti), 699
  Range-Energy and other Relations for, in Kodak Nuclear Plates (Dr. Marion A. S. Ross and Barbara Zajac), 923
4-MeV. Electrons : A Travelling-Wave Linear Accelerator for (D. W. Fry, R. B. R.-S. Harvie, L. B. Mullett and W. Walkinshaw), 859
Electrons in Gases (Sir John Townsend), *review* by Prof. F. Llewellyn Jones, 276
Electrophoresis : Membrane, in relation to Bioelectrical Polarization Effects (Prof. Torsten Teorell), 961
Element 61 : Promethium, the New Name for, 175
Elements: Physical Periodicity of the Periodic Table of the, in the Light of Statistical Theory (Dr. G. Herdan), 216
Elements and their Compounds : The Rare-Earth (Prof. Don M. Yost, Horace Russell, Jr., and Prof. Clifford S. Garner), *review*, 278
Elimination of Water from Wet Crude Oil (K. A. Clark and D. S. Pasternack), 483
Elm Disease (Prof. E. P. Stebbing), 196
Embryo of the Stick Insect : Utilization of Mineral Constituents of the Egg-shell by the Developing (A. Moscona), 62
Embryo Culture Media : A Simple Apparatus for Adding Seitz-Filtered Components Aseptically to (S. G. Stephens), 932
Emetine : Structure and Biogenesis of (Sir Robert Robinson), 524
'E-MIL' Laboratory Glassware (H. J. Elliott, Ltd.), 974
Emission Schumann—Runge O_2 Bands (M. W. Feast), 214
Emissivity of Small Particles in Flames (H. G. Wolfhard and W. G. Parker), 259
Empire Mining and Metallurgical Congress : Fourth, 606
Empire Scientific Conference, June–July 1946 (Royal Society), Report, *review* by R. B., 679
Empire's Children—The People of Tzintzunzan (George M. Foster, assisted by Gabriel Ospina), 270
Employment of Women (P.E.P. Broadsheet No. 285), 605
Emulsion (Electron-sensitive) : Selective Development of Fission Tracks in an (Dr. G. W. W. Stevens), 526
Emulsions for Nuclear Research : Processing Thick (C. C. Dilworth, Dr. G. P. S. Occhialini and R. M. Payne), 102
Encyclopædia of Eyes, *review* by Dr. E. N. Willmer, 910
Endocrinology and Constitutional Medicine : Clinical (Dr. A. P. Cawadias), *review*, 512
Ends : Means and (T. G. N. Haldane), 972
d'Energia : Le grandi linee di trasmissione ; calcolazione elettrica (A. Dalla Verde), *review* by C. W. Marshall, 277
Engineer : The Young (Wing-Comdr. T. R. Cave-Browne-Cave), 402
Engineers' Approach to Electricity and Magnetism, *review* by Prof. J. Greig, 753
Engineering : Plasticity in (F. K. Th. van Iterson), *review* by G. D. S. MacLellan, 679
  Production and Management; Selected Techniques of Statistical Analysis for Scientific and Industrial Research and (Statistical Research Group, Columbia University), edited by Churchill Eisenhart, Millard W. Hastay and W. Allen Wallis, *review* by Prof. M. S. Bartlett, 510
Engineering Mechanics : Applied (Prof. Alfred Jensen), *review* by R. A. Foulkes, 754
Engineering Research at Cambridge, 117
Engineering Students and Mathematics, 582
England and Wales : A Picture Book of the Whole Coast of (J. A. Steers), *review* by L. D. S., 638
Entomological Aspects of 'Swollen Shoot' of Cacao (F. A. Squire), 743
Entomological Conference : Fifth Commonwealth, 99, 308
Entry and Careers (*Universities Quarterly* Symposium on), 349
Environment in Horticulture : Control of (British Association, Section M (Agriculture), Discussion on), 584
Enzymatic Control of Cell Division in Micro-organisms (Dr. Walter J. Nickerson), 241
Enzymatic Degradation of Ribonucleoproteins of Chromosomes, Nucleoli and Cytoplasm (Dr. Berwind P. Kaufmann, Margaret McDonald and Helen Gay), 814
Enzyme Systems (Respiratory) : Inhibition of some, by Derivatives of Sulphuric Acid (Donald Hockenhull), 813
Eötvös Medal of the Hungarian Academy of Science awarded to Prof. J. Barňóthy and Dr. M. Forró, 100
Epicurus Up to Date, *review* by Prof. A. D. Ritchie, 757
Epididymal Cysts in the Syrian Hamster : Testicular Hypoplasia and (Humberto Granados and Prof. Henrik Dam), 297
Epithelial Tissues of Teleost Fishes : Coarse Granulocytes in (W. T. Catton), 894
Equation of State : An Approximate (Antonio E. Rodriguez), 304
Equations : Difference – Differential (Prof. E. M. Wright), 334
  Introduction to the Theory of (Prof. Lois Wilfred Griffiths), second edition, *review*, 87
Equations in Piezoelectricity (Prof. Walter G. Cady), 933
Equilibrium Diagrams : Systematization of certain Binary Metallic (H. J. Axon), 997
Erkenntnis : Natur und (Prof. Arthur March), *review* by Dr. R. Fürth, 509.
Error in Counting Reticulocytes (Rosemary Biggs), 457
Errors of Treatment Comparisons when Observations are Missing (J. Taylor), 262
i-Erythritol : Production of, by *Aspergillus niger* (John L. Yuill), 652
Erythroblastosis : Fœtal Hæmoglobin and (Dr. H. S. Baar), 190
Erythroblastosis fœtalis : The Very Rare *Rh* Genotype $R_y r$ (*CdE/cde*) in a Case of (Dr. Clara Van den Bosch), 781
Escherichia coli : Production of Indole by (Dr. Edwin A. Dawes), 229
Esperanto and Science, 918
Esterification of Phthalic Anhydride with Primary Alcohols at Room Temperature (F. J. Bristow), 1004
Esters (Silicon) : Treatment of Paper with (Ingvar Jullander), 300
Estimation of Inorganic Compounds : A New Method for the Separation, Detection and (T. V. Arden, Dr. F. H. Burstall, Dr. G. R. Davies, J. A. Lewis and Prof. R. P. Linstead), 691
Ether : Viscosity-Volume Relation for (A. Jobling), 620
Ethical Progress : Material and, 793
Ethylene Diamine : Properties of (Dr. S. G. Boas-Traube, E. M. Dresel and I. G. C. Dryden), 960
  Anhydrous; Extraction of Bright Coals by (I. G. C. Dryden), 959
Ethylene Oxide Explosions (Dr. J. H. Burgoyne and F. A. Burden), 181
Ethylorthoformate : Photochemical Action of (Ahmed Mustafa), 856
Etiology of Grass Disease (Prof. A. Robertson, D. E. Donald, J. S. S. Inglis and H. Paver), 116
Europe: Factors Controlling the Atlantic Coastline of (Muriel A. Arber), 741
Europe's Population in the Inter-War Years (Dudley Kirk), *review* by Prof. H. J. Fleure, 428
Evaluation : Photographic, of Blackout Indices (Dr. Robert W. Lawson), 531
Evaporation on to Liquid Surfaces : Production of Extremely Thin Metal Films by (Prof. Nils Hast), 892
Everyman's Mathematics (F. G. Brown), *review* by Prof. H. T. H. Piaggio, 679
Everything about the Dog, *review* by Lieut.-Colonel C. E. G. Hope, 677
Evolution : Large-Scale, *review* by Prof. C. H. Waddington, 979
  Human; Papers on (Dr. Franz Weidenreich), 484
  Human; A New Theory of (Sir Arthur Keith), *review* by Prof. H. J. Fleure, 352
Evolution of Cotton : Taxonomy and, *review* by E. Lord, 716
Evolution of the Dentition of the Orang-utan (Dr. D. A. Hooijer), 306
Evolution of the Gene (Prof. A. H. Sturtevant), 136
Evolution of Gossypium (J. B. Hutchinson, R. A. Silow and S. G. Stephens), *review* by E. Lord, 716
Evolution of Hydrogen from Ferrous Hydroxide (Dr. U. R. Evans and J. N. Wanklyn), 27
Evolution in Mankind, *review* by Prof. H. J. Fleure, 352
Evolution of the Universe (Dr. G. Gamow), 680 ; (Ralph A. Alpher and Dr. Robert Herman), 774
Ewing (James Alfred) Medal of the Institution of Civil Engineers for 1947 awarded to Sir John Cockcroft, 865
Examinations and Selection Boards, 123
Excavations of a Roman House, 78
Exchange of Scientific Information : International (Prof. N. F. Mott), 417
Exchange of War-time Periodicals with Germany, 96
Exchanges: Inter-University Relations and (Universities of the British Commonwealth Discussion on), 585
Excitation Probability Functions of Atomic and Molecular Energy-Levels (R. W. Nicholls), 487
Excitation Processes in Molecular Nitrogen (R. W. Nicholls), 231
Excited States of Silver Bromide and Iodide (Dr. R. F. Barrow and M. F. R. Mulcahy), 336
Excretion of D-Pyrrolidone Carboxylic Acid by Rat and Dog Fed with Tumour Proteins (Prof. F. Kögl, T. J. Barendregt and A. J. Klein), 732
Exhibitions : Research Studentships and Dominion and Colonial (Trinity College, Cambridge), 990
Experimental Biology : Conference on (National Tsinghua University), 446
Experimental Evidence for the Theory of Quasi-Properties : Further (Dr. G. W. Scott Blair and J. E. Caffyn), 368
Experimental Hydronephrosis studied by the Colchicine Method (Dr. Marc Herlant), 251
Experimental Situation in Psychical Research (S. G. Soal), *review*, 432
Experimental Zoology at Manchester, 645
Experiments on Metabolic Processes, using Isotopic Tracer Elements : Interpretation of (Dr. A. G. Ogston), 963
Explosions : Initiation of, by Grit Particles (Dr. F. P. Bowden and O. A. Gurton), 654
  Ethylene Oxide (Dr. J. H Burgoyne and F. A. Burden), 181
Explosives : Liquid; Detonation in (D. Croney), 490
  Solid High; Low-Order Detonation in (T. C. Tranter), 335
Extinction of Petrol Fires by Methyl Iodide (A. Nicholson), 111
Extracellular Fluid : Renal Regulation of the (Dr. Derek A. Denton), 618
Extraction of Bright Coals by Anhydrous Ethylene Diamine (I. G. C. Dryden), 959

Extraction Metallurgy : Research Fellowship in (Nuffield Foundation), 290
Extracts of Nerves and Tissues : Assay of *nor*Adrenalin and Adrenalin in (Prof. U. S. v. Euler), 570
Extrafloral Glands of Cucurbitaceæ (Dr. H. L. Chakravarty), 576
Extrinsic Agents : Sex and Organ Specificity in the Response of β-Glucuronidase to (Lynda M. H. Kerr and Dr. G. A. Levvy), 219
Eye Movements during Monocular Fixation (Dr. Mary P. Lord and Dr. W. D. Wright), 25 ; *erratum*, 100
Eyes : Encyclopædia of, *review* by Dr. E. N. Willmer, 910

F REGION of the Ionosphere: Short-Period Changes in the (G. H. Munro), 886
F_2 Ionization : Evidence of Horizontal Motion in Region (Dr. W. J. G. Beynon), 887
Fabry-Perot Fringe System : A New Heterochromatic, applicable to the Interferometry of Absorption Spectra (Rev. P. J. Treanor), 885
Factorial Analysis of Rheological Measurements on Cheese (R. Harper and M. Baron), 821
Fading of Radio Waves : Diffraction from the Ionosphere and the (J. A. Ratcliffe), 9
Faeroes : The, *review* by Seton Gordon, 4
α-Fagarine : Structure of (Dr. V. Deulofeu, R. Labriola and B. Berinzaghi), 694
Fahrten in Island (Rudolf Jonas), *review*, 513
Family Studies in the Eastern Health District, 4, Permanence of Residence with respect to Various Family Characteristics (Dr. H. M. C. Luykx), 647
Farm : Garden, Smallholding and, *review*, 757
  I Bought a (Roy Ganders), *review*, 8
Farm Livestock : The Feeding of (J. C. B. Ellis), second edition, *review* by E. T. Halnan, 432
Fatty Acids : Volatile Cuprous and Silver Salts of (A. Keller and Dr. F. Körösy), 580
Fauna (Island) : Destruction and Rehabilitation of an, *review*, 552
Fauna of Krakatau, 1883–1933 (K. W. Dammerman), *review*, 552
Faune de France, 47, Hyménoptères tenthredoides (Lucien Berland), *review*, 49
Federalist, or the New Constitution (Alexander Hamilton, James Madison and John Jay), *review* by Maurice Bruce, 238
Feedback Networks (Reactive) : Influence of, on the Response of Galvanometers (P. Savic), 569
Feeding of Farm Livestock (J. C. B. Ellis), second edition, *review* by E. T. Halnan, 432
Fellowship : Research, in Extraction Metallurgy (Nuffield Foundation), 290
Fellowships : Beit, for Medical Research, 212
  Beit, for Scientific Research, 100
  Colonial Medical Research, 607
  Commonwealth Fund, 844
  Medical (National Research Council of Canada), 523
  Rockefeller Travelling, in Medicine (Medical Research Council awards), 290
Feret's Statistical Diameter as a Measure of Particle Size (W. H. Walton), 329
Fermentation of Pyruvate, β-Hydroxybutyrate and of C_4-dicarboxylic Acids by some Butyric Acid-forming Organisms (Dr. Georges N. Cohen and Germaine Cohen-Bazire), 578
Fern Phylogeny, *review* by Prof. I. Manton, 314
Ferns : Genera Filicum, the Genera of (Dr. Edwin Bingham Copeland), *review* by Prof. I. Manton, 314
  Leptosporangiate; A Revised Classification of (E. E. Holttum), *review* by Prof. I. Manton, 314
Ferromagnetic Manganese Alloys : Some New (F. A. Hames and D. S. Eppelsheimer), 968
Ferrous Hydroxide : Evolution of Hydrogen from (Dr. U. R. Evans and J. N. Wanklyn), 27
Ferrous Ions in Aqueous Solution : Oxidation of, by X- and γ-Radiation (N. Miller), 448
Fertilisers and Soils : Students' Handbook to (L. T. Lowe), *review* by Dr. E. W. Russell, 8
Fertilization : Function of Hyaluronidase in (C. R. Austin), 63
  Number of Sperms required for (C. R. Austin), 534
Fertilizer Manufacture in East Africa, 522
Fertilizing Capacity of Bull Semen in the Genital Tract of the Cow : Preservation of the (Prof. M. Vandeplassche and Dr. F. Paredis), 813
Festival of Britain 1951, 645
Fibiger, Pioneer of Experimental Cancer, *review* by Dr. P. R. Peacock, 162
Fibre Contraction : Ionic Exchange and (H. G. Ingersoll and A. A. Johnson), 225
Fibre Diagrams (X-Ray) : Crystal Structure of *B*-Starch from (Prof. R. E. Rundle), 107
Field : Estimation of Insect Populations in the (A. H. Strickland), 308
Field Research in the Archæology of Great Britain : Survey and Policy of, 1, The Prehistoric and Early Historic Ages to the Seventh Century A.D. (Council for British Archæology, University of London Institute of Archæology, Report on), 883
Fifty Prints (Emerson Tuttle), *review* by Frances Pitt, 431
Figure of the Earth (Prof. Harold Jeffreys), 915
Filicum : Genera, the Genera of Ferns (Dr. Edwin Bingham Copeland), *review* by Prof. I. Manton, 314
Film in Scientific Research (Sciences Committee of the Scientific Film Association Conference on), 250
Films of Benzene Hexachloride : Insecticidal Power and Microscopical Structure of Residual (A. J. Musgrave), 296
Films of Living Cells : Cinematograph (C. C. Speidel), 249
Financial Aid for Delegates at Conferences (British Council), 808
Fine Structure of the Hydrogen α-Line (Dr. H. Kuhn and G. W. Series), 373
Finite Differences and Difference Equations in the Real Domain (Prof. Tomlinson Fort), *review* by L. M. M.-T., 391
Finland : Geophysics in, 919
Fires (Petrol) : Extinction of, by Methyl Iodide (A. Nicholson), 111
  A Study of Mechanically Produced Foam for Combating (Dr. N. O. Clark), 158
Fish Cultivation : Marine (Dr. F. Gross), 378 ; (Dr. L. H. N. Cooper and G. A. Steven), 378
'Fish Eye' as an Ideal Electron Lens : Maxwell's (Prof. Walter Glaser), 455
Fish-Farming : 'Weeding' in (D. W. Le Mare), 704
Fish-Farming in the Belgian Congo (Dr. A. F. de Bont), 998
Fisheries : Marine, of Great Britain (British Association, Section D (Zoology), Symposium on), 641
Fisherman : Nature Lover and, *review* by Seton Gordon, 48
Fishes (Teleost) : Coarse Granulocytes in Epithelial Tissues of (W. T. Catton), 894
Fission Tracks in an Electron-sensitive Emulsion : Selective Development of (Dr. G. W. W. Stevens), 526
Fixation of Atmospheric Nitrogen : Symbiotic Micro-organisms of Aphids and (Dr. J. D. Smith), 930
Flames : Emissivity of Small Particles in (H. G. Wolfhard and W. G. Parker), 259
  Spectrum of Iodine Oxide (IO) in (E. H. Coleman, Dr. A. G. Gaydon and Dr. W. M. Vaidya), 108
Fleming Memorial Lecture of the Television Society (Arthur Blok), 485
Flooding : Prehistoric, in the Somerset Levels (Dr. H. G. Baker), 1008
Flora : The Palestine (Eric Hardy), 286
  British; Study of the (Prof. J. R. Matthews), 405
  Fossil, of Kerguelen Island, 309
Flow : Elastic and Plastic; Application of Dynamic Similarity to Metal Structures with (M. W. Thring), 193
  Pipe; Instability in (R. B. Whittington and E. W. S. Ashton), 997
Flowering Earth (Donald Culross Peattie), *review* by Dr. W. B. Turrill, 679
Flowers, Shrubs and Fruit for the Small Garden (G. A. Carter), *review*, 757
Fluctuating Galactic Noise : Origin of (Prof. M. Minnaert), 858 ; (M. Ryle and F. G. Smith), 858
Fluoranthene Syntheses (Dr. Neil Campbell, R. S. Gow and H. Wang), 857
Fluorescence in Chlorophyll Solutions : Concentration Quenching of (W. F. Watson and Robert Livingston), 452
Fluorescence Reactions in the Steroid and Synthetic Œstrogen Series : New Colour and (Dr. R. J. Boscott), 577
Fluorine : Proton Bombardment of (S. Devons and H. G. Hereward), 331
  Short-Range α-Particles from the Disintegration of Sodium, Aluminium and, by Protons (Joan M. Freeman and A. S. Baxter), 696
Foam for Combating Petrol Fires : A Study of Mechanically Produced (Dr. N. O. Clark), 158
Fœtal Hæmoglobin and Erythroblastosis (Dr. H. S. Baar), 190
Foliaires multiples: La théorie des hélices (Prof. Lucian Plantefol), *review*, 798
Folic Acid Complex : A Natural Precursor of the (Dr. David A. Hall), 178
Folk-Belief (British) : Local Genii of, *review* by Dr. E. J. Dingwall, 388
Folk-Life in Britain and Abroad : Investigation of (R. U. Sayce), 403
Folk-Lore : 'Hillbilly', *review* by Dr. E. J. Dingwall, 474
Folliculinidæ (Ciliata, Heterotricha) : British (Dr. S. M. Das), 534
Food : Anti-Vitamins in (Nutrition Society Discussion on), 985
  Recent Researches on (M. W. Grant), 466
Food Problem (World) : Agriculture and the (Dr. G. Scott Robertson), 406
Food and Agricultural Industries : Seventh International Congress of, 19
Foods : Manufactured (Nutrition Panel of the Food Group of the Society of Chemical Industry Lectures on), 956
Force Constants of Polyatomic Molecules : A General Solution for the (P. Torkington), 370, 607
Forces between Colloidal Particles, *review* by Dr. J. A. V. Butler, 315
Forest Policy in Uganda, 864
Forestry : Modern Developments in, 974
  Soil Improvement for, 271
Formaldehyde (Gaseous) : Mechanism of the Oxidation of (Chas. A. McDowell and J. H. Thomas), 367 ; (Prof. R. G. W. Norrish), 367
Formation of Branched Polysaccharides : Isophosphorylase and the (Dr. P. Bernfeld and A. Meutémédian), 618
Formation of the Continents by Convection (G. F. S. Hills), *review* by Prof. H. H. Read, 981
Formation of Hydrogen Peroxide in Water Irradiated with X- and Alpha-Rays (Dr. P. Bonet-Maury and M. Lefort), 381
Forrest (James) Medal and a Miller Prize of the Institution of Civil Engineers awarded to D. M. Beaton, 865
Fossil Flora of Kerguelen Island, 309
Foundry Core Bonding Agents (British Iron and Steel Research Association Conference on), 59
Fountain Pressure and Heat Current in Helium II : Relation between (Lothar Meyer and William Band), 67
Fourier Synthesizer for Crystal Structure Analysis : Quantitative Electron-Density Contour Delineation in the Electronic (Prof. R. Pepinsky and D. Sayre), 22
Fourth Order Reaction (J. H. Baxendale and Philip George), 777
Fowl (*P. gallinaceum*) : Resistance to Sulphadiazine and 'Paludrine' in the Malaria Parasite of the (Dr. Ann Bishop and Elspeth W. McConnachie), 541
France : Faune de, 47, Hyménoptères tenthredoides (Lucien Berland), *review*, 49
Frankland (Percy Faraday) Memorial Lecture (To be established by the Birmingham and Midlands Section of the Royal Institute of Chemistry), 809
Frazer Lecture in Social Anthropology (Dr. E. W. Smith), 482
Free Air : Velocity of Sound in (J. M. A. Lenihan), 656
Free Atmosphere : Distribution of Ice-Particle Nuclei in the (H. P. Palmer), 568
Free Electron *in vacuo*, *review* by A. H. Beck, 678
Free Energy of Protein Solutions in the Light of the Work of Procter : Recent Work on Osmotic Pressures, Membrane Equilibrium and the Generalised (G. S. Adair), 670
Free Radicals : The Chemistry of (Dr. W. A. Waters), second edition, *review* by George Porter, 390
Freedom and Obligations, 508 ; (Prof. J. M. Burgers and Dr. M. Florkin), 783
French Abstracts, 605
French Palæolithic Art, *review* by M. C. Burkitt, 511
Frequencies : High; Anomalous Magnetic Behaviour of Nickel-Iron at (A. Wieberdink), 527 ; (Prof. R. Kronig), 528
  Ultra-high; Dielectric Properties of Titanates at (Dr. J. G. Powles), 614
Frequency Distributions : Transformation of (D. J. Finney), 898
Frequency Distributions of Insect Populations : Truncated Log-Normal and Root-Normal (D. Spiller), 530

Frequency Transmissions : Standard, in Great Britain, 269
Friction between Wool Fibres : Influence of some Anti-Shrink Treatments on the (Joel Lindberg and Dr. Nils Gralén), 112
Frictional Electrification of Sand (E. W. B. Gill), 568
Fringe System : A New Heterochromatic Fabry-Perot, applicable to the Interferometry of Absorption Spectra (Rev. P. J. Treanor), 885
Frost and the Fruitgrower (Raymond Bush), 584
Fructose Content of Human Semen : Relation between the Volume and (Clare Harvey), 812
Fruit : Gall Midges of (Dr. H. F. Barnes), *review* by A. D. I., 834
  Garden; Harvesting and Storing (Raymond Bush), *review* by Prof. R. H. Stoughton, 981
Fruit for the Small Garden : Flowers, Shrubs and (G. A. Carter), *review*, 757
Fruit and the Soil (Collected edition of the John Innes Leaflets, edited by Dr. C. D. Darlington), 791
Fruit Growing and Storage, *review* by Prof. R. H. Stoughton, 981
Fruitgrower : Frost and the (Raymond Bush), 584
Fuels (Liquid) : Modern Applications of (Institute of Petroleum and the Institute of Fuel Conference on), 328, 951
Function of Hyaluronidase in Fertilization (C. R. Austin), 63
Functions : Quasi-Abelian, *review* by L. Roth, 593
Fundamental Colour Sensation (Dr. A. H. S. Holbourn), 26
Fungal Metabolic Products : Stimulation of Adventitious Root Formation by (Dr. M. A. Mostafa and M. S. Naim), 575
Fungal Mutations obtained with Methyl Xanthines (Dr. Nils Fries and Bengt Kihlman), 573
Fungi : Antibiotics produced by, and a New Phenomenon in Optical Resolution (Dr. A. H. Cook, S. F. Cox and T. H. Farmer), 61
  Tropical (G. B. Hansford), 212
Fungi o fIndia : Some, 271
Fungi of Madras : New (T. S. and K. Ramakrishnan), 447
Fungi and Bacteria Isolated from the Air in 1947 : Arctic Aerobiology, 2, Preliminary Report on (Dr. S. M. Pady, Dr. C. D. Kelly and Prof. Nicholas Polunin), 379
Fungicides : A Catalogue of Insecticides and, Vol. 1, Chemical Insecticides (compiled by Prof. Donald E. H. Frear), *review*, 354
  New (R. W. Marsh), 289
Fungus, *Acaulopage dichotoma*, in Britain : An Aquatic Predaceous (Mrs. M. Peach), 148
Funzioni quasi-abeliane (Prof. Francesco Severi), *review* by L. Roth, 593
Furnace Models : Open Hearth (A. R. Philip), 188
'Fusarex' (Bayer Products, Ltd.), 843

GALACTIC Noise (R. v. d. R. Woolley), 249
  Origin of Fluctuating (Prof. M. Minnaert), 858; (M. Ryle and F. G. Smith), 858
Galactic Radio Frequency Noise : Discrete Sources of (J. G. Bolton), 141
Gall Midges of Economic Importance (Dr. H. F. Barnes), Vol. 3, Gall Midges of Fruit, *review* by A. D. I., 834
Galvanometers : Influence of Reactive Feedback Networks on the Response of (P. Savic), 569
γ-Radiation : Oxidation of Ferrous Ions in Aqueous Solution by X- and (N. Miller), 448
Gamma-Rays from Proton Bombardment of Separated Argon Isotopes (K. J. Brostrøm, T. Huus and Dr. J. Koch), 695
'Gammexane' : Absence of Carcinogenic Activity of Benzene Hexachloride (Dr. J. W. Orr), 189
  Crystal Structure of (G. W. van Vloten, Ch. A. Kruissink, B. Strijk and J. M. Bijvoet), 771
  see also under Benzene Hexachloride
Ganglionic Block : Clinical Potentialities of certain Bisquaternary Salts causing Neuromuscular and (Dr. W. D. M. Paton and Dr. E. J. Zaimis), 810
Ganties-Montespan (Haute-Garonne) : Le centre préhistorique de (Félix Trombe et Gabriel Dubuc), *review* by M. C. Burkitt, 511
Garden (Small) : Flowers, Shrubs and Fruit for the (G. A. Carter), *review*, 757
Garden, Smallholding and Farm, *review*, 757
Garden Fruit : Harvesting and Storing (Raymond Bush), *review* by Prof. R. H. Stoughton, 981
Garden Plants : The Genetics of (M. E. Crane and W .J. B. Lawrence), third edition, *review* by Dr. F. W. Sansome, 595
Gas Analyser (Infra-Red) : Determination of Mixing of Gas Streams by the (R. D. Collins and M. P. Newby), 224
Gas Industry : The British (H. J. Hodsman), 440
Gas Streams : Determination of Mixing of, by the Infra-Red Gas Analyser (R. D. Collins and M. P. Newby), 224
Gaseous Formaldehyde : Mechanism of the Oxidation of (Chas. A. McDowell and J. H. Thomas), 367 ; (Prof. R. G. W. Norrish), 367
Gases : Electrons in (Sir John Townsend), *review* by Prof. F. Llewellyn Jones, 276
Gaster (Leon) Memorial Premium for 1948 of the Illuminating Engineering Society awarded to J. N. Bowtell and H. G. Jenkins, 607
Gastric Juice : Source of the Hydrogen Ions in (Prof. Edward J. Conway and Thomas G. Brady), 456
Gastric Urease : Role of (Dr. Oliver FitzGerald and Philip Murphy), 896
Gastrophilus intestinalis : Succinic Acid in the Blood of the Larva of (L. Levenbook and Dr. Y. L. Wang), 731
Gaza : Land-mine Detectors designed at (Dr. W. Lawrence Balls), 98
Geiger-Müller Counters : Reduction of Dead Times in (B. Collinge), 853
Gelation of Aluminium Soaps in Hydrocarbons : Role of the Hydroxyl Group in the (T. S. McRoberts and Dr. J. H. Schulman), 101
Gels : Hysteresis in the Swelling of (Dr. W. W. Barkas), 32
Gene : Evolution of the (Prof. A. H. Sturtevant), 136
Generators : Pulse (edited by Prof. G. N. Glasoe and Prof. J. V. Lebacqz), *review* by Prof. J. T. Randall, 754
Genes (Blood-Group) : Genetic Transmission of Two Rare (Dr. A. S. Wiener), 735
Genetic Transmission of Two Rare Blood-Group Genes (Dr. A. S. Wiener), 735
Genetical Structure of Plant Populations (British Association, Section K (Botany), Symposium on), 517
Genetics (Dr. H. Kalmus, in collaboration with Lettice M. Crump), *review*, 717
  Some Stereochemical Aspects in (Dr. L. Zechmeister and Prof. F. W. Went), 847
Genetics at the John Innes Horticultural Institution, 605
Genetics in the Soviet Union (Prof. Eric Ashby), 912
Genetics at the University of Birmingham, 17
Genetics of Cancer (Genetical Society of Great Britain and the British Empire Cancer Campaign Symposium on), 514
Genetics of Garden Plants (M. B. Crane and W. J. B. Lawrence), third edition, *review* by Dr. F. W. Sansome, 595
Genetics of Style-Length in *Oxalis* (Prof. R. A. Fisher and V. C. Martin), 533
Genii of British Folk-Belief : Local, *review* by Dr. E. J. Dingwall, 388
Genital Tract of the Cow : Preservation of the Fertilizing Capacity of Bull Semen in the (Prof. M. Vandeplassche and Dr. F. Paredis), 813
Geography : Air Transport and (Royal Geographical Society), 58
  Cultural, of the Tarascan Area, Mexico (Robert C. West), 728
  Social (Lord Rennell of Rodd), 401
Geological Age : Evidence of, against Decay of Tin-115 to Indium-115 by Electron Capture (Dr. L. H. Ahrens), 413
Geological Congress : International, 232, 663
Geology : Historical, the Geologic History of North America (Prof. Russell C. Hussey), second edition, *review*, 946
Geology at the University of Liverpool, 55
Geology To-day and To-morrow (Dr. A. E. Trueman), 400
Geology and Mineral Resources of Africa (Association of African Geological Surveys Conference on), 971
Geology and Scenery of Scotland (Dr. Douglas A. Allan), 920
Geomagnetism : A Suggested Explanation of Sangster's Rotations and Schmidt's 'Wandering Vortices' in (A. T. Price), 110
Geometrical Considerations regarding Imbricate Æstivation : Some (Dr. K. J. Dormer), 653
Geometrical Property : A Gravitational Field with a curious (Prof. V. V. Narlikar and K. R. Karmarkar), 187
Geometry (Algebraic) : Methods of (Prof. W. V. D. Hodge and Dr. D. Pedoe), *review* by Dr. J. A. Todd, 6
Geophysical Surveys (Electrical Resistivity) : Interpretation of Data from (Dr. S. Whitehead and Dr. W. G. Radley), 187 ; (J. M. Hough), 187, 970
Geophysics in Finland, 919
Geotectonic Map of North-west Germany (Reichsamt der Bodenforschung, Hanover), 365
German Atom Bomb : The Search for the, *review* by Prof. N. F. Mott, 3
German Hydrographic Journal, 364, 842
German Motor Roads (B.I.O.S. Overall Report No. 5), 345
German Science : Alsos, the Failure in (Prof. Samuel A. Goudsmit), *review* by Prof. N. F. Mott, 3
German Scientific Text-books (Dr. Julian Huxley), 562
German Scientific and Technical Periodicals (Foreign Office), 808
Germanium : Electronic Applications of, 982
Germany : Exchange of War-time Periodicals with, 96
  Radioactive Tracers for, 883
  North-west; Geotectonic Map of (Reichsamt der Bodenforschung, Hanover), 365
Glaciers : Recession of (Prof. H. W. Ahlmann), 484
Glass : Ink for Writing on (E. H. Leach), 809
  A Kinetic Approach to the Theory of the Strength of (S. M. Cox), 947
  Some Aspects of the Nature and Constitution of (International Commission on Glass and the Society of Glass Technology Symposium on), 938
Glasshouse Crops : Insect Pests of (Prof. Herbert W. Miles and Mary Miles), second edition, *review*, 946
Glasshouses : The Control of Heat and Light in (Dr. W. F. Bewley), 584
Glassware Production : Laboratory (R. Sutcliffe), 974
Glide Bands in Silver Chloride (J. F. Nye), 299
β-Glucuronidase to Extrinsic Agents: Response of; Sex and Organ Specificity in the (Lynda M. H. Kerr and Dr. G. A. Levvy), 219
Glucuronide (Urinary) : Destruction of, by Bacteria (Mary Barber, B. W. L. Brooksbank and Dr. G. A. D. Haslewood), 701
Glycogen Deposition in Isolated Muscle : Effect of Hypophysectomy on (Dr. J. Bornstein and J. F. Nelson), 572
Gold : Hydride and Deuteride Bands of Aluminium, Copper, Silver and (Bengt E. Nilsson), 109
Gold Coast : Cocoa Disease in the, 689
Golden Hamster *Cricetus auratus* as a Laboratory Animal : Origin of the (Prof. S. Adler), 256
Golgi Apparatus : Methylene Blue as a Vital Stain for the (Prof. J. Brontë Gatenby and Tohamy A. A. Moussa), 736
Golgi Apparatus of Living Human Testicular Cells Seen with Phase-Contrast Microscopy (A. G. Oettlé), 76
Gonadotropic Hormones : Cytochemistry of the (Anthony G. Everson Pearse), 651
Good : The Definition of (Dr. A. C. Ewing), *review* by F. I. G. Rawlins, 944
Goodness Defined, *review* by F. I. G. Rawlins, 944
Gossypium : The Evolution of (J. B. Hutchinson, R. A. Silow and S. G. Stephens), *review* by E. Lord, 716
Government : A Fragment on, and An Introduction to the Principles of Morals and Legislation (Jeremy Bentham), *review* by Maurice Bruce, 238
Graduate in Industry (Dr. Percy Dunsheath), 125 ; *review* by R. Brightman, 388
Grain : Protection of, against Weevils (V. A. Beckley), 737
Grain-Boundaries during Melting : Intergranular Corrosion of Pure Aluminium in relation to the Behaviour of (Prof. G. Chaudron, Dr. P. Lacombe and N. Yannaquis), 854
Gram-Positive Micro-organisms : Some Components of the Lytic System of (Prof. M. Stacey and Dr. M. Webb), 11
Granit's Theory : Human Colour Vision and (Dr. R. W. Pickford), 414
Granulocytes in Epithelial Tissues of Teleost Fishes : Coarse (W. T. Catton), 894
Grass : Œstrogens in, and their possible Effects on Milk Secretion (Dr. S. Bartlett, Dr. S. J. Folley, Dr. S. J. Rowland, D. H. Curnow and Sylvia A. Simpson), 845
Grass Disease : Etiology of (Prof. A. Robertson, D. E. Donald, J. S. S. Inglis and H. Paver), 116

Grasshoppers : Locusts and (Dr. B. P. Uvarov), 308
Gravitation : Magnetism of Celestial Bodies and (J. Mariani), 612
Gravitational Field with a Curious Geometrical Property (Prof. V. V. Narlikar and K. R. Karmarkar), 187
Gravity and Vibration Responses from the Labyrinth of the Thornback Ray (*Raja clavata*) : Oscillographic Analysis of the (Dr. Otto Lowenstein and T. D. M. Roberts), 852
Great Britain : Occurrence of *Acanthocephalus ranae* in (R. Phillips Dales), 1001
  Marine Fisheries of (British Association, Section D (Zoology), Symposium on), 641
  Population Policy in (A Report by P.E.P.), *review* by Prof. Walter Fitzgerald, 635
  Social and Economic Research in, 905
  Standard Frequency Transmissions in, 269
  Survey and Policy of Field Research in the Archæology of, I, The Prehistoric and Early Historic Ages to the Seventh Century A.D. (Council for British Archæology, University of London Institute of Archæology, Report on), 883
  see also under Britain
Greece : Earthquake on the Island of Levkas on June 30, 248
Green Auroral Line as an Initiator of Phosphorescence in Condensed Systems (Prof. L. Vegard and G. Kvifte), 967
Grit Particles : Initiation of Explosions by (Dr. F. P. Bowden and O. A. Gurton), 654
Ground-Levels on Coe Fen, Cambridge : Variation of (E. G. Sterland), 532
Groundnut Breeding (Dr. C. D. Darlington), 621
Growing Plant : The (Prof. W. Neilson-Jones), *review* by Prof. E. Ashby, 870
Growth : Atypical, Abnormal Mitosis, Polyploidy and Chromosome Fragmentation induced by Hexachlorocyclohexane (Dontcho Kostoff), 845
  Nicotinic Acid and the Inhibition of, by Auxin (Dr. L. J. Audus), 811
Growth of *C. diphtheriæ* : Production of Riboflavin and Allied Substances during the (A. J. Woiwod and Dr. F. V. Linggood), 219
Growth of *Culex molestus* under Sterile Conditions (E. P. Lichtenstein), 227
Growth of Plants : Soilless (Carleton Ellis and M. W. Swaney), second edition, *review* by W. E. B., 717
Growth-Factor for certain Brewer's Yeasts : *p*-Aminobenzoic Acid a (Cyril Rainbow), 572
Growth-Factor Analogues : Antibiotic Activity of, 356
Growth-Inhibitors as Tools in Metabolic Investigations : Use of certain (R. J. Pennington), 661
Guatemala (off the coast of) : Earthquake on April 12, 138 ; Earthquakes on July 16, 768
Gums : The Water-Soluble (Dr. C. L. Mantell), *review*, 128
Gut of *Arenicola marina* : Blood System of the (Doris M. Kermack), 576

H. PERTUSSIS : Aluminium Phosphate as Precipitant of Agglutinable and Non-Agglutinable Strains of (Dr. J. Ungar and P. Muggleton), 734
Hæmatin : Inhibition of Aerobic Sporing Bacilli by (Dr. W. E. van Heyningen), 114
Hæmoglobin : Carbon Monoxide Affinity of Chlorocruorin and (Prof. H. Munro Fox), 20
  Fœtal, and Erythroblastosis (Dr. H. S. Baar), 190
Hæmoglobin from Blood : Passage of, into Eggs of *Daphnia* (Elisabeth I. B. Dresel), 736
Hæmoglobin – Methæmoglobin Mixtures' (Q. H. Gibson and Prof. D. C. Harrison), 258
Hæmolymph of the Dragon-fly Nymph, *Aeschna cyanea* : Amino-Acids in the (Dr. Richard Raper and John Shaw), 999
Hæmophilia in Dogs (F. B. Hutt, C. G. Rickard and R. A. Field), 136
^{181}Hf : Decay Scheme of (J. Benes, A. Ghosh, A. Hedgran and N. Hole), 262
Haiti : Education in (T. H. Hawkins), 975
Halley Lecture for 1948 (Dr. F. Zwicky), 627
Hallucinations (Dr. D. J. West), 447
Haloalkylarylamines : Effects upon Tumours of various (Prof. Alexander Haddow, Prof. G. A. R. Kon and Dr. W. C. J. Ross), 824
Hamster (Golden): Origin of the, as a Laboratory Animal (Prof. S. Adler), 256
Hamster (Syrian) : Testicular Hypoplasia and Epididymal Cysts in the (Humberto Granados and Prof. Henrik Dam), 297
Hardening of Cadmium Crystals : Thermal (Dr. A. H. Cottrell and D. F. Gibbons), 488
Hardwoods in Britain : Establishment of, 97
Harkins-Jura Isotherms : Relation between the Brunauer-Emmett-Teller and (T. D. Smith and R. Bell), 109
Harpedidæ: Indications of Cephalic Sutures in Trinucleidæ and (Dr. Archie Lamont), 376
Harvesting and Storing Garden Fruit (Raymond Bush), *review* by Prof. R. H. Stoughton, 981
Hawaii : Union List of Serials in, 809
Hawaiian Libraries, 809
Hawksley (Charles) Prize of the Institution of Civil Engineers awarded to J. Black, 865
Health : Honey and your (Dr. B. F. Beck and Dorée Smedley), *review* by Dr. Colin G. Butler, 128
  Radiations and (Dr. A. S. McFarlane), 480
  Public; Recent Advances in (Dr. J. L. Burn), *review* by Sir Arthur MacNalty, 47
Health of the People of Britain (Dr. G. Lapage), 586
Heart Beats : Aural Sensitivity and (Dr. Robert W. Lawson), 782
Heat Capacity of Methanol Vapour (J. S. Rowlinson), 820
Heat Current in Helium II : Relation between Fountain Pressure and (Lothar Meyer and William Band), 67
Heat and Light in Glasshouses : The Control of (Dr. W. F. Bewley), 584
Heather Grown in Nutrient Solution : Effects of Aeration on Bracken and (L. W. Poel), 115
Heating in Industry : Process, *review* by M. R. Gavin, 637
Heating Research (Domestic) : Calorimeter Building for, at the Fuel Research Station, Greenwich (Dr. A. C. Monkhouse), 133
Height of the Sodium Layer Responsible for the Strong Yellow Line in Twilight : Thickness and (Prof. L. Vegard), 300
Hélices foliaires multiples : La théorie des (Prof. Lucien Plantefol), *review*, 798
Helium II : Relation between Fountain Pressure and Heat Current in (Lothar Meyer and William Band), 67
  Liquid; Propagation of Pulses of Second Sound in (D. V. Osborne), 213
He II Line $\lambda = 4686$ A. : Fine Structure of the (Prof. H. Kopfermann and W. Paul), 33
Helium-3 : Spectrum of (L. C. Bradley and Dr. H. Kuhn), 412
Hemipterous Insect from New Zealand : An Interesting, 919
Hen : Life-Span of Red and White Blood Corpuscles of the (J. Ottesen), 730
Hen's Egg : Permeability of the Membranes of the (Prof. N. Klissiunis), 77
Herbertia, Vols. 13 and 14 (American Plant Life Society), 347
Herbs and Drugs, *review* by Dr. W. O. James, 636
Heterochromatic Fabry-Perot Fringe System Applicable to the Interferometry of Absorption Spectra : A New (Rev. P. J. Treanor), 885
Heterocycles : Nitration of Simple (David W. Mathieson and A. McCoubrey), 73
Heterogeneous Reactions : Application of Measurements of Semi-conductivity to (T. J. Gray), 260
Hexachlorocyclohexane : Atypical Growth, Abnormal Mitosis, Polyploidy and Chromosome Fragmentation induced by (Dontcho Kostoff), 845
n-Hexacosane : Dielectric Relaxation-Times of Solid Solutions of Aliphatic Long-Chain Esters and Ketones in Paraffin Wax and (R. J. Meakins), 994
Hexamethyl Benzene : Volume Change of (H. Chihara and S. Seki), 773
Hexosamine Components of the Human Blood Group Substances (D. Aminoff and W. T. J. Morgan), 579
High Explosives (Solid) : Low-Order Detonation in (T. C. Tranter), 335
High Frequencies : Anomalous Magnetic Behaviour of Nickel–Iron at (A. Wieberdink), 527 ; (Prof. R. Kronig), 528
High-Frequency Resistance of Superconductors (A. B. Pippard), 68
High-Frequency Techniques : Very (compiled by the Staff of the Radio Research Laboratory, Harvard University), *review* by Dr. John Lamb, 83
High Permittivity : Physical Properties of Substances of (Electronics Group of the Institute of Physics Symposium on), 245
High-Power Pulse Generators, *review* by Prof. J. T. Randall, 754
High-Pressure Hydrogen-filled Ionization Chamber (G. H. Stafford), 771
High Temperatures : Electric Conductivity of Rocks at (H. P. Coster), 270
High Vacua (Society of Chemical Industry Convention on), 328, 523, 936
High-Vacuum Equipment (W. Edwards and Co., Ltd.), 729
Higher Education in the Colonies (Universities of the British Commonwealth Discussion on), 478
'Hillbilly' Folk-Lore, *review* by Dr. E. J. Dingwall, 474
Hindu Psychology (Swami Akhilananda), *review* by Mrs. D. M. Wheatley, 592
Histamine – Heparin – Thrombin Chain Reaction (Dr. M. Gerendás, I. Csefkó and M. D. F. Udvardy), 257
Histochemical Examination : Method for obtaining Wool Roots for (William J. Ellis), 957
Histology of Vertebrates: A Comparative, *review* by Dr. P. D. F. Murray, 430
Historical Geology, the Geologic History of North America (Prof. Russell C. Hussey), second edition, *review*, 946
History : Science in relation to, *review* by W. L. Sumner, 354
History of Chemistry : Chymia, Annual Studies in the (edited by Tenney L. Davis), Vol. I, *review*, 278
History of Science : Some Reflexions on the (Prof. Herbert Dingle), 564
Hive : The Skyscraper (Father M. Dugat), translated by Norman C. Reeves, *review* by Dr. Colin G. Butler, 87
Honduras (off the northern coast of) : Earthquake on June 27, 248
Honey and your Health (Dr. B. F. Beck and Dorée Smedley), *review* by Dr. Colin G. Butler, 128
Honey Bee : The Cytology of the (Dr. Ann R. Sanderson and David W. Hall), 34
  The Spell of the (W. Eric Kelsey), second edition, *review*, 8
Hopkins Prize of the Cambridge Philosophical Society awarded to Prof. H. J. Bhabha for 1939–42, and to Dr. C. F. Powell for 1942–45, 690
Horizontal Motion in Region F_2 Ionization : Evidence of (Dr. W. J. G. Beynon), 887
Hormones : Gonadotropic; Cytochemistry of the (Anthony G. Everson Pearse), 651
  Steroid ; Chemistry, Metabolism and Biological Effects of (University of Wisconsin and the U.S. National Research Council Committee on Growth Symposium on), 176
Hormones and Horticulture (George S. Avery, Jr., and Elizabeth Bindloss Johnson, with the collaboration of Prof. Ruth M. Addoms and Prof Betty F. Thomson), *review* by Dr. M. A. H. Tincker, 943
Horology, the Science of Time Measurement and the Construction of Clocks, Watches and Chronometers (J. Eric Haswell), *review* by R. A. Fell, 163
Horticultural Crops in their Relationship to Water (F. A. Secrett), 584
Horticultural Science : Ten Years Progress in, *review* by Dr. M. A. H Tincker, 943
Horticulture : Control of Environment in (British Association, Section (Agriculture), Discussion on), 584
  Hormones and (George S. Avery, Jr., and Elizabeth Bindloss Johnson with the collaboration of Prof. Ruth M. Addoms and Prof. Betty F Thomson), *review* by Dr. M. A. H. Tincker, 943
Hot-wire Vacuum Switches (Sunvic Controls, Ltd.) 97
House (Roman) : Excavations of a, 78
Hughes Medal for 1948 of the Royal Society awarded to Sir Robert Watso Watt, 807, 874
Human Blood Group Substances : Hexosamine Components of the (D Aminoff and W. T. J. Morgan), 579
Human Colour Vision and Granit's Theory (Dr. R. W. Pickford), 414
Human Ecology, the Science of Social Adjustment (Thomas Robertson *review* by Prof. T. S. Simey, 755
Human Evolution : A New Theory of (Sir Arthur Keith), *review* by Pro H. J. Fleure, 352
  Papers on (Dr. Franz Weidenreich), 484
Human Insemination : Artificial (Report of a Commission appointed the Archbishop of Canterbury), 790
Human Milk Bank (Edith G. Dare), 439
Human Relations : Mathematical Theory of (N. Rashevsky), *review* Prof. R. G. D. Allen, 352
Human Relationships To-day : The Critical Problem in (G. Wilson Knigh Herbert Read and Dr. J. H. Oldham), 793

Human Semen : Relation between the Volume and Fructose Content of (Clare Harvey), 812
Human Testicular Cells seen with Phase-Contrast Microscopy : Golgi Apparatus of Living (A. G. Oettlé), 76
Human Values : Physical Science and (A Symposium by P. W. Bridgman, F. S. C. Northrop, H. Shapley, I. I. Rabi, H. N. Russell, M. Polanyi, F. T. Spaulding and L. A. DuBridge), 751
Hundred Years of Chemistry (Prof. Alexander Findlay), second edition, *review* by Prof. John Read, 946
Hunting Wasp : The (John Crompton), *review* by Dr. V. B. Wigglesworth, 758
Huygens (Christian) and the Development of Science in the Seventeenth Century (Dr. A. E. Bell), *review* by Prof. E. N. da C. Andrade, 472
Hyaluronidase in Fertilization : Function of (C. R. Austin), 63
Hyaluronidase Unit : A (Sv. Dalgaard-Mikkelsen, S. A. Kvorning and Prof. Knud O. Moller), 221
Hybrid Vigour in Crops and Livestock : Inbreeding and (British Association, Sections M (Agriculture), K (Botany) and D (Zoology), joint Discussion on), 642
Hydration of Interstitial Connective Tissue : Influence of Hydrogen Ions and Neutral Salts upon the (Dr. T. D. Day), 152
Hydride and Deuteride Bands of Aluminium, Copper, Silver and Gold (Bengt E. Nilsson), 109
Hydrocarbons : Role of the Hydroxyl Group in the Gelation of Aluminium Soaps in (T. S. McRoberts and Dr. J. H. Schulman), 101
    Aromatic ; Action of Oxalyl Chloride on the (Hussein Ahmad Fahim), 526
    Petroleum ; Testing, *review* by H. B. Milner, 714
Hydrochloric Acid : '17-Ketosteroid II' Isolated from Urine—its Reaction with (Dr. Elizabeth Dingemanse, Leonora G. Huis in't Veld and S. Lore Hartogh-Katz), 492
Hydrogen : Afterglow of the Balmer Spectrum of (Renée Herman and Louis Herman), 261
    Evolution of, from Ferrous Hydroxide (Dr. U. R. Evans and J. N. Wanklyn), 27
Hydrogen α-Line : Fine Structure of the (Dr. H. Kuhn and G. W. Series), 373
Hydrogen Atoms: Effect of, on Intensities of X-Ray Reflexions (Dr. J. D. Morrison, W. P. Binnie and Prof. J. Monteath Robertson), 889
Hydrogen Ions in Gastric Juice : Source of the (Prof. Edward J. Conway and Thomas G. Brady), 456
Hydrogen Ions and Neutral Salts upon the Hydration of Interstitial Connective Tissue : Influence of (Dr. T. D. Day), 152
Hydrogen Micas : Titration Curves of (Dr. R. P. Mitra and K. S. Rajagopalan), 104
Hydrogen Peroxide and the Indirect Effect of Ionizing Radiations (Tikvah Alper), 615
Hydrogen Peroxide in Water Irradiated with X- and Alpha-Rays : Formation of (Dr. P. Bonet-Maury and M. Lefort), 381
Hydrogen-filled Ionization Chamber : A High-Pressure (G. H. Stafford), 771
Hydrographic Journal : New German, 364
Hydrojuglone and Apparent Vitamin C in Walnuts (C. Daglish and Dr. Frank Wokes), 179
Hydrolysis and Absorption of Sucrose by Plant Cells : Effect of Phosphorus on the (Prof. Husein Said), 496
Hydronephrosis studied by the Colchicine Method : Experimental (Dr. Marc Herlant), 251
Hydroperoxide : Tetrahydrofuran (A. Robertson), 153
Hydroxyamino-Acid : Occurrence of a Phosphate Ester of a (Dr. A. H. Gordon), 778
β-Hydroxybutyrate: Fermentation of Pyruvate, and of C_4-dicarboxylic Acids by some Butyric Acid-forming Organisms (Dr. Georges N. Cohen and Germaine Cohen-Bazire), 578
Hydroxyl Group in the Gelation of Aluminium Soaps in Hydrocarbons : Role of the (T. S. McRoberts and Dr. J. H. Schulman), 101
Hydroxymethylfurfuraldehyde : Biological Properties of a Substance Isolated from Wheat Middlings and of (Dr. T. B. Heaton and G. M. Robinson), 570
Hyménoptères tenthredoides (Faune de France, 47), (Lucien Berland), *review*, 49
Hypervitaminosis A and Avitaminosis A : Changes in the Incisor Teeth and Incisal Alveolar Bone of Rats in (Prof. J. T. Irving), 377
Hypophysectomy : Effect of, on Glycogen Deposition in Isolated Muscle (Dr. J. Bornstein and J. F. Nelson), 572
Hypoplasia: Testicular, and Epididymal Cysts in the Syrian Hamster (Humberto Granados and Prof. Henrik Dam), 297
Hypothetical di-Neutron : Properties of a (Prof. N. Feather), 213
Hysteresis in the Swelling of Gels (Dr. W. W. Barkas), 32

ICE : Arctic, 988
Ice-Particle Nuclei in the Free Atmosphere : Distribution of (H. P. Palmer), 568
Imbricate Æstivation : Some Geometrical Considerations regarding (Dr. K. J. Dormer), 653
Immunity to Virus Diseases, 92
In vitro Effect of Penicillin on Prothrombin Activity of Bovine Plasma (I. M. Chak, J. F. Pereira and K. V. Giri), 930
Inactivation of Complement by Nitrogen Mustard (W. H. Watkins and Prof. A. Wormall), 535
Inactive Cystine : Conversion of DL-Serine into (Dr. D. F. Elliott), 658
Inbreeding and Hybrid Vigour in Crops and Livestock (British Association, Sections M (Agriculture), K (Botany) and D (Zoology), joint Discussion on), 642
Incentives : Academic and Professional, 977
    Nature of (British Association, Section J (Psychology), Discussion on), 557
Incidence of Malaria in Tropical Africa (G. A. Walton), 114
Incisor Teeth and Incisal Alveolar Bone of Rats in Hypervitaminosis A and Avitaminosis A : Changes in the (Prof. J. T. Irving), 377
Inclusions in Aluminium Crystals (W. May, T. J. Tiedema and Prof. W. G. Burgers), 740
Incomes (Colonial National) : The Measurement of (Phyllis Deane), *review* by D. Randal Wightman, 431
Increased Muscle Phosphorylase Activity in the Starved Rat (Knud Lundbaek and Ewald S. Goranson), 1002
Index Kewensis Plantarum Phanerogamarum, Supplementum 10, 1936–1940 (edited by A. W. Hill and E. J. Salisbury), *review* by Prof. J. R. Matthews, 909
India : Some Fungi of, 271
    Ancient ; The Technique of Casting Coins in (Prof. F. C. Thompson), 266
Indian Archæology at the University of London, 727
Indian Dairy Science (Prof. H. D. Kay), 864
Indian Forest Service (Prof. E. P. Stebbing), 129
Indian Premium of the Institution of Civil Engineers awarded to C. G. Sexton, 865
Indians (South American) : Handbook of (edited by Julian H. Steward), Vol. 3, The Tropical Forest Tribes ; Vol. 4 : The Circum-Caribbean Tribes, *review* by Dr. G. H. S. Bushnell, 908
Indicator Yellow and Retinene$_1$ (Dr. H. J. A. Dartnall), 222 ; (S. Ball, F. D. Collins and Prof. F. A. Morton), 222 ; (Alfred F. Bliss), 661
Indirect Effect of Ionizing Radiations : Hydrogen Peroxide and the (Tikvah Alper), 615
Indium-115 : Evidence of Geological Age against Decay of Tin-115 to, by Electron Capture (Dr. L. H. Ahrens), 413
Indole : Production of, by *Escherichia coli* (Dr. Edwin A. Dawes), 229
Induced Adenocarcinoma of the Stomach in Mice (Dr. D. R. Peacock and S. Beck), 252
Induced and Spontaneous Abnormality in Ciliates (Dr. Ll. Lloyd), 188
Industrial Applications of Infrared (James Doyle Hall), *review* by M. R. Gavin, 637
Industrial Medicine : International Congress of, 59
Industrial Practice in the Iron and Steel Industry : Science and, 59
Industrial Productivity : Social Sciences and, 628
Industrial Progress : Pure Science, Fertile Source of (Prof. L. de Broglie), 769
Industrial Radiographs : Exhibition of (Industrial Radiology Group of the Institute of Physics), 990
Industrial Research : Surface Chemistry for (J. J. Bikerman), *review* by Dr. A. S. C. Lawrence, 164
Industrial Research and Production and Management Engineering : Selected Techniques of Statistical Analysis for Scientific and (Statistical Research Group, Columbia University), edited by Churchill Eisenhart, Millard W. Hastay and W. Allen Wallis, *review* by Prof. M. S. Bartlett, 510
Industrial Survival : Britain's (Ian Bowen), *review*, 45
Industries (Nationalized) : Control of, 807
Industry : Applications of Electronics to Research and (Electronics Group of the Scientific Instrument Manufacturers' Association Symposium on), 485, 769
    The Cathode Ray Oscillograph in (Dr. W. Wilson), third edition, *review* by L. E. C. H., 391
    Distribution of, in Britain, 829
    Dust in (Society of Chemical Industry Conference on), 328, 485
    The Graduate in (Dr. Percy Dunsheath), 125 ; *review* by R. Brightman, 388
    Instrumentation and Control in (A. J. Young), 761
    Mathematical Tables for Science and, 98
    Process Heating in, *review* by M. R. Gavin, 637
    Statistical Methods in (Dr. B. P. Dudding), 607
    Trade Unions in, 365
    The Young Worker in (British Association, Section L (Education), Discussion on), 667
    Non-Competitive ; The Consumer in relation to (Herbert Morrison), 807
Infection of *Trypanosoma evansi* in Rats : Effect of Pantothenic Acid on the (Dr. H. N. Ray and S. Harbans), 849
Infections of *Litomosoides carinii* in the Cotton Rat : Course of Untreated (W. E. Kershaw and Dr. D. S. Bertram), 149
Infectious Chlorosis of Bananas in the Cameroons (Prof. C. W. Wardlaw), 894
Inflammation : Spreading Phenomenon and (Dr. Oscar Hechter and Sidney Solomon), 701 ; *erratum*, 809
Influence of Hydrogen Ions and Neutral Salts upon the Hydration of Interstitial Connective Tissue (Dr. T. D. Day), 152
Influence of Low Temperatures on the Mechanism of the Austenite–Martensite Transformation (Dr. Jozef Mazur), 184
Influenza Virus Infection : Viropexis, the Mechanism of (Dr. S. Fazekas de St. Groth), 294
Information (Technical) : The Presentation of (Prof. Reginald O. Kapp), *review* by R. Brightman, 909
Information Services : Central and Local General, 1
    Organised (Northern Branch of ASLIB Conference on), 809
    Formation of a Standing Committee on (Royal Society), 955
Infra-Red: Industrial Applications of (James Doyle Hall), *review* by M. R. Gavin, 637
Infra-Red Gas Analyser : Determination of Mixing of Gas Streams by the (R. D. Collins and M. P. Newby), 224
Infra-Red Radiation : Crystal Structure of Acetanilide—Use of Polarized (Dr. C. J. Brown and D. E. C. Corbridge), 72
Infra-Red Region : Absorption of Magnesium Oxide in the (J. C. Willmott), 996
Inhibition of Aerobic Sporing Bacilli by Hæmatin (Dr. W. E. van Heyningen), 114
Inhibition of Growth by Auxin : Nicotinic Acid and the (Dr. L. J. Audus), 811
Inhibition of some Respiratory Enzyme Systems by Derivatives of Sulphuric Acid (Donald Hockenhull), 813
Inhibition of a Succinic Aerodehydrogenase System by Surface-active Agents (Donald Hockenhull), 850
Inhibitor of Pseudocholinesterase : N-Diethylaminoethylphenothiazine, a Specific (Dr. J. J. Gordon), 146
Initiation of Explosions by Grit Particles (Dr. F. P. Bowden and O. A. Gurton), 654
Initiation Reaction of the Polymerization of Styrene : Radical Reactivity in the (W. Cooper), 897
Ink for Writing on Glass (E. H. Leach), 809
Innervation of the Adenohypophysis (Dr. E. Vazquez-Lopez), 458

Inorganic Analysis : Organic Substances used in, *review* by Dr. G. M. Bennett, 48
Inorganic Compounds : A New Method for the Separation, Detection and Estimation of (T. V. Arden, Dr. F. H. Burstall, Dr. G. R. Davies, J. A. Lewis and Prof. R. P. Linstead), 691
Inorganic Constituents of Wheat Bran Extract in Streptomycin Production : Role of the (R. Raghunandana Rao), 850
Insect : An Interesting Hemipterous, from New Zealand, 919
Insect Attractants and Repellents : Chemical (Prof. Vincent G. Dethier), *review* by Dr. V. B. Wigglesworth, 550
Insect Behaviour: Chemical Stimuli and, *review* by Dr. V. B. Wigglesworth, 550
Insect Natural History (Dr. A. D. Imms), *review* by Dr. V. B. Wigglesworth, 5
Insect Pests of Glasshouse Crops (Prof. Herbert W. Miles and Mary Miles), second edition, *review*, 946
Insect Populations : Truncated Log-Normal and Root-Normal Frequency Distributions of (D. Spiller), 530
  Estimation of ; in the Field (A. H. Strickland), 308
Insect Vectors : Specific Crystalline Protein and Nucleoprotein from a Plant Virus having (Dr. Roy Markham, Dr. R. E. F. Matthews and Dr. Kenneth M. Smith), 88
Insecticidal Power and Microscopical Structure of Residual Films of Benzene Hexachloride (A. J. Musgrave), 296
Insecticides : Recent Developments in (Dr. R. A. E. Galley), 308 ; (Dr. V. B. Wigglesworth), 308 ; (W. A. Ross), 308
  Application of ; from the Air (Dr. D. L. Gunn), 308
Insecticides and Fungicides : A Catalogue of, Vol. I, Chemical Insecticides (compiled by Prof. Donald E. H. Frear), *review*, 354
Insects : Biological Control of (A. B. Baird), 308 ; (Dr. W. Cottier), 308 ; (Dr. R. H. Le Pelley), 308
  Biological Control of Weeds by means of (Dr. D. Miller), 308
  British ; Natural History of, *review* by Dr. V. B. Wigglesworth, 5
  Stored Products ; Control of (F. N. Ratcliffe), 308
Insects and other Terrestrial Arthropods : Astaxanthin in (Prof. C. Manunta), 298
Insemination : Artificial Human (Report of a Commission appointed by the Archbishop of Canterbury), 790
  Artificial ; Physiology and Pathology of Animal Reproduction and (International Congress on the), 138
Instability in Pipe Flow (R. B. Whittington and E. W. S. Ashton), 997
Installing of Electric Discharge Lamps (Institution of Electrical Engineers Regulations for the Electrical Equipment of Buildings, Revised Section 8), 447
Instrument Jewels: Dimensions of (British Standard 904: 1948), revised edition, 843
Instrumentation and Control, including Electronic Devices (British Association, Section A (Physics), Symposium on), 761
Insulation (Organic) : Electrical Breakdown of, by Electro-chemical Reactions (H. F. Church and C. G. Garton), 301
Insulin : Some Peptides from (Dr. F. Sanger), 491
Insulin Molecule : The Core of the (Dr. J. A. V. Butler, D. M. P. Phillips and J. M. L. Stephen), 418
Intensities of X-Ray Reflexions : Effect of Hydrogen Atoms on (Dr. J. D. Morrison, W. P. Binnie and Prof. J. Monteath Robertson), 889
Inter-University Relations and Exchanges (Universities of the British Commonwealth Discussion on), 585
Inter-War Years : Europe's Population in the (Dudley Kirk), *review* by Prof. H. J. Fleure, 428
Interaction between Curare and the Potassium Ion at the Motor End Plate (P. E. B. Holmes, D. J. Jenden and Dr. D. B. Taylor), 217
Interaction between Nucleons : Fast Neutron-Proton Scattering and the Law of (E. H. S. Burhop and H. N. Yadav), 738
Interference Fringes: New Localized (Prof. S. Tolansky and N. Barakat), 816
Interferometry : Liquid Surface (H. Barrell and R. Marriner), 529
  Multiple-Beam ; Current Investigations with (Prof. S. Tolansky), 523
Interferometry of Absorption Spectra : A New Heterochromatic Fabry-Perot Fringe System Applicable to the (Rev. P. J. Treanor), 885
Intergranular Corrosion of Pure Aluminium in relation to the Behaviour of Grain-Boundaries during Melting (Prof. G. Chaudron, Dr. P. Lacombe and N. Yannaquis), 854
Intermediaries in Soil Nitrification (Dr. Howard Lees), 702,
Internal Combustion Engines : 'Knock' in (R. W. Wheeler, D. Downs and Dr. A. D. Walsh), 893
Internal Pair Conversion (M. H. Wang), 264
International Conference on Mental Hygiene, 442
International Conference on Noise and Sound Transmission (Acoustics Group of the Physical Society, in association with the Royal Institute of British Architects), 59
International Congress on Analytical Chemistry, 156
International Congress on Biological Chemistry (Société de Chimie biologique), 59, 870
International Congress of Comparative Pathology (Fifth meeting in Istanbul), 844
International Congress of Food and Agricultural Industries : Seventh, 19
International Congress of Industrial Medicine, 59
International Congress of Mathematicians (To be held in Cambridge, Mass.), 843
International Congress on Mental Health, 441
International Congress on the Physiology and Pathology of Animal Reproduction and Artificial Insemination, 138
International Congress on Rheology : First (Dr. G. W. Scott Blair), 747
International Exchange of Scientific Information (Prof. N. F. Mott), 417
International Geological Congress, 232, 663
International Limnological Congress, Zurich : Tenth (Prof. F. E. Fritsch), 623
International Scientific Film Congress, 59
Interphase Chromosomes : Relative X-Ray Sensitivity of Metaphase and (Dr. Arnold H. Sparrow), 651
Interpretation of Data from Electrical Resistivity Geophysical Surveys (Dr. S. Whitehead and Dr. W. G. Radley), 187 ; (J. M. Hough), 187, 970
Interpretation of Experiments on Metabolic Processes, using Isotopic Tracer Elements (Dr. A. G. Ogston), 963
Interrelations of the Serum Protein in the Thymol Turbidity Test (Dr. Nicholas H. Martin), 145
Interstellar Material: Condensation of, into Stars (F. Hoyle), 233
Interstitial Connective Tissue : Influence of Hydrogen Ions and Neutral Salts upon the Hydration of (Dr. T. D. Day), 152
Intestinal Microflora : Control of (H. Dalton), 227
Intracranial Tumours of Man : Presence of a Parasitic Agent in various (Dr. R. A. Krynauw and Prof. Cecil Jackson), 147
Intuition and Reason (Dr. Maurice Burton), 956
Invertebrates : Practical Zoological Illustrations— (W. S. Bullough), *review*, 834
Iodine Oxide (IO) in Flames : Spectrum of (E. H. Coleman, Dr. A. G. Gaydon and Dr. W. M. Vaidya), 108
Iodoacetate-Poisoned Muscle : Electrical Potential Change accompanying the Development of Rigor in (Y. M. Liu, C. H. Hsu and Dr. T. P. Feng), 962
Ion Concentrations : Measurement of Alkaline Earth, by Rennet Action (Prof. G. T. Pyne), 925
Ionic Exchange and Fibre Contraction (H. G. Ingersoll and A. A. Johnson), 225
Ionic Reactions in Liquid Dinitrogen Tetroxide (Dr. C. C. Addison and R. Thompson), 369
Ionization in Liquid and Solid Argon (G. W. Hutchinson), 610
Ionization Chamber : A High-Pressure Hydrogen-filled (G. H. Stafford), 771
Ionizing Power (Minimum) : Recording of Charged Particles of, in Photographic Emulsions (Dr. R. W. Berriman), 992
Ionizing Radiations : Hydrogen Peroxide and the Indirect Effect of (Tikvah Alper), 615
Ionophoresis Apparatus : A Modified (Dr. David A. Hall), 105
Ionosphere : Diffraction from the, and the Fading of Radio Waves (J. A. Ratcliffe), 9
  Lunar Tidal Oscillations in the (Sir Edward Appleton and Dr. W. J. G. Beynon), 486
  Radio Communication and the, 465
  Short-Period Changes in the *F* Region of the (G. H. Munro), 886
Ionospheric *D*-Region : Electric Conductivity of the (Dr. D. F. Martyn), 142 ; (Prof. T. G. Cowling and R. Borger), 143
Ionospheric Transmission : Fundamental Principles of (Department of Scientific and Industrial Research, Radio Research Special Report No. 17), 465
Iran : Earthquake on October 5, 647
Iron-59 (Pure) : Preparation of, of High Specific Activity (A. W. Kenny and W. R. E. Maton), 567
Iron and Steel Industry : Science and Industrial Practice in the, 59
Irrationality of the General Cubic Threefold (Prof. G. Fano), 563
Island : Fahrten in (Rudolf Jonas), *review*, 513
Island Fauna : Destruction and Rehabilitation of an, *review*, 552
Isolation from Argemone Oil of Dihydrosanguinarine and Sanguinarine—Toxicity of Sanguinarine (S. N. Sarkar), 265
Isolation of Threonine : Studies in the Synthesis and (Dr. D. F. Elliott), 657
Isomeric Transitions of Short Periods : Nuclear (P. B. Treacy), 186
Isophorphorylase (Dr. P. Bernfeld and A. Meutémédian), 297
Isophosphorylase and the Formation of Branched Polysaccharides (Dr. P. Bernfeld and A. Meutémédian), 618
Isotherms : Relation between the Brunauer–Emmett–Teller and Harkins–Jura (T. D. Smith and R. Bell), 109
Isotopes : Radioactive and Stable, for Research Purposes, 786
  Radioactive ; Therapeutic Applications of (Radiology Section of the British Medical Association Symposium on), 480
Isotopic Assignment of the α-Activity of Samarium (Prof. N. Feather), 412
Isotopic Tracer Elements : Interpretation of Experiments on Metabolic Processes, using (Dr. A. G. Ogston), 963
Italy: Earthquake at San Sepolcro on June 13, 248; Earthquake at Apulia on August 18, 768; Earthquake at Orda Nova on August 21, 768; Earthquake on August 22, 768
Italy from the Prehistoric Period to Augustus : Ancient Roman Construction in (Marion Elizabeth Blake), *review* by Joan Liversidge, 755

JAN Mayen Island (near) : Earthquake on August 30, 768
Japan : Earthquake near the southern coast of Honshu on June 15, 248
  Earthquake in Fukui on June 28, 248
  Earthquakes on June 28, 57
  United States Scientific Mission to, 954
Jefferson (Thomas) Among the Arts (Eleanor Davidson Berman), *review* by F. I. G. Rawlins, 513
Jewels (Instrument): Dimensions o i(British Standard 904: 1948), revised edition, 843
Joule (James Prescott) Medal and Miller Prize of the Institution of Civil Engineers awarded to S. Rodin, 865

KAMCHATKA (southern coast of) : Earthquake on March 23, 138
Kangaroos (G. H. H. Tate), 989
Karlsruhe, Rasstat, Lauterbourg area : Swarm of earthquakes during June, 249
Kavirondo (Central), Kenya Colony : Dimple-Based Pottery from (M. D. Leakey, the late W. E. Owen and L. S. B. Leakey), *review* by Bernard Fagg, 834
Kerguelen Archipelago : Plant Microfossils from the Lignites of the (Isabel C. Cookson), 309
Kerr Cells : Brief Light Pulses using (Prof. W. M. Cady and A. M. Zarem), 528
Ketone Synthesis : A New (R. E. Bowman), 111
'17-Ketosteroid II' as *i*-Androsten-6-ol-17-one : Identification of (Dr. D. H. R. Barton and Dr. W. Klyne), 493
'17-Ketosteroid II' Isolated from Urine—its Reaction with Hydrochloric Acid (Dr. Elizabeth Dingemanse, Leonora G. Huis in't Veld and S. Lore Hartogh-Katz), 492
Ketosteroids: Cytochemical Demonstration of (Dr. R. J. Boscott, Anita M. Mandl, Dr. J. F. Danielli and Dr. C. W. Shoppee), 572
Ketoyobyrine: Structure of (Prof. G. R. Clemo and G. A. Swan), 693
Kewensis Plantarum Phanerogamarum : Index, Supplementum 10, 1936–1940, edited by A. W. Hill and E. J. Salisbury, *review* by Prof. J. R. Matthews, 909

Kinetic Approach to the Theory of the Strength of Glass (S. M. Cox), 947
Kinetics of Reactions in Solution (Dr. E. A. Moelwyn-Hughes), second edition, *review* by R. P. Bell, 275
Kitab Al-Muntazam of Ibn Al-Jauzi: Further References to Cosmic Phenomena in the, and a few in Tarikh-E-Rahat Afza (Mohd. Abdur Rahman Khan), 289
'Knock' in Internal Combustion Engines (R. W. Wheeler, D. Downs and Dr. A. D. Walsh), 893
Kocher (Theodor) Prize of the University of Berne awarded to Dr. H. Greinacher, 990
Kodak Nuclear Plates : Range-Energy and other Relations for Electrons in (Dr. Marion A. S. Ross and Barbara Zajac), 923
Krakatau, 1883–1933 : The Fauna of (K. W. Dammerman), *review*, 552
Krásná: Zeme (The Beautiful Earth), (J. K. Riha), *review* by J. G. F. D., 49
Kronfeld Memorial Fund (Royal Aeronautical Society), 769

LABORATORY Animal : Origin of the Golden Hamster *Cricetus auratus* as a (Prof. S. Adler), 256
Laboratory Glassware Production (R. Sutcliffe), 974
Labour Force in Britain : Women as a, 605
Labyrinth of the Thornback Ray (*Raja clavata*) : Oscillographic Analysis of the Gravity and Vibration Responses from the (Dr. Otto Lowenstein and T. D. M. Roberts), 852
Laccase from its Protein and Copper : Reconstruction of (A. Tissières), 340
Lactation : Physiology of (British Association, Sections M (Agriculture) and I (Physiology), joint Discussion on the), 601
Lambeth Conference Report, 589
Laminaria ochroleuca De La Pylaie Growing on the Coast of Britain (Mary Parke), 295
Lamps for Photography and Projection : Discharge (H. K. Bourne), *review* by J. N. Aldington, 758
Land : The Education and Social Significance of the (Association of Agriculture and the University of London Institute of Education series of sessions on), 920
  Wild Animals and the (F. Howard Lancum), *review* by Seton Gordon, 85
Land Reclamation (P. J. O. Trist), *review* by Dr. E. W. Russell, 475
Land and Poverty in the Middle East (Dr. B. A. Keen), 53 ; (Dr. Doreen Warriner), 53
Land-mine Detectors designed at Gaza (Dr. W. Lawrence Balls), 98
Langley Memorial Prize of the London School of Hygiene and Tropical Medicine awarded to Dr. D. Fitzgerald Moore, 990
Language : Origin of (Prof. Alexander Johannesson), 902
Lantern Slides of Diagrams, Formulæ, etc., 809
Larder of the Red-backed Shrike (T. H. Hawkins), 504 ; (J. H. Owen), 504
Larva of *Gastrophilus intestinalis* : Succinic Acid in the Blood of the (L. Levenbook and Dr. Y. L. Wang), 731
Latitude Effect and Meson Decay (Dr. H. D. Rathgeber), 303
Latitude Effect of Penetrating Cosmic Ray Showers (Dr. V. Appapillai and Prof. A. W. Mailvaganam), 887
Lattice : Random Association of Points on a (P. V. Krishna Iyer), 333
Law of Interaction between Nucleons : Fast Neutron-Proton Scattering and the (E. H. S. Burhop and H. N. Yadav), 738
Laws and Constitutions, *review* by Maurice Bruce, 238
Layers of Crystals : Surface (P. B. Hirsch and the late Dr. J. N. Kellar), 609
Lea (Dr. Douglas Edward) Memorial Lecture, 100
Lead Isotopes and the Age of the Earth (Prof. Harold Jeffreys), 822
Leaf Formation : A New Theory of, *review*, 798
Legislation : A Fragment on Government and An Introduction to the Principles of Morals and (Jeremy Bentham), *review* by Maurice Bruce, 238
Leptones of Protoplasm : Birefringence and Orientation-rate of the (Dr. Hans H. Pfeiffer), 419
Leptosporangiate Ferns : A Revised Classification of (E. E. Holttum), *review* by Prof. I. Manton, 314
Level-Shift and Effect of Radiation Field : Electromagnetic (Prof. D. S. Kothari and F. C. Auluck), 143
Lewis Blood Group and Secretor Character in Man : Correlation between (R. Grubb), 933
Libraries : Hawaiian, 809
Life-Histories of North American Birds (—. Burt), 522
Life-History of *Splachnidium rugosum* (R. J. Hopkins), 75
Life-Span of Red and White Blood Corpuscles of the Hen (J. Ottesen), 730
Light in Glasshouses : The Control of Heat and (Dr. W. F. Bewley), 584
Light Pulses using Kerr Cells : Brief (Prof. W. M. Cady and A. M. Zarem), 528
Lighting Exhibition at the Science Museum, 564
Lightning Discharge : Effect of (Prof. E. W. Marchant), 366
Lignified Cell Walls : A Simple Technique for the Differential Staining of (Dr. Iwo R. W. Lominski and S. A. Hutchison), 415
Lignites of the Kerguelen Archipelago : Plant Microfossils from the (Isabel C. Cookson), 309
Limitations of Planning, 41
Limiting Diffusion Currents at Wire Electrodes (Dr. A. Hickling and W. H. Wilson), 489
Limnological Congress, Zurich : Tenth International (Prof. F. E. Fritsch), 623
Linear Accelerator for 4-MeV. Electrons : A Travelling-Wave (D. W. Fry, R. B. R.-S. Harvie, L. B. Mullett and W. Walkinshaw), 859
Lipoid Content of the Oxyntic Granules of the Rat's Stomach (Gordon Menzies), 64
Liquid Dinitrogen Tetroxide : Ionic Reactions in (Dr. C. C. Addison and R. Thompson), 369
Liquid Explosives : Detonation in (D. Croney), 490
Liquid Fuels : Modern Applications of (Institute of Petroleum and the Institute of Fuel Conference on), 328, 951
Liquid Helium II : Propagation of Pulses of Second Sound in (D. V. Osborne), 213
Liquid Surface Interferometry (H. Barrell and R. Marriner), 529
Liquid Surfaces : Production of Extremely Thin Metal Films by Evaporation on to (Prof. Nils Hast), 892
Lister Medal for 1948 awarded to Prof. Geoffrey Jefferson, 138
Litomosoides carinii in the Cotton Rat : Course of Untreated Infections of (W. E. Kershaw and Dr. D. S. Bertram), 149
Littorinidæ (British) : Nomenclature of the (Dr. G. Seshappa), 702
Liver Diseases (Parenchymatous) : Abnormal Serum Protein in (Dr. A. Fischer, Dr. C. Sellei and Dr. M. Bretán), 1002
Livestock : Inbreeding and Hybrid Vigour in Crops and (British Association, Sections M (Agriculture), K (Botany) and D (Zoology), joint Discussion on), 642
  Farm ; The Feeding of (J. C. B. Ellis), second edition, *review* by E. T. Halnan, 432
Living Cells : Cinematograph Films of (C. C. Speidel), 249
Living Human Testicular Cells seen with Phase-Contrast Microscopy : Golgi Apparatus of (A. G. Oettlé), 76
Living Malignant Cells : Ultra-Violet Microscopy of (Dr. R. J. Ludford, J. Smiles and F. V. Welch), 650
Local Action of Calciferol and Vitamin A on Bone (N. A. Barnicot), 848
Local Government Areas : The Boundaries of (E. W. Gilbert), 884
Local Societies : The Functions and Organisation of (G. Gosnell), 79
Localization of Alkaline Phosphatase in Yeast (Dr. Walter J. Nickerson, Edith J. Krugelis and Nils Andrèsen), 192
Localization of Polyphenoloxidase in the Chloroplasts of *Beta vulgaris* (Prof. Daniel I. Arnon), 341
Locustana pardalina Walk. : Pore Canals in the Egg Membranes of (J. J. Matthée), 226
Locusts and Grasshoppers (Dr. B. P. Uvarov), 308
Log-Normal and Root-Normal Frequency Distributions of Insect Populations : Truncated (D. Spiller), 530
London : The Little Ringed Plover in, 563
LORAN, Long Range Navigation (edited by J. A. Pierce, A. A. McKenzie and R. H. Woodward), *review* by Dr. R. L. Smith-Rose, 633
Loss of White Cells in Bone Marrow Culture (H. J. F. Cairns and L. G. Lajtha), 536
Low Temperature Physics (Dr. L. C. Jackson), revised second edition, *review* by Dr. D. Shoenberg, 510
Low Temperatures : Cold Working of Aluminium at (T. S. Hutchison), 374
  Influence of, on the Mechanism of the Austenite – Martensite Transformation (Dr. Józef Mazur), 184
Low-Angle X-Ray Diffraction Pattern of Collagen (Barbara A. Wright), 23
Low-Level Atmospheric Ducts (Dr. J. S. McPetrie and B. Starnecki), 818
Low-Order Detonation in Solid High Explosives (T. C. Tranter), 335
Lugworm : Burrowing of the (Garth Chapman and Dr. G. E. Newell), 894
  Thixotropy, and the Mechanics of Burrowing in the (G. P. Wells), 652
Lugworms : Distribution of (Dr. G. E. Newell and Garth Chapman), 75
Luminescence (Electronics Division of the Electrochemical Society, Inc., Symposium on), 290
Lunar Tidal Oscillations in the Ionosphere (Sir Edward Appleton and Dr. W. J. G. Beynon), 486
Lyophobic Colloids : Theory of the Stability of (E. J. W. Verwey and J. Th. G. Overbeek, with the collaboration of K. van Nes), *review* by Dr. J. A. V. Butler, 315
Lytic System of Gram-Positive Micro-organisms : Some Components of the (Prof. M. Stacey and Dr. M. Webb), 11

MADRAS : New Fungi of (T. S. and K. Ramakrishnan), 447
Magnesium Oxide in the Infra-Red Region : Absorption of (J. C. Willmott), 996
Magnet Alloys (Anisotropic Permanent): Recent Advances in (D. A. Oliver), 799
Magnetic Behaviour of Nickel–Iron at High Frequencies : Anomalous (A. Wieberdink), 527 ; (Prof. R. Kronig), 528
Magnetic Field : Behaviour of a Particle of Very Small Size in a (Prof. J. Thibaud), 329
Magnetic Field of a White Dwarf : An Attempt to Detect (Dr. A. D. Thackeray), 483
Magnetic Materials (Dr. F. Brailsford), *review* by L. E. C. H., 513
Magnetic Properties of Superconductors (Dr. D. Schoenberg), 800
Magnetic Resonance Accelerator for Electrons (Prof. W. J. Henderson, H. LeCaine and R. Montalbetti), 699
Magnetism (British Association, Section A (Mathematics and Physics), Symposium on), 799
  The Engineer's Approach to Electricity and, *review* by Prof. J. Greig, 753
Magnetism of Celestial Bodies and Gravitation (J. Mariani), 612
Magneto-Resistance Effects in Bismuth : Anomalous (Dr. G. K. T. Conn and B. Donovan), 336
Magnetron : The Cavity, *review* by Prof. J. T. Randall, 591
Magnetrons : Microwave (edited by George B. Collins), *review* by Prof. J. T. Randall, 591
Makapansgat Valley : A (?) Promethean *Australopithecus* from (Prof. Raymond A. Dart), 375
Malaria : Incidence of, in Tropical Africa (G. A. Walton), 114
  Mosquitoes and (Dr. J. H. Kenneth), 227
Malaria Parasite of the Fowl (*P. gallinaceum*) : Resistance to Sulphadiazine and 'Paludrine' in the (Dr. Ann Bishop and Elspeth W. McConnachie), 541
Malaysia : Birds of (Jean Delacour), *review* by Frances Pitt, 49
Maleic Anhydride: Addition of, to Anethole (Prof. M. Lora-Tamayo), 969
Malignant Cells (Living) : Ultra-Violet Microscopy of (Dr. R. J. Ludford, J. Smiles and F. V. Welch), 650
Malt-Amylase : Molecular Weight of (Carl-Erik Danielsson), 525
Man : Active Psychology and the Welfare and Progress of (G. E. Witt), *review*, 758
  Aneurin-Pyrophosphate Content of Red and White Blood Corpuscles in the Rat and in (Dr. E. Florijn and G. Smits), 220
  Chemistry in the Service of (Prof. Alexander Findlay), seventh edition, *review*, 128
  Correlation between Lewis Blood Group and Secretor Character in (R. Grubb), 933
  Prehistoric Teeth of, and of the Orang-utan from Central Sumatra, with Notes on the Fossil Orang-utan fron Java and Southern China (Dr. D. A. Hooijer), 306
  Presence of a Parasitic Agent in various Intracranial Tumours of (Dr. R. A. Krynauw and Prof. Cecil Jackson), 147
Man in Australia : Antiquity of (H. H. Finlayson), 256
Man-Power : Distribution of Scientific, 199
  Scientific Research and, 711
Man-Power in Britain : Scientific and Technical, 469

Man-Power in the United States : Scientific Research and, 673
Management Engineering : Selected Techniques of Statistical Analysis for Scientific and Industrial Research and Production and (Statistical Research Group. Columbia University), edited by Churchill Eisenhart, Millard W. Hastay and W. Allen Wallis, *review* by Prof. M. S. Bartlett, 510
Managers, Men and Morale (Wilfred B. D. Brown and Winifred Raphael), *review* by E. F. L. Brech, 796
Mandragora . . . : Not poppy, nor, 97
Manganese in Soil : Effect of Carbon Dioxide on Availability of, producing Manganese Deficiency (B. D. Bolas and G. B. Portsmouth), 737
Manganese Alloys (Ferromagnetic) : Some New (F. A. Hames and D. S. Eppelsheimer), 968
Manganese Deficiency : Effect of Carbon Dioxide on Availability of Manganese in Soil producing (B. D. Bolas and G. B. Portsmouth), 737
Mankind : Cultural and Spiritual Progress of, 589
    Evolution in, *review* by Prof. H. J. Fleure, 352
Mannosido–Streptomycin : Chemical Assay of Streptomycin *B*, (W. B. Emery and A. D. Walker), 525
Manufactured Foods (Nutrition Panel of the Food Group of the Society of Chemical Industry Lectures on), 956
Map of North-west Germany: Geotectonic (Reichsamt der Bodenforschung, Hanover), 365
Maps : Rare and Historic, 920
Maps of Britain (Ordnance Survey), 57
Maps of Svalbard (Norsk Polar-institutt), 18
Marasmius ramealis : The Antibiotic Agent from (Gerd Bendz, Gösta Wallmark and Karin Öblom), 61
Marconi Jubilee International Congress : Publication of the *Proceedings*, 689
Marconi Transmitters for East Africa, 248
Marine Algæ : The Cellulose of (Dr. E. G. V. Percival and Alan G. Ross), 895
Margidunum : The Commandant's House at (Dr. Felix Oswald), 78
Marine Fish Cultivation (Dr. F. Gross), 378 ; (Dr. L. H. N. Cooper and G. A. Steven), 378
Marine Fisheries of Great Britain (British Association, Section D (Zoology), Symposium on), 641
Market Research : Report of the Conference arranged by the Manchester Joint Research Council on, 289
Martell Scholarship in Naval Architecture (Institution of Naval Architects), 956
Mass-Luminosity Law : Giant Binary Stars and the (Dr. J..A. Hynek), 815
Masses of Mesons (Dr. R. Fürth), 772
    Relation between the (Prof. Jean-Louis Destouches), 451
Material and Ethical Progress, 793
Matérialisme progressiste (Dr. Charles Mayer), *review* by Prof. A. D. Ritchie, 757
Materials : Some New Rheological Phenomena and their Significance for the Constitution of (S. M. Freeman and K. Weissenberg), 320
Mathematical Analysis : A Text-Book of (R. L. Goodstein), *review* by Prof. L. M. Milne-Thomson, 353
Mathematical Principles of Physics, *review* by Dr. R. Fürth, 44
Mathematical Sociology : Towards a, *review* by Prof. R. G. D. Allen, 352
Mathematical Statistics at the University of Sao Paulo, 56
Mathematical Tables for Science and Industry, 98
Mathematical Theory of Human Relations (N. Rashevsky), *review* by Prof. R. G. D. Allen, 352
Mathematicians, International Congress of (To be held in Cambridge, Mass.), 843
Mathematics : Applicable (British Association, Section A (Mathematics, and Section G (Engineering), joint Discussion on), 582
    Engineering Students and, 582
    Everyman's (F. G. Brown), *review* by Prof. H. T. H. Piaggio, 679
    Mechanics minus, *review* by R. A. Foulkes, 754
Mathematics at Ibadan, 842
Mathematics at King's College, Newcastle-upon-Tyne, 445
Mathematics at Queen Mary College, London, 56
Mathematics at University College, Bangor, 174
Mathématique : Visages de la (Dr. Pierre Defrise), *review* by Prof. H. T. H. Piaggio, 638
Maxwell's 'Fish Eye' as an Ideal Electron Lens (Prof. Walter Glaser), 455
Means and Ends (T. G. N. Haldane), 972
Measure of Particle Size : Feret's Statistical Diameter as a (W. H. Walton), 329
Measurement of Alkaline Earth Ion Concentrations by Rennet Action (Prof. G. T. Pyne), 925
Measurement of Colonial National Incomes (Phyllis Deane), *review* by D. Randal Wightman, 431
Measurements of Semi-conductivity to Heterogeneous Reactions : Application of (T. J. Gray), 260
Mécanique : Cours de (Henri Beghin), Tome I, Chapitres I à 18, *review*, 911
Mechanical Working of Metals (Institution of Metallurgists Refresher Course on), 447
Mechanically Produced Foam for Combating Petrol Fires : A Study of (Dr. N. O. Clark), 158
Mechanics : Applied Engineering (Prof. Alfred Jensen), *review* by R. A. Foulkes, 754
Mechanics minus Mathematics, *review* by R. A. Foulkes, 754
Mechanics of Burrowing in the Lugworm (*Arenicola marina* L.) : Thixotropy, and the (G. P. Wells), 652
Mechanism of the Austenite–Martensite Transformation : Influence of Low Temperatures on the (Dr. Józef Mazur), 184
Mèchanism of Influenza Virus Infection : Viropexis, the (Dr. S. Fazekas de St. Groth), 294
Mechanism of Nuclear Physics Counters, *review* by Dr. C. H. Westcott, 551
Mechanism of the Oxidation of Gaseous Formaldehyde (Chas. A. McDowell and J. H. Thomas), 367 ; (Prof. R. G. W. Norrish), 367
Mechanization of African Agriculture, 366
Medical Education, 311
Medical Fellowships (National Research Council of Canada), 523
Medical Progress in Chile, 137
Medical Research : Beit Memorial Fellowships for, 212
Medical Research Fellowships : Colonial, 607
Medical Use : Fine Chemicals for (Prof. J. H. Burn), 447
Medicine : Clinical Endocrinology and Constitutional (Dr. A. P. Cawadias), *review*, 512
    Rockefeller Travelling Fellowships in (Medical Research Council awards), 290
    The Social, of Old Age—Report of an Inquiry in Wolverhampton (Dr. J. H. Sheldon), 466
    Industrial ; International Congress of, 59
Meldola Medal for 1949 of the Society of Maccabæans, 769
Melting : Intergranular Corrosion of Pure Aluminium in relation to the Behaviour of Grain-Boundaries during (Prof. G. Chaudron, Dr. P. Lacombe and N. Yannaquis), 854
Membrane Electrophoresis in relation to Bioelectrical Polarization Effects (Prof. Torsten Teorell), 961
Membrane Equilibrium and the Generalized Free 'Energy of Protein Solutions in the Light of the Work of Procter : Recent Work on Osmotic Pressures, (G. S. Adair), 670
Membranes (Thin) : Occurrence of, in the Structure of Wool (Joel Lindberg, Bo Philip and Dr. Nils Gralén), 458
Membranes of the Hen's Egg : Permeability of the (Prof. N. Kissiunis), 77
Men (Oligospermic) : Variations in Spermatogenesis of (Margaret Hadley Jackson and Clare Harvey), 67
Men and Morale : Managers, (Wilfred B. D. Brown and Winifred Raphael), *review* by E. F. L. Brech, 796
Mental Health : International Congress on, 441
Mental Hygiene : International Conference on, 442
Meson Decay : Latitude Effect and (Dr. H. D. Rathgeber), 303
Mesons : Masses of (Dr. R. Fürth), 772
    Observations on the Production of, by Cosmic Radiation (Dr. G. P. S. Occhialini and Dr. C. F. Powell), 168
    Relation between the Masses of (Prof. Jean-Louis Destouches), 451
    Slow ; Decay and Capture of, in Dielectrics (Dr. H. Fröhlich, R. Huby, R. Kolodziejski and R. L. Rosenberg), 450
    Slow ; Observations on, of the Cosmic Radiation (U. Camerini, H. Muirhead, Dr. C. F. Powell and D. M. Ritson), 433
Metabolic Aspects of Convalescence : Conference on (Transactions of the Fifteenth Meeting), 157
Metabolic Investigations : Use of certain Growth-Inhibitors as Tools in (R. J. Pennington), 661
Metabolic Processes : Interpretation of Experiments on, using Isotopic Tracer Elements (Dr. A. G. Ogston), 963
Metabolic Product of *Trichothecium roseum* Link : Trichothecin, an Antifungal (Dr. G. G. Freeman and Dr. R. I. Morrison), 30
Metabolic Products (Fungal) : Stimulation of Adventitious Root Formation by (Dr. M. A. Mostafa and M. S. Naim), 575
Metabolism of Aminohydroxybenzoic Acids (Dr. H. G. Bray, Brenda E. Ryman and Dr. W. V. Thorpe), 64
Metabolism of $\alpha : \beta$-Dihydroxy-γ-(2-methylphenoxy)propane ('Myanesin'), (E. L. Graves, T. J. Elliott and Dr. W. Bradley), 257
Metabolism of Drugs, *review* by Dr. E. Boyland, 127
Metabolism of Micro-organisms : A Method for Studying the Carbohydrate (Dr. W. G. C. Forsyth and Dr. D. M. Webley), 150
Metabolism and Biological Effects of Steroid Hormones : Chemistry, (University of Wisconsin and the U.S. National Research Council Committee on Growth Symposium on), 176
Metachloridine-substituted Aryl Biguanides as possible Antimalarial Compounds (H. L. Bami, B. H. Iyer and Prof. P. C. Guha), 146
Metal Caps for Test-tubes (Oxo, Ltd.), 920
Metal Complexes : Order of Stability of (Dr. H. Irving and R. J. P. Williams), 746
Metal Films : Production of Extremely Thin, by Evaporation on to Liquid Surfaces (Prof. Nils Hast), 892
Metal Structures with Elastic and Plastic Flow : Application of Dynamic Similarity to (M. W. Thring), 193
Metallic Corrosion : An Introduction to (Dr. Ulick R. Evans), *review* by Dr. J. C. Hudson, 316
Metallic Equilibrium Diagrams : Systematization of certain Binary (H. J. Axon), 997
Metallurgy: Extraction; Research Fellowship in (Nuffield Foundation), 290
    Process ; The Physical Chemistry of (Faraday Society Discussion on), 212, 719
Metals : Corrosion of, *review* by Dr. J. C. Hudson, 316
    Electrolytic Polishing and Bright Plating of (Dr. S. Wernick), *review*, 834
    The Mechanical Working of (Institution of Metallurgists Refresher Course on), 447
    Strength of (Dr. W. A. Wood and W. A. Rachinger), 891
    Cold-worked ; X-Ray Line Broadening in (M. S. Paterson and Dr. E. Orowan), 991
    Noble ; Paper Chromatography of the (Michael Lederer), 776
Metals subjected to Compression Stress : Creep of (A. H. Sully, G. N. Cale and G. Willoughby), 411
Metals and Recrystallization : Creep of (Prof. E. N. da C. Andrade), 410
Metaphase and Interphase Chromosomes : Relative X-Ray Sensitivity of (Dr. Arnold H. Sparrow), 651
Meteors (Discussion held at the University of Manchester), 328
Methæmoglobin Mixtures : Hæmoglobin– (Q. H. Gibson and Prof. D. C. Harrison), 258
Methanol Vapour : Heat Capacity of (J. S. Rowlinson), 820
Methyl Iodide : Extinction of Petrol Fires by (A. Nicholson), 111
Methyl Palmitate : Dielectric Behaviour of—Evidence of Resonance Absorption (J. S. Dryden and Prof. Willis Jackson), 656
Methyl Xanthines : Fungal Mutations obtained with (Dr. Nils Fries and Bengt Kihlman), 573
Methylcholanthrene : A Test for Mutagenicity of (Dr. S. Bhattacharya), 573
N-Methyl-2-Pyridone from Nicotinic Acid and Nicotinamide : Synthesis of Derivatives of (Chr. Wiegand and W. I. M. Holman), 659
Methylene Blue as a Vital Stain for the Golgi Apparatus (Prof. J. Bronte Gatenby and Tohamy A. A. Moussa), 736
Mexican Village Life (G. I. Jones), 270
Micas (Hydrogen) : Titration Curves of (Dr. R. P. Mitra and K. S. Rajagopalan), 104
Mice : Induced Adenocarcinoma of the Stomach in (Dr. D. R. Peacock and S. Beck), 252
    Some Unusual Findings on the Carcinogenic Action of Urethane in (Prof. R. L. Noble and M. Jean Millar), 253

- Microbiological Oxidation of Sterols (Dr. A. Krámli and Dr. J. Horváth), 619
- Microflora (Intestinal) : Control of (H. Dalton), 227
- Microflora of the Rumen of the Sheep (M. Ingram and C. A. McGaughey), 533
- Microfossils: Plant, from the Lignites of the Kerguelen Archipelago (Isabel C. Cookson), 309
- Micro-organisms : Concentration of Cobalt by, and its relation to Cobalt Deficiency in Sheep (Dr. J. Tosic and Dr. R. L. Mitchell), 502
  - Culture Collections of, 447
  - Enzymatic Control of Cell Division in (Dr. Walter J. Nickerson), 241
  - A Method for Studying the Carbohydrate Metabolism of (Dr. W. G. C. Forsyth and Dr. D. M. Webley), 150
  - Symbiotic, of Aphids and Fixation of Atmospheric Nitrogen (Dr. J. D. Smith), 930
  - Gram-Positive ; Some Components of the Lytic System of (Prof. M. Stacey and Dr. M. Webb), 11
- Microscopic Anatomy of Vertebrates (Prof. James I. Kendall), third edition, *review* by Dr. P. D. F. Murray, 430
- Microscopical Structure of Residual Films of Benzene Hexachloride : Insecticidal Power and (A. J. Musgrave), 296
- Microscopy (Phase-Contrast) : Golgi Apparatus of Living Human Testicular Cells seen with (A. G. Oettlé), 76
  - of Viruses (Dr. Robert Barer), 251
- Microscopy of Living Malignant Cells : Ultra-Violet (Dr. R. J. Ludford, J. Smiles and F. V. Welch), 650
- Microseisms : Sea Waves and (M. S. Longuet-Higgins and F. Ursell), 700
- Microwave Duplexers (edited by Louis D. Smullin and Prof. Carl G. Montgomery), *review* by Dr. J. A. Saxton, 868
- Microwave Magnetrons (edited by George B. Collins), *review* by Prof. J. T. Randall, 591
- Microwave Measurements : Technique of (edited by Prof. Carol G. Montgomery), *review* by Dr. J. A. Saxton, 868
- Microwave Mixers (Robert V. Pound), *review* by Dr. J. A. Saxton, 868
- Microwave Receivers (edited by Prof. S. N. Van Voorhis), *review* by Dr. J. A. Saxton, 868
- Microwave Techniques, *review* by Dr. J. A. Saxton, 868
- Microwave Transmission Circuits (edited by George L. Ragan), *review* by Dr. J. A. Saxton, 868
- Middle East : The Agricultural Development of the (Dr. B. A. Keen), 53
  - Animal Industry in the (Dr. N. C. Wright), 53
  - Land and Poverty in the (Dr. B. A. Keen), 53 ; (Dr. Doreen Warriner), 53
  - Rural Education and Welfare in the (H. B. Allen), 53
- Middle East Oil (H. B. Milner), 501
- Middle East Science (Dr. E. B. Worthington), 53
- Midges of Economic Importance : Gall (Dr. H. F. Barnes), Vol. 3, Gall Midges of Fruit, *review* by A. D. I., 834
- Milk : Influence of Time and Temperature of Storage on Dye-Reduction Tests in (R. K. Morton and J. M. Vincent), 415
- Milk, from Cow to Consumer, 955
- Milk Bank : The Human (Edith G. Dare), 439
- Milk Secretion : Œstrogens in Grass and their possible Effects on (Dr. S. Bartlett, Dr. S. J. Folley, Dr. S. J. Rowland, D. H. Curnow and Sylvia A. Simpson), 845
- Milky Way : The (Documentary film produced by Wallace Productions, Ltd., for United Dairies, Ltd.), 955
- Miller Prizes of the Institution of Civil Engineers : Awards for the Session 1947–48, 865
- Mind of the Child, *review* by Dr. O. L. Zangwill, 871
- Mineral Constituents of the Egg-shell : Utilization of, by the Developing Embryo of the Stick Insect (A. Moscona), 62
- Mineral Key (Howard B. Graves, Jr.), *review* by P. A. S., 946
- Mineral Resources of Africa : Geology and (Association of African Geological Surveys Conference on), 971
- Minerals : Two New British (Dr. F. A. Bannister and Prof. S. E. Hollingworth), 565
- Minimum Oxygen Layer in the Ocean (Dr. R. B. Seymour Sewell and Prof. Louis Fage), 949
- Mining and Metallurgical Congress : Fourth Empire, 606
- Missing : Errors of Treatment Comparisons when Observations are (J. Taylor), 262
- Mitosis (Abnormal), Polyploidy and Chromosome Fragmentation induced by Hexachlorocyclohexane : Atypical Growth, (Dontcho Kostoff), 845
- Mixing of Gas Streams by the Infra-Red Gas Analyser : Determination of (R. D. Collins and M. P. Newby), 224
- Molecular Association : Sound Velocity and Temperature Change of (Prof. A. Van Itterbeek and A. de Bock), 611
- Molecular Energy-Levels : Excitation Probability Functions of Atomic and (R. W. Nicholls), 487
- Molecular Nitrogen : Excitation Processes in (R. W. Nicholls), 231
- Molecular Weight of Malt-Amylase (Carl-Erik Danielsson), 525
- Molecule (Insulin) : The Core of the (Dr. J. A. V. Butler, D. M. P. Phillips and J. M. L. Stephen), 418
- Molecules (Polyatomic) : A General Solution for the Force Constants of (P. Torkington), 370, 607
- Mollusca : Distribution of Shell Porphyrins in (Alex. Comfort), 851
- Money : New Light on the Origin of (Dr. Paul Einzig), 983
- Monocarboxylic Acids : Crystal Structures of the Acid Salts of some (Dr. J. C. Speakman), 695
- Monocular Fixation : Eye Movements during (Dr. Mary P. Lord and Dr. W. D. Wright), 25 ; *erratum*, 100
- Monolayers of Myosin : Effect of Adenosine Triphosphate on (Agnete Munch-Petersen), 537
- Montmorillonite : Adsorption by, and its relation to Surface Adsorption (Dr. D. M. C. MacEwan), 935
- Morale : Managers, Men and (Wilfred B. D. Brown and Winifred Raphael), *review* by E. F. L. Brech, 796
- Morals and Legislation : A Fragment on Government and An Introduction to the Principles of (Jeremy Bentham), *review* by Maurice Bruce, 238
- Morphological Astronomy (Dr. F. Zwicky), 627
- Morphological and Biochemical Characteristics of Anærobic Butyric Acid Bacteria : Variation in (Dr. Otto Richard), 463
- Morphology of Protoplasm and its Derivatives : Submicroscopic (Prof. A. Frey-Wyssling), translated by Prof. J. J. Hermans and M. Hollander, *review* by Dr. J. Danielli, 753
- Mosquito Repellents : Tests of (Major R. N. McCullough and Capt. D. F. Waterhouse), 249
- Mosquitoes and Malaria (Dr. J. H. Kenneth), 227
- Motor End Plate : Interaction between Curare and the Potassium ion at the (P. E. B. Holmes, D. J. Jenden and Dr. D. B. Taylor), 217
- Motor Industry in Britain (Political and Economic Planning, Broadsheet No. 284), 646
- Motor Roads : German (B.I.O.S. Overall Report No. 5), 345
- Mouse : Vestibular Effect of Streptomycin in the (Dr. R. Caussé, I. Gondet and B. Vallancien), 929
- Mouse Brain : Physical Nature of (M. C. H. Dodgson), 253
- Movements of Population in the British Commonwealth (British Association, Section E (Geography), Symposium on), 718
- Muds (Black) : A Concentration of Uranium in (Dr. Kaare Münster Strøm), 922
- Multiple Allelomorphs in Colour Vision (Dr. R. W. Pickford), 684
- Multiple-Beam Interferometry : Current investigations with (Prof. S. Tolansky), 523
- Multiplication of Bacteriophage (Dr. Ralph W. G. Wyckoff), 649
- Muscle (Iodoacetate-Poisoned) : Electrical Potential Change accompanying the Development of Rigor in (Y. M. Liu, C. H. Hsu and Dr. T. P. Feng), 962
- Muscle (Isolated) : Effect of Hypophysectomy on Glycogen Deposition in (Dr. J. Bornstein and J. F. Nelson), 572
- Muscle Cells : Permeability of (E. J. Harris and G. P. Burn), 929
- Muscle Phosphorylase Activity in the Starved Rat : Increased (Knud Lundbaek and Ewald S. Goranson), 1002
- Museum : Televizing the, 18
- Museums : South African (J. R. Harding), 861
- Mushroom Cultivation : Diseases of (Mushroom Growers' Association Bulletins 11 and 12, and Leaflet 3, on), 289
- Mushroom Diseases (Mushroom Growers' Association Bulletin 10), 58
- Mustard (Nitrogen) : Inactivation of Complement by (W. H. Watkins and Prof. A. Wormall), 535
  - Mutations induced in *Coprinus fimetarius* (L.) by (Lisbeth Fries), 846
- Mutagenicity of Methylcholanthrene : A Test for (Dr. S. Bhattacharya), 573
- Mutations induced in *Coprinus fimetarius* (L.) by Nitrogen Mustard (Lisbeth Fries), 846
- 'Myanesin' : Metabolism of α : β-Dihydroxy-γ-(2-methylphenoxy)propane: Metabolism of (E. L. Graves, T. J. Elliott and Dr. W. Bradley), 257
- Mycological Conference : Fourth Commonwealth, 60
- Myers (Frederic W. H.) Memorial Lecture: Ninth (S. G. Soal), *review*, 432
- Myoglobin (Whale) : Crystallization of (Joan Keilin and K. Schmid), 496
- Myosin : Effect of Adenosine Triphosphate on Monolayers of (Agnete Munch-Petersen), 537
  - Phosphorylation of, by Adenosine Triphosphate (Prof. Fritz Buchthal, Adam Deutsch, Gustav G. Knappeis and Agnete Munch-Petersen), 965
- Mysticism : Psychology and, *review* by Mrs. D. M. Wheatley, 592
- Mythology (British) : The Minor Traditions of (Lewis Spence), *review* by Dr. E. J. Dingwall, 388

- NAIROBI, Master Plan for a Colonial Capital (Prof. L. W. Thornton White, L. Silberman and P. R. Anderson), *review*, 432
- Narcotics and similar Drugs : Use of Rotifera for Testing Analgesics, (R. H. Marriott, S. Morris and Y. Larthe), 189
- National Gallery Pictures : Cleaning and Care of the (W. G. Constable), 166
- National Incomes (Colonial) : The Measurement of (Phyllis Deane), *review* by D. Randal Wightman, 431
- National Parks in Britain, 631
- Nationalized Industries : Control of, 807
- Nations of the World : Regions and (Prof. Earl E. Lackey and Prof. Esther S. Anderson), *review* by H. J. F., 7
- Natur und Erkenntnis (Prof. Arthur March), *review* by Dr. R. Fürth, 509
- Natural History : Insect (Dr. A. D. Imms), *review* by Dr. V. B. Wigglesworth, 5
- Natural History Societies : Directory of (Amateur Entomologists' Society), 647
- Naturalist : Adventures with a (Roy Bedichek), *review* by Frances Pitt, 513
  - Travelling (Anthony Buxton), *review* by Seton Gordon, 48
- Naturalists : Children as (Margaret M. Hutchinson), *review* by T. H. Hawkins, 595
- Nature : The Course of (*The Times*), *review* by Frances Pitt, 512
- Nature of Incentives (British Association, Section J (Psychology), Discussion on), 557
- Nature of Scientific Philosophy (Prof. Herbert Dingle), 100
- Nature and Constitution of Glass : Some Aspects of the (International Commission on Glass and the Society of Glass Technology Symposium on), 938
- Nature Calendar, *review* by Frances Pitt, 512
- Nature Lover and Fisherman, *review* by Seton Gordon, 48
- Nature and Cognition, *review* by Dr. R. Fürth, 509
- Naval Architecture : Martell Scholarship in (Institution of Naval Architects), 956
- Navigation : LORAN, Long Range (edited by J. A. Pierce, A. A. McKenzie and R. H. Woodward), *review* by Dr. R. L. Smith-Rose, 633
  - Radar Aids to (edited by Prof. John S. Hall), *review* by Dr. R. L. Smith-Rose, 633
- Navigation through the Ages (Institute of Navigation Exhibition), 564
- Navigation Tables : Astronomical, Vol. A, Latitudes 0°–4° North and South (prepared by H.M. Nautical Almanac Office on behalf of the Air Ministry), *review* by Sir Harold Spencer Jones, 7
- Needles': 'Pins and (G. Gordon), 742
- Neill Prize (1945–47) of the Royal Society of Edinburgh presented (*in absentia*) to Dr. Robert Broom, 100
- Nemestrinid Parasite of *Schistocerca gregaria* (Forsk.), (Dr. A. Shulov), 255
- Nerve Fibres : Transmission of Effects from the Ends of (British Association, Section I (Physiology), Discussion on), 558
- Nerves and Tissues : Assay of *nor*Adrenalin and Adrenalin in Extracts of (Prof. U. S. v. Euler), 570
- Nervous Mechanism in Tunicata (Dr. S. M. Das), 963
- Networks (Reactive Feedback) : Influence of, on the Response of Galvanometers (P. Savic), 569

Neurohumours : Animal Colour Changes and their (George Howard Parker), *review* by Dr. H. Waring, 84
Neuromuscular and Ganglionic Block : Clinical Potentialities of certain Bisquaternary Salts causing (Dr. W. D. M. Paton and Dr. E. J. Zaimis), 810
Neurotic Behaviour in Ants (Derek Wragge Morley), 74
Neutral Salts: Influence of Hydrogen Ions and, upon the Hydration of Interstitial Connective Tissue (Dr. T. D. Day), 152
di-Neutron : Properties of a Hypothetical (Prof. N. Feather), 213
Neutron-Proton Scattering and the Law of Interaction between Nucleons : Fast (E. H. S. Burhop and H. N. Yadav), 738
Neutrons : Delayed (S. Das), 853
  Fast ; Disintegration of Nitrogen by (C. P. Sikkema), 698
New Guinea (west coast of) : Earthquake on March 1, 138
New Hebrides (near the) : Earthquake on May 23, 211
New Zealand : Earthquake on May 23, 211
  Earthquakes registered during June, 690
  A Second *Xenophyes* from (Carl J. Drake and J. T. Salmon), 919
Nickel Plating by Chemical Reduction (J. G. M. Bremner), 183
Nickel-iron at High Frequencies : Anomalous Magnetic Behaviour of (A. Wieberdink), 527 ; (Prof. R. Kronig), 528
Nicotinamide : Synthesis of Derivatives of N-Methyl-2-Pyridone from Nicotinic Acid and (Chr. Wiegand and H. I. W. Holman), 659
Nicotinic Acid and Nicotinamide : Synthesis of Derivatives of N-Methyl-2-Pyridone from (Chr. Wiegand and H. I. W. Holman), 659
Nicotinic Acid and the Inhibition of Growth by Auxin (Dr. L. J. Audus), 811
Nigeria : Vascular Wilt Disease of Oil Palms in (Prof. C. W. Wardlaw), 850
Nitration of Simple Heterocycles (David W. Mathieson and A. McCoubrey), 73
Nitrogen : Disintegration of, by Fast Neutrons (C. P. Sikkema), 698
  Atmospheric ; Symbiotic Micro-organisms of Aphids and Fixation of (Dr. J. D. Smith), 930
  Molecular ; Excitation Processes in (R. W. Nicholls), 231
Nitrogen Afterglow (Dr. S. K. Mitra), 774
Nitrogen Mustard : Inactivation of Complement by (W. H. Watkins and Prof. A. Wormall), 535
  Mutations Induced in *Coprinus fimetarius* (L.) by (Lisbeth Fries), 846
Nitrogen-free Sulphuric Acid : Preparation of (B. V. Ramachandran), 450
Nitronium Perchlorate : Crystal Structure of (Prof. E. G. Cox, Dr. G. A. Jeffrey and M. R. Truter), 259
Nobel Prize for Chemistry for 1948 awarded to Prof. Arne Tiselius, 766
Nobel Prize for Medicine for 1948 awarded to Dr. Paul Müller, 727
Nobel Prize for Physics for 1948 awarded to Prof. P. M. S. Blackett, 841
Noise and Sound Transmission : International Conference on (Acoustics Group of the Physical Society, in association with the Royal Institute of British Architects), 59, 499
Nomenclature (Zoological) : Rules of (Francis Hemming), 708
Nomenclature of the British Littorinidæ (Dr. G. Seshappa), 702
Nomography : Elements of (Prof. Raymond D. Douglass and Prof. Douglas P. Adams), *review*, 278
Non-Agglutinable Strains of *H. pertussis* : Aluminium Phosphate as Precipitant of Agglutinable and (Dr. J. Ungar and P. Muggleton), 734
Non-Competitive Industry : The Consumer in relation to (Herbert Morrison), 807
Non-destructive Testing of Castings (British Iron and Steel Research Association Conference on), 59
*nor*Adrenalin and Adrenalin : Assay of, in Extracts of Nerves and Tissues (Prof. U. S. v. Euler), 570
North America : Silva of (Prof. C. S. Sargent), 884
North American Birds : Life-Histories of (—. Burt), 522
Northumberland : Occurrence of *Talorchestia brito* on the Coast of (Donald I. Williamson), 295
Nottingham : University Education in (Prof. H. T. H. Piaggio), 240
Nuclear Counters : Electron and (Prof. Serge A. Korff), fourth printing, *review* by Dr. C. H. Westcott, 551
Nuclear Energy : Pulsating Stars and (D. Stanley-Jones), 934
Nuclear Forces (Prof. L. Rosenfeld), *review* by Prof. M. H. L. Pryce, 907
Nuclear Isomeric Transitions of Short Periods (P. B. Treacy), 186
Nuclear Physics : Cosmic Rays and (Prof. L. Jánossy), *review* by Prof. T. G. Cowling, 513
Nuclear Physics Counters : Mechanism of, *review* by Dr. C. H. Westcott, 551
Nuclear Physics Exhibition at the University of the Witwatersrand, 606
Nuclear Plates (Kodak) : Range-Energy and other Relations for Electrons in (Dr. Marion A. S. Ross and Barbara Zajac), 923
Nuclear Research: Processing Thick Emulsions for (C. C. Dilworth, Dr. G. P. S. Occhialini and R. M. Payne), 102
Nucleoli and Cytoplasm : Enzymatic Degradation of Ribonucleoproteins of Chromosomes, (Dr. Berwind P. Kaufmann, Margaret McDonald and Helen Gay), 814
Nucleons : Fast Neutron-Proton Scattering and the Law of Interaction between (E. H. S. Burhop and H. N. Yadav), 738
Nucleoprotein from a Plant Virus having Insect Vectors : Specific Crystalline Protein and (Dr. Roy Markham, Dr. R. E. F. Matthews and Dr. Kenneth M. Smith), 88
Numerical Methods, *review* by John Womersley, 85
Nurseries : Some Improved Techniques in, and on Planting Sites (J. J. MacGregor), 974
Nutrient Solution : Effects of Aeration on Bracken and Heather Grown in (L. W. Poel), 115
Nutrition : The Changing Aspects of (British Association, Section I (Physiology), Discussion on), 543
  Science and (A. L. Bacharach), third edition, *review*, 165
Nutrition of Athletes (Nutrition Society Conference on), 207

OBLIGATIONS : Freedom and, 507 ; (Prof. J. M. Burgers and Dr. M. Florkin), 783
Observations are Missing : Errors of Treatment Comparisons when (J. Taylor), 262
Ocean : Minimum Oxygen Layer in the (Dr. R. B. Seymour Sewell and Prof. Louis Fage), 949
Oculus (Tabulæ Biologicæ, Vol. 22, Pars I), (K. Steindorff, F. P. Fischer, J. S. Friedenwald, Arnold Sorsby), *review* by Dr. E. N. Willmer, 910
Œstrogen Series (Synthetic) : New Colour and Fluorescence Reactions in the Steroid and (Dr. R. J. Boscott), 577
Œstrogens in Grass and their possible Effects on Milk Secretion (Dr. S. Bartlett, Dr. S. J. Folley, Dr. S. J. Rowland, D. H. Curnow and Sylvia A. Simpson), 845
Oil : Middle East (H. B. Milner), 501
  Shark Liver ; Deodorization of (P. K. Mathew, Prof. P. V. Nair, T. A. Ramakrishnan and H. Sreemulanathan), 494
  Wet Crude ; Elimination of Water from (K. A. Clark and D. S. Pasternack), 483
Oil Palms in Nigeria : Vascular Wilt Disease of (Prof. C. W. Wardlaw), 850
Old Age : The Social Medicine of—Report of an Inquiry in Wolverhampton (Dr. J. H. Sheldon), 466
Oligospermic Men : Variations in Spermatogenesis of (Margaret Hadley Jackson and Clare Harvey), 67
Olympic Torches, 175
Open Hearth Furnace Models (A. R. Philip), 188
Operational Calculus : Modern (Dr. N. W. McLachlan), *review* by Prof. L. M. Milne-Thomson, 945
Optical Analogue of X-Ray and Electron Diffraction Patterns (J. Dyson), 140
Optical Observations on Chromosome Structure in Resting Cells : Electron (Fernando Calvet, Benjamin M. Siegel and Dr. Kurt G. Stern), 305
Optical Resolution : Antibiotics produced by Fungi, and a New Phenomenon in (Dr. A. H. Cook, S. F. Cox and T. H. Farmer), 61
Optical Spectra : Atomic Energy Levels as derived from the Analyses of, Vol. 1, Section 1, The Spectra of Hydrogen, Deuterium, Helium, Lithium, Beryllium, Boron, Carbon, Nitrogen, Oxygen and Fluorine (Charlotte E. Moore), *review* by A. G. G., 391
Orang-utan from Central Sumatra : Prehistoric Teeth of Man and of the, with Notes on the Fossil Orang-utan from Java and Southern China (Dr. D. A. Hooijer), 306
Ordeal by Planning (Prof. John Jewkes), 42
Order of the Nile (3rd Class) awarded by the Egyptian Government to Dr. J. T. Edwards, 138
Organ Specificity in the Response of β-Glucuronidase to Extrinsic Agents : Sex and (Lynda M. H. Kerr and Dr. G. A. Levvy), 219
Organic Analysis : Semimicro Qualitative (Nicholas D. Cheronis and John B. Entrikin), *review*, 164
Organic Analytical Reagents (Prof. Frank J. Welcher), *review* by Dr. G. M. Bennett, 48
Organic Compounds : Reactions of (Dr. Wilfred John Hickinbottom), second edition, *review*, 164
Organic Disulphides : Photolysis of (Dr. L. E. Lyons), 1004
Organic Insulation by Electro-chemical Reactions : Electrical Breakdown of (H. F. Church and C. G. Garton), 301
Organic Substances used in Inorganic Analysis, *review* by Dr. G. M. Bennett, 48
Organic Syntheses (edited by R. L. Shriner), Vol. 27, *review* by J. R., 278
Organised Information Services (Northern Branch of ASLIB Conference on), 809
Orientation-rate of the Leptones of Protoplasm : Birefringence and (Dr. Hans H. Pfeiffer), 419
Origin of Cosmic Ray Stars (Dr. E. P. George), 333
Origin of Money : New Light on the (Dr. Paul Einzig), 983
Origin of some Plant Viruses (Dr. J. E. van der Plank), 291
Oscillograph in Industry : The Cathode Ray (Dr. W. Wilson), third edition, *review* by L. E. C. H., 391
Oscillographic Analysis of the Gravity and Vibration Responses from the Labyrinth of the Thornback Ray (*Raja clavata*), (Dr. Otto Lowenstein and T. D. M. Roberts), 852
Osler as a Scientist (Sir Arthur MacNalty), 346
Osmoregulatory Capacity of Contractile Vacuoles (Dr. J. A. Kitching), 149
Osmotic Pressures, Membrane Equilibrium and the Generalized Free Energy of Protein Solutions in the Light of the Work of Procter : Recent Work on (G. S. Adair), 670
Overseas Science Research Scholarships (Royal Commission for the Exhibition of 1851 Awards for 1948), 100
Oxalacetate: Decarboxylation of, by Blood (Peter M. Nossal), 36
Oxalis : Genetics of Style-Length in (Prof. R. A. Fisher and V. C. Martin), 533
Oxalyl Chloride : Action of, on the Aromatic Hydrocarbons (Hussein Ahmad Fahim), 526
Oxidant (Selective) : Red Lead as a (Prof. L. Vargha), 927
Oxidation of Ferrous Ions in Aqueous Solution by X- and γ-Radiation (N. Miller), 448
Oxidation of Gaseous Formaldehyde : Mechanism of the (Chas. A. McDowell and J. H. Thomas), 367 ; (Prof. R. G. W. Norrish), 367
Oxidation of Sterols : Microbiological (Dr. A. Krámli and Dr. J. Horváth), 619
Oxidation of Uranium Dioxide (UO_2), (Fredrik Grønvold and Prof. Haakon Haraldsen), 69
Oxidation Products of Substituted o-Phenylene Diamines : Anti-Tubercular Activity of (Dr. Vincent C. Barry, J. G. Belton, M. L. Conalty and D. Twomey), 622
Oximes : Bacteriostatic Action of (J. D. Allan Gray and R. A. Lambert), 733
Oxydation (anodische) : Werkstoff Aluminium und seine (Dr. Max Schenk), *review* by H. W. L. Phillips, 715
Oxygen : Application of, to Steel-making (Dr. W. C. Newell), 518
O_2 Bands : Emission Schumann-Runge (M. W. Feast), 214
Oxygen Layer in the Ocean : Minimum (Dr. R. B. Seymour Sewell and Prof. Louis Fage), 949
Oxyntic Granules of the Rat's Stomach : Lipoid Content of the (Gordon Menzies), 64
Ozark Superstitions (Vance Randolph), *review* by Dr. E. J. Dingwall, 474

PACIFIC Science Congress : Seventh, 409
Pair Conversion : Internal (M. H. Wang), 264
Palæolithic Art ; French, *review* by M. C. Burkitt, 511
Palestine Flora (Eric Hardy), 286
'Paludrine' in the Malaria Parasite of the Fowl (*P. gallinaceum*) : Resistance to Sulphadiazine and (Dr. Ann Bishop and Elspeth W. McConnachie), 541

Pantothenic Acid: Effect of, on the Infection of *Trypanosoma evansi* in Rats (Dr. H. N. Ray and S. Harbans), 849
Paper: Partition Chromatography on, its Scope and Application (Dr. R. Consden), 359
  Treatment of, with Silicon Esters (Ingvar Jullander), 300
Paper Chromatography of the Noble Metals (Michael Lederer), 776
Paper Partition Chromatography: Application of, to the Separation of the Sugars and their Methylated Derivatives on a Column of Powdered Cellulose (L. Hough, Dr. J. K. N. Jones and W. H. Wadman), 448
Paraffin Wax and *n*-Hexacosane: Dielectric Relaxation-Times of Solid Solutions of Aliphatic Long-Chain Esters and Ketones in (R. J. Meakins), 994
Parallelism between Atomic and Planetary Properties (B. Liebowitz), 409
Paramagnetic Resonance in Copper Sulphate—Experimental Investigation (D. M. S. Bagguley and Dr. J. H. E. Griffiths), 538; Theory (Prof. M. H. L. Pryce), 539
Parasite of Schistocerca gregaria (Forsk.): A Nemestrinid (Dr. A. Shulov), 255
Parasitic Agent in various Intracranial Tumours of Man: Presence of a (Dr. R. A. Krynauw and Prof. Cecil Jackson), 147
Parboiling Treatment of Rice (Dr. J. J. C. Hinton), 913
Parenchymatous Liver Diseases: Abnormal Serum Protein in (Dr. A. Fischer, Dr. C. Sellei and Dr. M. Bretán), 1002
Parks in Britain: National, 631
Parthenogenetic Paternity in Central Australia, *review* by Mrs. K. Rishbeth, 276
Particle of Very Small Size in a Magnetic Field: Behaviour of (Prof. J. Thibaud), 329
Particle Size: Feret's Statistical Diameter as a Measure of (W. H. Walton), 329
Particles in Flames: Emissivity of Small (H. G. Wolfhard and W. G. Parker), 259
Partition Chromatograms: Effect of Salt on (Dr. R. Consden and Dr. A. H. Gordon), 180
Partition Chromatography (Paper): Application of, to the Separation of the Sugars and their Methylated Derivatives on a Column of Powdered Cellulose (L. Hough, Dr. J. K. N. Jones and W. H. Wadman), 448
Partition Chromatography on Paper, its Scope and Application (Dr. R. Consden), 359
Partition Chromatography on Starch of Ribonucleosides (Peter Reichard), 662
Passing World: The (Sir Henry Tizard), 392
Paternity in Central Australia: Parthenogenetic, *review* by Mrs. K. Rishbeth, 276
Pathogenicity of *Aspergillus nidulans* (Dr. Charles H. Drake), 98
Pathology in Glasgow, 363
Pathology of Animal Reproduction and Artificial Insemination: Physiology and (International Congress on the), 138
Pathology of Tumours (Prof. R. A. Willis), *review* by Dr. E. S. Horning, 315
Pea Moth: Biology and Control of the (D. W. Wright and Q. A. Geering), 309
Penetrating Cosmic Ray Showers: Latitude Effect of (Dr. V. Appapillai and Prof. A. W. Mailvaganam), 887
Penicillin: *In vitro* Effect of, on Prothrombin Activity of Bovine Plasma (I. M. Chak, J. F. Pereira and K. V. Giri), 930
People: Plans and a—a Dynamic Science of Men in the Service of Africa (Dr. E. W. Smith), 482
People of Britain: Health of the (Dr. G. Lapage), 586
People of Tzintzunzan: Empire's Children—The (George M. Foster, assisted by Gabriel Ospina), 270
Peptides: Chromatography of Dinitrophenyl Amino-acids and (D. M. P. Phillips and J. M. L. Stephen), 152
Peptides from Insulin: Some (Dr. F. Sanger), 491
Periodic Table of the Elements in the Light of Statistical Theory: Physical Periodicity of the (Dr. G. Herdan), 215
Permanence of Residence with respect to Various Family Characteristics (Family Studies in the Eastern Health District, 4), (Dr. H. M. C. Luykx), 647
Permanent Magnet Alloys (Anisotropic): Recent Advances in (D. A. Oliver), 799
Permeability of the Membranes of the Hen's Egg (Prof. N. Klissiunis), 77
Permeability of Muscle Cells (E. J. Harris and G. P. Burn), 929
Permittivity (High): Physical Properties of Substances of (Electronics Group of the Institute of Physics Symposium on), 245
Peroxide Catalysed Vinyl Polymerization (W. Cooper), 927
Persistence of D.D.T. in the Soil (Philip B. Carne), 743
Personality Test (Rorschach): Principles and Practice of the (W. Mons), *review* by Dr. John Cohen, 87
Peru: Earthquake on May 11, 211; Earthquake on May 28, 211
  (off the south-west coast of): Earthquake on July 20, 768
Pest Control: Use of Selenium for, 176
Pests of Glasshouse Crops: Insect (Prof. Herbert W. Miles and Mary Miles), second edition, *review*, 946
Petrol Fires: Extinction of, by Methyl Iodide (A. Nicholson), 111
  A Study of Mechanically Produced Foam for Combating (Dr. N. O. Clark), 158
Petroleum and its Products: Standard Methods for Testing (Institute of Petroleum), ninth edition, *review* by H. B. Milner, 714
Petroleum Hydrocarbons: Testing, *review* by H. B. Milner, 714
Petrosal (Blackfish): Density of the (Prof. L. R. Richardson), 150
Pharmacology of some *bis*-Trimethyl Ammonium Compounds (Dr. Gertrude E. Glock, G. A. Mogey and Dr. J. W. Trevan), 113
Pharmacy: The Importance of Physical Chemistry in (Dr. N. Evers), 789
Phase-Contrast Microscopy: Golgi Apparatus of Living Human Testicular Cells seen with (A. G. Oettlé), 76
Phase-Contrast Microscopy of Viruses (Dr. Robert Barer), 251
Phenomenon of a 'Ceiling Temperature': Reversibility of the Propagation Processes in Polymerization Processes and its Manifestation in the (Dr. F. S. Dainton and K. J. Ivin), 705
o-Phenylene Diamines: Anti-Tubercular Activity of Oxidation Products of Substituted (Dr. Vincent C. Barry, J. G. Belton, M. L. Conalty and D. Twomey), 622
Philippine Islands: Earthquake off the north-west coast of Luzon on March 3, 138
Philosophy: Science and, *review* by Dr. A. C. Crombie, 46
  Scientific; The Nature of (Prof. Herbert Dingle), 100
Philosophy of Science, 59
Phosphatase Determination in Tissue Sections: Tracer (Jörgen B. Dalgaard), 811
Phosphatase Distribution during the Spermatogenesis of *Asellus aquaticus*: Ribonucleic Acid Supply and (Giovanna Vitagliano and Marina de Nicola), 965
Phosphate Ester of a Hydroxyamino-Acid: Occurrence of a (Dr. A. H. Gordon), 778
Phosphatic Fertilizer: Soil Phosphate Uptake as Influenced by (Dr. K. Strezemienski), 932
Phosphorescence in Condensed Systems: The Green Auroral Line as an Initiator of (Prof. L. Vegard and G. Kvifte), 967
Phosphorus on the Hydrolysis and Absorption of Sucrose by Plant Cells: Effect of (Prof. Husein Said), 496
Phosphorylase in Plastids (Dr. H. C. Yin), 928
Phosphorylase Activity in the Starved Rat: Increased Muscle (Knud Lundbaek and Ewald S. Goranson), 1002
Phosphorylation of Myosin by Adenosine Triphosphate (Prof. Fritz Buchthal, Adam Deutsch, Gustav G. Knappeis and Agnete Munch-Petersen), 965
Photochemical Action of Ethylorthoformate (Ahmed Mustafa), 856
Photoconductive Cells: New (E. Schwarz), 614
Photodisintegration of Deuterium and Beryllium by Thorium C″ γ-Rays (D. L. Allan and M. J. Poole), 373
Photodisintegration of the Deuteron (R. Wilson, C. H. Collie and Dr. H. Halban), 185
Photo-Elastic Effect in Barium Nitrate (Prof. S. Bhagavantam and D. Suryanarayana), 740
Photo-electric Star-following Telescopes (A. Uttley, S. Jones and L. Manns), 144
Photographic Emulsions: Recording of Charged Particles of Minimum Ionizing Power in (Dr. R. W. Berriman), 992
Photographic Evaluation of Blackout Indices (Dr. Robert W. Lawson), 531
Photography and Projection: Discharge Lamps for (H. K. Bourne), *review* by J. N. Aldington, 758
Photolysis of Organic Disulphides (Dr. L. E. Lyons), 1004
Photons: Velocity of (Hon. H. Fletcher Moulton), 303; (J. W. Awbery), 461; (Dr. George Novello Copley), 461
Phthalic Anydride: Esterification of, with Primary Alcohols at Room Temperature (F. J. Bristow), 1004
Phthalocyanines as Semiconductors (Dr. D. D. Eley), 819
Phthalyl-L-Glutamic Acid: Preparation of (Dr. A. Kidd and Dr. F. E. King), 776
Physica: Principia (Hans Georg Küssner), *review* by Dr. R. Fürth, 44
Physical Chemistry in Pharmacy: The Importance of (Dr. N. Evers), 789
Physical Chemistry of Process Metallurgy (Faraday Society Discussion on), 212, 719
Physical Investigations on Dairy Products: Chemical and (H. Eilers, R. N. J. Saal and M. van der Waarden), *review* by H. D. K., 87
Physical Nature of Mouse Brain (M. C. H. Dodgson), 253
Physical Periodicity of the Periodic Table of the Elements in the Light of Statistical Theory (Dr. G. Herdan), 215
Physical Properties of Rubber, *review* by W. P. Fletcher, 678
Physical Properties of Substances of High Permittivity (Electronics Group of the Institute of Physics Symposium on), 245
Physical Science and Human Values (A Symposium by P. W. Bridgman, F. S. C. Northrop, H. Shapley, I. I. Rabi, H. N. Russell, M. Polanyi, F. T. Spaulding and L. A. DuBridge), 751
Physics: Low Temperature (Dr. L. C. Jackson), revised second edition, *review* by Dr. D. Shoenberg, 510
  The Mathematical Principles of, *review* by Dr. R. Fürth, 44
Physics for Students of Science and Engineering (Prof. William H. Michener), *review*, 717
Physics, Chemistry and Biology: Wave Mechanics in (Prof. C. A. Coulson), 504
Physiology: Annual Review of (edited by Victor E. Hall), Vol. 10, *review*, 429
  Pre-Natal (Dr. Louis B. Flexner), 1004
  Recent Researches in, *review*, 429
Physiology at the London Hospital, 407
Physiology at the London Hospital Medical College, 210
Physiology at Queen's University, Belfast, 55
Physiology of Lactation (British Association, Sections M (Agriculture) and I (Physiology), Joint Discussion on the), 601
Physiology and Pathology of Animal Reproduction and Artificial Insemination: International Congress on the, 138
Phytopathological Classics, No. 8, Observations, Botanical and Physiological, on the Potato Murrain (M. J. Berkeley), *review* by Dr. John Grainger, 239
Phytophthora infestans (Mont.) de Bary on Artificial Media: Growth of (Dr. Sydney Dickinson and Margaret A. Keay), 32
Picture Book of the Whole Coast of England and Wales (J. A. Steers), *review* by L. D. S., 638
Pictures: Scientific Method in the Conservation of, 161
  National Gallery; Cleaning and Care of the (W. G. Constable), 166
Piezoelectricity: Equations in (Prof. Walter G. Cady), 933
Pigment of *Chromobacterium iodinum*: Structure of the (Prof. G. R. Clemo and A. F. Daglish), 776
Pigment derived from Tryptophan: Tryptochrome, a (Prof. W. R. Fearon), 338
Pigmentary Effector System, *review* by Dr. H. Waring, 84
Pigs: Behaviour of (R. Braude), 938
'Pins and Needles' (G. Gordon), 742
Pipe Flow: Instability in (R. B. Whittington and E. W. S. Ashton), 997
Planetary Properties: Parallelism between Atomic and (B. Liebowitz), 409
Planets: Constitution of the (Rupert Wildt), 345
Planning: Limitations of, 41
  Ordeal by (Prof. John Jewkes), 42
Plans and a People—a Dynamic Science of Men in the Service of Africa (Dr. E. W. Smith), 482
Plant: The Growing (Prof. W. Neilson-Jones), *review* by Prof. E. Ashby, 870
Plant Cells: Effect of Phosphorus on the Hydrolysis and Absorption of Sucrose by (Prof. Husein Said), 496

Plant Communities : The Study of (Prof. Henry J. Oosting), *review* by Dr. W. B. Turrill, 387
Plant Densities : Determination of (E. J. Machin), 257 ; (Prof. M. S. Bartlett), 621
Plant Life : British (Dr. W. B. Turrill), *review* by L. J. F. Brimble, 676
Plant Microfossils from the Lignites of the Kerguelen Archipelago (Isabel C. Cookson), 309
Plant Pathology : Berkeley, Father of, *review* by Dr. John Grainger, 239
Plant Physiology at Ghent, 689
Plant Populations : Genetical Structure of (British Association, Section K (Botany), Symposium on), 517
Plant Research : Twenty Years of Seed Research at Boyce Thompson Institute for (Lela V. Barton and William Crocker), *review*, 594
Plant Tissues (Fresh) : Fine Structure of Cell Walls in (Dr. R. D. Preston, A. B. Wardrop and Dr. E. Nicolai), 957
Plant Tumours : Action of Streptomycin on (R. S. de Ropp), 459
Plant Virus having Insect Vectors : Specific Crystalline Protein and Nucleoprotein from a (Dr. Roy Markham, Dr. R. E. F. Matthews and Dr. Kenneth M. Smith), 88
Plant Viruses : Origin of some (Dr. J. E. van der Plank), 291
Planting Sites : Some Improved Techniques in Nurseries and on (J. J. MacGregor), 974
Plants : Drugs from (Dr. Trevor Illtyd Williams), *review* by Dr. W. O. James, 636
  Soilless Growth of (Carleton Ellis and M. W. Swaney), second edition, *review* by W. E. B., 717
  Garden ; The Genetics of (M. B. Crane and W. J. B. Lawrence), third edition, *review* by Dr. F. W. Sansome, 595
Plasma (Bovine) : *In vitro* Effect of Penicillin on Prothrombin Activity of (I. M. Chak, J. F. Pereira and K. V. Giri), 930
Plastic Flow : Application of Dynamic Similarity to Metal Structures with Elastic and (M. W. Thring), 193
Plasticity in Engineering (F. K. Th. van Iterson), *review* by G. D. S. MacLellan, 679
Plastics in Scotland (Scottish Council (Development and Industry), Final Report of the Committee on Plastics), 1009
Plastids : Phosphorylase in (Dr. H. C. Yin), 928
Plating of Metals (Bright) : Electrolytic Polishing and (Dr. S. Wernick), *review*, 834
Plover in London : The Little Ringed, 563
Plywood : Elasticity of Wood and (Forest Products Research Laboratory, Special Report No. 7), 826
Points on a Lattice : Random Association of (P. V. Krishna Iyer), 333
Poisons, their Isolation and Identification (Frank Bamford), second edition, *review* by Edgar Rentoul, 8
Poland : Venereal Disease Control in (Dr. James Marshall), 35
Poland's Northward Thrust, 445
Polarization of Annihilation Radiation (R. C. Hanna), 332
Polarization of the Raman Line of the Totally Symmetric Vibration of Stannic Chloride (Dr. A. E. Douglas and Prof. D. H. Rank), 453
Polarization Effects (Bioelectrical) : Membrane Electrophoresis in relation to (Prof. Torsten Teorell), 961
Polarized Infra-red Radiation : Crystal Structure of Acetanilide—Use of (Dr. C. J. Brown and D. E. C. Corbridge), 72
Polarography : Vibrating Electrodes in (E. D. Harris and A. J. Lindsey), 413
Polishing and Bright Plating of Metals : Electrolytic (Dr. S. Wernick), *review*, 834
Polyatomic Molecules : A General Solution for the Force Constants of (P. Torkington), 370, 607
Polycelis (Platyhelminthes) : British Species of (Dr. T. B. Reynoldson), 620
Polymerization : Peroxide Catalysed Vinyl (W. Cooper), 927
Polymerization of Styrene : Radical Reactivity in the Initiation Reaction of the (W. Cooper), 897
Polymerization Processes : Reversibility of the Propagation Reaction in, and its Manifestation in the Phenomenon of a 'Ceiling Temperature' (Dr. F. S. Dainton and K. J. Ivin), 705
Polypeptides (Synthetic) : Studies of the Structure of (Prof. W. T. Astbury, Dr. Charles E. Dalgliesh, S. E. Darmon and Dr. G. B. B. M. Sutherland), 596
Polyphenoloxidase in the Chloroplasts of *Beta vulgaris* : Localization of (Prof. Daniel I. Arnon), 341
Polyploidy in Bacteria ? (A. Buzzati-Traverso, Dr. N. Visconti di Modrone and Dr. L. L. Cavalli), 295
Polyploidy and Chromosome Fragmentation induced by Hexachlorocyclohexane : Atypical Growth, Abnormal Mitosis, (Dontcho Kostoff), 845
Polyploidy and Variation of Chromosome Number in *Ribes nigrum* : Cryptic (Dr. Antero Vaarama), 782
Polysaccharides (Branched) : Isophosphorylase and the Formation of (Dr. P. Bernfeld and A. Meutémédjian), 618
Polytetrafluoroethylene (British Mechanical Productions, Ltd.), 768
Poppy, nor Mandragora . . . : Not, 97
Population in the British Commonwealth : Movements of (British Association, Section E (Geography), Symposium on), 718
Population in the Inter-War Years : Europe's (Dudley Kirk), *review* by Prof. H. J. Fleure, 428
Population Policy in Great Britain (A Report by P.E.P.), *review* by Prof. Walter Fitzgerald, 635
Pore Canals in the Egg Membranes of *Locustana pardalina* Walk. (J. J. Matthée), 226
Porphyrins (Shell) : Distribution of, in Mollusca (Alex. Comfort), 851
Portugal : Earthquake on August 22, 768
  Earthquakes near Oporto on August 12, 13 and 15, 768
Post-Glacial History of British Vegetation : Studies of the (Prof. A. R. Clapham and Prof. H. Godwin), 1008
Potash (Alcoholic) : Solubility of Bituminous Coal in (N. Berkowitz), 960
Potassium and Argon in the Earth's Surface Materials : Relative Abundances of (Prof. J. H. J. Poole), 775
Potassium Ion at the Motor End Plate : Interaction between Curare and the (P. E. B. Holmes, D. J. Jenden and Dr. D. B. Taylor), 217
Potato Caterpillar Pest (*Agrotis* spec.) of Tristan da Cunha (Dr. G. J. Broekhuysen and W. Macnae), 225
Potato Dry Rot Disease : Chemical Prevention of, 843
Potato Murrain : Observations, Botanical and Physiological, on the (M. J. Berkeley), *review* by Dr. John Grainger, 239
Potato-Root Eelworm : Resistance to the (Dr. C. Ellenby), 704
Potatoes : Vitamin C in (Dr. Frank Wokes and Gordon Nunn), 900
Pottery from Central Kavirondo, Kenya Colony : Dimple-Based (M. D. Leakey, the late W. E. Owen and L. S. B. Leakey), *review* by Bernard Fagg, 834
Poulsen (Valdemar) Gold Medal of the Danish Academy of Technical Sciences awarded to Sir Edward Appleton, 884
Poverty in the Middle East : Land and (Dr. B. A. Keen), 53 ; (Dr. Doreen Warriner), 53
Power Supply and the Electrical Engineer, 972
Power Transmission : Alternating-Current, *review* by C. W. Marshall, 277
Pre-Natal Physiology (Dr. Louis B. Flexner), 1004
Precession of an Unsymmetrical Top (G. Grioli), 365
Precipitant of Agglutinable and Non-Agglutinable Strains of *H. pertussis* : Aluminium Phosphate as (Dr. J. Ungar and P. Muggleton), 734
Precursor of the Folic Acid Complex : A Natural (Dr. David A. Hall), 178
Pregnancy Test using the Male Toad (Dr. Magnus Haines), 416
Prehistoric Flooding in the Somerset Levels (Dr. H. G. Baker), 1008
Prehistoric Teeth of Man and of the Orang-utan from Central Sumatra, with Notes on the Fossil Orang-utan from Java and Southern China (Dr. D. A. Hooijer), 306
Préhistorique : Le centre, de Gantes-Montespan (Haute-Garonne), (Félix Trombe et Gabriel Dubuc), *review* by M. C. Burkitt, 511
Preparation of Adsorbents for Chromatography : A New Method for the (D. E. Weiss), 372
Preservation of the Fertilizing Capacity of Bull Semen in the Genital Tract of the Cow (Prof. M. Vandeplassche and Dr. F. Paredis), 813
Price System : The (Sir Hubert Henderson), 402
Primitive Techniques, Agriculture and Economic Organisation (British Association, Section H (Anthropology), Discussion on), 602
Principia Physica (Hans Georg Küssner), *review* by Dr. R. Fürth, 44
Principles of Morals and Legislation : A Fragment on Government, and An Introduction to the (Jeremy Bentham), *review* by Maurice Bruce, 238
Prints : Fifty (Emerson Tuttle), *review* by Frances Pitt, 431
Private Woodlands : Dedication of (Forestry Commission Booklet No. 2), 364
Process Chemistry for the Chemist, *review* by Dr. E. F. G. Herington, 550
Process Heating in Industry, *review* by M. R. Gavin, 637
Process Metallurgy : The Physical Chemistry of (Faraday Society Discussion on), 212, 719
Processing Thick Emulsions for Nuclear Research (C. C. Dilworth, Dr. G. P. S. Occhialini and R. M. Payne), 102
Proconsul from Rusinga Island : Skull of (Dr. L. S. B. Leakey), 688
Procter Memorial Lecture (G. S. Adair), 670
Production of Indole by *Escherichia coli* (Dr. Edwin A. Dawes), 229
Production of Mesons by Cosmic Radiation : Observations on the (Dr. G. P. S. Occhialini and Dr. C. F. Powell), 168
Production and Management Engineering : Selected Techniques of Statistical Analysis for Scientific and Industrial Research and (Statistical Research Group, Columbia University), edited by Churchill Eisenhart, Millard W. Hastay and W. Allen Wallis, *review* by Prof. M. S. Bartlett, 510
Productivity (Industrial) : Social Sciences and, 628
Professional Incentives : Academic and, 977
Professional Status of the Biologist, 867
Progress of Mankind : Cultural and Spiritual, 589
Progressive Society : The School in a (W. O. Lester Smith), 405
Projected Area of Convex Bodies (V. Voux), 330
Projection : Discharge Lamps for Photography and (H. K. Bourne), *review* by J. N. Aldington, 758
Promethean *Australopithecus* from Makapansgat Valley : A (?) (Prof. Raymond A. Dart), 375
Promethium, the New Name for Element 61, 175
Propagation of Pulses of Second Sound in Liquid Helium II (D. V. Osborne), 213
Propagation Reaction in Polymerization Processes and its Manifestation in the Phenomenon of a 'Ceiling Temperature' : Reversibility of the (Dr. F. S. Dainton and K. J. Ivin), 705
Properties of a Hypothetical di-Neutron (Prof. N. Feather), 213
Properties of Slow Electrons in Gases, *review* by Prof. F. Llewellyn Jones, 276
Prophylaxis of Virus Infections with special reference to the Use of Vaccines (British Medical Association, Section of Pathology, Discussion on), 92
Protection of Grain against Weevils (V. A. Beckley), 737
Protein (Serum) : Interrelations of the, in the Thymol Turbidity Test (Dr. Nicholas H. Martin), 145
Protein and Nucleoprotein from a Plant Virus having Insect Vectors : Specific Crystalline (Dr. Roy Markham, Dr. R. E. F. Matthews and Dr. Kenneth M. Smith), 88
Protein Solutions in the Light of the Work of Procter : Recent Work on Osmotic Pressures, Membrane Equilibrium and the Generalised Free Energy of (G. S. Adair), 670
Proteines : Un symposium sur les (A. Tiselius, D. P. Riley, E. Gorter, D. G. Dervichian, M. Joly, J. Brachet, P. Rebuffat, R. Vendrely, C. Wunderly, V. Desreux, H. Dieu, M. Dubuisson, J. Jacob, E. J. Bigwood, M. Jutisz, E. Lederer, G. Hamoir, P. Desnuelle, M. Rovery et M. Errera), *review*, 870
Proteins (Tumour) : Excretion of D-Pyrrolidone Carboxylic Acid by Rat and Dog Fed with (Prof. F. Kögl, T. J. Barendregt and A. J. Klein), 732
Prothrombin Activity of Bovine Plasma : *In vitro* Effect of Penicillin on (I. M. Chak, J. F. Pereira and K. V. Giri), 930
Proton Bombardment of Fluorine (S. Devons and H. G. Hereward), 331
Proton Bombardment of Separated Argon Isotopes : Gamma-Rays from (K. J. Brostrøm, T. Huus and Dr. J. Koch), 695
Protons : Short-Range α-Particles from the Disintegration of Sodium, Aluminium and Fluorine by (Joan M. Freeman and A. S. Baxter), 696
Protoplasm : Birefringence and Orientation-rate of the Leptones of (Dr. Hans H. Pfeiffer), 419
Protoplasm and its Derivatives : Submicroscopic Morphology of (Prof. A. Frey-Wyssling), translated by Prof. J. J. Hermans and M. Hollander, *review* by Dr. J. Danielli, 753
Protozoa : New exhibit of (British Museum (Natural History),), 19
Protozoology : Veterinary (U. F. Richardson), *review* by Dr. G. Lapage, 756, 884
Pseudocholinesterase : N-Diethylaminoethylphenothiazine, a Specific Inhibitor of (Dr. J. J. Gordon), 146

Psittacosis Virus : Antigenic Components of (Dr. C. F. Barwell), 460
Psychical Research : The Experimental Situation in (S. G. Soal), *review*, 432
  Practical (Society for Psychical Research course of Lectures on), 607
Psychological Medicine in Glasgow, 363
Psychology : Annual Review of (Annual Reviews, Inc.), 60
  Hindu (Swami Akhilananda), *review* by Mrs. D. M. Wheatley, 592
  British ; Present-day Trends in (Prof. Rex Knight), 404
Psychology of Ego-Involvements (Muzafer Sherif and Hadley Cantril), *review* by Dr. John Cohen, 7
Psychology and Mysticism, *review* by Mrs. D. M. Wheatley, 592
Psychology at Work (National Institute of Industrial Psychology Report on), 382
Psychology and the Welfare and Progress of Man : Active (G. E. Witt), *review*, 758
Pteridine : A Synthesis of (Dr. W. G. M. Jones), 524
Pteroic and Pteroylglutamic Acids : Benziminazole Analogues of (Dr. F. E. King, P. C. Spensley and Dr. R. H. Nimmo-Smith), 153
Pteroylglutamic Acids : Benziminazole Analogues of Pteroic and (Dr. F. E. King, P. C. Spensley and Dr. R. H. Nimmo-Smith), 153
Public Health : Recent Advances in (Dr. J. L. Burn), *review* by Sir Arthur MacNalty, 47
Public Health and Municipal Engineering Congress and Exhibition at Olympia, 366
Public Policy : Science and (John R. Steelman), 673
Pulsating Stars and Nuclear Energy (D. Stanley-Jones), 934
Pulse Generators (edited by Prof. G. N. Glasoe and Prof. J. V. Lebacqz), *review* by Prof. J. T. Randall, 754
Pulses of Radio-frequency Radiation from the Sun : Shape of (Dr. S. E. Williams), 108
Pulses of Second Sound in Helium II : Propagation of (D. V. Osborne), 213
Pure Science, Fertile Source of Industrial Progress (Prof. L. de Broglie), 769
Purification : Theory and Practice of New Techniques in Separation and (Chemical Society Discussion on), 729
Purity of Diphenylene Oxide (Dibenzofuran), (A. Fowler Williams), 925
Pursuit and Application of Science : Balance between the, 385
Pyrethrins : Total Synthesis of some (L. Crombie, M. Elliott, Dr. S. H. Harper and H. W. B. Reed), 222
Pyridyl Anions during Decarboxylation : Production of Quinolyl and (B. R. Brown, Dr. D. Ll. Hammick and B. H. Thewlis), 73
D-Pyrrolidone Carboxylic Acid : Excretion of, by Rat and Dog Fed with Tumour Proteins (Prof. F. Kögl, T. J. Barendregt and A. J. Klein), 732
Pyruvate, β-Hydroxybutyrate: Fermentation of, and of C_4-dicarboxylic Acids by some Butyric Acid-forming Organisms (Dr. Georges N. Cohen and Germaine Cohen-Bazire), 578

QUADRATURE : A Simple Result in (Sir K. S. Krishnan), 215, *erratum*, 485
Qualitative Analysis by Spot Tests, Inorganic and Organic Applications (Dr. Fritz Feigl), third English edition, translated by Prof. Ralph E. Oesper, *review* by Prof. J. R. Partington, 474
Quantitative Electron-Density Contour Delineation in the Electronic Fourier Synthesizer for Crystal Structure Analysis (Prof. R. Pepinsky and D. Sayre), 22
Quasi-Abelian Functions, *review* by L. Roth, 593
Quasi-Properties : Further Experimental Evidence for the Theory of (Dr. G. W. Scott Blair and J. E. Caffyn), 368
Quenching of Fluorescence in Chlorophyll Solutions : Concentration (W. F. Watson and Robert Livingston), 452
2:7-Disubstituted-1:2:3:4-tetrahydro-*iso*-quinolines : A New Synthesis of (Dr. F. G. Mann and M. H. Beeby), 337
Quinolyl and Pyridyl Anions during Decarboxylation : Production of (B. R. Brown, Dr. D. Ll. Hammick and B. H. Thewlis), 73

RABBITS : Effect of 5-Alkyl (Benzyl) Derivatives of 2-Thio-4-Methyl-Uracil on the Thyroid Gland and the Bone Marrow of (Dr. Arthur Jurand), 896
Rabelais on Syphilis (Dr. James Marshall), 118
Rabelais et la Verole (Dr. J. Mottron), 118
Radar Aids to Navigation (edited by Prof. John S. Hall), *review* by Dr. R. L. Smith-Rose, 633
Radar Beacons (edited by Prof. Arthur Roberts), *review* by Dr. R. L. Smith-Rose, 633
Radar Synthetic Training Devices for the R.A.F. : Aids to Training—The Design of (G. W. A. Dummer), 989
Radiation : Annihilation ; Polarization of (R. C. Hanna), 332
  Cosmic ; Observations on Slow Mesons of the (U. Camerini, H. Muirhead, Dr. C. F. Powell and D. M. Ritson), 433
  Radio-Frequency ; A New Intense Source of, in the Constellation of Cassiopeia (M. Ryle and F. G. Smith), 462
Radiation Field : Electromagnetic Level-Shift and Effect of (Prof. D. S. Kothari and F. C. Auluck), 143
Radiations and Health (Dr. A. S. McFarlane), 480
Radical Addition Reactions (Dr. D. H. R. Barton), 182 ; (Dr. W. A. Waters), 183
Radical Reactivity in the Initiation Reaction of the Polymerization of Styrene (W. Cooper), 897
Radicals (Free) : The Chemistry of (Dr. W. A. Waters), second edition, *review* by George Porter, 390
Radio : Essentials of (Morris Slurzberg and William Osterheld), *review* by W. R., 945
  Radar, Beacons and Navigation by, *review* by Dr. R. L. Smith-Rose, 633
Radio Communication and the Ionosphere, 465
Radio Engineering : An Introduction to, *review* by W. R., 945
Radio Frequency Noise (Galactic) : Discrete Sources of (J. G. Bolton), 141
Radio Frequency Radiation in the Constellation of Cassiopeia : A New Intense Source of (M. Ryle and F. G. Smith), 462
Radio Frequency Radiation from the Sun: Shape of Pulses of (Dr. S. E. Williams), 108
Radio Research at Harvard University : War-time, *review* by Dr. John Lamb, 83
Radio Waves : Diffraction from the Ionosphere and the Fading of (J. A. Ratcliffe), 9
Radio and Electronic Components Exhibition in Stockholm (Radio Component Manufacturers' Association), 767
Radioactive Isotopes : Therapeutic Applications of (Radiology Section of the British Medical Association Symposium on), 480
Radioactive and Stable Isotopes for Research Purposes, 786
Radioactive Tracers : Introduction of, into Antisera (F. D. S. Butement), 731
Radioactive Tracers for Germany, 883
Radioactivité artificielle : Dix ans d'application de la (Dr. Pierre Süe), *review* by Prof. F. A. Paneth, 509
Radioactivity: The Impact of, on Inorganic Chemistry (Prof. H. J. Emeléus), 212
Radiographs (Industrial) : Exhibition of (Industrial Radiology Group of the Institute of Physics), 990
Radium, 1898–1948 (Prof. G. T. R. Evans), 606
Radium to the Atomic Bomb : From, *review* by S. Weintroub, 239
R.A.F. : Aids to Training—the Design of Radar Synthetic Training Devices for the (G. W. A. Dummer), 989
Rain : Artificial Stimulation of (J. A. King, E. C. Halliday, F. J. Hewitt and D. G. Kingwill), 921
Raja clavata : Oscillographic Analysis of the Gravity and Vibration Responses from the Labyrinth of the Thornback Ray (Dr. Otto Lowenstein and T. D. M. Roberts), 852
Raman Line of the Totally Symmetric Vibration of Stannic Chloride : Polarization of the (Dr. A. E. Douglas and Prof. D. H. Rank), 453
Random Association of Points on a Lattice (P. V. Krishna Iyer), 333
Range-Energy and other Relations for Electrons in Kodak Nuclear Plates (Dr. Marion A. S. Ross and Barbara Zajac), 923
Rare-Earth Elements and their Compounds (Prof. Don M. Yost, Horace Russell, Jr., and Prof. Clifford S. Garner), *review*, 278
Rat : Aneurin-Pyrophosphate Content of Red and White Blood Corpuscles in the, and in Man (Dr. E. Florijn and G. Smits), 220
  Cotton ; Course of Untreated Infections of *Litomosoides carinii* in the (W. E. Kershaw and Dr. D. S. Bertram), 149
  Starved ; Increased Muscle Phosphorylase Activity in the (Knud Lundbaek and Ewald S. Goranson), 1002
Rat and Dog Fed with Tumour Proteins: Excretion of D-Pyrrolidone Carboxylic Acid by (Prof. F. Kögl, T. J. Barendregt and A. J. Klein), 732
Rats : Changes in the Incisor Teeth and Incisal Alveolar Bone of, in Hypervitaminosis A and Avitaminosis A (Prof. J. T. Irving), 377
  Effect of Pantothenic Acid on the Infection of *Trypanosoma evansi* in (Dr. H. N. Ray and S. Harbans), 849
Rat's Stomach : Lipoid Content of the Oxyntic Granules of the (Gordon Menzies), 64
Rational Approach to Chemical Principles (Dr. John A. Cranston), *review* by Dr. J. A. V. Butler, 125
Reaction : A Fourth Order (J. H. Baxendale and Philip George), 777
  The Sommelet (Dr. John Graymore), 154 ; (Prof. C. W. Shoppee), 619
  Propagation; Reversibility of the, in Polymerization Processes and its Manifestation in the Phenomenon of a 'Ceiling Temperature' (Dr. F. S. Dainton and K. J. Ivin), 705
Reaction of Cyanogen and related Compounds with Butadiene (Dr. G. J. Janz and P. J. Hawkins), 28
Reaction of Effector Cells to Chemical Transmitters (Dr. B. Minz), 254
Reaction with Hydrochloric Acid : '17-Ketosteroid II' isolated from Urine—its (Dr. Elizabeth Dingemanse, Leonora G. Huis in't Veld and S. Lore Hartogh-Katz), 492
Reaction of the Polymerization of Styrene : Radical Reactivity in the Initiation (W. Cooper), 897
Reaction Kinetics in Solution, *review* by R. P. Bell, 275
Reactions : Radical Addition (Dr. D. H. R. Barton), 182 ; (Dr. W. A. Waters), 183
  Electro-chemical ; Electrical Breakdown of Organic Insulation by (H. F. Church and C. G. Garton), 301
  Heterogeneous ; Application of Measurements of Semi-conductivity to (T. J. Gray), 260
  Ionic, in Liquid Dinitrogen Tetroxide (Dr. C. C. Addison and R. Thompson), 369
Reactions of Organic Compounds (Dr. Wilfred John Hickinbottom), second edition, *review*, 164
Reactions in Solution : The Kinetics of (Dr. E. A. Moelwyn-Hughes), second edition, *review* by R. P. Bell, 275
Reactive Feedback Networks : Influence of, on the Response of Galvanometers (P. Savic), 569
Reactivity: Radical, in the Initiation Reaction of the Polymerization of Styrene (W. Cooper), 897
Reagents : Organic Analytical (Prof. Frank J. Welcher), *review* by Dr. G. M. Bennett, 48
Real Domain : Finite Differences and Difference Equations in the (Prof. Tomlinson Fort), *review* by L. M. M.-T., 391
Reason : Intuition and (Dr. Maurice Burton), 956
Receptor Organs in Tunicata (Dr. S. M. Das), 1000
Reclamation : Land (P. J. O. Trist), *review* by Dr. E. W. Russell, 475
Reconstruction of Laccase from its Protein and Copper (A. Tissières), 340
Recovery : Research and (Herbert Morrison), 645
Recrystallization : Creep of Metals and (Prof. E. N. da C. Andrade), 410
Re-discovery of *Apus cancriformis* (Prof. Frank Balfour-Browne), 116
Red-backed Shrike : Larder of the (T. H. Hawkins), 504 ; (J. H. Owen), 504
Red Lead as a Selective Oxidant (Prof. L. Vargha), 927
Rede Lecture (Sir Walter Moberly), 648
Reduction of Dead Times in Geiger-Müller Counters (B. Collinge), 853
Regions and Nations of the World (Prof. Earl E. Lackey and Prof. Esther S. Anderson), *review* by H. J. F., 7
Register : The Annual, for the Year 1947 (edited by Ivison S. Macadam, assisted by Hugh Latimer), *review*, 49
Rehabilitation of an Island Fauna : Destruction and, *review*, 552
Relations and Exchanges: Inter-University (Universities of the British Commonwealth Discussion on), 585
Relaxation-Times: Dielectric, of Solid Solutions of Aliphatic Long-Chain Esters and Ketones in Paraffin Wax and *n*-Hexacosane (R. J. Meakins), 994

- Religion : Sociology of (Joachim Wach), *review* by A. D. R., 128
- Religion of a Scientist (Selections from Gustav Th. Fechner), edited and translated by Walter Lowrie, *review* by A. D. R., 203
- Remedies (Modern) : An Index of (William Mair), new edition, 97
- Renal Pedicles Clamped : Alloxan Diabetes in Dogs with (Prof. B. A. Houssay and Dr. C. Martinez), 571
- Renal Regulation of the Extracellular Fluid (Dr. Derek A. Denton), 618
- 'Renal Threshold' : The (M. Földi), 337
- Rennet Action : Measurement of Alkaline Earth Ion Concentrations by (Prof. G. T. Pyne), 925
- Research : Chemical, in South Africa, 1910–1939 ; A Bibliography of (compiled by Dr. Herbert Coblans), *review*, 391
  - Chemistry, 1938 to 1946, 91
  - Cytological, and Biophysics, *review* by Dr. J. Danielli, 753
  - Domestic Heating; Calorimeter Building for, at the Fuel Research Station, Greenwich (Dr. A. C. Monkhouse), 133
  - Engineering, at Cambridge, 117
  - Industrial ; Surface Chemistry for (J. J. Bikerman), *review* by Dr. A. S. C. Lawrence, 164
  - Market (Report of the Conference arranged by the Manchester Joint Research Council on), 289
  - Medical ; Beit Memorial Fellowships for, 212
  - Nuclear ; Processing Thick Emulsions for (C. C. Dilworth, Dr. G. P. S. Occhialini and R. M. Payne), 102
  - Plant ; Twenty Years of Seed Research at Boyce Thompson Institute for (Lela V. Barton and William Crocker), *review*, 594
  - Psychical ; The Experimental Situation in (S. G. Soal), *review*, 432
  - Practical Psychical (Society for Psychical Research course of Lectures on), 607
  - River, in East Africa (Dr. Vernon D. van Someren), 784
  - Road (Road Research Laboratory of the Department of Scientific and Industrial Research, in collaboration with the Ministry of Transport, and in association with the Glasgow and District Association of the Institution of Civil Engineers, the Scottish Branches of the Institution of Municipal Engineers and the County Surveyors' Society, and the Scottish Accident Prevention Council, Conference on), 290, 784
  - Scientific ; Beit Fellowships for, 100
  - Scientific ; The Film in (Sciences Committee of the Scientific Film Association Conference on), 250
  - Scientific, and Man-Power, 711
  - Scientific, and Man-Power in the United States, 673
  - Scientific ; Wave Mechanics in, 504
  - Scientific and Industrial ; Selected Techniques of Statistical Analysis for, and Production and Management Engineering (Statistical Research Group, Columbia University), edited by Churchill Eisenhart, Millard W. Hastay and W. Allen Wallis, *review* by Prof. M. S. Bartlett, 510
  - Social and Economic, in Great Britain, 905
  - War-time Radio, at Harvard University, *review* by Dr. John Lamb, 83
- Research Fellowship in Extraction Metallurgy (Nuffield Foundation), 290
- Research Problems of Telecommunications : The Fundamental (Report of the Telecommunications Research Committee), 58
- Research Purposes : Radioactive and Stable Isotopes for, 786
- Research Scholarships : Overseas Science (Royal Commission for the Exhibition of 1851 Awards for 1948), 100
  - Science (Royal Institution), 100
- Research Services in East Africa (Dr. E. B. Worthington), 554
- Research Studentships and Dominion and Colonial Exhibitions (Trinity College, Cambridge), 990
- Research and Industry : Applications of Electronics to (Electronics Group of the Scientific Instrument Manufacturers' Association Symposium on), 485, 769
- Research and Recovery (Herbert Morrison), 645
- Research and Teaching at Universities: The Balance of (Universities of the British Commonwealth Discussion on), 441
- Researches on Food : Recent (M..W. Grant), 466
- Researches in Physiology : Recent, *review*, 429
- Residence : Permanence of, with respect to Various Family Characteristics (Family Studies in the Eastern Health District, 4), (Dr. H. M. C. Luykx), 647
- Residual Films of Benzene Hexachloride : Insecticidal Power and Microscopical Structure of (A. J. Musgrave), 296
- Resistance to the Potato-Root Eelworm (Dr. C. Ellenby), 704
- Resistance to Sulphadiazine and 'Paludrine' in the Malaria Parasite of the Fowl (*P. gallinaceum*), (Dr. Ann Bishop and Elspeth W. McConnachie), 541
- Resistance of Superconductors : High-Frequency (A. B. Pippard), 68
- Resonance in Copper Sulphate : Paramagnetic—Experimental Investigation (D. M. S. Bagguley and Dr. J. H. E. Griffiths), 538 ; Theory (Prof. M. H. L. Pryce), 539
- Resonance Absorption : Dielectric Behaviour of Methyl Palmitate—Evidence of (J. S. Dryden and Prof. Willis Jackson), 656
- Resonance Accelerator for Electrons : A Magnetic (Prof. W. J. Henderson, H. LeCaine and R. Montalbetti), 699
- Respiration in the Sea Urchin : Rhythmic (Peisung Tang), 189
- Respiration and Circulation : A Simple Method for Direct Comparison of the Depressant Effect of the Barbiturates on the (Sten Wiedling), 1003
- Respiratory Enzyme Systems : Inhibition of some, by Derivatives of Sulphuric Acid (Donald Hockenhull), 813
- Response to Diabetogenic Substances: Species Difference in the Biosynthesis of Vitamin C and (Prof. M. C. Nath, C. H. Chakraborty, V. G. Hatwalne and Kusum S. Laul), 660
- Response of Galvanometers : Influence of Reactive Feedback Networks on the (P. Savic), 569
- Response of β-Glucuronidase to Extrinsic Agents : Sex and Organ Specificity in the (Lynda M. H. Kerr and Dr. G. A. Levvy), 219
- Resting Cells : Electron Optical Observations on Chromosome Structure in (Fernando Calvet, Benjamin M. Siegel and Dr. Kurt G. Stern), 305
- Reticulo-endothelial System : Discriminating 'Athrocytes' in the (Dr. L. Lison and J. Smulders), 65
- Reticulocytes : Error in Counting (Rosemary Biggs), 457
- Retinene$_1$: Indicator Yellow and (Dr. H. J. A. Dartnall), 222 ; (S. Ball, F. D. Collins and Prof. R. A. Morton), 222
- Retinene$_1$ and Indicator Yellow (Alfred F. Bliss), 661
- Reversibility of the Propagation Reaction in Polymerization Processes and its Manifestation in the Phenomenon of a 'Ceiling Temperature' (Dr. F. S. Dainton and K. J. Ivin), 705
- R_F Measurement in Chromatography : Rapid (D. M. P. Phillips), 29
- *Rh* Factor : Recent Advances in our Knowledge of the (Pathological Section of the British Medical Association Discussion on), 515
- *Rh* Genes Allelomorphic to *D* (Dr. R. R. Race, Ruth Sanger and Sylvia D. Lawler), 292 ; (Dr. F. Stratton and P. H. Renton), 293
- *Rh* Genotype R_yr (*CdE/cde*) in a Case of Erythroblastosis fœtalis : The Very Rare (Dr. Clara Van den Bosch), 781
- Rheological Measurements on Cheese : Factorial Analysis of (R. Harper and M. Baron), 821
- Rheological Phenomena and their Significance for the Constitution of Materials : Some New (S. M. Freeman and K. Weissenberg), 320
- Rheology : First International Congress on (Dr. G. W. Scott Blair), 747
- Rhythmic Respiration in the Sea Urchin (Peisung Tang), 189
- *Ribes nigrum* : Cryptic Polyploidy and Variation of Chromosome Number in (Dr. Antero Vaarama), 782
- Riboflavin and Allied Substances during the Growth of *C. diphtheriae* : Production of (A. J. Woiwod and Dr. F. V. Linggood), 219
- Ribonucleic Acid Supply and Phosphatase Distribution during the Spermatogenesis of *Asellus aquaticus* (Giovanna Vitagliano and Marina de Nicola), 965
- Ribonucleoproteins of Chromosomes, Nucleoli and Cytoplasm : Enzymatic Degradation of (Dr. Berwind P. Kaufmann, Margaret McDonald and Helen Gay), 814
- Ribonucleosides: Partition Chromatography on Starch of (Peter Reichard), 662
- Rice : Parboiling Treatment of (Dr. J. J. C. Hinton), 913
- Rickets : Yeast and (Dr. Th. J. de Man), 574 ; (Dr. E. Hoff-Jørgensen), 575
- Rigor in Iodoacetate-Poisoned Muscle: Electrical Potential Change accompanying the Development of (Y. M. Liu, C. H. Hsu and Dr. T. P. Feng), 962
- River Research in East Africa (Dr. Vernon D. van Someren), 784
- Road Research (Road Research Laboratory of the Department of Scientific and Industrial Research, in collaboration with the Ministry of Transport, and in association with the Glasgow and District Association of the Institution of Civil Engineers, the Scottish Branches of the Institution of Municipal Engineers and the County Surveyors' Society, and the Scottish Accident Prevention Council, Conference on), 290, 784
- Robin : Clutch and Brood-size in the (David Lack), 250
- Rockefeller Travelling Fellowships in Medicine (Medical Research Council awards), 290
- Rocks at High Temperatures : Electric Conductivity of (H. P. Coster), 270
- Roman Construction in Italy from the Prehistoric Period to Augustus : Ancient (Marion Elizabeth Blake), *review* by Joan Liversidge, 755
- Roman House : Excavations of a, 78
- Room Temperature : Esterification of Phthalic Anhydride with Primary Alcohols at (F. J. Bristow), 1004
- Root Formation (Adventitious) : Stimulation of, by Fungal Metabolic Products (Dr. M. A. Mostafa and M. S. Naim), 575
- Root Vegetables : Commercial Cultivation of (Ministry of Agriculture and Fisheries Bulletin No. 120), new revision of the third edition, 365
- Root-Normal Frequency Distributions of Insect Populations : Truncated Log-Normal and (D. Spiller), 530
- Rorschach Personality Test : Principles and Practice of the (W. Mons), *review* by Dr. John Cohen, 87
- Rotifera for Testing Analgesics, Narcotics and other Drugs : Use of (R. H. Marriott, S. Morris and Y. Larthe), 189
- Royal Air Force: Aids to Training—The Design of Radar Synthetic Training Devices for the (G. W. A. Dummer), 989
- Royal Medals for 1948 of the Royal Society awarded to Prof. Harold Jeffreys and Prof. James Gray, 807, 873
- Rubber : Buna (Frank A. Howard), *review* by Dr. C. W. Long, 637
  - Physical Properties of, *review* by W. P. Fletcher, 678
  - Synthetic ; Development of, in the United States, *review* by Dr. C. W. Long, 637
- Rubber Chemistry : Modern (Dr. Harry Barron), second edition, *review*, 128
- Rubber Technology (Institution of the Rubber Industry Conference on), 204, 211
- Ruling Engine used by Sir John Barton, and its Products (P. Grodzinski), 446
- Rumen of the Sheep : Microflora of the (M. Ingram and C. A. McGaughey), 533
- Rumford Medal for 1948 of the Royal Society awarded to Prof. F. E. Simon, 807, 872
- Rural Education and Welfare in the Middle East (H. B. Allen), 53
- Rusinga Island : Skull of *Proconsul* from (Dr. L. S. B. Leakey), 688
- Rutaceæ (Australian) : Alkaloids of the (G. K. Hughes, Dr. F. N. Lahey, Dr. J. R. Price and L. J. Webb), 223

- *SALMONELLA typhi* Organisms : Bacteriophage Typing of Untypable (Lieut. James M. Dunbar), 851
- Salt on Partition Chromatograms : Effect of (Dr. R. Consden and Dr. A. H. Gordon), 180
- Salts (Neutral) : Influence of Hydrogen Ions and, upon the Hydration of Interstitial Connective Tissue (Dr. T. D. Day), 152
- Samarium : Isotopic Assignment of the α-Activity of (Prof. N. Feather), 412
- Samoan Islands : Earthquake on June 29, 248
- Sand : Frictional Electrification of (E. W. B. Gill), 568
- Sangster's Rotations and Schmidt's 'Wandering Vortices' in Geomagnetism : A Suggested Explanation of (A. T. Price), 110
- Sanguinarine : Isolation from Argemone Oil of Dihydrosanguinarine and —Toxicity of Sanguinarine (S. N. Sarkar), 265
- Scatter Clouds : Observations of (T. L. Eckersley), 24
- Scenery of Scotland : The Geology and (Dr. Douglas A. Allan), 920
- *Schistocerca gregaria* (Forsk.) : A Nemestrinid Parasite of (Dr. A. Shulov), 255
- Schmidt's 'Wandering Vortices' in Geomagnetism : A Suggested Explanation of Sangster's Rotations and (A. T. Price), 110
- Scholarship in Naval Architecture : Martell (Institution of Naval Architects), 956

Scholarships : Overseas Science Research (Royal Commission for the Exhibition of 1851 Awards for 1948), 100
  Science Research (Royal Institution), 100
Scholarships for Postgraduate studies (National Research Council of Canada), 18
School in a Progressive Society : The (W. O. Lester Smith), 405
Schools : Councils and their (P.E.P. Broadsheets on), 941
Schumann – Runge O_2 Bands : Emission (M. W. Feast), 214
Science : Balance between the Pursuit and Application of, 385
  Esperanto and, 918
  Middle East (Dr. E. B. Worthington), 53
  Philosophy of, 59
  Pure ; Fertile Source of Industrial Progress (Prof. L. de Broglie), 769
  Some Reflexions on the History of (Prof. Herbert Dingle), 564
  On Understanding (James B. Conant), *review* by Prof. Herbert Dingle, 552
Science of the Amaryllids, 347
Science and its Background (Lieut.-Colonel H. D. Anthony), *review* by W. L. Sumner, 354
Science in relation to History, *review* by W. L. Sumner, 354
Science in the Seventeenth Century : Christian Huygens and the Development of (Dr. A. E. Bell), *review* by Prof. E. N. da C. Andrade, 472
Science in the U.S.S.R., 882
Science and Industrial Practice in the Iron and Steel Industry, 59
Science and Industry : Mathematical Tables for, 98
Science and the Meanings of Truth (Dr. Martin Johnson), *review* by Dr. A. C. Crombie, 46
Science and Nutrition (A. L. Bacharach), third edition, *review*, 165
Science and Philosophy, *review* by Dr. A. C. Crombie, 46
Science and Public Policy (John R. Steelman), 673
Science and its Social Relations, 235
Science Research Scholarships (Royal Institution), 100
  Overseas (Royal Commission for the Exhibition of 1851 Awards for 1948), 100
Science Teaching at the City of London School, 767
Sciences : Social, and Industrial Productivity, 628
Scientific Aspects of Colonial Development (British Association, Section E (Geography), Discussion on), 556
Scientific Conference, June–July 1946 : Empire (Royal Society), Report, *review* by R. B., 679
Scientific Information : International Exchange of (Prof. N. F. Mott), 417
Scientific Information Conference : Summary of the recommendations of the (Royal Society), 447
Scientific Instruments : Exhibition at Brighton of (Scientific Instrument Manufacturers' Association of Great Britain), 445
  Exhibition at Copenhagen of, 837
Scientific Man-Power : Distribution of, 199
Scientific Method in the Conservation of Pictures, 161
Scientific Mission to Japan : United States, 954
Scientific Philosophy : The Nature of (Prof. Herbert Dingle), 100
Scientific Research : Beit Fellowships for, 100
  The Film in (Sciences Committee of the Scientific Film Association Conference on), 250
  Wave Mechanics in, 504
Scientific Research and Man-Power, 711
Scientific Research and Man-Power in the United States, 673
Scientific Text-books : German (Dr. Julian Huxley), 562
  Shortage of (Roy Innes), 209, 417 ; (John Grant), 416
Scientific and Industrial Research and Production and Management Engineering : Selected Techniques of Statistical Analysis for (Statistical Research Group, Columbia University), edited by Churchill Eisenhart, Millard W. Hastay and W. Allen Wallis, *review* by Prof. M. S. Bartlett, 510
Scientific and Technical Man-Power in Britain, 469
Scientist : Atomic Energy and the (Atomic Scientists' Association Conference on), 1005
  Osler as a (Sir Arthur MacNalty), 346
  Religion of a (Selections from Gustav Th. Fechner), edited and translated by Walter Lowrie, *review* by A. D. R., 203
Scientists Starred 1903–1943 in 'American Men of Science' (Prof. Stephen Sargent Visher), *review*, 595
Scotland : Chemical Industries in (Scottish Council on Industry Report on), 39
  Colpomenia sinuosa (Mert.) Derb. et Sol. in (Helen Blackler), 1001
  The Geology and Scenery of (Dr. Douglas A. Allan), 920
  Plastics in (Scottish Council (Development and Industry), Final Report of the Committee on Plastics), 1009
  Road Research in, 290, 784
Scott (James) Prize for 1948 of the Royal Society of Edinburgh presented to Prof. Herbert Dingle, 100
Sea, Breakers and Surf : Wind Waves at (Henry B. Bigelow and W. T. Edmondson), *review* by N. F. Barber, 389
Sea Fisheries : West African (T. J. Hart), 38
Sea Fisheries of Sierra Leone : Report on the (G. A. Steven), 38
Sea Urchin : Rhythmic Respiration in the (Peisung Tang), 189
Sea Urchin Eggs : Activation of Unfertilized, by Trypsin (Aage Bohus Jensen), 931
Sea Waves and Microseisms (M. S. Longuet-Higgins and F. Ursell), 700
Sea Waves and Surf, *review* by N. F. Barber, 389
Searchlights : Symposium on (Dr. W. M. Hampton), 424
Seaweed Culture (F. T. Walker and Margaret McL. Smith), 31
Second Sound in Liquid Helium II: Propagation of Pulses of (D. V. Osborne), 213
Secretor Character in Man : Correlation between Lewis Blood Group and (R. Grubb), 933
Seed Research at Boyce Thompson Institute for Plant Research : Twenty Years of (Lela V. Barton and William Crocker), *review*, 594
Seeds : The Behaviour of, *review* by Dr. S. Clay, 594
  Toxicity of Sulphydryl Compounds to (Dr. P. W. Brian, Mary Jamieson and Dr. J. C. McGowan), 780
Seitz-Filtered Components : A Simple Apparatus for Adding, Aseptically to Embryo Culture Media (S. G. Stephens), 932
Selection at the University Level (British Association, Section I (Education), Discussion on), 626
Selection Boards : Examinations and, 123
Selenium for Pest Control : Use of, 176
Semen (Bull) : Preservation of the Fertilizing Capacity of, in the Genital Tract of the Cow (Prof. M. Vandeplassche and Dr. F. Paredis), 813
Semen (Human) : Relation between the Volume and Fructose Content of (Clare Harvey), 812
Semi-conductivity to Heterogeneous Reactions : Applications of Measurements to (T. J. Gray), 260
Semi-conductors : Phthalocyanines as (Dr. D. D. Eley), 819
Semi-conductors and their Applications (Manchester and District Branch of the Institute of Physics Conference on), 624
Semi-micro Qualitative Organic Analysis (Nicholas D. Cheronis and John B. Entrikin), *review*, 164
Separation, Detection and Estimation of Inorganic Compounds : A New Method for (T. V. Arden, Dr. F. H. Burstall, Dr. G. R. Davies, J. A. Lewis and Prof. R. P. Linstead), 691
Separation and Purification : Theory and Practice of New Techniques in (Chemical Society Discussion on), 729
Serials in Hawaii : Union List of, 809
DL-Serine : Conversion of, into inactive Cystine (Dr. D. F. Elliott), 658
Serum Protein in Parenchymatous Liver Diseases : Abnormal (Dr. A. Fischer, Dr. C. Sellei and Dr. M. Bretán), 1002
Serum Protein in the Thymol Turbidity Test : Interrelations of the (Dr. Nicholas H. Martin), 145
Service of Man : Chemistry in the (Prof. Alexander Findlay), seventh edition, *review*, 128
Services : Education in and For the, 159
Seventeenth Century : Christian Huygens and the Development of Science in the (Dr. A. E. Bell), *review* by Prof. E. N. da C. Andrade, 472
Sex and Organ Specificity in the Response of β-Glucuronidase to Extrinsic Agents (Lynda M. H. Kerr and Dr. G. A. Levvy), 219
Shape of Pulses of Radio-frequency Radiation from the Sun (Dr. S. E. Williams), 108
Shark Liver Oil : Deodorization of (P. K. Mathew, Prof. P. V. Nair, T. A. Ramakrishnan and H. Sreemulanathan), 494
Sheep : Concentration of Cobalt by Micro-organisms and its relation to Cobalt Deficiency in (Dr. J. Tosic and Dr. R. L. Mitchell), 502
  Microflora of the Rumen of the (M. Ingram and C. A. McGaughey), 533
Shell Porphyrins in Mollusca : Distribution of (Alex. Comfort), 851
Shock (Traumatic) : Blood Capillary Circulation under Normal Conditions and in (Prof. Robert Chambers), 835
Short-Period Changes in the *F* Region of the Ionosphere (G. H. Munro), 886
Shortage of Scientific Text-Books (Roy Innes), 209, 417 ; (John Grant), 416
Shrike (Red-backed) : Larder of the (T. H. Hawkins), 504 ; (J. H. Owen), 504
Shrinking : Swelling and (Faraday Society General Discussion on), *review*, 638
Shrubs and Fruit for the Small Garden : Flowers, (G. A. Carter), *review*, 757
Sicily : Earthquake at Palermo on May 24, 211
Sidereal Variations of Cosmic Rays (A. R. Hogg), 613
Sierra Leone : Report on the Sea Fisheries of (G. A. Steven), 38
Silicon Esters : Treatment of Paper with (Ingvar Jullander), 300
Silicon–Iron : Anisotropic (N. F. Astbury), 800
Silva of North America (Prof. C. S. Sargent), 884
Silver and Gold: Hydride and Deuteride Bands of Aluminium, Copper, (Bengt E. Nilsson), 109
Silver Bromide and Iodide : Excited States of (Dr. R. F. Barrow and M. F. R. Mulcahy), 336
Silver Chloride : Glide Bands in (J. F. Nye) 299
Silver Salts of Fatty Acids : Volatile Cuprous and (A. Keller and Dr. F. Körösy), 580
Site of Action of D.D.T. and Cause of Death after Acute D.D.T. Poisoning (D. Dresden), 1000
Skull of *Proconsul* from Rusinga Island (Dr. L. S. B. Leakey), 688
Sky : The Night, in July, 19 ; in August, 176 ; in September, 328 ; in October, 485 ; in November, 690, *erratum*, 729 ; in December, 844
Skyscraper Hive : The (Father M. Dugat), translated by Norman C. Reeves, *review* by Dr. Colin G. Butler, 87
Slow Mesons of the Cosmic Radiation : Observations on (U. Camerini, H. Muirhead, Dr. C. F. Powell and D. M. Ritson), 433
Slow Mesons in Dielectrics : Decay and Capture of (Dr. H. Fröhlich, R. Huby, R. Kolodzieiski and R. L. Rosenberg), 450
Smallholder Broadcasts, Vol. 3, *review*, 757
Smallholding : Your (edited by Alan Thompson), *review*, 757
Smallholding and Farm : Garden, *review*, 757
Smallholdings for Pleasure and Profit (W. V. Ball), *review*, 757
Social Factor : Permanence of Residence as a, 647
Social Geography (Lord Rennell of Rodd), 401
Social Medicine of Old Age—Report of an Inquiry in Wolverhampton (Dr. J. H. Sheldon), 466
Social Relations : Science and its, 235
Social and Economic Research in Great Britain, 905
Social Sciences and Industrial Productivity, 628
Social Studies at Sheffield, 767
Societies : The Corresponding, and the Community (Prof. H. J. Fleure), 406
  Local ; The Functions and Organisation of (G. Gosnell), 79
Society: Atomic Energy and (Atomic Scientists' Association Conference on), 1005
  Progressive ; The School in a (W. O. Lester Smith), 405
Sociology (Mathematical) : Towards a, *review* by Prof. R. G. D. Allen, 352
Sociology in the London School of Economics, 326
Sociology of Religion (Joachim Wach), *review* by A. D. R., 128
Sodium Layer Responsible for the Strong Yellow Line in Twilight : Thickness and Height of the (Prof. L. Vegard), 300
Sodium, Aluminium and Fluorine: Short-Range α-Particles from the Disintegration of, by Protons (Joan M. Freeman and A. S. Baxter), 696
Soil : The Fruit and the (Collected edition of the John Innes Leaflets, edited by Dr. C. D. Darlington), 791
  Persistence of D.D.T. in the (Philip B. Carne), 743
Soil Conservation, an International Study (Food and Agriculture Organisation of the United Nations), 13
Soil Improvement for Forestry, 271
Soil Nitrification : Intermediaries in (Dr. Howard Lees), 702
Soil Phosphate Uptake as Influenced by Phosphatic Fertilizer (Dr. K. Strzemienski), 932

Soilless Growth of Plants (Carleton Ellis and M. W. Swaney), second edition, *review* by W. E. B., 717
Soils : Students' Handbook to Fertilisers and (L. T. Lowe), *review* by Dr. E. W. Russell, 8
  Using and Managing (Prof. A. F. Gustafson), *review* by Dr. E. W. Russell, 758
Solar Apex : The (O. R. Walkey), 920
Solar Eclipse of November 1, 521
Solid Solutions of Aliphatic Long-Chain Esters and Ketones in Paraffin Wax and *n*-Hexacosane : Dielectric Relaxation-Times of (R. J. Meakins), 994
Solomon Islands : Earthquake on June 18, 248
Solubility of Bituminous Coal in Alcoholic Potash (N. Berkowitz), 960
Solutes (Associating) : Activities of (Dr. A. F. H. Ward and Dr. L. Tordai), 494
Solution : The Kinetics of Reactions in (Dr. E. A. Moelwyn-Hughes), second edition, *review* by R. P. Bell, 275
Solution for the Force Constants of Polyatomic Molecules : A General (P. Torkington), 370, 607
Somaliland (British) : Report on the General Survey of, 137
Somerset Levels : Prehistoric Flooding in the (Dr. H. G. Baker), 1008
Sommelet Reaction (Dr. John Graymore), 154 ; (Prof. C. W. Shoppee), 619
Sound : Velocity of, in Free Air (J. M. A. Lenihan), 656
  Second ; Propagation of Pulses of, in Liquid Helium II (D. V. Osborne), 213
Sound Transmission and Noise : International Conference on (Acoustics Group of the Physical Society, in association with the Royal Institute of British Architects), 59, 499
Sound Velocity and Temperature Change of Molecular Association (Prof. A. Van Itterbeek and A. de Bock), 611
South Africa, 1910–1939 : A Bibliography of Chemical Research in (compiled by Dr. Herbert Coblans), *review*, 391
South African Museums (J. R. Harding), 861
South American Anthropological Symposium, *review* by Dr. G. H. S. Bushnell, 908
South American Indians : Handbook of (edited by Julian H. Steward), Vol. 3, The Tropical Forest Tribes ; Vol. 4, The Circum-Caribbean Tribes, *review* by Dr. G. H. S. Bushnell, 908
Soviet Union ; Genetics in the (Prof. Eric Ashby), 912
Spark Discharges : Development of (R. F. Saxe and Prof. J. M. Meek), 263; (Dr. T. E. Allibone), 264
l-Sparteine: Synthesis of (Prof. G. R. Clemo, Dr. R. Raper and W. Short), 296
Species Difference in the Biosynthesis of Vitamin C and Response to Diabetogenic Substances (Prof. M. C. Nath, C. H. Chakraborty, V. G. Hatwalne and Kusum S. Laul), 660
Specific Crystalline Protein and Nucleoprotein from a Plant Virus having Insect Vectors (Dr. Roy Markham, Dr. R. E. F. Matthews and Dr. Kenneth M. Smith), 88
Spectra (Absorption) : A New Heterochromatic Fabry-Perot Fringe System applicable to the Interferometry of (Rev. P. J. Treanor), 885
Spectra (Optical) : Atomic Energy Levels as derived from the Analyses of, Vol. 1, Section 1, The Spectra of Hydrogen, Deuterium, Helium, Lithium, Beryllium, Boron, Carbon, Nitrogen, Oxygen and Fluorine (Charlotte E. Moore), *review* by A. G. G., 391
Spectrum of Helium-3 (L. C. Bradley and Dr. H. Kuhn), 412
Spectrum of Iodine Oxide (IO) in Flames (E. H. Coleman, Dr. A. G. Gaydon and Dr. W. M. Vaidya), 108
β-Spectrum of Tritium (Dr. S. C. Curran, J. Angus and A. L. Cockcroft), 302
Spell of the Honey Bee (W. Eric Kelsey), second edition, *review*, 8
Spermatogenesis of *Asellus aquaticus* : Ribonucleic Acid Supply and Phosphatase Distribution during the (Giovanna Vitagliano and Marina de Nicola), 965
Spermatogenesis of Oligospermic Men: Variations in (Margaret Hadley Jackson and Clare Harvey), 67
Sperms required for Fertilization : Number of (C. R. Austin), 534
Spiritual Progress of Mankind : Cultural and, 589
Splachnidium rugosum : Life-History of (R. J. Hopkins), 75
Sponges : Ecology of (Dr. Maurice Burton), 73
Spontaneous Abnormality in Ciliates : Induced and (Dr. Ll. Lloyd), 188
Spontaneous Deformation of Crystals (Prof. R. W. Wood), 523
Spot Tests, Inorganic and Organic Applications : Qualitative Analysis by (Dr. Fritz Feigl), third English edition, translated by Prof. Ralph E. Oesper, *review* by Prof. J. R. Partington, 474
Spotted Wilt Virus : Tomato (D. O. Norris), 249
Spray Injury : Mitigation of (M. H. Moore), 408
Spreading Phenomenon and Inflammation (Dr. Oscar Hechter and Sidney Solomon), 701, *erratum*, 809
Sputum on Streptomycin : Effect of (Herta Schwabacher), 339
Stability of Lyophobic Colloids : Theory of the (E. J. W. Verwey and J. Th. G. Overbeek, with the collaboration of K. van Nes), *review* by Dr. J. A. V. Butler, 315
Stability of Metal Complexes : Order of (Dr. H. Irving and R. J. P. Williams), 746
Stable Isotopes for Research Purposes : Radioactive and, 786
Stain (Vital) : Methylene Blue as a, for the Golgi Apparatus (Prof. J. Bronte Gatenby and Tohamy A. A. Moussa), 736
Staining of Lignified Cell Walls : A Simple Technique for the Differential (Dr. Iwo R. W. Lominski and S. A. Hutchison), 415
Standard Frequency Transmissions in Great Britain, 269
Standardization of the Vitamins : The Biological (Dr. Katharine H. Coward), second edition, *review* by Prof. S. K. Kon and Dr. P. White, 202
Stannic Chloride : Polarization of the Raman Line of the Totally Symmetric Vibration of (Dr. A. E. Douglas and Prof. D. H. Rank), 453
Staphylococcal Coagulation and Fibrinolysis (Earl B. Gerheim), 732
Star-following Telescopes : Photo-electric (A. Uttley, S. Jones and L. Manns), 144
Starch of Ribonucleosides: Partition Chromatography on (Peter Reichard), 662
B-Starch from X-Ray Fibre Diagrams : Crystal Structure of (Prof. R. E. Rundle), 107
Stars : Condensation of Interstellar Material into (F. Hoyle), 233
  Giant Binary, and the Mass-Luminosity Law (Dr. J. A. Hynek), 815
  Pulsating, and Nuclear Energy (D. Stanley-Jones), 934
  Cosmic Ray ; Origin of (Dr. E. P. George), 333
State : An Approximate Equation of (Antonio E. Rodriguez), 304
  Universities and the (Sir Walter Moberly), 648
State Control : Economic and (Prof. G. C. Allen), 646
Statistical Analysis for Scientific and Industrial Research and Production and Management Engineering : Selected Techniques of (Statistical Research Group, Columbia University), edited by Churchill Eisenhart, Millard W. Hastay and W. Allen Wallis, *review* by Prof. M. S. Bartlett, 510
Statistical Diameter: Feret's, as a Measure of Particle Size (W. H. Walton), 329
Statistical Method : American War-time Contributions to, *review* by Prof. M. S. Bartlett, 510
Statistical Methods in Industry (Dr. B. P. Dudding), 607
Statistical Theory : Physical Periodicity of the Periodic Table of the Elements in the Light of (Dr. G. Herdan), 215
Statistics of the Ministry of Labour and National Service, 248
Status of the Biologist : Professional, 867
Steel-making : Application of Oxygen to (Dr. W. C. Newell), 518
Steels (Chromium) : A New Carbide in (H. J. Goldschmidt), 855
Stellar Astronomy : An Outline of (Peter Doig), second edition, *review* by Dr. R. d'E. Atkinson, 390
Stellar Populations : Mixed Types of (Dr. G. Gamow), 816
Stereochemical Aspects in Genetics : Some (Dr. L. Zechmeister and Prof. F. W. Went), 847
Steric Hindrance in Vinyl-Mesitylene (F. R. Buck, G. T. Kennedy, F. Morton and E. M. Tanner), 103
Sterile Conditions : Growth of *Culex molestus* under (E. P. Lichtenstein), 227
Steroid Derivatives : Sulphur-containing (A. S. Jones, F. Smith and M. Webb), 857
Steroid Hormones: Chemistry, Metabolism and Biological Effects of (University of Wisconsin and the U.S. National Research Council Committee on Growth Symposium on), 176
Steroid and Synthetic Œstrogen Series : New Colour and Fluorescence Reactions in the (Dr. R. J. Boscott), 577
Sterols : Microbiological Oxidation of (Dr. A. Krámli and Dr. J. Horváth), 619
Stick Insect : Utilization of Mineral Constituents of the Egg-shell by the Developing Embryo of the (A. Moscona), 62
Stimulation of Adventitious Root Formation by Fungal Metabolic Products (Dr. M. A. Mostafa and M. S. Naim), 575
Stimulation of Rain : Artificial (J. A. King, E. C. Halliday, F. J. Hewitt and D. G. Kingwill), 921
Stomach (Rat's) : Lipoid Content of the Oxyntic Granules of the (Gordon Menzies), 64
Stomach in Mice : Induced Adenocarcinoma of the (Dr. P. R. Peacock and S. Beck), 252
Storage : Influence of Time and Temperature of, on Dye-Reduction Tests in Milk (R. K. Morton and J. M. Vincent), 415
Stored Products Insects : Control of (F. N. Ratcliffe), 308
Storing Garden Fruit : Harvesting and (Raymond Bush), *review* by Prof. R. H. Stoughton, 981
Strains (Large) : Electrical Resistance of Wires with (Dr. W. Weibull), 966
Strawberries (Ministry of Agriculture Bulletin 95), new edition, 58
Strength of Glass : A Kinetic Approach to the Theory of the (S. M. Cox), 947
Strength of Metals (Dr. W. A. Wood and W. A. Rachinger), 891
Streptomyces griseus: Utilization of Wheat Bran for Streptomycin Production by (R. Raghunandana Rao), 820
Streptomycin : Action of, on Plant Tumours (R. S. de Ropp), 459
  Effect of Sputum on (Herta Schwabacher), 339
  Vestibular Effect of, in the Mouse (Dr. R. Causse, I. Gondet and B. Vallancien), 929
Streptomycin Production: Role of the Inorganic Constituents of Wheat Bran Extract in (R. Raghunandana Rao), 850
Streptomycin Production by *S. griseus*: Utilization of Wheat Bran for (R. Raghunandana Rao), 820
Streptomycin *B* (Mannosido-Streptomycin) : Chemical Assay of (W. B. Emery and A. D. Walker), 525
Stress (Compression) : Creep of Metals subjected to (A. H. Sully, G. N. Cale and G. Willoughby), 411
Stress Analysis and the Designer (Institute of Physics, Stress Analysis Group, Discussion on), 119
Stresses (Complex) : Work-Hardening under (Dr. K. H. Swainger), 532
Strontium Titanates at 10,000 Mc./s. : Dielectric Properties of Mixed Barium and (Dr. J. G. Powles), 655, *erratum*, 690
Structure
  of Abraded Surfaces (J. B. Dance and D. J. Norris), 71
  of the Antibacterial Compound, Aspergillic Acid (George Dunn, G. T. Newbold and Prof. F. S. Spring), 779
  of Calciferol (Dr. Dorothy Crowfoot and Dr. J. D. Dunitz), 608
  of Carbon Monofluoride (D. E. Palin and K. D. Wadsworth), 925
  of Citrinin (J. P. Brown, N. J. Cartwright, Prof. A. Robertson and W. B. Whalley), 72
  of Co_2Al_9 (Mrs. A. M. B. Douglas), 565; (Dr. G. V. Raynor and M. B. Waldron), 566
  of the Dinitrososulphite Ion (Prof. M. G. Evans and J. Gergely), 770
  of Dunnione (R. G. Cooke), 178
  of *α*-Fagarine (Dr. V. Deulofeu, R. Labriola and B. Berinzaghi), 694
  of Ketoyobyrine (Prof. G. R. Clemo and G. A. Swan), 693
  of the Pigment of *Chromobacterium iodinum* (Prof. G. R. Clemo and A. F. Daglish), 776
  of Synthetic Polypeptides; Studies of the (Prof. W. T. Astbury, Dr. Charles E. Dagliesch, S. E. Darmon and Dr. G. B. B. M. Sutherland), 596
  of O-Trimethylbrazilone (R. E. Richards and Dr. M. L. Tomlinson), 693
  of Wool; Occurrence of Thin Membranes in the (Joel Lindberg, Bo Philip and Dr. Nils Gralén), 458
  Crystal, of Acetanilide—Use of Polarized Infra-Red Radiation (Dr. C. J. Brown and D. E. C. Corbridge), 72
  Crystal, of 'Gammexane' (G. W. van Vloten, Ch. A. Kruissink, B. Strijk and J. M. Bijvoet), 771
  Crystal, of Nitronium Perchlorate (Prof. E. G. Cox, Dr. G. A. Jeffrey and M. R. Truter), 259
  Crystal, of *B*-Starch from X-Ray Fibre Diagrams (Prof. R. E. Rundle), 107

  Crystal, of Uranium Oxide (U_8O_8), (Fredrik Grønvold), 70
  Crystal, of *d*-Tartaric Acid (Dr. C. A. Beevers and F. Stern), 854
  Fine, of Cell Walls in Fresh Plant Tissues (Dr. R. D. Preston, A. B. Wardrop and Dr. E. Nicolai), 957
  Fine, of the He II Line $\lambda = 4686$A. (Prof. H. Kopfermann and W. Paul), 33
  Fine, of the Hydrogen *a*-Line (Dr. H. Kuhn and G. W. Series), 373
  Microscopical, of Residual Films of Benzene Hexachloride; Insecticidal Power and (A. J. Musgrave), 296
Structure and Biogenesis of Emetine (Sir Robert Robinson), 524
Structures: Crystal, of the Acid Salts of some Monocarboxylic Acids (Dr. J. C. Speakman), 695
  Crystal; X-Rays and the Eigen-Vibrations of (Sir C. V. Raman), 23
Strychnos Alkaloids : Biogenesis of the (Prof. R. B. Woodward), 155
Students : Engineering, and Mathematics, 582
  Selection of, for Universities, 626
Studentships : Research, and Dominion and Colonial Exhibitions (Trinity College, Cambridge), 990
Style-Length in *Oxalis* : Genetics of (Prof. R. A. Fisher and V. C. Martin), 533
Styrene : Radical Reactivity in the Initiation Reaction of the Polymerization of (W. Cooper), 897
Styrenes : Electric Dipole Moments of some (K. B. Everard and Dr. L. E. Sutton), 104
Submicroscopic Morphology of Protoplasm and its Derivatives (Prof. A. Frey-Wyssling), translated by Prof. J. J. Hermans and M. Hollander, *review* by Dr. J. Danielli, 753
Subtense : Apparent Colours of Surfaces of Small (W. E. Knowles Middleton), 486
Substituted *o*-Phenylene Diamines : Anti-Tubercular Activity of Oxidation Products of (Dr. Vincent C. Barry, J. G. Belton, M. L. Conalty and D. Twomex), 622
Succinic Acid in the Blood of the Larva of Gastrophilus intestinalis (L. Levenbook and Dr. Y. L. Wang), 731
Succinic Aerodehydrogenase System : Inhibition of a, by Surface-active Agents (Donald Hockenhull), 850
Sucrose : Effect of Phosphorus on the Hydrolysis and Absorption of, by Plant Cells (Prof. Husein Said), 496
Sugar Industry of the Caribbean (Caribbean Research Council, Crop Inquiry Series No. 6), 137
Sugars and their Methylated Derivatives on a Column of Powdered Cellulose : Application of Paper Partition Chromatography to the Separation of the (L. Hough, Dr. J. K. N. Jones and W. H. Wadman), 448
Sugars and related Substances : Chromatography of (W. W. Binkley and M. L. Wolfram), 1007
Sulphadiazine and 'Paludrine' in the Malaria Parasite of the Fowl (*P. gallinaceum*) : Resistance to (Dr. Ann Bishop and Elspeth W. McConnachie), 541
Sulphur-containing Steroid Derivatives (A. S. Jones, F. Smith and M. Webb), 857
Sulphuric Acid : Inhibition of some Respiratory Enzyme Systems by Derivatives of (Donald Hockenhull), 813
  Nitrogen-free ; Preparation of (B. V. Ramachandran), 450
Sulphydryl Compounds : Toxicity of, to Seeds (Dr. P. W. Brian, Mary Jamieson and Dr. J. C. McGowan), 780
Sumatra (Central) : Prehistoric Teeth of Man and of the Orang-utan from, with Notes on the Fossil Orang-utan from Java and Southern China (Dr. D. A. Hooijer), 306
Summer School on Recent Advances in various branches of Chemistry (Irish Chemical Association), 137
Summer School in Electrical Engineering (British Thomson-Houston Co., Ltd.), 19
Sun : Shape of Pulses of Radio-frequency Radiation from the (Dr. S. E. Williams), 108
Sun-Bathing by Birds (Noble Rollin), 843
Superconductive Transition : The (Dr. D. K. C. MacDonald and Dr. K. Mendelssohn), 924
Superconductors : High-Frequency Resistance of (A. B. Pippard), 68
  Magnetic Properties of (Dr. D. Shoenberg), 800
Supersonic Flow around Yawing Cones : Tables of (Staff of the Computing Section, Center of Analysis, Massachusetts Institute of Technology Department of Electrical Engineering, under the direction of Zdenek Kopal), *review* by Prof. W. J. Duncan, 432
Superstitions : Ozark (Vance Randolph), *review* by Dr. E. J. Dingwall, 474
Surf : Wind Waves at Sea, Breakers and (Henry B. Bigelow and W. T. Edmondson), *review* by N. F. Barber, 389
Surface Adsorption : Adsorption by Montmorillonite, and its relation to (Dr. D. M. C. MacEwan), 935
Surface Chemistry : Applied, *review* by Dr. A. S. C. Lawrence, 164
Surface Chemistry for Industrial Research (J. J. Bikerman), *review* by Dr. A. S. C. Lawrence, 164
Surface Effects with Single Crystal Wires of Cadmium (Prof. E. N. da C. Andrade and R. F. Y. Randall), 890
Surface Interferometry : Liquid (H. Barrell and R. Marriner), 529
Surface Layers of Crystals (P. B. Hirsch and the late Dr. J. N. Kellar), 609
Surface-active Agents : Inhibition of a Succinic Aerodehydrogenase System by (Donald Hockenhull), 850
Surfaces of Small Subtense : Apparent Colours of (W. E. Knowles Middleton), 486
Sutures (Cephalic) : Indications of, in Trinucleidae and Harpedidae (Dr. Archie Lamont), 376
Svalbard : Maps of (Norsk Polarinstitutt), 18
Swedish Deep-Sea Expedition (Prof. Hans Pettersson), 324
Swelling of Gels : Hysteresis in the (Dr. W. W. Barkas), 32
Swelling and Shrinking (Faraday Society General Discussion on), *review*, 638
Swiney Lectures on Geology (Dr. Douglas A. Allan), 920
'Swollen Shoot' of Cacao : Entomological Aspects of (F. A. Squire), 743
Symbiotic Micro-organisms of Aphids and Fixation of Atmospheric Nitrogen (Dr. J. D. Smith), 930
Synchrotron : Air-Cored (T. R. Kaiser and J. L. Tuck), 616
Synonyms and Trade Names : Chemical (William Gardner), fifth edition revised by Edward I. Cooke, *review*, 278
Syntheses : Fluoranthene (Dr. Neil Campbell, R. S. Gow and H. Wang), 857
  Organic (edited by R. L. Shriner), Vol. 27, *review* by J. R., 278
Synthesis : Chemical, Made Easy, *review* by Prof. J. W. Cook, 202
  A New Ketone (R. E. Bowman), 111
Synthesis of Colchicine Derivatives (G. L. Buchanan, Prof. J. W. Cook, Dr. J. D. Loudon and J. MacMillan), 692
Synthesis of Derivatives of N-Methyl-2-Pyridone from Nicotinic Acid and Nicotinamide (Chr. Wiegand and W. I. M. Holman), 659
Synthesis of 2 : 7-Disubstituted-1 : 2 : 3 : 4-tetrahydro-*iso*-quinolines : A New (Dr. F. G. Mann and M. H. Beeby), 337
Synthesis of Pteridine (Dr. W. G. M. Jones), 524
Synthesis of some Pyrethrins : Total (L. Crombie, M. Elliott, Dr. S. H. Harper and H. W. B. Reed), 222
Synthesis of *l*-Sparteine (Prof. G. R. Clemo, Dr. R. Raper and W. Short), 296
Synthesis of Vomipyrine (Sir Robert Robinson and A. M. Stephen), 177
Synthesis and Isolation of Threonine : Studies in the (Dr. D. F. Elliott), 657
Synthesizer for Crystal Structure Analysis : Quantitative Electron-Density Contour Delineation in the Electronic Fourier (Prof. R. Pepinsky and D. Sayre), 22
Synthetic Analgesics (Dr. G. M. Badger, Prof. J. W. Cook, G. M. S. Donald, J. D. P. Graham and T. Walker), 21
Synthetic Methods of Organic Chemistry (W. Theilheimer), Vol. I, translated from the German by Hans Wynberg, *review* by Prof. J. W. Cook, 202
Synthetic Œstrogen Series : New Colour and Fluorescence Reactions in the Steroid and (Dr. R. J. Boscott), 577
Synthetic Polypeptides : Studies of the Structure of (Prof. W. T. Astbury, Dr. Charles E. Dalgliesch, S. E. Darmon and Dr. G. B. B. M. Sutherland), 596
Synthetic Rubber in the United States : Development of, *review* by Dr. C. W. Long, 637
Syphilis : Rabelais on (Dr. James Marshall), 118
Syrian Hamster : Testicular Hypoplasia and Epididymal Cysts in the (Humberto Granados and Prof. Henrik Dam), 297
Systematization of certain Binary Metallic Equilibrium Diagrams (H. J. Axon), 997

TABULAE Biologicae, Vol. 22, Oculus, Pars I (K. Steindorff, F. P. Fischer, J. S. Friedenwald, Arnold Sorsby), *review* by Dr. E. N. Willmer, 910
Talorchestia brito on the Coast of Northumberland : Occurrence of (Donald I. Williamson), 295
Tarakh-E-Rahat Afza : Further References to Cosmic Phenomena in the Kitab Al-Muntazam of Ibn Al-Jauzi, and a few in (Mohd. Abdur Rahman Khan), 289
Tarascan Area, Mexico : Cultural Geography of the (Robert C. West), 728
d-Tartaric Acid : Crystal Structure of (Dr. C. A. Beevers and F. Stern), 854
Taxonomy and Evolution of Cotton, *review* by E. Lord, 716
Teaching at Universities: The Balance of Research and (Universities of the British Commonwealth Discussion on), 441
Teaching Zoology in the University, 401
Technical Assistance : Sources of, 842
Technical Information : The Presentation of (Prof. Reginald O. Kapp), *review* by R. Brightman, 909
Technical Man-Power in Britain : Scientific and, 469
Technical Students : Vacation Work for, 955
Technical Writing, *review* by R. Brightman, 909
Technique of Casting Coins in Ancient India (Prof. F. C. Thompson), 266
Technique for the Differential Staining of Lignified Cell Walls : A Simple (Dr. Iwo R. W. Lominski and S. A. Hutchison), 415
Techniques in Nurseries and on Planting Sites : Some Improved (J. J. MacGregor), 974
Teeth of Man and of the Orang-utan from Central Sumatra: Prehistoric, with Notes on the Fossil Orang-utan from Java and Southern China (Dr. D. A. Hooijer), 306
Telecommunications : The Fundamental Research Problems of (Report of the Telecommunications Research Committee), 58
Teleost Fishes : Coarse Granulocytes in Epithelial Tissues of (W. T. Catton), 894
Telescopes : Photo-electric Star-following (A. Uttley, S. Jones and L. Manns), 144
Television Development in Britain, 427
Televising the Museum, 18
Telford Premiums of the Institution of Civil Engineers : Awards for the Session 1947–48, 865
Temperature : Variation of Standard Electrode Potentials with (Dr. M. H. Everdell), 995
  Ceiling ; Reversibility of the Propagation Reaction in Polymerization Processes and its Manifestation in the Phenomenon of a (Dr. F. S. Dainton and K. J. Ivin), 705
  Room ; Esterification of Phthalic Anhydride with Primary Alcohols at (F. J. Bristow), 1004
Temperature of Storage : Influence of Time and, on Dye-Reduction Tests in Milk (R. K. Morton and J. M. Vincent), 415
Temperature Change of Molecular Association : Sound Velocity and (Prof. A. Van Itterbeek and A. de Bock), 611
Temperatures (High) : Electric Conductivity of Rocks at (H. P. Coster), 270
Temperatures (Low) : Cold Working of Aluminium at (T. S. Hutchison), 374
Terrestrial Arthropods : Astaxanthin in Insects and other (Prof. C. Manunta), 298
Territory in Bird Life (Eliot Howard), new edition, *review* by Frances Pitt, 595
Terry Lectures (James B. Conant), 552
Test-tubes : Metal Caps for (Oxo, Ltd.), 920
Testicular Cells seen with Phase-Contrast Microscopy : Golgi Apparatus of Living Human (A. G. Oettlé), 76
Testicular Hypoplasia and Epididymal Cysts in the Syrian Hamster (Humberto Granados and Prof. Henrik Dam), 297
Testing Analgesics, Narcotics and similar Drugs : Use of Rotifera for (R. H. Marriott, S. Morris and Y. Larthe), 189
Tetrahydrofuran Hydroperoxide (A. Robertson), 153
Text-Books in Cambridge : Shortage of Scientific (Roy Innes), 209, 417; (John Grant), 416

Textiles : National Certificates in, 648
Theory of Equations : Introduction to the (Prof. Lois Wilfred Griffiths), second edition, *review*, 87
Theory of Human Evolution : A New (Sir Arthur Keith), *review* by Prof. H. J. Fleure, 352
Theory of Human Relations : Mathematical (N. Rashevsky), *review* by Prof. R. G. D. Allen, 352
Theory of Quasi-Properties : Further Experimental Evidence for the (Dr. G. W. Scott Blair and J. E. Caffyn), 368
Theory of the Stability of Lyophobic Colloids (E. J. W. Verwey and J. Th. G. Overbeek, with the collaboration of K. van Nes), *review* by Dr. J. A. V. Butler, 315
Theory of the Strength of Glass : A Kinetic Approach to the (S. M. Cox), 947
Therapeutic Applications of Radioactive Isotopes (Radiology Section of the British Medical Association Symposium on), 480
Thermal Hardening of Cadmium Crystals (Dr. A. H. Cottrell and D. F. Gibbons), 488
Thermal Vibrations in Crystals : X-Ray Scattering by (Dr. Kathleen Lonsdale), 216
Thickness and Height of the Sodium Layer Responsible for the Strong Yellow Line in Twilight (Prof. L. Vegard), 300
Thixotropy, and the Mechanics of Burrowing in the Lugworm (*Arenicola marina* L.), (G. P. Wells), 652
Thorium and Uranium Content of the Velence Mountains, Hungary (Prof. A. Szalay), 454
Thorium C'' γ-Rays : Photodisintegration of Deuterium and Beryllium by (D. L. Allan and M. J. Poole), 373
Thornback Ray (*Raja clavata*) : Oscillographic Analysis of the Gravity and Vibration Responses from the Labyrinth of the (Dr. Otto Lowenstein and T. D. M. Roberts), 852
Threonine : Studies in the Synthesis and Isolation of (Dr. D. F. Elliott), 657
Thymol Turbidity Test : Interrelations of the Serum Protein in the (Dr. Nicholas H. Martin), 145
Thyroid Gland : Autoradiography of the (Dr. Geoffrey H. Bourne), 495
Thyroid Gland and the Bone Marrow in Rabbits : Effect of 5-Alkyl (Benzyl) Derivatives of 2-Thio-4-Methyl-Uracil on the (Dr. Arthur Jurand), 896
Tilden Lecture of the Chemical Society (Prof. C. E. H. Bawn), 607
Tilted-plate Compensators (F. Record), 454
Time : British (Donald de Carle), *review* by R. A. Fell, 6
Time and Temperature of Storage : Influence of, on Dye-Reduction Tests in Milk (R. K. Morton and J. M. Vincent), 415
Tin-115 to Indium-115 : Evidence of Geological Age against Decay of, by Electron Capture (Dr. L. H. Ahrens), 413
Tissue Sections : Tracer Phosphatase Determination in (Jorgen B. Dalgaard), 811
Tissues : Assay of *nor*Adrenalin and Adrenalin in Extracts of Nerves and (Prof. U. S. v. Euler), 570
Titanate Polycrystals : Voltage Effects in (Prof. J. R. Partington, G. V. Planer and I. I. Boswell), 151
Titanates (Mixed Barium and Strontium): Dielectric Properties of, at 10,000 Mc./s. (Dr. J. G. Powles), 655, *erratum*, 690
Titanates at Ultra-high Frequencies : Dielectric Properties of (Dr. J. G. Powles), 614
Titration Curves of Hydrogen Micas (Dr. R. P. Mitra and K. S. Rajagopalan), 104
Toad (Male) : Pregnancy Test using the (Dr. Magnus Haines), 416
Tomato Spotted Wilt Virus (D. O. Norris), 249
Tools in Metabolic Investigations : Use of certain Growth-inhibitors as (R. J. Pennington), 661
Top (Unsymmetrical) : Precession of an (G. Grioli), 365
Torches : Olympic, 175
Toxicity of D.D.T. (Surgeon-Lieut. F. M. G. Stammers and Lieut.-Comdr. F. G. Sarel Whitfield), 120
Toxicity of Sanguinarine: Isolation from Argemone Oil of Dihydrosanguinarine and Sanguinarine—(S. N. Sarkar), 265
Toxicity of Sulphydryl Compounds to Seeds (Dr. P. W. Brian, Mary Jamieson and Dr. J. C. McGowan), 780
Tracer Elements (Isotopic) : Interpretation of Experiments on Metabolic Processes, using (Dr. A. G. Ogston), 963
Tracer Phosphatase Determination in Tissue Sections (Jorgen B. Dalgaard), 811
Tracer Work : A Review of, *review* by Prof. F. A. Paneth, 509
Trade Names : Chemical Synonyms and (William Gardner), fifth edition revised by Edward I. Cooke, *review*, 278
Trade Unionism : British (Six Studies by P.E.P.), *review*, 511
Trade Unions in Industry, 365
Traditions of British Mythology : The Minor (Lewis Spence), *review* by Dr. E. J. Dingwall, 388
Training : Aids to—The Design of Radar Synthetic Training Devices for the R.A.F. (G. W. A. Dummer), 989
Training of a Doctor (British Medical Association), 311
Training the Worker, *review* by T. H. Hawkins, 797
Training Devices for the R.A.F. : Aids to Training—The Design of Radar Synthetic (G. W. A. Dummer), 989
Transcaucasia : Earthquake on June 29, 248
Transformation of Frequency Distributions (D. J. Finney), 898
Transition : The Superconductive (Dr. D. K. C. MacDonald and Dr. K. Mendelssohn), 924
Transitions of Short Periods ; Nuclear Isomeric (P. B. Treacy), 186
Transmission of Effects from the Ends of Nerve Fibres (British Association, Section I (Physiology), Discussion on), 558
Trasmissione d'energia, calcolazione elettrica : Le grandi linee di (A. Della Verde), *review* by C. W. Marshall, 277
Transmitters : Marconi, for East Africa, 248
Traumatic Shock : Blood Capillary Circulation under Normal Conditions and in (Prof. Robert Chambers), 835
Travelling Naturalist (Anthony Buxton), *review* by Seton Gordon, 48
Travelling-Wave Linear Accelerator for 4-MeV. Electrons (D. W. Fry, R. B. R.-S. Harvie, L. B. Mullett and W. Walkinshaw), 859
Treatment of Paper with Silicon Esters (Ingvar Jullander), 300
Treatment Comparisons when Observations are Missing : Errors of (J. Taylor), 262
Trichothecin, an Antifungal Metabolic Product of *Trichothecium roseum* Link (Dr. G. G. Freeman and Dr. R. I. Morrison), 30
Trichothecium roseum Link : Trichothecin, an Antifungal Metabolic Product of (Dr. G. G. Freeman and Dr. R. I. Morrison), 30
bis-Trimethyl Ammonium Compounds : Pharmacology of some (Dr. Gertrude E. Glock, G. A. Mogey and Dr. J. W. Trevan), 113
O-Trimethylbrazilone: Structure of (R. E. Richards and Dr. M. L. Tomlinson), 693
Trimethylplatinic Group : The (W. J. Lile and R. C. Menzies), 298
Trimethylplatinum Derivatives (Prof. C. S. Gibson, Dr. R. V. G. Ewens and M. E. Foss), 693
Trinucleidae and Harpedidae : Indications of Cephalic Sutures in (Dr. Archie Lamont), 376
Tristan da Cunha : The Potato Caterpillar Pest (*Agrotis* spec.) of (Dr. G. J. Broekhuysen and W. Macnae), 225
Tritium : Beta Spectrum of (Dr. S. C. Curran, J. Angus and A. L. Cockcroft), 302
Tropical Africa : Incidence of Malaria in (G. A. Walton), 114
Tropical Fungi (G. B. Hansford), 212
Troughs for use in Chromatography Tanks : Construction of (H. F. Atkinson), 858
Truncated Log-Normal and Root-Normal Frequency Distributions of Insect Populations (D. Spiller), 530
Truth : Science and the Meanings of (Dr. Martin Johnson), *review* by Dr. A. C. Crombie, 46
Trypanosoma cruzi in the Developing Chick Embryo : Cultivation of (Dr. P. N. Ganapati), 963
Trypanosoma evansi in Rats : Effect of Pantothenic Acid on the Infection of (Dr. H. N. Ray and S. Harbans), 849
Trypsin : Activation of Unfertilized Sea Urchin Eggs by (Aage Bohus Jensen), 931
Tryptochrome, a Pigment derived from Tryptophan (Prof. W. R. Fearon), 338
Tryptophan : Tryptochrome, a Pigment derived from (Prof. W. R. Fearon), 338
Tsetse Fly Research and Control (Dr. T. A. M. Nash), 308 ; (Dr. K. R. S. Morris), 308
Tumor Chemotherapy : Approaches to (American Association for the Advancement of Science, Chemistry Section, Symposium on), edited by Forest Ray Moulton, *review* by Dr. I. Hieger, 713
Tumour Inhibition : Alkaline Phosphatase and (R. F. Fleming and Dr. O. Peczenik), 338
Tumour Proteins: Excretion of D-Pyrrolidone Carboxylic Acid by Rat and Dog Fed with (Prof. F. Kögl, T. J. Barendregt and A. J. Klein), 732
Tumours : Effects upon, of various Haloalkylarylamines (Prof. Alexander Haddow, Prof. G. A. R. Kon and Dr. W. C. J. Ross), 824
    Pathology of (Prof. R. A. Willis), *review* by Dr. E. S. Horning, 315
Tumours of Man (Intracranial) : Presence of a Parasitic Agent in various (Dr. R. A. Krynauw and Prof. Cecil Jackson), 147
Tunicata : Nervous Mechanism in (Dr. S. M. Das), 963
    Receptor Organs in (Dr. S. M. Das), 1000
Turkey : Earthquake in the region of Alasehir on August 10, 768
    Earthquake near Sivrice on August 18, 768
Turnip Yellow Mosaic Virus : Unit Cell Measurements of Wet and Dry Crystalline (Prof. J. D. Bernal and Dr. C. H. Carlisle), 139
Twilight : Thickness and Height of the Sodium Layer Responsible for the Strong Yellow Line in (Prof. L. Vegard), 300
Tzintzunzan : Empire's Children—The People, of (George M. Foster, assisted by Gabriel Ospina), 270

UGANDA : Forest Policy in, 864
Ultra-high Frequencies: Dielectric Properties of Titanates at (Dr. J. G. Powles), 614
Ultra-sonic Method : Elastic Constants of Alum Determined by a new (Prof. S. Bhagavantam and B. Ramachandra Rao), 818
Ultra-sonic Waves in Acetic Acid : Absorption of (J. M. M. Pinkerton), 106
    Absorption and Dispersion of (Dr. John Lamb, J. H. Andreae and R. Bird), 993
Ultra-violet Light on Urease : Study of the Action of, by means of the Ultracentrifuge (Dr. A. D. McLaren, E. Sheppard and J. Wagman), 370
Ultra-violet Microscopy of Living Malignant Cells (Dr. R. J. Ludford, J. Smiles and F. V. Welch), 650
Undergraduate Zoology (Prof. H. Graham Cannon), 401
Understanding Science : On (James B. Conant), *review* by Prof. Herbert Dingle, 552
Unesco and a World Society (Ministry of Education, Pamphlet No. 12), 787
Unfertilized Sea Urchin Eggs : Activation of, by Trypsin (Aage Bohus Jensen), 931
Union List of Serials in Hawaii, 809
Unit Cell Measurements of Wet and Dry Crystalline Turnip Yellow Mosaic Virus (Prof. J. D. Bernal and Dr. C. H. Carlisle), 139
United States : Development of Synthetic Rubber in the, *review* by Dr. C. W. Long, 637
    Earthquake off the west coast of Oregon on May 25, 211
    Scientific Research and Man-Power in the, 673
    Elementary Zoology in the, *review* by Dr. N. B. Eales, 980
Universe : The Evolution of the (Dr. G. Gamow), 680 ; (Ralph A. Alpher and Dr. Robert Herman), 774
Universities: The Balance of Research and Teaching at (Universities of the British Commonwealth Discussion on), 441
    Selection of Students for, 626
    British ; The Problems facing (Nuffield College Statement on), 349 470
Universities and the State (Sir Walter Moberly), 648
University : Teaching Zoology in the, 401
University Education in Nottingham (Prof. H. T. H. Piaggio), 240
University Expansion : Second Thoughts on, 349
University Level : Selection at the (British Association, Section L (Education), Discussion on), 626
Unsymmetrical Top : Precession of an (G. Grioli), 365

Untreated Infections of *Litcmosoides carinii* in the Cotton Rat : Course of (W. E. Kershaw and Dr. D. S. Bertram), 149
2-Thio-4-Methyl-Uracil: Effect of 5-Alkyl (Benzyl) Derivatives of, on the Thyroid Gland and the Bone Marrow in Rabbits (Dr. Arthur Jurand), 896
Uranium in Black Muds : A Concentration of (Dr. Kaare Münster Strøm), 922
Uranium Content of the Velence Mountains, Hungary : Thorium and (Prof. A. Szalay), 454
Uranium Dioxide (UO_2) : Oxidation of (Fredrik Grønvold and Prof. Haakon Haraldsen), 69
Uranium Oxide (U_3O_8) : Crystal Structure of (Fredrik Grønvold), 70
Uranus for the Period 4000 B.C.–A.D. 3000 : Tables of (M. Kamiénski and R. Walter), 446
Urease : Study of the Action of Ultra-violet Light on, by means of the Ultracentrifuge (Dr. A. D. McLaren, E. Sheppard and J. Wagman), 370
Gastric ; Role of (Dr. Oliver FitzGerald and Philip Murphy), 896
Urethane in Mice : Some Unusual Findings on the Carcinogenic Action of (Prof. R. L. Noble and M. Jean Millar), 253
Urinary Glucuronide : Destruction of, by Bacteria (Mary Barker, B. W. L. Brooksbank and Dr. G. A. D. Haslewood), 701
Urine : '17-Ketosteroid II Isolated from—its Reaction with Hydrochloric Acid (Dr. Elizabeth Dingemanse, Leonora G. Huis in't Veld and S. Lore Hartogh-Katz), 492
U.S.S.R. : Science in the, 882
Ustilago microchloae, a New Record (Dr. D. Chatterjee), 703
Uterus : Actomyosin Content of the (Dr. Á. Csapó), 218
Utilization of Mineral Constituents of the Egg-shell by the Developing Embryo of the Stick Insect (A. Moscona), 62

VACATION Work for Technical Students, 955
accines : The Prophylaxis of Virus Infections with special reference to the Use of (British Medical Association, Section of Pathology, Discussion on), 92
acua: High (Society of Chemical Industry Convention on), 328, 523, 936
acuoles (Contractile) : Osmoregulatory Capacity of (Dr. J. A. Kitching), 149
acuum Switches : Hot-wire (Sunvic Controls, Ltd.), 97
acuum Tubes (Prof. Karl R. Spangenberg), *review* by A. H. Beck, 678
alonia ventricosa : An Electron Microscope Study of Cellulose in the Wall of (Dr. R. D. Preston, Dr. E. Nicolai, Dr. R. Reed and A. Millard), 665
alves (Cooled-Anode) : The Development and Design of (F. Smith), 767
ariation in Morphological and Biochemical Characteristics of Anaerobic Butyric Acid Bacteria (Dr. Otto Richard), 463
ariation of Standard Electrode Potentials with Temperature (Dr. M. H. Everdell), 995
ariations of Cosmic Rays : Sidereal (A. R. Hogg), 613
ascular Wilt Disease of Oil Palms in Nigeria (Prof. C. W. Wardlaw), 850
egetable Growing (Prof. James Sheldon Shoemaker), *review* by Prof. R. H. Stoughton, 910
egetables (Root) : Commercial Cultivation of (Ministry of Agriculture and Fisheries Bulletin No. 120), new revision of the third edition, 365
egetación de la Argentina (Prof. L. Hauman, Prof. A. Burkart, Prof. L. R. Parodi and Prof. A. L. Cabrera), *review* by G. M. Roseveare, 203
egetation (British) : Studies of the Post-Glacial History of (Prof. A. R. Clapham and Prof. H. Godwin), 1008
egetation of the Argentine, *review* by G. M. Roseveare, 203
elence Mountains, Hungary : Thorium and Uranium Content of the (Prof. A. Szalay), 454
elocity of Photons (Hon. H. Fletcher Moulton), 303 ; (J. W. Awbery), 461 ; (Dr. George Novello Copley), 461
elocity of Sound in Free Air (J. M. A. Lenihan), 656
enereal Disease Control in Poland (Dr. James Marshall), 35
enereal Diseases : The (Dr. John Marshall), second edition, *review* by Dr. T. E. Osmond, 86
entilation of Bee-Hives (E. B. Wedmore), *review* by Dr. C. G. Butler, 717
erole : Rabelais et la (Dr. J. Mottron), 118
ertebrate Anatomy : An Introduction to (Harold Madison Messer), revised edition, *review* by Dr. N. B. Eales, 980
ertebrates : A Comparative Histology of, *review* by Dr. P. D. F. Murray, 430
Microscopic Anatomy of (Prof. James I. Kendall), third edition, *review* by Dr. P. D. F. Murray, 430
estibular Effect of Streptomycin in the Mouse (Dr. R. Caussé, I. Gondet and B. Vallancien), 929
eterinary Education (Prof. W. I. B. Beveridge), 721
eterinary Education—Developments at Cambridge (Dr. James T. Edwards), 721
eterinary Protozoology (U. F. Richardson), *review* by Dr. G. Lapage, 756, 884
eterinary Science in Bristol, 327
brating Electrodes in Polarography (E. D. Harris and A. J. Lindsey), 413
bration of Stannic Chloride (Totally Symmetric) : Polarization of the Raman Line of the (Dr. A. E. Douglas and Prof. D. H. Rank), 453
bration Responses from the Labyrinth of the Thornback Ray (*Raja clavata*) : Oscillographic Analysis of the Gravity and (Dr. Otto Lowenstein and T. D. M. Roberts), 852
brations (Thermal) : X-Scattering by, in Crystals (Dr. Kathleen Lonsdale), 216
nyl Polymerization : Peroxide Catalysed (W. Cooper), 927
nyl-Mesitylene : Steric Hindrance in (F. R. Buck, G. T. Kennedy, F. Morton and E. M. Tanner), 103
nylidene Chloride Copolymer in Solution : Degradation of a (D. L. C. Jackson and W. S. Reid), 29
opexis, the Mechanism of Influenza Virus Infection (Dr. S. Fazekas de St. Groth), 294
us (*Psittacosis*) : Antigenic Components of (Dr. C. F. Barwell), 460
us having Insect Vectors : Specific Crystalline Protein and Nucleoprotein from a Plant (Dr. Roy Markham, Dr. R. E. F. Matthews and Dr. Kenneth M. Smith), 88
Virus Diseases : Immunity to, 92
Virus Infections with special reference to the Use of Vaccines : The Prophylaxis of (British Medical Association, Section of Pathology, Discussion on), 92
Viruses : Phase-Contrast Microscopy of (Dr. Robert Barer), 251
Plant ; Origin of some (Dr. J. E. van der Plank), 291
Visages de la mathématique (Dr. Pierre Defrise), *review* by Prof. H. T. H. Piaggio, 638
Viscosity-Volume Relation for Ether (A. Jobling), 620
Vision: Colour (British Association, Section I (Physiology), Discussion on), 639
Colour ; Multiple Allelomorphs in (Dr. R. W. Pickford), 684
Colour ; Recent Advances in (Prof. H. Hartridge), 403
Colour ; Human, and Granit's Theory (Dr. R. W. Pickford), 414
Visual Aid Material : Sources of (National Foundation for Adult Education Supplement on), 1009
Vital Stain for the Golgi Apparatus : Methylene Blue as a (Prof. J. Bronte Gatenby and Tohamy A. A. Moussa), 736
Vitamin A: Local Action of Calciferol and, on Bone (N. A. Barnicot), 848
Vitamin C : Species Difference in the Biosynthesis of, and Response to Diabetogenic Substances (Prof. M. C. Nath, C. H. Chakraborty, V. G. Hatwaine and Kusum S. Laul), 660
Vitamin C in Potatoes (Dr. Frank Wokes and Gordon Nunn), 900
Vitamin C in Walnuts : Hydrojuglone and Apparent (C. Daglish and Dr. Frank Wokes), 179
Vitamin D Assay (Society of Public Analysts and other Analytical Chemists and the Society of Chemical Industry Joint Committee on), 919
Vitamins : The Biological Standardization of the (Dr. Katharine J. Coward), second edition, *review* by Prof. S. K. Kon and Dr. P. White, 202
Vitamins and Anti-Vitamins, 985
Vocational Education : Principles and Practices of (Prof. Arthur B. Mays), *review* by T. H. Hawkins, 797
Volatile Cuprous and Silver Salts of Fatty Acids (A. Keller and Dr. F. Körösy), 580
Voltage Effects in Titanate Polycrystals (Prof. J. R. Partington, G. V. Planer and I. I. Boswell), 151
Volume and Fructose Content of Human Semen : Relation between the (Clare Harvey), 812
Volume Change of Hexamethyl Benzene (H. Chihara and S. Seki), 773
Volumetric Analysis (Prof. I. M. Kolthoff and V. A. Stenger), second edition, Vol. 2, *review*, 128
Voluntary Agencies in Adult Education (National Foundation for Adult Education Supplement on), 1009
Vomipyrine : Synthesis of (Sir Robert Robinson and A. M. Stephen), 177

WALES : A Picture Book of the Whole Coast of England and (J. A. Steers), *review* by L. D. S., 638
Wall of *Valonia ventricosa* : An Electron Microscope Study of Cellulose in the (Dr. R. D. Preston, Dr. E. Nicolai, Dr. R. Reed and A. Millard), 665
Walnuts : Hydrojuglone and Apparent Vitamin C in (C. Daglish and Dr. Frank Wokes), 179
War-time Contributions to Statistical Method : American, *review* by Prof. M. S. Bartlett, 510
War-time Periodicals : Exchange of, with Germany, 96
War-time Radio Research at Harvard University, *review* by Dr. John Lamb, 83
Wars (World) : Demography between the Two, *review* by Prof. H. J. Fleure, 428
Wasp : The Hunting (John Crompton), *review* by Dr. V. B. Wigglesworth, 758
Watches : Clocks and, *review* by R. A. Fell, 163
Water : Horticultural Crops in their Relationship to (F. A. Secrett), 584
Water Irradiated with X- and Alpha-Rays : Formation of Hydrogen Peroxide in (Dr. P. Bonet-Maury and M. Lefort), 381
Water from Wet Crude Oil : Elimination of (K. A. Clark and D. S. Pasternack), 483
Water Vapour below 0° C. : Condensation of (E. M. Fournier d'Albe), 921
Water-Soluble Gums (Dr. C. L. Mantell), *review*, 128
Watercress Cultivation (Charles H. Sansom), (Ministry of Agriculture Bulletin 136), 58
Wave-Guide for Linear Electron Accelerators : A Proposed New Form of Dielectric-loaded (R. B. R.-Shersby-Harvie), 890
Wave Mechanics in Physics, Chemistry and Biology (Prof. C. A. Coulson), 504
Wave-lengths for Broadcasting, 562
Waves : Coastal (British Association, Section A (Mathematics and Physics), Symposium on), 682
Sea ; and Microseisms (M. S. Longuet-Higgins and F. Ursell), 700
Waves and Beaches (Prof. J. D. Bernal), 684
Waves at Sea, Breakers and Surf : Wind (Henry B. Bigelow and W. T. Edmondson), *review* by N. F. Barber, 389
Webb Prize of the Institution of Civil Engineers awarded jointly to C. E. Dunton and K. Brinsmead, 865
'Weeding' in Fish-Farming (D. W. Le Mare), 704
Weeds : Biological Control of, by means of Insects (Dr. D. Miller), 308
Recent Developments in the Control of (Prof. G. E. Blackman), 249
Weevils : Protection of Grain against (V. A. Beckley), 737
Welfare in the Middle East : Rural Education and (H. B. Allen), 53
West African Sea-Fisheries (T. J. Hart), 38
Whale Myoglobin : Crystallization of (Joan Keilin and K. Schmid), 496
Whales : The Stock of (Dr. N. A. Mackintosh), 148
Wheat Bran for Streptomycin Production by *S. griseus* : Utilization of (R. Raghunandana Rao), 820
Wheat Bran Extract in Streptomycin Production : Role of the Inorganic Constituents of (R. Raghunandana Rao), 850
Wheat Middlings : Biological Properties of a Substance Isolated from, and of Hydroxymethylfurfuraldehyde (Dr. T. B. Heaton and G. M. Robinson), 570
White Cells in Bone Marrow Culture : Loss of (H. J. F. Cairns and L. G. Lajtha), 536
White Dwarf : An Attempt to Detect the Magnetic Field of a (Dr. A. D. Thackeray), 483

Wien's Law : The Proof of (Prof. E. O. Hercus), 143
Wild Animals and the Land (F. Howard Lancum), *review* by Seton Gordon, 85
Wilderness : Wings in the (Allan D. Cruickshank), *review* by Frances Pitt, 431
Wind Waves at Sea, Breakers and Surf (Henry B. Bigelow and W. T. Edmondson), *review* by N. F. Barber, 389
Wing : Birds on the (John Barlee), *review* by Frances Pitt, 49
Wings in the Wilderness (Allan D. Cruickshank), *review* by Frances Pitt, 431
Wire Electrodes : Limiting Diffusion Currents at (Dr. A. Hickling and W. H. Wilson), 489
Wireless : Introduction to (W. E. Pearce), *review* by W. R., 911
Wires of Cadmium : Surface Effects with Single Crystal (Prof. E. N. da C. Andrade and R. F. Y. Randall), 890
Wires with Large Strains : Electrical Resistance of (Dr. W. Weibull), 966
Wolverhampton : The Social Medicine of Old Age—Report of an Inquiry in (Dr. J. H. Sheldon), 466
Women : Employment of (P. E. P. Broadsheet No. 285), 605
Women as a Labour Force in Britain, 605
Wood and Plywood : Elasticity of (Forest Products Research Laboratory, Special Report No. 7), 826
Woodlands (Private) : Dedication of (Forestry Commission Booklet No. 2), 364
Wool : Occurrence of Thin Membranes in the Structure of (Joel Lindberg, Bo Philip and Dr. Nils Gralén), 458
Wool Fibres : Influence of some Anti-Shrink Treatments on the Friction between (Joel Lindberg and Dr. Nils Gralén), 112
Wool Roots for Histochemical Examination : Method for obtaining (William J. Ellis), 957
Work : Co-operative Communities at (Henrik F. Infield), *review*, 45
  Psychology at (National Institute of Industrial Psychology Report on), 382
Work-Hardening under Complex Stresses (Dr. K. H. Swainger), 532
Worker : Training the, *review* by T. H. Hawkins, 797
Worker in Industry : The Young (British Association, Section L (Education), Discussion on), 667
Working of Aluminium at Low Temperatures : Cold (T. S. Hutchison), 374
World : The Passing (Sir Henry Tizard), 392
  Regions and Nations of the (Prof. Earl E. Lackey and Prof. Esther S. Anderson), *review* by H. J. F., 7
World as an Economic Entity (Business and Brotherhood and Res et Caritas), *review*, 45
World Economic Survey (P. E. P. Broadsheet No. 283), 467
World Food Problem : Agriculture and the (Dr. G. Scott Robertson), 406
World Power Conference : Fourth, 988
World Society : Unesco and a (Ministry of Education, Pamphlet No. 12), 787
World Wars : Demography between the Two, *review* by Prof. H. J. Fleure, 428
Wright Aeroplane to be returned to the United States, 646
Writing : The Art of, *review* by Sir John Myres, 82
  Technical, *review* by R. Brightman, 909
Writing on Glass : Ink for (E. H. Leach), 809

X-and γ-Radiation: Oxidation of Ferrous Ions in Aqueous Solution by (N. Miller), 448
X-Ray Diffraction Effect shown by some Specimens of Chrysotile (J. G. Jones and Dr. A. J. C. Wilson), 334
X-Ray Diffraction Pattern of Collagen : Low-Angle (Barbara A. Wright), 23
X-Ray Fibre Diagrams: Crystal Structure of B-Starch from (Prof. R. E. Rundle), 107
X-Ray Line Broadening in Cold-worked Metals (M. S. Paterson and Dr. E. Orowan), 991
X-Ray Reflexions : Effect of Hydrogen Atoms on Intensities of (Dr. J. D. Morrison, W. P. Binnie and Prof. J. Monteath Robertson), 889
X-Ray Scattering by Thermal Vibrations in Crystals (Dr. Kathleen Lonsdale), 216
X-Ray Sensitivity : Relative, of Metaphase and Interphase Chromosome (Dr. Arnold H. Sparrow), 651
X-Ray and Electron Diffraction Patterns : An Optical Analogue of (J. Dyson), 140
X-Rays : Deamination of Amino-Acids by (Gabriel Stein and Dr. Joseph Weiss), 184
X- and Alpha-Rays : Formation of Hydrogen Peroxide in Water Irradiated with (Dr. P. Bonét-Maury and M. Lefort), 381
X-Rays and the Eigen-Vibrations of Crystal Structures (Sir C. V. Raman), 23
Xenophyes from New Zealand : A Second (Carl J. Drake and J. T. Salmon), 919

YAWING Cones : Tables of Supersonic Flow around (Staff of the Computing Section, Center of Analysis, Massachusetts Institute o Technology Department of Electrical Engineering, under the direction of Zdenek Kopal), *review* by Prof. W. J. Duncan, 432
Yeast : Localization of Alkaline Phosphatase in (Dr. Walter J. Nickerson Edith J. Krugelis and Nils Andrèsen), 192
Yeast and Rickets (Dr. Th. J. de Man), 574 ; (Dr. E. Hoff-Jørgensen), 57
Yeasts (Brewer's) : *p*-Aminobenzoic Acid a Growth-Factor for certai (Cyril Rainbow), 572
Yellow (Indicator) : Retinene$_1$ and (Dr. H. J. A. Dartnall), 222 ; (S. Bal F. D. Collins and Prof. R. A. Morton), 222 ; (Alfred F. Bliss), 661
Yellow Line in Twilight : Thickness and Height of the Sodium Laye Responsible for the Strong (Prof. L. Vegard), 300
Young Worker in Industry (British Association, Section L (Education) Discussion on), 667

ZEME Krásná (The Beautiful Earth), (J. K. Riha), *review* by J. G. F. D., 4
Zoological Illustrations : Practical—Invertebrates (W. S. Bullough *review*, 834
Zoological Nomenclature : Rules of (Francis Hemming), 708
Zoology : Elementary, in the United States, *review* by Dr. N. B. Eales, 98
  Textbook of (Prof. George Edwin Potter), second edition, *review* b Dr. N. B. Eales, 980
Zoology : Teaching, in the University, 401
  Undergraduate (Prof. H. Graham Cannon), 401
Zoology at Oxford : Hope Professorship of, 174
Zoology at Queen's University, Belfast, 135

CENTRAL AND LOCAL GENERAL INFORMATION SERVICES

As the Royal Society Conference on Scientific Information closes, it is not inappropriate to consider the wider questions of the diffusion of information in general. The debate in the House of Commons on May 13 on the Civil Estimates for the Central Office of Information covered a wide field; from one point of view it was of interest on account of the statement which it drew from the Lord President of the Council, regarding information services and publicity organisation of the Government. That statement should do something to dispel the confusion which, as the debate itself indicated, still persists between a fact-finding organisation and that concerned with the dissemination of the information collected. Of the first the Economic Information Unit is typical, being concerned to supply the Government with information on the broad facts of the economic state of the nation and the economic problems of the world in relation to Great Britain.

While the Central Office of Information also deals with economic policy and exposition, working with the chief planning officers of the Central Statistical Office, with the Economic Section of the Cabinet Office and with the economic Departments of State, the research aspect of its work is less pronounced than in the Economic Information Unit, and the emphasis is rather on exposition. There can be no serious question about the need for the research aspect of information or intelligence work: the questions are rather whether there is enough of such fact-finding as a basis for policy, whether the departments are as active in this field as they should be, how best to correlate the work of the individual information units which clearly the departments must possess, and whether the work is of the highest quality and its results made known throughout the whole organisation of government with the swift efficiency that is desirable. It is on the aspect of dissemination that criticism has centred. Is that dissemination sufficiently effective to avoid unnecessary duplication? Does it reach the official who needs it sufficiently promptly? And does it reach the general public in a way that ensures their co-operation and understanding of the issues involved?

On the internal aspects of dissemination little was said in the debate. Criticism centred rather on the weakness of the relatively small amount of Central Office of Information publicity directed towards the general body of the public. Some of the criticism is obviously to be discounted. Every step taken by a party in power to direct and control the sources of public information is naturally watched with healthy suspicion. However anxious a Government may be to avoid using departmental channels of publicity for propaganda, it is never easy to avoid the danger; further, public relations officers can, in the nature of things, easily become a cloud of witnesses for the defence of Ministers.

There can be little doubt that the Central Office of Information justifies its existence, and that the departmental information services and public relations officers are doing valuable work. The importance of such services was well indicated in a recent broadsheet issued by Political and Economic Planning. None the less, they call for friendly but searching scrutiny; while there may be much to praise, there is still room for improvement in the standard as well as the cost of the work, and Mr. Herbert Morrison seemed not indisposed to admit the importance of quality.

It can be taken as common ground, as Sir D. Maxwell Fyfe indicated, that each Minister should be responsible for the information policy of his own department with the aid of a small but highly trained information staff; that there should be adequate means for the co-ordination of both home and overseas information services so as to ensure consistency of policy and presentation; and that a central Government agency should carry out on behalf of departments most of the technical and production functions. What is at issue is rather the use made of these organisations, and the quality of the work. In particular, there is the question how far the work of informing the public, for example, in foreign affairs, should be left to Government publicity organs rather than to the Press. That question may well be the fundamental factor behind much of the criticism directed against the shortcomings of Government publicity organisations, and the criticism would be less sharp were it not for the way the Government's economic policy is cramping the free discussion and reporting of public affairs in the Press.

To complete the picture which the Lord President of the Council gave on May 13, it is necessary to turn to the statement Sir Stafford Cripps made on June 1 giving the membership of the Panel on Technical Information Services and its terms of reference. Under the chairmanship of Dr. A. King, of the Lord President's Office, the Panel is to review existing information services for distributing scientific and technical information, to consider what improvements can be made to ensure a rapid and wide dissemination of such information to industry and to make recommendation to the Committee on Industrial Productivity accordingly. That is only one aspect, and a highly specialized one, of the question, and indeed goes beyond the field of Government publicity in the strict sense; but it will be surprising if the Panel does not comment on the way in which the Government's newsprint policy retards the free dissemination of scientific and technical information through the scientific and technical Press.

It is true that certain concessions have been made and the position is easier than it has been. No scientific man, however, can be satisfied with the present position of the scientific and technical Press in Britain, whether in respect of periodicals or of books. The suspension of periodicals in the fuel crisis of 1947 is only one of a number of Government actions which engender distrust of its good faith in regard to freedom of communication; nor can scientific and technical publications be sharply distinguished from the general body of the Press. It is precisely because the Government has such a poor record in this matter that so much bitterness has been manifest in recent debates on the supply of newsprint and of books.

The Government, in fact, has still to show that it is sincere in the support which it gave at Geneva to freedom of information. The effect of the present situation is well displayed in an article in *The Fortnightly Review* of June by W. C. Andrews. This article deserves to be studied by everyone concerned with the preservation of freedom of communication. Mr. Andrews shows why newsprint cannot be treated as just another material commodity, and some at least of the current criticism of Government information services is inspired by resentment of the apparently lavish supply of paper at their disposal in the face of the drastic curtailment of the space available for public discussion and comment in the independent Press as compared with a decade ago. It cannot be too strongly emphasized that this restriction, even if it is due to economic motives alone, is an effective form of censorship. Important events are reported imperfectly or not at all, and the formation of sound opinion is severely handicapped. Nor is that all. Mr. Andrews indicates how adverse are the repercussions on the functioning of democratic institutions, for example, local government; and the interim report of the Consultative Committee on Publicity for Local Government presented last autumn might well be studied afresh from this point of view. The Committee was agreed that much more needs to be done to stimulate publicity at both national and local levels, and it emphasizes, like Mr. Andrews, that the problem is mainly one of widespread lack of knowledge leading to apathy. The report is, in fact, like his article, a commentary on the aphorism of Junius which Mr. Andrews quotes: "The liberty of the press is the palladium of all the civil, political and religious rights". Local authorities have an undoubted duty to make information public by the most suitable means, and some of them have been justly criticized for failure to do so.

The report suggests that every local authority should review all its channels of communication with the public of its area and consider how these can be improved and extended. It does not advocate the expenditure of large sums on centralized publicity. Rather the Committee believes that local authorities can carry out consistent and effective publicity without elaborate machinery and heavy expenditure. It does hold, however, that much more could be done to educate officials of all grades in the right way of dealing with members of the public, and that the public relations spirit should permeate the whole organisation, members as well as staff. It insists also that one of the main needs is the fullest possible use of the facilities offered by the local Press for supplying regular information to the local people. No policy for improving publicity for local government can, in its opinion, be effective unless every effort is made to secure the co-operation of local newspapers.

This section of the report is of particular interest, for it is here, as Mr. Andrews indicates, that Government policy has proved most hampering and is indeed tending to frustrate the functioning of democracy. Opportunity for public comment and debate is essential to secure action in accordance with the facts of a situation and not on lines dictated by prejudice or vested interest. It is just as true at the local as at the national level that scientific and technical factors must be explained to the public. A closely related matter is the control of nationalized industries. The recent resignation of Sir Charles Reid from the National Coal Board has given warning of the danger that due weight may not be given to the technical factors in the reorganisation of this nationalized industry; unless some means of public discussion are found, there is real danger that a fresh set of sectional interests and prejudices will arise to obstruct the technical reorganisation that the public interest demands.

If the scientific man or technical expert, such as the mining engineer, is to be given the executive authority he needs to carry out the technical functions entrusted to him, the co-operation and support of the public as well as of the other workers in the industry concerned will often be required. For this reason alone the question of the control of nationalized industry and the responsibility of such industries to Parliament is a matter of close concern to him. It is evident that Parliament itself is much exercised over the special status of the boards of nationalized industries, and that while there is no desire to interfere with matters of day-to-day administration, there is a desire for fuller information on policy and for opportunity for public criticism. The Speaker indicated in the House of Commons on June 7 that he was prepared, if it was generally approved, to exercise his discretion to direct the acceptance of questions asking for statements to be made on matters about which information had been previously refused, provided that, in his opinion, the matters were of sufficient public importance. Public importance is one of the tests for motions for the adjournment of the House and was not in his experience an unduly difficult test to apply. This suggestion the Government is prepared to accept; it is probably to be welcomed as affording further time for the whole question of public information and public relations to be re-examined.

What must be remembered, however, is that any such procedure inside the House of Commons will still be insufficient while the newsprint position restricts the Press from reporting such questions and debates at reasonable length. We come back to the point with which we started, that freedom of information and communication are an essential element in the functioning of democracy as well as in the application of knowledge to public affairs and the advancement of science; it is impossible in the presence of a direct censorship or of that indirect censorship which the absence of adequate supplies of paper or print imposes. There are few members of the Government who, despite obvious touchiness in regard to criticism, can fairly be suspected of an illiberal attitude on this question of information and independent comment. None the less, in spite of the work of the British delegates at Geneva on the resolution that freedom of information is a fundamental right of the people and the touchstone of all the freedoms to which the United Nations are dedicated, the Government's attitude on the question of imports of newsprint still gives rise to serious concern. Such resolutions are hypocritical unless they are accompanied by practical evidence of concern to provide the essential means for a free Press, technical and scientific, as well as general, to discharge properly and efficiently its function of keeping men and women informed on advances in knowledge and on the issues involved in every aspect of public affairs. Nor can any Government information service, however efficient and free from party bias, undertake that task without the support of an independent Press which has also the resources for acting as an efficient instrument of information.

THE SEARCH FOR THE GERMAN ATOM BOMB

Alsos

The Failure in German Science. By Prof. Samuel A. Goudsmit. Pp. xiv+260. (London: Sigma Books, Ltd., 1947.) 15*s.* net.

PROF. GOUDSMIT has written a racy account of the part played by the Alsos mission in the investigation by Allied intelligence of the German uranium projects, which makes very good reading. He tells some first-class stories; the one about the radioactive wine dispatched by air to Washington deserves to become a classic; and he has some interesting things to say about the methods used by his unit and about security in armament research. His book necessarily treats only part of the subject, namely, the work of scientists who accompanied the advancing armies from the time of the liberation of Paris until the end of the War. It is to be hoped that it will some time be possible to release an account of earlier investigations, of the extent to which it was possible for military intelligence to keep track of the relevant activities of German scientists, and of the conclusions that were drawn. It was not until the occupation of Strasbourg that the Alsos mission obtained certain proof that the Germans were far from obtaining either an atomic bomb or radioactive poisons; but whether at this or at an earlier stage of the War fear of these developments was a potent motive in Allied strategy, or whether enough evidence existed to show that they were most unlikely, Goudsmit's account does not say.

But to the reviewer by far the most interesting part of the book is the description of Goudsmit's meetings with the German scientists, and his discussion of their motives in working or not working for the German war machine. This is a subject of profound interest and importance, for the question of the relation of the scientific worker to the State is one which every one of us has to face, even though we hope that the problem will not soon be again so acute as it was in the Third Reich. It is of particular importance also in connexion with the re-establishment of normal relations with the scientific workers of Germany. For a German professor invited abroad acquires thereby some prestige in his own country, and it is widely felt in Britain that this prestige should not be conferred where it is not deserved.

But a discussion of the motives of German scientists concerns the actions of living men, who can and do state their side of the case, as has Von Laue recently* and Heisenberg in an article in *Nature*† on the German work on uranium. The subject is one likely to arouse the bitterest emotions, both in Germany and among those in Britain who have suffered personal loss in the War or at the hands of the Gestapo. It is therefore particularly necessary that Allied scientists, if they approach it at all, should do so with all possible objectivity, quoting, if possible, from documents rather than hearsay, and judging a man only on the basis of generally available evidence. In this respect it is possible to offer one criticism of Goudsmit's book. It contains a witty description of the scene among the German scientists interned in England when they heard the news of Hiroshima. First they did not believe it possible; then they saw how it was done, and were ashamed that they had not thought of the method themselves; and finally, he says, they built a rationalization for their failure, by denying that they had ever tried to make an atomic explosive.

How does Goudsmit know all this? Unless it was by questioning the scientists afterwards, it must be assumed that some record of the conversation was obtained. In that case, Goudsmit's conclusions would have been more convincing if the record could have been published, rather than this dramatization of it. Perhaps this is at present impossible; but in the circumstances this record of the motives of the German scientists reads rather like a theory in physics based on unpublished experimental facts, so that it is impossible to judge how valid or fair the conclusions are.

The truth in a matter like this is unlikely to be simple. It is clear that German scientists were by no means so unanimous in their desire to work for the war effort as were the British and Americans. Some, of course, did so; others—a point which Goudsmit makes very well—wished to do so and were prevented by the stupidities of the Nazi organisation; others held aloof as much as possible. There also seems to have been, especially towards the end of the War, a rather cynical desire to obtain from the war machine facilities for scientific projects of fictitious military value, to "use the war to help science". To the men working on the uranium project, as the War drew to an end, it must have been clear, whether or not they realized the potentialities of plutonium or of a fast chain reaction with uranium 235, that no weapon for Germany could come out of their work. At that time it must have been true that the aim of their work was to obtain machines, or prestige, but not bombs. The innocence of the motives with which it was started is, however, less certain; no one who realized that a bomb might result from his researches can say honestly that he did nothing which might have armed the Nazis with atomic weapons.

It is doubtful, however, whether this question of motives in research is of lasting importance for the reputation of German physics. Many of us in Britain can realize only too well the strains to which a German scientist of integrity has been subjected; the conflict between the desire to stay and save from the Nazis something of German culture and the desire to escape to a free country; the reluctance to be an "armourer of Himmler and of Auschwitz", and the desire to strike back at the destroyers of Hamburg and of Dresden. In a few years time, when passions have cooled a little the welcome that a German scientist will find among his colleagues in the West should depend very little on the extent to which, under the stress of war, he worked on weapons. It is to be hoped that it will depend far more on his earlier record, on the opposition that he offered within and outside his university, at the time when opposition was still possible, to the steps that stifled freedom in Germany and made war inevitable.

THE FAEROES

The Atlantic Islands

A Study of the Faeroe Life and Scene. By Kenneth Williamson. Pp. 360+23 plates. (London and Glasgow: Wm. Collins, Sons and Co., Ltd., 1948.) 16*s.* net.

MR. WILLIAMSON has published a notable book on the Faeroe Islands, where he was stationed during the war years. He is the better qualified in that he married a Faeroese wife.

The Faeroes are a group of islands lying in the North Atlantic between Shetland and Iceland. There are more than twenty islands, covering an area of 541 square miles. Seventeen of the islands are inhabited and the population is 30,000, of which more than 5,000 live in the capital, Tórshavn. The people are of Viking stock, with a culture originally brought from Norway when the islands were settled in the tenth century. Even before they were colonized from Norway, the Faeroes were inhabited by Irish Culdees, who in the ninth century had retreats both on these islands and on the Vestmanna, an island group off the south-west coast of Iceland. It is interesting that there should be a Vestmanna in Faeroe also; the name means Isle of the West-men, as the Culdees were named. Many of the Faeroe inhabitants held positions in Denmark in 1939, and when the Germans invaded Denmark in 1940 a full tenth of the island race were cut off from their homeland.

The Faeroe Islands are mountainous, and most of the land lies at a height of between 1,000 and 2,500 ft. It is rough and rugged country, and on their west sides the hills often fall sheer to the sea from a height of more than 1,000 ft.; here are great colonies of sea birds, of considerable economic importance to the people. The moorlands provide grazing for sheep, and have a considerable proportion of peat, the fuel chiefly used. The chief rock is basalt. The annual rainfall is around sixty inches.

In winter the Faeroe hills are grim and desolate, vexed almost ceaselessly by ocean winds; in March come the golden plover, and the oystercatcher (*tjaldur*), which is the Faeroe national bird, the name of which adorns boats and businesses. The oystercatcher which appears often on the decorative needlework on the islands, is, like the whimbrel, only a summer visitor to the Faeroes. The author on page 41 gives a fine, poetic description of the song of the whimbrel above the wild island dales. Another migrant, the red-necked phalarope, is welcomed as being the precursor of the herring and is called (p. 84) "herring hen" for this reason.

When sailing in a boat at sea certain names are taboo (this was formerly the case in the Hebrides also). A knife is always 'the sharp one'; a clergyman is called at sea not a parson but *lundi*, the puffin. The Faeroese are great fishermen, and their smacks (p. 88) go as far as Greenland and Bear Island. During the worst period of the War, Faeroe boats brought no less than 75 per cent of the total catch landed in British waters: although the Iceland fishing boats refused to sail without air escort, the Faeroe boats carried on without it. Nearly one third of the active fleet was lost during the war years.

Mr. Williamson describes not only the bird life, but also the customs and folk-lore of the people. On page 234 is a most interesting story of seals laying aside their seals' coverings and assuming human shape. Almost the same story was at one time well known in the Hebridean island of North Uist, and no doubt was brought there by the Norsemen, who ruled the Hebrides until the Battle of Largs in 1263. Summer and the puffin arrive on April 14: between that date and August 24 no light is, or was, used in the houses in the evening, for 'early to bed and early to rise' is the motto in the Faeroe islands.

The book abounds in interesting bird notes and descriptions. On page 121 the bathing parade of kittiwakes to an inland lake throughout the daylight hours is described. This recalls a similar habit I observed on the island of Unst in Shetland. On page 128 is described what must be an unusual habit of Arctic terns, of collecting small fry dropped by puffins at the entrance to their nesting burrows. The puffins are afraid of the terns and scurry into their burrows when these light-winged birds hover near. This reminds me of the habits of the Lambay jackdaws, which during the guillemots' nesting season fare well on the fry the guillemots drop on their ledges. A patrolling jackdaw sees the gleam of the fry, drops down, and carries it off. The puffin is an article of food on the Faeroes. Upwards of 500,000 puffins are captured and eaten annually (p. 145) on the island group, and more than 100,000 young fulmars. They are mostly salted down for winter use. The fowlers believe that the puffin matures slowly and does not (p. 153) come to land the first summer after it is reared. On page 175 an inland-breeding colony of the puffin is noted. The young birds there when ready to leave the nest enter a small river and are carried on its waters during the night hours to the friendly sea.

There is a gannet colony on the Faeroes, and the author (p. 133) records that a gannet ringed there as a bird in down on August 25, 1944, was caught ten weeks later in a fishing net off Agadir, in Morocco. For thirty-four years a black-browed albatross, which won the name 'King of the Gannets' (p. 135), came to this solan colony at Mykineshólmur with the gannets. This bird of the southern hemisphere was shot on May 11, 1894, and the skin is preserved in the Natural History Museum in Copenhagen. On page 140 is given the record of a kittiwake ringed as a nestling on one of the Faeroe cliffs and recovered rather more than three months later off the coast of Newfoundland.

Leach's fork-tailed petrel arrives at its colony later in the evening, after spending the daylight hours at sea (p. 181), than the storm petrel. On page 183 is noted the habit of cats of taking storm petrels. I have known this happen also in the Hebrides.

I have been able to mention only a few of the good things in this book, which will be a delight to all who love Nature, and also to those who wish to learn something of the customs of a fine race of people, strong and self-reliant, and pro-British almost to a man during the darkest days of the Second World War.

SETON GORDON

NATURAL HISTORY OF BRITISH INSECTS

Insect Natural History

By Dr. A. D. Imms. (New Naturalist Series.) Pp. xviii + 317 + 72 plates. (London and Glasgow: Wm. Collins, Sons and Co., Ltd., 1947.) 16*s*. net.

AS a medium for the study of natural history the insects have no equals. The number and variety of their species and the diversity of their habits are such that they afford unrivalled opportunities for the collector, the photographer or the mere observer. The appearance of a general introduction to the natural history of insects in Great Britain prompts some reflexions on the aims and purposes of the amateur entomologist. For British entomology has been built up in the past century and a half by the amateur. To-day there are so many professional openings in entomology that the boy with a consuming interest in insects will probably end by joining the profession. Yet the need for amateur entomology is greater than it ever was. For it is common knowledge that many students now graduate into entomology from the laboratory and the lecture room, with no real feeling for the insect as it exists in the field. It is a curious paradox that it is an ignorant use of insecticides of ever-increasing potency which is forcing the applied entomologist to reflect more and more closely upon the way in which insects live among themselves. It is the avowed purpose of the volumes in the New Naturalist Series to bridge the gap between the scientific worker and the lover of Nature; in the sphere of entomology it is the scientific worker who stands in need of education, at least as much as does the naturalist.

Dr. Imms is singularly well qualified to bridge this gap. He does not attempt a systematic survey of the subject but, in true insect fashion, he collects nectar where he finds it. Wings and flight, senses and behaviour, ordinary and extraordinary habits of feeding, gall formation, the curiosities of insect reproduction, means of protection, aquatic insects and social life—these are some of the subjects, chosen because the author finds them interesting; and it is remarkable how much of the cream of the subject he has taken off. Science is not much use unless it can be brought to the understanding of the ordinary man and incorporated into common knowledge; and it is in the integration of classification, morphology, physiology, ecology and anecdotal natural history that the author has been so successful. The reader will find plenty of anecdotes—often with a pleasant turn of phrase, and without the creaking which is apt to characterize the witticisms of some scientific authors. "If a housefly could keep a diary of its doings it would be a most sordid document" is effective by what it leaves unsaid.

A "Documentary Appendix" is added with the object of guiding the reader to specialist works. This serves to emphasize once more how lacking we are in systematic books on the British insects, so that it is almost impossible for the amateur to make much headway except with two or three of the most worked orders. It is unfortunate that this appendix contains almost no references to economic entomology apart from those on biological control.

No review would be complete without some reference to the illustrations—forty plates from coloured photographs and thirty-two in half-tone—which are an outstanding feature of this book. Not all are uniformly good, but most are excellent. The coloured 'close-up' of a Capsid bug about to plunge its stylets into a plant (Plate 37) is particularly successful. Some of the coloured illustrations have that disagreeable aniline quality—but the book should be read only by artificial light; then almost all are wholly delightful, and even Plate 5 of *Libellula depressa* is tolerable.

Some typographical errors there are, but not a great many. On Plate 18 the large white butterfly is called *Pieris rapæ*; in Plate 34*b* surely the yellow larva at the top is the prepupal instar of the gooseberry sawfly. As in the other volumes of this series, the editors state that they have done their best to see that the author has got his facts right, but that he alone is responsible for what he says about them. Is this statement really necessary?

V. B. WIGGLESWORTH

ALGEBRAIC GEOMETRY

Methods of Algebraic Geometry

By Prof. W. V. D. Hodge and Dr. D. Pedoe. Vol. 1. Book 1: Algebraic Preliminaries; Book 2: Projective Space. Pp. viii+440. (Cambridge: At the University Press, 1947.) 30*s*. net.

"THIS volume is the first part of a work designed to provide a convenient account of the foundations and methods of modern algebraic geometry." These words from the authors' preface explain the scope of the present volume and account for the selection of topics treated. It has become increasingly clear in recent years that a rigorous treatment of algebraic geometry must be based, to a much greater extent than the classical accounts of the subject, on algebraic principles. It is therefore no occasion for surprise that more than a third of the volume under discussion is purely algebraic. The first four chapters constitute, in fact, a clear and concise introduction to the theory of algebraic fields, polynomials and matrices (over a ground field which is not necessarily commutative). This account is in itself most valuable, since the modern point of view in algebra is not to be found in many English works, though several accounts have been published in the United States.

The next two chapters deal with the foundations of projective geometry, first on an algebraic and then on a purely synthetic basis. A comparison in detail of these two independent formulations of the theory is full of interest. It will be noticed, for example, that the synthetic treatment is much longer. This is due in part to the fact that it starts from abstract axioms, whereas the algebraic development presupposes a knowledge of fundamental algebraic results; but a second and most significant reason is that in the synthetic treatment it is necessary to consider in detail a rather large number of special cases (in themselves of a somewhat trivial nature) in order to assert the validity of general theorems. It is not always sufficiently realized that the apparent elegance and brevity of a synthetic proof of a geometrical theorem may conceal tacit assumptions as to the generality of the figure under discussion which logically demand examination. A novelty in the present treatment, which otherwise follows classical lines (though with unusual care in matters of detail), is that the assumption of Pappus' theorem is deferred until after the introduction of co-ordinates.

The remaining chapters deal with Grassmann co-ordinates (where one would welcome, if possible, the introduction of a more elegant notation), and with the general theory of collineations and correlations, and the reduction of their equations to canonical forms. The geometrical content of the book thus never leaves the domain of projective geometry; the more general birational theory will presumably appear in the second volume.

This treatise is likely to become a standard work. It is notable for its clarity of treatment and for the rigour of its demonstrations, and will repay careful study even in those parts which deal with matters generally considered familiar. The printing maintains the standard that we have come to expect from the Cambridge University Press.

J. A. TODD

DISTRIBUTION OF TIME IN BRITAIN

British Time

By Donald de Carle. Pp. 199+47 plates. (London: Crosby Lockwood and Son, Ltd., 1947.) 15*s*. net.

MR. D. de CARLE has assembled a great deal of interesting information regarding the standardization and distribution of time in Great Britain. The majority of people take for granted the accurate time available from such sources as the B.B.C. time signals, Big Ben and 'TIM'. After a brief opening chapter on various early forms of time-keepers, the author deals with the history and present constitution of the Royal Observatory, Greenwich; this chapter brings out the astonishing accuracy with which time is measured and distributed over the radio, and further emphasizes the fact that the pendulum clock is giving way to the quartz-crystal clock when the highest possible accuracy is required.

Reference is made to the facilities for testing watches and the issuing of 'Kew certificates', and in Appendix 2 details of the test and specimen performances of watches obtaining various numbers of marks are given.

Chapters 4 and 5 deal with the development of the clock and the clockmaking industry in Britain, the section on Big Ben serving to emphasize what a redoubtable machine it is, both from the point of view of size and accuracy of performance.

The section dealing with electric clocks contains much information, particularly regarding the development of the Shortt clock, but the description of the quartz clock is unfortunately rather poor.

The chapters on the need for time signals and their history, and the evolution of 'TIM' are of particular interest, and the great amount of development work needed to produce the latter excellent service is given due prominence.

Although the style and lay-out of the book might have been better, it contains a range of information which is not collected together in any other publication, and the book can therefore be recommended with confidence to anyone interested in the subject of time and timekeepers.

R. A. FELL

Astronomical Navigation Tables

(Air Publication 1618.) Vol. A: Latitudes 0°–4° North and South. Prepared by H.M. Nautical Almanac Office on behalf of the Air Ministry. Pp. 233. (London: H.M. Stationery Office, n.d.) 7*s.* 6*d.* net.

IN 1936 the Nautical Almanac Office undertook, by agreement with the Admiralty, the preparations of an "Air Almanac" and of "Astronomical Navigation Tables" for astronomical navigation in the air. The "Air Almanac" has always been on sale to the general public; but the "Tables" have been restricted to official use and are now for the first time being placed on general sale.

The complete set of tables comprises fifteen volumes, catering for all latitudes from 79° N. to 79° S. Fourteen of these cover belts of 5° of latitude both north and south of the equator; the fifteenth covers the ten degrees 70°–79°. The tables are designed to facilitate the calculation of the altitude and azimuth of an observed heavenly body. For each degree of latitude and for each degree of hour-angle, the altitude is given to the nearest minute of arc and the azimuth to the nearest degree for each of twenty-two selected bright stars, well distributed over the sky, within the range of altitudes between 10° and 80°, and also for each degree of declination from 28° S. to 28° N., which covers the range of declination for the sun, moon, and planets. The computed altitudes include the effect of refraction at a height of 5,000 ft., but a table of corrections for other heights, from sea-level, for surface navigation, to 40,000 ft., is given.

In order to avoid interpolation with three arguments, the tables are intended to be used with an *assumed* position, corresponding to tabulated values of latitude and of hour-angle. No provision is therefore made for interpolation other than for declination.

The tables are well designed and well printed, and their convenience in practice has been amply proved by their extensive use during and since the War by the Royal Air Force. Though intended primarily for air navigation, they are equally useful for surface navigation, subject to the limitations of accuracy inherent in the tabulations of altitudes to the nearest minute of arc. H. SPENCER JONES

Regions and Nations of the World

By Assoc. Prof. Earl E. Lackey and Asst. Prof. Esther S. Anderson. Reprint. Pp. xix+489. (New York: D. Van Nostrand Co., Inc.; London: Macmillan and Co., Ltd., 1947.) 26*s.* net.

THE authors have here tried to choose what they think most useful for a course in world geography, to be given in a year, or abbreviated into a semester, in an American college or university. It requires "few if any additional references or assigned reading to be provided by the instructor"; the reviewer would add here 'more's the pity'. The scheme for each region is (*a*) natural features, (*b*) cultural features leading on to urban centres, and sometimes on to a short appraisal of current problems or of prospects. The book has many illustrations and the photographs are often very telling; the maps are of poor quality. Cultural features are usually notes on commercial and political matters; they vary greatly in appositeness but are sometimes quite to the point, though the accounts of cities are so short as often to be trivial. The book has 100 pages given to the United States and 37 to the rest of North America, 60 to South America, about 140 to the whole of Eurasia, 38 to Africa and 30 to Australasia and Antarctica. The aim is to say something about every region and every country and every really big town, and to follow as uniform a plan as possible, all commendable in a certain measure as facilitating reference to a limited extent; but the book needs vitalizing.

Surely a course of this kind should aim at giving a vision of vital change going on everywhere, a vision that would tempt students who are interested to follow the subject for themselves thereafter. One judges from the text that the writers have not much knowledge of what Edinburgh or Zurich, to take two instances, mean in the human story; but it would be unprofitable to go on with hundreds of instances of missing the point. We must be thankful that geography is being increasingly recognized in the United States and hope that its exponents there may improve on this type of book; so many American books have such high quality already. H. J. F.

The Psychology of Ego-Involvements

Social Attitudes and Identifications. By Muzafer Sherif and Hadley Cantril. (Wiley Publications in Psychology.) Pp. viii+525. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1947.) 36*s.* net.

THE chief aim of this competent work is to show that the 'ego', or rather the 'ego-involved reaction', is an outcome of social forces impinging upon the individual throughout his life. The authors are deeply versed in the literature of experimental psychology, sociology and social anthropology, and by skilfully weaving together relevant results of research in these fields bring abundant evidence in support of their thesis.

Starting with an analysis of the theory of attitudes and making full use of the important concept of 'frame of reference', they trace the growth of the ego through infancy and childhood and its re-formation in adolescence. This is followed by a valuable treatment of the structural properties of diverse groups in which the participant 'egos' take their shape, and a study of ego pathology in conditions of stress, deprivation and group disintegration. Phenomena brought to light are further illustrated by reference to drama and fiction. Finally, there is a critique of the psychoanalytic theory of the ego, a critique which many readers will think too severe in its conclusions.

The book is a substantial contribution to social psychology. Its robust attention to concrete situations of social life gives it realism without loss of scientific value. As the authors rightly say, scientific objectivity is derived from the methods employed and not from the aloofness of the worker. JOHN COHEN

Bird Life in Cornwall

By B. H. Ryves. Pp. 256+16 plates. (London and Glasgow: Wm. Collins, Sons and Co., Ltd., 1948.) 10*s.* 6*d.* net.

LOCAL ornithologies to be of value must be precise, and they therefore tend to become lists; however, Lieut.-Colonel B. H. Ryves in his volume dealing with bird life in the most southerly counties of England has cleverly avoided this by dividing his book into two parts. The first includes an account of Cornwall and its bird haunts and has chapters on such outstanding Cornish birds as the chough, raven, peregrine, common buzzard and Montagu's harrier. In the second part we have a guide to the birds of Cornwall with notes on behaviour, etc. The whole is admirably illustrated with pen-and-ink sketches by R. A. Richardson, his pintails, showing a duck and drake floating on still water, being a particularly satisfying picture.

As we have said, the early part of the book is that devoted to general observations, and it affords much interesting reading; for example, the account in Chapter 3 of migration movements of sea-birds. The author describes how on March 22, 1932, a warm and sunny day, he watched from Gurnard's Head for five hours an immense stream of birds. "Guillemots and razorbills, the former predominating, kept passing at speed low over the sea in flocks of 100 to 200 birds . . . they were travelling when I came on the scene and still travelling when I was obliged to leave." Gannets, shearwaters and herring gulls also passed, and the author wonders "what was the meaning of this vast 'migrational' movement? The gannets and shearwaters were travelling away from their breeding stations off the Welsh coast." Two other especially interesting chapters are those on the chough—with particular reference to its decrease—and the Montagu's harrier, with its history of the vicissitudes of certain individuals.

FRANCES PITT

The Spell of the Honey Bee

By W. Eric Kelsey. Second edition, revised. Pp. xi+274+49 plates. (London: Chapman and Hall, Ltd., 1947.) 18*s*. net.

THE first edition of this book appeared in 1945 and it was rapidly exhausted. This in itself is a tribute to its merits and that it has fulfilled a need. The author is to be congratulated on the publication of a second edition so soon afterwards and, in his revision, he has taken the opportunity of rewriting the chapter dealing with bee diseases. The book is one of the most attractive bee-keeping manuals we can recall. The essentials of the craft are explained with a freshness of style that is one of the book's special attractions. Also, its value is enhanced by the copious series of half-tone plates, some of which are of exceptional merit. The working drawings of hives and appliances are an additional feature that makes the text easy to follow. Written as a manual for beginners, and with the idea of producing efficient bee-keepers, nevertheless the more experienced will find much that is of interest within its pages. It is obviously outside the scope of the author to discuss the scientific aspects of the bee in any but very general terms and, although he may be a little weak on some parts in this field, the fault scarcely detracts from the merits of the book as a whole.

I Bought a Farm

By Roy Genders. Pp. 112 + 8 plates. (Worcester: Littlebury and Co., Ltd., n.d.) 10*s*. 6*d*. net.

WHEN an author buys a farm and sets about working it for profit, what more natural than that he should proceed to record the ups and downs of his first year's operations for publication. Mr. Genders, released from the R.A.F. after the War, purchased Holly Gate Farm. It was an upland Derbyshire holding of about 78 acres with an ancient but substantial homestead and buildings in a very poor state of repair. In any circumstances a new start in a farm is an anxious business, but the year 1946–47 was a nightmare for any farmer, experienced or otherwise, for one of the wettest harvests on record was followed by a very severe winter. In this book we follow the day-to-day struggle of the author and his two men to make good in the face of great difficulties. A few useful sidelines, such as mushroom growing and dog breeding, made a useful contribution to the enterprise. The story ends on a note of quiet optimism. The account is written in a conversational, almost gossipy style, and will commend itself to the general public, rather than to the body of farmers, who will already be familiar with much of the technical information, and will also have experienced all the hazards, hitches and satisfactions there recorded.

Students' Handbook to Fertilizers and Soils

By L. T. Lowe. Edited by G. H. Purvis. (Published for the Monmouthshire Institute of Agriculture.) Pp. 84. (Worcester: Littlebury and Co., Ltd., 1947.) 7*s*. 6*d*. net.

THIS book aims at giving a simple account of the scientific principles of manuring and of soil science suitable for students at farm institutes. It is always difficult to write simple but accurate books in any science that are acceptable to research workers in that science. The difficulty is particularly great in agricultural science, both because the scientific principles of many practical techniques are not too well understood and also because of the great scarcity of clear accounts of the present-day views held by the research workers themselves. Thus lecturers in soil science and crop nutrition in farm institutes and agricultural colleges can justly complain that they are not well served by the research institutes of Britain, and this book unfortunately illustrates the truth of this complaint.

The book suffers in the first place from a brevity so extreme that the choice of topics mentioned appears to be arbitrary, and statements of apparent facts or theories often lack very necessary qualifications. It also, unfortunately, contains a certain number of false statements or obsolete theories. But there are many places in which it gives a reasonable account of some of our present ideas on fertilizer practice and soil science.

E. W. RUSSELL

Poisons: their Isolation and Identification

By Frank Bamford. Second edition, revised by Dr. C. P. Stewart. Pp. viii + 304. (London: J. and A. Churchill, Ltd., 1947.) 21*s*.

THIS is a book which within a relatively small compass gives a vast amount of information. The distinguishing feature of this information is its usefulness. In too many books describing processes of scientific investigation, one finds that some vital detail of technique is not mentioned, and further research is required before the technique can be successfully used. This is not true of 'Bamford'. The details given are adequate for the working out of the processes described and they bear the marks of the author having used them.

The book, however, is not a mere catalogue of toxicological processes, and much information of general interest is given; a particularly good example of this is the short chapter on drugs of addiction.

There is no mention in the section on alcohols of the effect of the passage of time after death on the concentration of alcohol found in the blood. The book is fairly well up to date, although some of the more modern industrial poisons are missing. It is a little surprising to read that chloral has almost gone out of use in modern therapeutics. This is, however, rather outside the author's true scope; within his scope this is a good book.

EDGAR RENTOUL

DIFFRACTION FROM THE IONOSPHERE AND THE FADING OF RADIO WAVES

By J. A. RATCLIFFE
Cavendish Laboratory, Cambridge

WHEN a wireless wave is received partly or wholly by way of the ionosphere, it is observed to fade. Much of this fading is due to interference effects between waves which have travelled by different paths. Such waves may include the ground wave, singly or multiply reflected ionospheric waves, waves reflected from different ionospheric regions, or the two magneto-ionic components produced by the presence of the earth's magnetic field. It is, however, possible to isolate and observe only one downcoming wave from the ionosphere, for example, by the use of a pulse sender and a circularly polarized receiving aerial or by the use of a special aerial to suppress the ground wave under conditions when the absorption of the downcoming wave is large enough to make second reflexions unimportant. When only one downcoming wave is observed in this way, it is still found to fade at a speed which varies from time to time. Although few detailed observations of this kind of fading have been reported, workers in the subject will probably accept the general statement that the speed of fading is roughly proportional to the fréquency of the wave, and inversely proportional to the distance of the transmitter[1].

It is also known that the fading of a single ionospheric wave received at vertical incidence shows some dissimilarity at two points separated by about one wave-length, and from this fact it may be deduced that the wave is returned by a process of irregular diffractive reflexion from an ionospheric region which is considerably inhomogeneous in the horizontal plane[2,3]. It therefore appears more correct to think of the single wave returned from the ionosphere not as one sharply reflected from a smooth mirror, but as a cone of rays returned to the receiver from a diffuse scattering region in the ionosphere, much as light from a street lamp on a bridge might be reflected from an irregularly rippled stream to an observer standing near by. The consequences of this supposition are being worked out by considering the diffractive reflexion from a completely rough surface, and it appears that useful information may be obtained about the 'degrees of roughness' of the ionosphere in this way. It also appears that the amplitudes of waves successively reflected between ground and ionosphere may not be in the ratio expected for 'mirror-like' reflexions, and this fact may have important bearings on the deduction of reflexion coefficients by the usual methods. It is not, however, the main purpose of this article to develop more fully the ideas of the ionosphere as a diffractive reflector, but to suggest that if the roughness of the ionosphere is supposed to vary in a random manner, then the salient phenomena of the fading of a single wave can be explained. The possible causes of the roughness and variability will not be discussed.

To represent a varying rough ionosphere in a simple manner, we assume that there exist several scattering 'centres' distributed approximately in a horizontal plane and that each scatters the same power from the incident wave. The term 'scattering centre' is here used in the sense common in the theory of diffraction, and no attempt is made to define it more precisely. The 'centres' make up the irregularities which form the roughnesses discussed above, and although related to the scattering centres of Eckersley are not necessarily the same. It is assumed that the 'centres' are in continual random motion in such a way that the velocities v in the line of sight are distributed according to a Gaussian law; so that the number $P(v).dv$ of centres with velocity between v and $v + dv$ is given by

$$P(v) . dv = A \exp(-v^2/2v_0^2)dv, \quad (1)$$

where v_0 is the root mean square velocity of a 'centre'. We consider the case of a receiver placed close to a sender emitting pulses of radio frequency f_0 as in the usual method of exploring the ionosphere at vertical incidence. The reflected wave suffers a Doppler shift of frequency after scattering from each of the 'centres', so that its frequency on returning to the ground is given by

$$f = f_0(1 + 2v/c). \quad (2)$$

The phases of the contributions from different 'centres' may be assumed to be randomly distributed, since the 'centres' are at random distances. Powers, therefore, add at the ground, and the resultant electromotive force consists of components of different frequency, the power $W(f).df$ in each frequency-range being obtained by combining equations (1) and (2) to give

$$W(f)\, df = B \exp\{-c^2(f-f_0)^2/8f_0^2v_0^2\}\, df. \quad (3)$$

For a reason which will be apparent shortly, we may also write this expression as

$$W(f) . df = \frac{\psi}{\sigma\sqrt{2\pi}} \exp\{-(f-f_0)^2/2\sigma^2\}\, df, \quad (3a)$$

$$\left.\begin{array}{l}\text{where } \sigma = 2f_0v_0/c = 2v_0/\lambda, \ \lambda \text{ being the wave-length of the wave}\\ \text{and } \psi = \int_0^\infty W(f) . df = \text{the total power in the wave.}\end{array}\right\} \quad (3b)$$

The fading of the wave is now seen to result from the beating between the component waves of different frequency represented in equations (3). But a series of E.M.F.s with random phases and with powers as given by (3) is *precisely what would result if random noise were passed through a filter the band-pass characteristic of which for power was given by* (3).

Now Fürth and MacDonald[4] have made a detailed analysis of the noise emerging from a filter with a power-pass-characteristic given by equation (3a), which is their equation (12). They have shown first that the amplitude R of the quasi-sinusoidal output E.M.F. is distributed according to a Rayleigh law, so that the probability $p(R).dR$ of finding an amplitude between R and $R + dR$ is independent of the filter and is given by

$$p(R) = (R/\psi) \exp(-R^2/2\psi), \quad (4)$$

the mean amplitude $\overline{R}$ being given by

$$\overline{R} = \sqrt{\pi\psi/2}. \quad (5)$$

They also show that the temporal rate of change of the amplitude depends on the characteristics of the filter in the following way. If the amplitude of the output E.M.F. is plotted against time, and if the time axis is divided up into *short* elements τ, and v_τ represents the change of amplitude which occurs during one of these intervals, then the probability

$P(v_\tau)dv_\tau$ of observing a change between v_τ and $(v_\tau + dv_\tau)$ in any one interval is Gaussian and is related to the pass-characteristic of the filter by their equation (19), which states that

$$P(v_\tau)\,dv_\tau = c \exp\{-(v_\tau/2\pi\sigma\tau\sqrt{\psi})^2\}\,dv_\tau. \qquad (6)$$

On our present theory it follows that the fading E.M.F. received from the ionosphere will have these same characteristics, so that it should be described by expressions (4) and (6). My colleague, Mr. S. K. Mitra, has analysed fading curves obtained by observing a single pulse at 4 Mc./s. reflected from Region F and received on a circularly polarized aerial and has shown that the results agree well with these equations. This agreement encourages us to believe that the explanation is correct, and to use it to deduce the R.M.S. random velocities of the scattering centres in the following way.

A comparison of the experimental results with equation (6) yields the value of the quantity $\sigma\sqrt{2\psi}$, and since equation (5) relates ψ to the mean amplitude of the received E.M.F. we can determine σ, and hence find v_0 from (3b). A typical fading record, analysed in this way, has yielded the value 5 m./sec. for the R.M.S. velocity of the scattering 'centres'.

A little further calculation yields a useful expression for the 'speed of fading'. Fürth and MacDonald[4] define a quantity ε given by

$$\varepsilon = \operatorname*{Lim}_{\tau\to 0}\,(\overline{|v_\tau|}/\tau) = \sqrt{2\pi\psi}.\sigma = 2\overline{R}\sigma = 4\overline{R}f_0v_0/c,$$

where $\overline{R}$ is the average E.M.F. In our case we may use the quantity $\varepsilon/\overline{R}$ as a logical measure of the speed of fading, and may then state the position in words as follows.

Let a fading curve in which the amplitude of the received E.M.F. is plotted as a function of time be divided up into short elements of time τ, and let v_τ represent the change in amplitude during the time τ, and $\overline{R}$ the mean amplitude; then the quantity $\overline{|v_\tau|}/\tau\overline{R}$ tends to a limit as τ tends to zero, and is here called the 'speed of fading', S. It is related to the velocities of the scattering centres by the expression

$$S = \overline{|v_\tau|}/\tau\overline{R} = 4f_0v_0/c = 4v_0/\lambda. \qquad (7)$$

It is at once apparent that the speed of fading is proportional to the frequency of the radio wave, in agreement with the facts mentioned at the start of this article.

If we had to do with only two scattering centres, one of which remained stationary and the other moved in the line of sight with velocity v_0, then we should record a complete cycle of fading in a time t such that $1/t = 2v_0/\lambda$. Equation (7) shows that the 'speed of fading' (S) in the case of several centres moving at random yields a quantity of the same order of magnitude.

In some experiments being made in Cambridge, the phase variations in a single downcoming wave are being studied, and it is of interest to consider what may be deduced from them. These phase variations are likely to be of importance in direction-finding and in radio navigational aids. If the downcoming wave is composed of contributions from several moving scattering 'centres', the phase φ will vary in a random manner, and a record of φ plotted against time may be analysed by dividing it up into short equal intervals τ, in which φ changes by $\Delta\varphi$, and evaluating the quantity $\operatorname*{Lim}_{\tau\to 0}\overline{|\Delta\varphi|}/\tau$, which may be called the 'average rate of change of phase'. We should expect this quantity to be simply related to the corresponding rate of change of phase $(2\pi.2v_0/\lambda)$ produced by reflexion from a single 'centre' moving with the velocity v_0 in the line of sight, and I am indebted to Dr. D. K. C. MacDonald for a proof that, in fact, the two quantities are equal. Dr. MacDonald has also shown how the probability of obtaining a value of $\Delta\varphi$ is related to $\Delta\varphi$ and has provided a theoretical expression with which measurements can be compared.

I have been able to examine records of the phase-variations of a single downcoming wave from Region E made on 2 Mc./s. by Mr. J. W. Findlay and on 100 kc./s. by Mr. K. Weekes, both working in Cambridge. The method used by Mr. J. W. Findlay has previously been described and a sample record illustrated[5]; the only records amenable to analysis are those of the simpler type illustrated in his Fig. 3. Mr. Weekes uses a method which has not yet been described. For both these frequencies I find that the probability distribution of the quantity $\Delta\varphi$ agrees fairly well with the expression of MacDonald. For the frequency of 2 Mc./s., the R.M.S. velocity deduced for the 'centres' is 0·5 m./sec. and for 100 kc./s. it is 1·0 m./sec. These orders of magnitude are consistent with that deduced from Mr. Mitra's analysis of the amplitude of fading on 4 Mc./s.

I have also been able to examine some measurements of the phase and amplitude of the downcoming wave observed at nearly vertical incidence by Mr. R. N. Bracewell on 30 kc./s. and 16 kc./s. These measurements have been made by an extension of the technique described by Best, Ratcliffe and Wilkes[6] and Budden, Ratcliffe and Wilkes[7]. On these frequencies the refined techniques now in use frequently show the occurrence of a relatively rapid variation of phase and amplitude superimposed on a slower variation. If the results are first smoothed so as to remove the more rapid variation (phase changing at the rate of about 2π in 5 min.), it is possible to analyse both the phase and amplitude records in the manner previously explained. Although the smoothed fading is then so slow (phase at the rate of about 2π in 1½ hr.) that the probability distribution cannot be checked in any detail, there is no obvious disagreement with the theory, and the mean values for the speed of amplitude and phase fading both lead to the same value, approximately 1·0 m./sec. for v_0. There appears to be no counterpart, on the higher frequencies, to the more rapid fading observed on these very low frequencies.

We have seen that observations at nearly vertical incidence on frequencies from 4 Mc./s. to 16 kc./s. yield results of the same order for v_0, provided we smooth out the more rapid fading on the very long waves. This agreement is indirect proof of the statement made at the start of this article that the rate of fading is proportional to the wave-frequency. It is next of interest to consider the phenomena associated with oblique transmission through the ionosphere.

By considering how a movement of a scattering centre affects the length of path of waves scattered from it at oblique incidence, it can be shown that the speed of fading should be roughly inversely proportional to the distance of transmission, provided that this distance is greater than the height of the reflecting region. Mr. R. W. McNicol has kindly made an analysis for me of some fading curves of distant broadcasting stations, provided through the courtesy of the B.B.C., and has shown that they can be explained in terms of scattering centres moving with random velocities of the same order as those deduced from the experiments made with vertically incident waves.

Up to this stage in the discussion we have assumed that the Doppler shift in the component waves occurs during backward scattering from moving 'centres' *situated in the reflecting region.* If, however, a wave, reflected from a given region (1), passes through an irregular region (2) below, then it will suffer diffraction at region (2), and if the scattering elements in region (2) are in motion, the diffraction pattern at the ground will vary with time, and an observer at a fixed point will notice that the wave 'fades'. The matter is complicated because the wave traverses the diffracting region twice, once on the upwards and once on the downwards journey; but the nature of this fading can be deduced, to a first approximation, by considering the Doppler shift due to the forward scattering from the scattering centres in region (2), and the results are then somewhat dependent on the assumptions which are made about the motions of these centres. The general trend of the calculations is the same as before, but the Doppler shifts are smaller for the same velocities.

Useful information should be obtainable by making simultaneous observations on the fading of single echoes from Regions *E* and *F*. If the fading of echoes from both regions were due to the movements of reflecting clouds in the appropriate region, then we should expect the application of the analysis given in detail in this article to apply to each echo separately, and to give an R.M.S. velocity v_0 which would probably not be the same for both. If, however, the fading of both echoes were due to inhomogeneities in an absorbing region below both reflecting regions, then the fading of both echoes should be explicable in terms of the same velocities in the absorbing region, provided we used the type of analysis applicable to transmission *through* a diffracting region. If the fading of the echo from Region *E* were due to backwards scattering from moving elements of that region, whereas the fading of the echo from Region *F* were due to the fact that it had passed through the irregular Region *E*, then we should have to use different types of calculation for the two echoes in order to get concordant results for the R.M.S. velocity v_0. These possibilities are being tested.

Although the theory outlined in this article is only meant to be a first approximation to the truth, it is nevertheless thought to contain the essence of the explanation of the fading of a single echo. Obvious extensions of the theory include the consideration of:

(*a*) A steady component of E.M.F. reflected from a constant and uniform part of the ionosphere in addition to that returned from the scattering centres. This will give rise to effects similar to those obtained when a steady E.M.F. is added to the output of a Gaussian filter-passing noise, and the analysis will follow that of Fürth and MacDonald for this case.

(*b*) 'Centres' which do not all scatter equal powers, and 'centres' the scattering effect of which varies with time.

(*c*) Velocities of the centres which are not distributed in a Gaussian manner.

(*d*) Different velocities in the horizontal and vertical directions.

(*e*) The possibility that, if the 'centres' are embedded in a region where the refractive index is considerably less than unity, the Doppler effect will be less than that indicated, so that the value of v_0 will be greater than that calculated here.

In conclusion, it may perhaps be pointed out that there are obvious analogies between the reflexion of a radio wave from randomly moving scattering 'centres' and the radiation of monochromatic light from a series of molecules moving with random heat motions. The broadening of the spectral line in the optical case is analogous to the spread of frequencies in the radio case, and if the light could be observed sufficiently rapidly it would be found to be fading, just as the radio E.M.F. fades.

I am indebted to my colleagues mentioned above, who have kindly put their observations at my disposal. Their researches are supported by a grant from the Department of Scientific and Industrial Research. I am also indebted to Dr. MacDonald for help with the analysis of phase.

SOME COMPONENTS OF THE LYTIC SYSTEM OF GRAM-POSITIVE MICRO-ORGANISMS

By Prof. M. STACEY and Dr. M. WEBB

Chemistry Department, University of Birmingham

FOLLOWING certain pioneer work and suggestions by our former colleague, Dr. H. Henry, it was apparent that much information regarding the structure of Gram-positive bacteria and their behaviour when acted upon by antibiotics could be obtained from a study of bacterial autolysis. The few detailed studies of autolysis which have previously been made have been mainly confined to the pneumococcus group. Goebel and Avery[1] showed that the autolytic disintegration of pneumococci was accompanied by proteolysis resulting in an increase in both amino-nitrogen and non-coagulable nitrogen, and by lipolysis liberating ether-soluble fatty acids. A non-specific cell-free autolytic enzyme system acted upon heat-killed pneumococci to give results comparable with those from spontaneous autolysis and also brought about the partial lysis of suspensions of heat-killed *Streptococcus viridans*[2].

In confirmation, Dubos[3] further made the significant observation that before lysis of the cells occurred the cocci first became Gram-negative, and this change in the Gram staining reaction was not necessarily associated with complete lysis of cells. It was possible, moreover, to effect this change in the Gram-staining reaction of heat-killed, Gram-positive penumococci by the action both of pancreatic ribonucleinase[4] and a ribonuclease-like 'tissue enzyme' isolated from rabbit leucocytes[5] (cf. Bartholomew and Umbreit[6]).

In our hands, these and other enzymes, for example, from the lower fungi, have been found to render Gram-negative a range of heat-killed Gram-positive micro-organisms. The change in the Gram-staining reaction appears to be brought about only by enzymes of the ribonucleinase type, that is, those which hydrolyse ribonucleic acid to the four mononucleotides[7]. We have found by way of contrast that preparations of intestinal phosphatase and of a phosphatase from dog fæces[8], although able to hydrolyse free yeast ribonucleic acid with the liberation of inorganic phosphate, had no action upon heat-killed Gram-positive cells.

Extension of our investigations to bacterial autolysis has shown that it is possible to divide the cellular disintegration of most Gram-positives into two separate and distinct stages, namely, (*a*) the change from Gram-positive to Gram-negative, and (*b*) the subsequent lysis of the Gram-negative cytoskeletons. We have so far recognized four distinct enzyme systems involved in the cellular disintegration. The extent to which the two stages occur in suspensions of autolysing Gram-positive cells depends sharply upon the *p*H and upon the oxidation-reduction potential of the system. For bacterial autolysis, there appears to be an optimum *p*H for each species which varies from *p*H 5 for certain sarcinæ to *p*H 8 for clostridia and some staphylococci. Our colleague Dr. Henry made the striking observation that, under reducing conditions, only the first stage of autolysis occurs, and this results in the formation of Gram-negative cytoskeletons which do not undergo further digestion at any *p*H less than 7. By carrying out autolysis in the presence of suitable reducing agents, such as hydrogen sulphide or thioglycollic acid, it was found possible to obtain in solution and free from the enzymes concerned with complete cellular disintegration, the enzyme system responsible for the initial stage of autolysis. Detailed studies of the properties of 'initial stage' enzymes from both *Cl. welchii* and *Staph. citreus* have shown that the two are closely similar. They have in common the property of hydrolysing free yeast ribonucleic acid but not deoxyribonucleic acid, while they differ in several respects from the ribonucleinase of animal tissues[4]. Thus they have *p*H optima at 7–8, are inactive at *p*H 4·0, are activated by reducing agents and inhibited under oxidizing conditions. Irreversible loss in activity occurs when the enzyme solutions are heated at 80° for 30 min., whereas at 60° any inactivation is dependent upon the *p*H and the time of heating, the enzymes being most stable at *p*H 8.

Although the enzymes from *Cl. welchii* and *Staph. citreus* both have the property of hydrolysing free ribonucleic acid, they are species specific, and indeed to some extent strain specific, in their action on heat-killed Gram-positive cells. Thus, the enzyme from *Cl. welchii* readily converted heat-killed Gram-positive *Cl. welchii* to Gram-negative cytoskeletons, but had no action on heat-killed Gram-positive *Staph. citreus*, *Staph. aureus* or *Lactobacillus helveticus*. Similarly, the enzyme from *Staph. citreus* exhibited no action on the Gram complex of heat-killed Gram-positive *Cl. welchii* or even of *Staph. aureus*, but was active against a rough variant isolated from an aged culture of *Staph. aureus*. As the smooth–rough transformation is known to involve the loss of the ability to synthesize certain bacterial polysaccharides, the latter observation suggested that the specificity of these bacterial enzymes was in some way connected with the specificity of the polysaccharides of the cell.

Recent studies on the action of lysozyme[9] have shown that ribonucleic acid and the specific polysaccharides of Gram-positives are presumably in combination at the cell surface. When heat-killed Gram-positive cells are incubated with lysozyme, certain carbohydrate linkages are disrupted, the Gram staining reaction becomes negative and undegraded ribonucleic acid and polysaccharides are released into solution.

Further, specific polysaccharides of staphylococci and of *Cl. welchii*, isolated by procedures which did not destroy cellular structure, also were found to be hydrolysed to a small but definite extent by the action of lysozyme.

Since these same polysaccharides were not acted upon by the initial stage bacterial nucleinases, the latter appeared to be essentially free from lysozyme. However, it was shown that, during the action of these enzymes in the autoconversion of Gram-positives to the Gram-negative cytoskeletons, a small percentage of reducing groups was released and specific polysaccharides were liberated in an apparently undegraded state into solution (cf. a similar observation by Dubos[10] during pneumococcus autolysis). We conclude that the initial stage in the autolysis of Gram-positives involves an enzyme, highly specific in its action, which breaks the relatively labile linkage joining the specific polysaccharide and the ribonucleic acid. Such enzymic activity is probably possessed by most preparations of animal ribonucleinases, and renders the Gram ribonucleoproteins[11] of the cells susceptible to the subsequent action of ribonucleinase. The latter breaks down the ribonucleic acid component to the mononucleotide stage, but does not disrupt the Gram-negative cytoskeleton.

All procedures which were found to inhibit the change in the staining reaction of Gram-positives to Gram-negatives also inhibited the ribonucleinase activity of the enzyme solution, and the variation in the activity of different enzyme preparations against killed cells was accompanied by a parallel variation in ribonucleinase activity. However, the fact that ribonucleic acid removed from one Gram-positive organism by extraction with sodium cholate may be replated on to the reduced Gram-negative cytoskeletons of a second extracted Gram-positive cell[11] would suggest that the bacterial ribonucleic acids themselves do not show any fundamental structural differences. This may account for the less specific nature of ribonucleinases, and suggests that the marked degree of specificity shown by the bacterial enzymes responsible for the conversion of Gram-positives to Gram-negatives is due to a 'polysaccharide-releasing' enzyme.

When the autolysis is rapid and less carefully controlled[12], the linkage between the nucleic acid and protein of the cytoskeleton may not be broken, and a certain proportion of the Gram-positive ribonucleoprotein is released into solution[12], so that the linkage between the nucleic acid and the protein, probably involving —S—S— linkage[11], is essentially firmer under certain conditions.

When a suspension of suitably prepared Gram-negative cytoskeletons is adjusted to *p*H 8, complete lysis rapidly follows. We have succeeded in isolating closely similar lytic enzymes from the cytoskeletons of *Staph. albus* and *Staph. citreus*. From both, preparations of two proteolytic enzymes were isolated, one of which hydrolyses casein but not peptone, and a second which hydrolyses peptone but not casein.

It was shown that the initial disintegration of the cytoskeletons is due to the action of the casein-hydrolysing enzyme. The protein fragments which result from this cellular disintegration appear to be further hydrolysed by the action of the peptone-hydrolysing enzyme.

In contrast to the enzymes responsible for the first stage (*a*) of bacterial autolysis, these proteolytic enzymes are not specific in their action and readily dissolved the Gram-negative cytoskeletons of all Gram-positives examined and also heat-killed true Gram-negative bacteria. They had no action on heat-killed Gram-positive cells, and it was concluded that these proteolytic enzymes do not play any part in autolysis until the cells have become Gram-negative.

In extension of these studies[13], we have shown that some *Actinomyces* cultures under certain conditions possess a system composed of a lipoidal bactericidal substance, a ribonucleinase and proteolytic enzymes. We have obtained evidence that such a system is also present in a culture filtrate of *Pseudomonas pyocyanæ* and in certain moulds which are antagonistic to bacterial growth. It would appear, therefore, that such a system may be of fundamental importance in the general phenomenon of bacteriolysis and may also have some bearing on the nature of phagocytosis. In the latter case, it will be recalled that leucocytes are known to contain an enzyme which hydrolyses ribonucleic acid[5] as well as proteolytic and other enzymes.

The precise role of lipases[1] and deoxyribonucleinases[14], said to be present also in Gram-positives, is under investigation.

We are grateful to Dr. H. Henry and Dr. A. S. Jones for considerable help and to the Medical Research Council for a grant.

SOIL CONSERVATION

THE Food and Agriculture Organisation of the United Nations Organisation has recently published a beautifully produced booklet entitled "Soil Conservation—an International Study" (Washington, D.C.). It comprises 190 pages, of which about half are occupied by pictures. Thus the problems of world soil conservation are covered in about a hundred pages of text. The idea behind the publication appears to be to appeal to politicians, administrators and publicists without whose co-operation the urgent need for soil conservation may be overlooked until too late. These will get the impression that soil conservation is an American invention. It is not an entirely false impression, but there are countries—for example, Japan and Java, and, for that matter, Great Britain and others—in which soil conservation is so highly perfected that the 'problem' of soil conservation scarcely exists, and the achievements of these countries in adapting their methods of land utilization to the environment have consequently been overlooked. The authors of the booklet admit that "much attention has been given to China and the United States of America"; but it would be more accurate to say that the United States gets 75 per cent of the space, China 10 per cent, and the rest of the world 15 per cent. It is worth quoting all that this leading international agricultural authority has to say on physical losses from the mismanagement of farm lands in the world outside the United States, China and Latin America. Under the heading "Other Countries", it is stated: "All over the world, wherever man has cultivated sloping land, there has been soil erosion in some degree. In the Mediterranean region of Europe, in Asia, in North Africa, in tropical Africa and South Africa, and in India its results have been described, but little measurement has been made of its extent or severity." One of the results in India that "have been described" is far more human misery than soil erosion has caused in the whole of the United States. Australia and New Zealand are other countries that appear to have been overlooked.

There is some justification for this one-sided approach. Modern methods of soil conservation used all over the world and the principles of planning land utilization to suit the land have nearly all been developed in the United States, which are in advance of most other countries not only in the application of mechanical measures and in the adaptation of land utilization to soil conservation, but also in appreciation of the social and economic consequences of the adoption of soil conservation. But the achievements of soil conservation in the United States tend to blind people there to the lesser, but certainly not negligible, achievements of countries which have not the money, the men or the means to accomplish what the United States have done. The book leaves the impression that the authors have used the material immediately available in Washington, but have not troubled to look further afield. Something better is expected of an international study with the imprint of the Food and Agriculture Organisation.

The fact that about the only reference to soil conservation in the British Empire is the statement that British settlers have given much attention to pasture development suggests that there were not many representatives of Empire agriculture available in Washington while the book was being prepared. The countries of the British Empire have less to show in the conservation 'shop window' than the United States, but they have a lot in the 'shop' itself. The forest and agricultural departments of India did a magnificent piece of work in face of tremendous difficulties in checking the devastating erosion in the foothills of the Himalayas and elsewhere, much but not all of which was of recent origin. India has a problem of peculiar difficulty—over-population. This has led to a growing recognition of the fact that the welfare of the land is a communal rather than an individual responsibility, and to communal schemes of integrated soil conservation. The successful adaptation of the *taungya* system, to which the Food and Agriculture Organisation book only refers in passing, to purposes of soil conservation had already reached a high degree of development some decades ago. The Indian Forest Service has a reputation second to none for applying soil-conservation measures.

Australia, New Zealand and South Africa have learnt much in recent years from the United States, and with varying success have adapted American principles of soil conservation to their particular circumstances. The mechanics of soil conservation—that is, the prevention of water and soil from running downhill—are essentially the same everywhere; but environmental and social conditions in different regions require that soil-conservation measures should be integrated in different patterns. The art and science of soil conservation consist in building up a pattern of land use that will fit the physical, economic and social environment. All three Dominions have adopted the idea of the American soil-conservation district as the social unit for soil-conservation planning, but in different forms. It is still too early to say with how much success their plans will ultimately be crowned, but these embryonic experiments in applied human ecology deserve most careful attention.

In the British Colonial territories, too, the problems of soil conservation peculiar to tropical conditions are being tackled with increasing vigour and imagination. Whereas until recently most territories relied mainly on mechanical methods of erosion control, there is to-day a general awareness that these are only a means to an end, and that soil conservation must be integrated into systems of husbandry that will enhance the fertility of the soil. A few years ago the goal of many Colonial agricultural policies was at best to maintain soil fertility. Now it is to increase fertility; and with increased fertility should come increased stability, both of the soil and of society. This latter goal is still far from attainment; but those who control British Colonial policy seem to be gradually awakening to the importance of fundamental scientific studies for the conservation of the tropical environment. The work of W. S. Martin, who showed that grass fallows could have a dramatic effect on the restoration of soil fertility, the improvement of soil structure and resistance to erosion, promises to revolutionize the basis of arable agriculture in East Africa. Attention is also being paid to methods for improving pastures and controlling grazing, and to the proper rôle of fire in tropical agriculture. Many of these problems require expert knowledge of the structure of native societies for their solution.

To be effective, conservation measures in the tropics, as elsewhere, have to be applied on a regional scale, which involves co-operative or communal action, and may involve drastic modifications in land utilization. One of the great difficulties in the Colonies has been to secure co-ordinated action throughout a region. Responsibility for the welfare of the land is divided among many authorities whose interests do not always coincide. There is, indeed, need for conservation education and propaganda not only among native and European farmers, but also at high administrative levels. Native peoples, in Africa at any rate, often have a tradition of communal land ownership that should facilitate the enforcement of legislation designed to secure effective co-operative action in the control of soil erosion.

Several British Colonies and Protectorates have already enacted legislation to enforce soil-conservation measures or to regulate land use and conditions of land tenure for the purpose of conserving the soil. The trend of recent legislation has been towards the setting-up of regional authorities on the pattern of the American soil-conservation districts. Indeed, the invention of the soil-conservation district is probably America's greatest contribution to the promotion of soil conservation throughout the world. The authors of the Food and Agriculture Organisation booklet, with unnecessary modesty, make little reference to it; though they do state the astonishing fact that within the last ten years more than 1,000,000,000 acres—more than half the total land area of the United States—have been brought under the control of soil-conservation districts.

G. V. JACKS

THE COLONIAL MICROBIOLOGICAL RESEARCH INSTITUTE, PORT OF SPAIN, TRINIDAD, B.W.I.

IN 1945 Sir Robert Robinson and Prof. J. L. Simonsen, acting on behalf of the Colonial Products Research Council, paid a visit to the West Indies to acquaint themselves with the tasks in which scientific research could assist these and other tropical territories of the Commonwealth. From the observations they made in the Colonies which they visited, they concluded that almost every branch of science could be called upon to take a share in raising the prosperity of these lands; but that a special claim could be made for microbiology, of which only the most urgent medical aspects had been receiving attention in the past.

The Colonial Office accepted their conclusions and made funds available for the foundation of a Colonial Microbiological Research Centre to be situated within the tropics.

Port of Spain, Trinidad, was decided on as a suitable location. It was approved that the centre should devote its energies to fundamental research in microbiology; to the application of the results of its investigations; and to assisting agricultural and other industries in improving their products. Further, it was approved that the new Institute should form a centre for postgraduate training in microbiology. Afterwards, it was decided that a branch of the new centre should devote itself to the maintenance of a collection of micro-organisms which could be made freely available to interested institutes and to research workers in tropical and temperate climates.

To meet the needs of the new centre a building was designed, which, in addition to a library, comprises six laboratories, three for microbiological and one for biochemical research. One laboratory is reserved for the type culture collection, and one for the preparation of culture media.

A special room is provided for the cleaning and sterilization of glassware. Adjoining, and communicating with, the biochemical laboratory is a balance room; another room is provided for photomicrographic work, in which an electron microscope may eventually be set up, should this prove desirable. For the cultivation of micro-organisms requiring temperature of 18° C. and below for maximum growth, a special room has been provided, which is maintained constantly at this temperature. In addition, the building houses three offices, a cafeteria, a first-aid room and a store-room.

The whole building is air-conditioned and will be maintained at a temperature of 25·5° C. (78° F.) and a relative humidity of 60 per cent. The air-conditioning plant is housed in a penthouse on the roof of the one-storied laboratory building.

Since some of the investigations which the new centre is expected to undertake may eventually be adopted by industry, it was felt to be important to incorporate a pilot plant in the design of the institute. The pilot plant, when completed, will house, in addition to a complete fermentation plant of 400 gallons capacity with a separate distillation unit, a boiler house, a gas plant, an air compressor unit and a machine shop. From the pilot plant, gas, steam and compressed air will be supplied to the various laboratories, through underground pipe systems. All equipment for the pilot and air-conditioning plants are of British design and manufacture.

In view of the acute housing shortage throughout the West Indies and in Port of Spain in particular, it was agreed that housing facilities should be provided for the scientific staff within the grounds of the Institute. To this end a block of four flats has been erected within the six acres of grounds belonging to the Institute. A bungalow for the engineer has also been erected there.

The construction of the various buildings was commenced early in 1947 and has by now progressed so far that the Institute is to be opened officially on July 5, when Lord Hankey, chairman of the Colonial Products Research Council, has consented to perform the ceremony in person.

Invitations to attend the ceremony have been sent to Governments of the various Colonies, to Governments with Colonial possessions in the tropics and to the Governments of the neighbouring Central and South American States.

It is hoped to make the opening an occasion for informal discussions, among the delegates, of microbiological problems, particularly such problems as are met with under tropical conditions.

OBITUARIES

Prof. W. T. David

THE sudden death on May 22 of Prof. W. T. David has removed from the University of Leeds a man of real distinction with a vivid personality. For twenty-six years he was professor of engineering and administrative head of the Engineering Departments.

David was born in Laugharne in 1886 and was educated at St. David's County School. After a brilliant career at University College, Cardiff, he went to Trinity College, Cambridge, where he specialized in a study of infra-red radiation from flame gases and related combustion phenomena under the inspiration of the late Prof. B. Hopkinson. This field of research ultimately became his abiding interest. In 1912 he was appointed H.M. Inspector of Schools on the technological side; during the First World War he became inspector of gun ammunition with headquarters at Woolwich Arsenal and later director of dilution of labour at the Ministry of Munitions. In 1920 he was appointed to the chair of engineering at University College, Cardiff, and in 1922 he succeeded the late Prof. John Goodman in the chair of engineering at Leeds.

David was no narrow scholar, and was a strong advocate of education in the true university sense. He was a man of high integrity and sound judgment, and his brilliance, kindness and wisdom endeared him both to colleagues and students. He freely gave to all students and encouraged them to high endeavour by his inspiring teaching and the impact of his personality. In his lectures he would stress the importance of grasping the fundamental principles of engineering science, revealing the basic concepts in brilliant flashes, and would carefully lead the student in some branch of the subject on to the very frontiers of knowledge. David frequently likened this method of lecturing to students to taking them to the top of Mount Pisgah to view 'the promised land', so that with few words he would excite and fire the imagination of the students and make a lasting impression upon their minds.

In the field of research David directed his efforts mainly towards the problems of combustion phenomena and the related problems of internal combustion engines. At Cambridge he took special interest in heat loss from gaseous explosions, and he became intrigued with the problem of 'missing-pressure' in internal-combustion engines. This resulted in a comprehensive study of explosions of inflammable gaseous mixtures at a time when the lack of reliable thermal data handicapped his investigations. His intuition, however, led him to believe that flame gases were not really normal hot gases but possessed energy in excess of that of normal gases. The development of quantum mechanics and afterwards the provision of thermal data have made it possible to confirm his early ideas concerning flame gases. No one was more devoted to his subject or to his students.

Outside the University of Leeds, David was known in engineering circles in Yorkshire and elsewhere; was a member of the Institutions of Civil and of Mechanical Engineers, and was chairman of the Yorkshire Association of the Institution of Civil Engineers for the session 1928–29.

David was a man whose views were highly valued in any assembly and his contributions to discussion, often brief and pungent, were commonly wise. He possessed an independent mind and a forceful character, "it's dogged that does it" being his motto. He will be sorely missed for his clear judgment, store of good humour and warm sympathy, especially at a time like the present, when the transition to peace and the expansion of the University of Leeds are raising so many problems. R. H. EVANS

Dr. A. E. Jones

DR. ARTHUR EMRYS JONES, lecturer in mathematics at the Imperial College of Science and Technology, London, was killed in a lift accident on May 7 at the age of twenty-seven. A scholar of St. John's College, Cambridge, he secured a first class in Part II of the Mathematical Tripos in 1939, and honours in Part III in the following year. During the War he worked in the Ballistics Section of the Armaments Research Department, and was associated with J. R. Womersley in his pioneer work on the application of statistical methods to the control of variability in gun-cordite. In 1945–46 he worked at Rothamsted Experimental Station on the design of grazing experiments, and thereafter entered the Statistics Section of the Mathematical Department at Imperial College.

A thesis on continuous stochastic processes and autocorrelation theory brought him his doctorate in 1946. He had also published, in *Biometrika*, vol. 33, Part IV, a paper on the routine estimation of dispersion from large samples. At the time of his death he was working on the effects of autocorrelation on experimental design and estimation. A paper on this subject, by him, will be published shortly by the Royal Statistical Society.

What advances in mathematical statistics Dr. Jones would have made, had he lived, cannot be known. What is certain is that they would have been considerable. He leaves a wife and daughter.

We regret to announce the following deaths:

Jacques Cochon de Lapparent, *Correspondant* of the Section of Mineralogy of the Paris Academy of Sciences, on May 18, aged sixty-five.

Mr. C. A. Malcolm, C.I.E., during 1928–34 chief conservator of forests, Central Provinces, India, on June 8, aged sixty-eight.

NEWS and VIEWS

Imperial College of Science and Technology: Sir Richard Southwell, F.R.S.

In September 1948, Sir Richard Southwell relinquishes the rectorship of the Imperial College of Science and Technology, London, after a period of tenure of six years. This step he has decided to take in order to be free to carry through various research projects concerned with the methods of relaxation that have become so closely associated with his name. Six years is but a short time in which to leave an imprint on the policy and development of an institution of the magnitude and scope of the Imperial College; but there is no doubt that his influence has left its distinctive mark. During this period detailed plans have been produced for the reconstruction of the three constituent colleges on a formidable scale; and if, for reasons of national exigency, these plans will not mature during this quinquennium, they are at least ready to be transformed into reality as soon as the opportunity arises. Not unconnected with this has been the celebration of the centenary of the first beginnings of the College, and the opportunity it presented of establishing a fund that will make possible many ventures of a social and educational nature that would have been otherwise cramped or completely frustrated. Moreover, a commencement has been made with the extension of hostel accommodation for students by the foundation of Selkirk Hall. In this period also the representation of the staff on the governing body has been enlarged, so that members of the teaching staff are involved to a much greater extent than heretofore in the determination of College policy. In this connexion also Sir Richard Southwell has been responsible for the extension of deanships to the three constituent colleges, a move that has made for much closer co-ordination and collaboration than hitherto. On the side of educational policy, he has been mainly responsible for the distinct shift in the incidence of College studies, whereby further developments in advanced study and research are coming into prominence while some of the more elementary preparatory work is fading out. Finally, he has unquestionably built up a tradition of social life that is not usual or easy to develop in a college situated in the metropolis. Sir Richard Southwell can now withdraw from the hurly-burly of the administration of the College with the sure knowledge that during his six years he has helped to determine much of its future character.

Chemistry at Birmingham: Sir Norman Haworth, F.R.S.

Sir Norman Haworth, who has held the Mason chair of chemistry and the directorship of the Chemistry Department in the University of Birmingham since 1925, is to retire from office at the end of the present session. He studied at the Victoria University of Manchester and, after periods spent in Germany and at the Imperial College of Science and Technology, London, he proceeded to St. Andrews as lecturer in organic chemistry. From there he went to Armstrong College, Newcastle (University of Durham), as professor of organic chemistry (1920), and five years later he was elected to the Mason chair at Birmingham in succession to Sir Gilbert Morgan. Under Haworth's leadership the research school at Birmingham rapidly became the chief centre for structural investigation in the carbohydrate group, and the importance of his contributions in this field was recognized by the award of the Nobel Prize for Chemistry (1937). In addition to the direction of a large research school which has attracted workers from all over the world, Sir Norman Haworth has contributed greatly to developments in teaching methods and to the organisation of his department. He has held office as dean of the Faculty of Science and as vice-principal of the University of Birmingham and has served on many Government boards and committees. He is a Longstaff medallist of the Chemical Society, of which he was president during the years 1944–46. He is now a vice-president of the Royal Society, from which he has received both the Davy Medal and a Royal Medal.

In the earlier part of Sir Norman's period of office, the work of the Birmingham school was directed mainly to the determination of the structures of the simpler sugars and their derivatives. For example, the difficult problem of the ring structures in sucrose was solved, and an elegant method, involving oxidation to the aldonic acid, followed by methylation, was developed for determining the structure of reducing disaccharides. Studies were made also of acetone derivatives, sugar carbonates, anhydro sugars, partially methylated sugars and other important reference compounds; and, on the broad and firmly established basis thus laid down, the investigations were extended to the naturally occurring polysaccharides. There followed the elucidation of the general type of structure present in the macromolecules of cellulose, starch, glycogen, inulin, xylan, mannan and certain levans, and the introduction of methods for the assay of terminal groups enabled still further insight to be gained into the detailed molecular architecture of the polysaccharides. Along with these developments should be noted the determination of the structure of vitamin C and its synthesis, and the elucidation of the structures of glucosamine and chondrosamine. More recently the attention of workers in the Birmingham school has been directed towards biochemical problems, and important discoveries have been made concerning the enzymic degradation of the components of starch and their synthesis from glucose 1-phosphate. Investigations are in progress also into the structure of the highly important bacterial polysaccharides.

Prof. H. W. Melville, F.R.S.

Prof. H. W. Melville, who will succeed Sir Norman Haworth at Birmingham, has made many valuable contributions to our knowledge in the field of reaction kinetics. His early work consisted in the examination of the various explosion limits in such mixtures as phosphine and oxygen. The implications of the free radical in such reactions led him to explore the mechanism of a number of photochemical reactions in which radicals are found, and here he first introduced the device of the rotating sector which has permitted us to obtain life-times of transient species with remarkable accuracy.

Some fifteen years ago when deuterium and its compounds became readily available, Melville examined a number of gas reactions in which hydrogen could be replaced by deuterium in order that the relative importance of mass and zero-point energy could be evaluated, thus throwing light on the detailed mechanism. With this background Melville felt that he was in a position to take up the suggestion that the study of the more complex processes of polymerization and macromolecular condensation might, if carried out in the gaseous phase, yield valuable information on the nature of the chain reactions involved. He threw himself into this work, both in the Department of Colloid Science at Cambridge and later at the University of Aberdeen, with his characteristic energy, and the continuous stream of papers in this field coming from these laboratories bears witness to his versatility and ingenuity in unravelling the complexities of these reactions. The School of Physical Chemistry which he created at Aberdeen combined in a characteristic manner the experimental with the theoretical. Birmingham is to be congratulated in its choice.

Genetics at Birmingham: Dr. K. Mather

Dr. Kenneth Mather, who has been appointed to the chair of genetics now established in the University of Birmingham, is known for his, in some respects, revolutionary outlook on this subject. Dr. Mather derives this outlook from a fusion of several of the main streams of thought in biology. He went from Manchester in 1931 to work at the John Innes Horticultural Institution, where he obtained a thorough grasp of the chromosome theory of heredity as it was being developed there at the time. In 1933 he went for a year to Sweden, where he gained a great deal from studying the methods of plant breeding used at Svalöv and by that notable sugar beet breeder, Dr. J. M. Rasmusson. In 1934 he took a post with Prof. R. A. Fisher, under whom he became familiar both with the breeding of mice and the still rapidly developing technique of statistical genetics, to which he began to make serious contributions. In 1937 he spent a year with Morgan and East in the United States. Finally, in 1938 he returned to take up the post of head of the Genetics Department at the John Innes Institution. There he has remained for ten years carrying out (with a success that has now been recognized) the very definite purpose and programme that he had in mind when he went there—that of combining biometry and genetics into a single efficient tool for the study of evolution, the practice of plant and animal improvement and the understanding of biology as a whole. During these years, however, Dr. Mather, like other workers in this field, has been painfully conscious of the widening gap between the advances of genetic research and the status of genetic teaching in the universities. In his new post he will have an opportunity of narrowing this gap and of rendering a great service to the University of Birmingham.

British Jute Trade Research Association

The British Jute Trade Research Association has acquired premises on the Dundee Industrial Estate to replace the temporary accommodation at present occupied in Bellfield Street, Dundee, following negotiations with the Scottish Industrial Estates, Ltd., and various Government committees. The new buildings will be utilized for future research and development in connexion with the activities of the Association, and it is hoped to be in occupation early in 1949. When completed, the Laboratory Section will cover an area of approximately 6,500 sq. ft., and will contain physical and chemical laboratories, photographic and physical dark rooms, a room where constant temperature and humidity can be maintained, machine rooms, library and administration. A separate Engineering Development Section will in the first instance cover an area of some 2,000 sq. ft., and the personnel in this Section will work in very close collaboration with the Laboratory scientific staff. The remaining space of 14,000 sq. ft. will be devoted to the Processing Section, in which will be installed a complete range of all jute processing, weaving and finishing machinery. The building will be the first industrial research laboratory of its kind to be set up in Scotland for co-operative research, and is supported by practically the whole of the jute interests. The importance of scientific research to the industry is being realized more and more, and the support for the project illustrates the desire of the industrialist to utilize every possible means to increase efficiency and quality of product.

Science and Technology in China

The Natural Science Society of China has recently inaugurated a new bulletin, *Science and Technology in China*, of which two numbers of the first volume have already appeared. It is very well printed and produced and contains many interesting articles. In the April issue, Dr. Mao I-Sheng writes on the present position and outlook of research in the engineering sciences in China; Dr. Li Ching-Yuan on current mineral exploration in China; and Dr. Jen Mei-O on the progress of land utilization surveys in the south-west part of the country. The work of the Scientific Office of the British Council in China is reviewed at some length, and the rest of the bulletin consists of research reports similar to the correspondence columns of *Nature*, together with abstracts of papers read at the February 1948 meeting of the Chinese Chemical Society at Nanking. While China has had for many years its chief scientific journal analogous to *Nature*, namely, *Ko-Hsueh*, this has always been and will continue to be published in the Chinese language. There has therefore been room for a periodical, perhaps of a smaller character but in the English language, and the new venture deserves every success. The chief editor is Dr. Wu Hsueh-Chou (director of the Chemical Institute of Academia Sinica), and inquiries and subscriptions should be addressed to him at that Institute, 320 Yoyang Road, Shanghai. Foreign subscribers may also communicate with Mr. S. H. Doo, 7137 Pennsylvania Avenue, Pittsburgh 8, Pa., U.S.A. The annual subscription is 2.00 American dollars per annum, or its equivalent.

Cambridge University Educational Film Council

The Cambridge University Educational Film Council was formed in February 1947 "to promote the use of films in higher education and for the purpose of academic research". The ultimate aim of the Council is the establishment by the University of Cambridge of a Film Centre with adequate facilities for the production, projection and storage of educational films; meanwhile, it is collecting information about educational films and film strips already in existence, giving technical advice to university departments wanting to make or project films, encouraging professional film units to consult with university teachers on the films required and their economic distribution, and arranging for the exchange of films with academic bodies of all kinds in Great Britain and other countries. Membership is open to members of the University, and all Faculties and Departments at Cambridge are automatically members of the Council. The General Board of Faculties and the Cambridge University Press appoint representatives to its executive committee. A memorandum on the provision of cinematograph facilities at Cambridge has been submitted by the Council to the General Board. The Council has already produced for distribution within the University a list of sources from which films suitable for use in university education can be procured, and obtained particulars of films made in Cambridge; it has also set up a library of film catalogues from Great Britain and abroad, and collected information regarding the use of films in a number of university departments outside Cambridge. At the suggestion of the Council, a conference on the use of films in universities was convened by the British Film Institute and the Scientific Film Association in November 1947, and a Universities Film Council for the British Isles has been established.

Televizing the Museum

The Cleveland Museum of Natural History has again shown commendable enterprise in extending its educational influence to a much larger public than habitual museum visitors (*The Explorer*: Bulletin of the Cleveland Museum of Natural History, 94; 1948). Through the courtesy of the American broadcasting station, W.E.W.S., it is now presenting a monthly television programme called "Your Museum of Natural History". Two general programmes have already been televized, one dealing with the timely subject of the Navaho Indians and the other with the recent gift to the Museum of the works of John J. Audubon, including the famous early nineteenth-century English prints of Havell. There is also a regular weekly television programme built round the Museum's explorers clubs for children; subjects so far presented include the Apache Indians, fur-bearing mammals, care of pets, bird migration and signs of spring.

Maps of Svalbard

Norges Svalbard og Ishavs-undersökelser, now known as Norsk Polarinstitutt, has begun the issue of a detailed map of Svalbard in folded sheets, each covering about 1,300 kilometres. The scale is 1 to 100,000. The map is based on a network of trigonometrical points and constructed from aero-photograms taken by oblique photography. It is in black for moraines, glacier limits and lettering, blue for seas, streams, lakes and glacier contours, brown for form lines and contours, and green for glacier slopes. In addition to the old place names in their accepted Norwegian forms, a number of new names have been added. The first sheet (price 3 kroner) covers the little-known Sörkapp area as far north as Hornsund and is numbered C.13.

Canadian National Research Council Scholarships

Scholarships have been granted by the National Research Council of Canada to 169 graduates for postgraduate studies during the academic year 1948–49. There are twenty-five fellowships at 900 dollars, sixty-three studentships at 750 dollars, seventy-five bursaries at 450 dollars tenable at Canadian universities, and ten special scholarships ranging in value from 500 to 1,000 dollars awarded for study abroad. The nominal value of all scholarships for the year is 107,900 dollars. Thirty departments of science are represented in the applications approved this year. Chemistry in its several branches is represented by 65 and physics by 62. The remaining awards are widely distributed in the other sciences as follows: agricultural bacteriology, 1; anatomy, 3; applied mathematics, 1; biology, 2; communications engineering, 2; dental bacteriology, 1; entomology, 1; experimental medicine, 1; genetics, 1; geology, 6; mathematics, 4; mathematical statistics, 3; medical research, 1; metallurgy, 1; mineralogy, 2; physiology, 3; physical metallurgy, 1; plant pathology, 1; and zoology, 7.

Conference on Civil Engineering Problems in the Colonies

A Conference on Civil Engineering Problems will be held at the Institution of Civil Engineers, Great George Street, Westminster, S.W.1, during July 19–23, at which a number of papers on subjects of importance in Colonial development will be read and discussed. Mr. A. Creech-Jones, Secretary of State for the Colonies, has consented to open the Conference on July 20, at 10.15 a.m. Among the topics to be discussed are: development planning with special reference to physical development, the East African groundnuts scheme, road improvement in Jamaica, railway gauge in tropical Africa, railways and roads in Malaya, problems of labour and material in West Africa, Colonial housing, and engineering aspects of tropical hygiene. The Conference is open to members of the Institution, to engineers and to other officers specially interested who are employed in the Colonial Service, and to other engineers who are otherwise engaged in civil engineering work in the Colonies. Application forms can be obtained from the secretary of the Institution of Civil Engineers.

Unione Matematica Italiana

The third national congress of the Unione Matematica Italiana is to be held at Pisa during September 23–36. The congress will be devoted to a comprehensive review of the Italian contributions to mathematics during the last few years, and particularly in so far as they are linked up with the mathematical activities of other countries during the same period. In addition to papers on pure and applied mathematics, special sections will deal more particularly with analysis, geometrical mechanics, mathematical physics, actuarial mathematics and probability, geodesy, astronomical and astrophysics, mathematics applied to engineering, the history of mathematics and didactics. The Unione Matematica Italiana cannot offer any financial assistance to visitors; but it is expected that expenses for the stay at Pisa will be low. All inquiries relating to the Congress should be sent to Prof. Luigi Berzolari, Università di Bologna, Bologna, president of the Unione Matematica Italiana, who is acting as secretary to the Congress.

British Thomson-Houston Summer School

The British Thomson-Houston Co., Ltd., Rugby, is holding a summer school in electrical engineering during July 12–16. Sir Henry Tizard is to open the school, which will consist of lectures and discussions on such topics as electronic control of motors, magnetic sheet steel, examination of large forgings, high-power pulse generation, power system analysis, switchgear problems, betatron developments, electric discharge and fluorescent lamps, etc. Tours of the Company's works have also been arranged. The purpose of the school is to enable engineers in academic posts to obtain first-hand knowledge of the more important recent advances in electrical engineering; attendance is by invitation of the Company. Further particulars can be obtained from the Manager, Publicity Department, British Thomson-Houston Co., Ltd., Rugby.

Seventh International Congress of Food and Agricultural Industries

The Seventh International Congress of Food and Agricultural Industries will meet in Paris during July 12–18 at the invitation of the French Government. Among the subjects for discussion are: the role of vitamins, hormones and trace-substances, ionic exchanges in sugar-refining, fermentation, homologization of malt, bread-making qualities of wheats, rational use of the combined harvester, improvements in the dairying and canning industries, advances in the feeding of livestock, digestibility of fats and oils, destruction of organic matter in waste waters, standardization of statistical methods, and technical instruction. Further details can be obtained from the Commission Internationale des Industries Agricoles, 18 Avenue de Villars, Paris.

University of London

The following appointments in the University of London have been announced: Dr. G. C. McVittie, to the University chair of mathematics tenable at Queen Mary College as from October 1; since 1936 he has been reader in mathematics at King's College, but during the War was engaged on work at the Government Communications Headquarters. Dr. Sidney Smith, honorary professor of Near Eastern archæology at the Institute of Archæology, London, to the University chair of ancient Semitic languages and civilizations tenable at the School of Oriental and African Studies, as from October 1.

The title of professor emeritus of physics in the University has been conferred on Dr. Frank Horton, professor of physics at Royal Holloway College during 1914–46 and vice-chancellor of the University during 1939–45. The title of professor emeritus of chemistry in the University has been conferred on Prof. T. S. Moore, professor of chemistry at Royal Holloway College during 1914–46.

The degree of D.Sc. has been conferred on Dr. Adrien Albert (School of Pharmacy), Louis Essen and A. E. J. Went.

The Night Sky in July

New moon occurs on July 6d. 21h. 09m., U.T., and full moon on July 21d. 02h. 31m. The following conjunctions with the moon take place: July 5d. 16h., Venus 8° S.; July 5d. 18h., Mercury 8° S.; July 9d. 06h., Saturn 4° S.; July 11d. 16h., Mars 3° S.; July 18d. 01h., Jupiter 4° N. Mercury is too close to the sun in the early part of the month to be observed, but in the middle of the month the planet rises an hour before sunrise and attains its greatest westerly elongation on July 16. At the end of the month Mercury rises at 3h. 16m., about an hour before sunrise. Venus rises about a quarter of an hour before the sun on July 1 but can be observed later in the month, rising at 2h. 28m. and 1h. 41m. on July 15 and 31, respectively. The planet attains its greatest easterly elongation on July 16 and its greatest brilliancy on July 31, when its stellar magnitude is −4·2. Mars sets at 23h. 10m., 22h. 30m. and 21h. 45m. at the beginning, middle and end of the month, respectively, and can be seen for a short time in the western sky after sunset. Jupiter, in the constellation of Ophiuchus, is visible during the early part of the night, setting at 2h. 40m., 1h. 36m. and 0h. 33m. at the beginning, middle and end of the month, respectively. Owing to its large declination south, nearly 23°, the planet is not very well placed for observation in high northern latitudes. Saturn sets about an hour before Mars and cannot be observed very long after sunset; at the end of the month it sets a little more than half an hour after the sun. No occultations of stars brighter than magnitude 6 take place in July. The earth reaches aphelion on July 4, when its distance from the sun is 94,561,000 miles.

Announcements

Dr. Julian Huxley has been elected *Correspondant* for the Section of Anatomy and Zoology of the Paris Academy of Sciences.

The honorary degree of D.Sc. of the University of Oxford has been conferred on Dr. Isaiah Bowman, president of Johns Hopkins University, and president during 1931–34 of the International Geographical Union; and on Prof. Linus Pauling, professor of chemistry and director of the Gates and Crellin Chemical Laboratories, California Institute of Technology, who is now George Eastman visiting professor at Oxford.

Mr. E. I. R. MacGregor has been appointed assistant civil air attaché at the British Embassy, Washington, in succession to Mr. N. Bicknell, who is entering the Foreign Service. Mr. MacGregor took first-class honours in physics at the Queen's University, Belfast, and after a short period on television research with Electric and Musical Industries, Ltd., he entered the R.A.F. Education Service (1936). During 1941–46 he served on the British Air Commission and R.A.F. Delegation at Washington.

A new exhibit of Protozoa in the Zoological Department of the British Museum (Natural History) has been opened to the public. It adjoins the Coral Gallery, which was reopened a few weeks ago. Owing to the minute size of these organisms, all but a few of the larger marine forms are displayed either by means of enlarged glass models or by tinted line drawings.

Carbon Monoxide Affinity of Chlorocruorin and Hæmoglobin

CHLOROCRUORIN, the green-red respiratory blood pigment of certain marine annelid worms, is the only known substance built on the same plan as hæmoglobin. Like most kinds of hæmoglobin, chlorocruorin has a higher affinity for carbon monoxide than for oxygen[1]. This property, valueless to animals, is utilized in experimental work to eliminate the possible respiratory activity of these pigments and so to test their functional significance[2,3]. The relative affinity of chlorocruorin (*Ch*), or of hæmoglobin, for the two gases in the reversible reaction

$$O.Ch + CO \rightleftharpoons COCh + O_2$$

is given by the equilibrium constant K in the equation

$$K = [COCh]/[O.Ch] \times p\,O_2/p\,CO,$$

from which it is seen that when the pigment is 50 per cent in the carboxy state and 50 per cent in the oxy state, K becomes the ratio of oxygen to carbon monoxide.

Krogh[4] was the first to show that different kinds of animals have different values of K. For the hæmoglobin of human blood, K has been found to be 235 or 246 (Douglas, Haldane and Haldane)[5], 240 (Killick)[6] or 490 (Anson *et al.*)[7]. The values for certain other hæmoglobins have been found to be as high as this or higher. For yet other hæmoglobins the values of K are low, that of horse muscle hæmoglobin (myoglobin)[8,9] being 14–51, of the hæmoglobin of leguminous root nodules[10] 37, and of the larva of the horse bot-fly (*Gastrophilus*)[11] 0·67. With these very considerable known differences in the relative affinity of hæmoglobins for carbon monoxide and oxygen, it was of interest to find the values of the equilibrium constant for several invertebrate hæmoglobins and for a chlorocruorin.

The blood of each kind of animal was diluted in $M/20$ phosphate buffer at pH 7·3 and then centrifuged and filtered to give a limpid solution. Some of this was put into a modified Thunberg tube with a 2 cm. optical cell, and the concentration was adjusted to give an optical density ($\log_{10} I_0/I$) of about 1·5 at the α-band, measured with a Hilger – Nutting visual spectrophotometer. After equilibration at 20° C., with air in the case of hæmoglobin, or oxygen for chlorocruorin (which cannot be saturated with oxygen at atmospheric partial pressure[1]), the densities were determined at wave-lengths 561 and 578 mμ for hæmoglobin, or 590 and 606 mμ for chlorocruorin. Previous plotting of the absorption curves of the oxy and carboxy compounds had shown that the two wave-lengths mentioned are those at which the light absorption differs most. The Thunberg tube was then evacuated, filled with an appropriate mixture of oxygen and carbon monoxide to obtain about a half-and-half mixture of the two compounds of the pigment, and the solution equilibrated with the gas by rotation for half an hour in a water thermostat at 20° C. in dim light, after which the changed densities were determined at the same two wave-lengths. (Although both carboxy compounds are dissociated by light[12,1], there was no progressive change in the spectrophotometer readings, even when the solution was left exposed to the lamp for a quarter of an hour; doubtless measurable changes only occur in thin layers.) The third step was to evacuate the tube anew, fill it with pure carbon monoxide, re-equilibrate and again measure the two densities. From the six density measurements the relative concentrations of the oxy and carboxy compounds in the solution in equilibrium with the gas mixture can be calculated by a formula given by Keilin and Wang[11], and from this the value of K in the equation above is directly deducible.

The following are the values of K which were obtained, in decreasing order of magnitude, the first being that of chlorocruorin, the remainder all of blood hæmoglobins: *Branchiomma vesiculosum* (Montagu), 570; *Chironomus dorsalis* Mg., 400; horse, 280; man, 230; *Arenicola marina* L., 150; *Tubifex* sp., 40; *Planorbis corneus* L., 40; rabbit, 40. From five to eleven determinations were made for each of the different animal forms. The values of K obtained for each of them varied considerably, and as there were not enough values to give standard errors, the means have been rounded to the nearest 10. There are several surprises in the results. The values differ greatly. The figure for man is virtually the same as those previously found by Douglas, Haldane and Haldane[5], and by Killick[6], which are given above. Anson *et al.*[7], who obtained a much higher value for man, agree with me in placing the horse a little above man and the rabbit much lower. The highest hæmoglobin value is that of the bloodworm, the larva of a midge, *Chironomus*. But chlorocruorin has a far higher value than any hæmoglobin. The lowest values which I found, namely, those of the oligochæte worm *Tubifex*, of the pond snail *Planorbis* and of the rabbit, are about the same as for the muscle hæmoglobin of the horse and the hæmoglobin in the root nodules of leguminous plants.

It is not possible at present to correlate the diverse values of K with other properties of these hæm pigments. *Chironomus*, with the highest value of K for any hæmoglobin, has also the highest oxygen affinity of a blood hæmoglobin[13], but chlorocruorin, with a still higher K, has an oxygen affinity much lower than any hæmoglobin[14]. The hæmoglobin in the muscle of the horse has a higher oxygen affinity than that of the blood, but a much lower K. The highest value of K in a hæmoglobin (*Chironomus*) and the lowest value (*Gastrophilus*) are both in the Insecta, in which class hæmoglobin is extremely rare. Keilin and Wang[11] have shown that there is no relation between K and span (difference between wave-lengths of oxy and carboxy α-bands) as was once thought. It is for future biochemical and physicochemical research to find the meaning of the very diverse values of K.

My sincere thanks are due to Prof. D. Keilin and Dr. E. F. Hartree for advice and help.

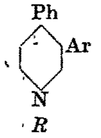
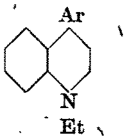
Synthetic Analgesics

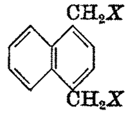
ATTEMPTS to prepare new analgesics have, for many years, been based almost exclusively on the morphine molecule, the peripheral groups of which may be modified considerably with relatively little effect on the biological activity. The synthetic drug 'Pethidine' (ethyl 4-phenyl-1-methylpiperidine-4-carboxylate) has several structural features in common with morphine, and there is a considerable body of evidence which relates analgesics of the piperidine type to the morphine model[1–4]. The recently discovered 'Amidone' (*dl*-2-dimethylamino-4 : 4-diphenylheptan-5-one) is also a potent analgesic. We have examined three types of compound for analgesic, antispasmodic and local anæsthetic action. Although none of these compounds is closely related to morphine, several have an analgesic potency equivalent to or approaching that of 'Pethidine'.



I



II



III

The synthesis of compounds of type I has already been reported[5]. Compounds of type II (in which Ar=Ph, or p-MeO.C_6H_4—) have been prepared by hydrogenation of the oximes of ethyl β-(2-keto*cyclo*hexyl)-β-arylpropionates, and the *p*-methoxy compound has also been demethylated to the corresponding *p*-hydroxy derivative[6]. The preparation of our compounds of type III has not previously been described. 1 : 4-*Bisdiethylaminomethylnaphthalene hydrochloride* (X = —NEt) was obtained as colourless needles, m.p. 229–230°, by condensing 1 : 4-bischloromethylnaphthalene[7] with diethylamine. (Found: C, 63·3; H, 8·4; N, 7·0. $C_{20}H_{32}N_2Cl_2.\frac{1}{2}H_2O$ requires C, 63·1; H, 8·7; N, 7·3 per cent. The *picrate* formed yellow needles, m.p. 203–204°. Found: C, 50·65; H, 4·6; N, 14·9. $C_{32}H_{36}O_{14}N_8$ requires C, 50·8; H, 4·8; N, 14·8 per cent.) 1 : 4-*Bis*iso*thiocarbamidomethylnaphthalene hydrochloride* (X = —SC(=NH)NH_2) was obtained as colourless plates, m.p. 270–272°, from the bischloromethyl compound and thiourea. (Found: C, 44·8; H, 4·6; N, 14·5. $C_{14}H_{18}N_4Cl_2S_2$ requires C, 44·6; H, 4·8; N, 14·8 per cent. The *picrate* formed yellow needles, m.p. 219–220°. Found: C, 41·2; H, 3·0. $C_{26}H_{22}O_{14}N_{10}S_2$ requires C, 41·0; H, 2·9 per cent.)

The L.D.$_{50}$ in mgm./kgm. was determined by intraperitoneal injection in white mice. Of the N-alkyl-3 : 4-diarylpiperidines (type I), increase in the length of the alkyl chain decreased toxicity from 90 mgm./kgm. for 3 : 4-diphenyl-1-methylpiperidine to 250 mgm./kgm. for 3 : 4-diphenyl-1-*n*-butylpiperidine. In group II, 1-ethyl-4-(*p*-hydroxyphenyl)decahydroquinoline (120 mgm./kgm.) was less toxic than the unsubstituted 4-phenyl compound (80 mgm./kgm.). In group III, the thiourea derivative (61 mgm./kgm.) was much more toxic than the diethylamino derivative (370 mgm./kgm.). The Straub tail phenomenon was present in greater or less degree in mice poisoned with various members of each group. Compounds of types I and II mainly produced motor excitement (as does 'Pethidine'); group III was depressant.

TOXICITY AND ANALGESIC ACTIVITY

Name	Relative analgesic potency (mice)	L.D.$_{50}$ (mgm./kgm.) intraperitoneal injection, mice
3 : 4-Diphenyl-1-methylpiperidine HCl	stimulant	90
3 : 4-Diphenyl-1-ethylpiperidine HCl (*A* isomer)	0·6	100
3 : 4-Diphenyl-1-ethylpiperidine HCl (*B* isomer)	0	130
3 : 4-Diphenyl-1-*n*-butylpiperidine HCl	0·6	250
4-Phenyl-3(*p*-methoxyphenyl)-1-ethylpiperidine HCl	0·4	150
4-Phenyl-1-ethyldecahydroquinoline HCl	0·6	81
4-(*p*-Methoxyphenyl)-1-ethyl-decahydroquinoline HCl	0·7	100
4-(*p*-Hydroxyphenyl)-1-ethyl-decahydroquinoline HBr	0	120
1 : 4-Bisdiethylaminomethyl-naphthalene HCl	1·0	370
1 : 4-Bis*iso*thiocarbamidomethyl-naphthalene HCl	1·0	61
'Pethidine'	1·0	150

Drugs in group I were irritant when placed in the conjunctival sac of rabbits, and neither group I nor group III showed any evidence of local anæsthetic properties. Group II drugs were less irritant than group I and had some effect as anæsthetics. The most powerful, 1-ethyl-4-(*p*-methoxyphenyl) decahydroquinoline, had a potency of 10 per cent of cocaine hydrochloride. The compounds were tested for antispasmodic activity against barium chloride (5 mgm.), histamine base (1 μgm.), acetylcholine (1 μgm.) in a 75 ml. bath. None of the compounds was highly specific, but all had some antispasmodic activity. Group I compounds were most active, 3 : 4-diphenyl-1-ethylpiperidine having 1/33 the activity of benadryl against spasm induced by histamine; against acetylcholine, 1/250 the activity of atropine sulphate; against barium, 1/6 the activity of 'Pavatrine'. Group II and group III were of a similar order of potency against barium-induced spasm, but much less active against histamine and acetylcholine. The analgesic potency was estimated according to the method of Davies *et al.*[8], except that mice were used instead of rats. Group III drugs were found to be equal in potency to 'Pethidine'. Groups I and II showed lesser and varying degrees of potency, and 3 : 4-diphenyl-1-methylpiperidine is a stimulant. The considerable analgesic activity of 1 : 4-bisdiethylaminomethylnaphthalene is of interest, as this is a new class of compound to exhibit pronounced activity.

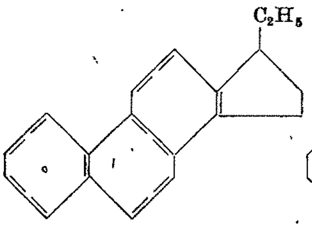
Constitution of Conessine

PREVIOUS work has shown that the alkaloid, conessine, is a ditertiary base, $C_{24}H_{40}N_2$, containing three N-methyl groups and one ethylenic linkage, and our work now establishes a relationship with the growing class of steroid bases. The absence of oxygen is noteworthy; this is uncommon in the alkaloids, and the natural occurrence of an oxygen-free steroid derivative has not been reported previously.

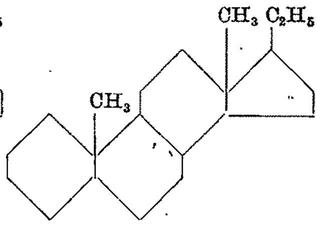
The first indication of the structure came from an examination of the selenium dehydrogenation products of the hydrocarbon mixture, $C_{21}H_{30}$, obtained by pyrolysis of conessine dihydriodide[1]. Careful fractionation of the products yielded a crystalline hydrocarbon, $C_{19}H_{18}$, m.p. 78–79°, which showed many similarities with synthetic[2] 3′-ethylcyclopentenophenanthrene (I), m.p. 84·5–85·5°.

Although the hydrocarbons and their derivatives with nitrohydrocarbons gave no depression in melting point on admixture, it was not possible to raise the melting point of the hydrocarbon obtained from conessine, even after recovery from the nitrohydrocarbon complexes; and, as some discrepancies were observed on comparison of the ultra-violet absorption spectra and X-ray photographs of the two hydrocarbons, the identity was not convincingly established.

By subjecting conessine to successive degradations by the Hofmann and Emde processes, Späth and Hromatka[3] obtained a hydrocarbon, $C_{21}H_{30}$, which gave a hexahydroderivative, $C_{21}H_{36}$, m.p. 56–58°. In our hands this reduction has yielded approximately equal amounts of two isomeric hydrocarbons, $C_{21}H_{36}$, m.p. 56–58° and 83–84° respectively. The former is presumably identical with the hydrocarbon obtained by Späth and Hromatka, and the isomer, m.p. 83–84°, is identical, chemically and physically, with *allo*pregnane (II), prepared from progesterone by described methods[4].



I



II

The carbon atoms of conessine are therefore accounted for by the *allo*pregnane structure (II) and the three N-methyl groups, but the positions of the ethylenic linkage and the points of attachment of the basic centres are still uncertain. Structural investigations on conessine and its relatives are being developed in several directions, and a full account will be published elsewhere.

Quantitative Electron-Density Contour Delineation in the Electronic Fourier Synthesizer for Crystal Structure Analysis

THE electronic Fourier synthesizer for crystal structure analysis reported earlier from this laboratory[1] has been modified so that contour lines of projected electron densities from one cell on any desired lattice plane can be accurately delineated.

It was originally intended that a pattern corresponding to a Bragg photographic synthesis be presented on a cathode ray tube screen; and the remark was made in the early report that such a presentation should not be considered as a replacement for accurately calculated contour maps, due to obvious limitations on linearity and range of screen response. This inexactness is removed by triggering coincidence circuits, set at predetermined voltage levels, directly from the voltage signal formerly applied for intensity modulation to the cathode ray tube grid. The circuits produce 1 microsec. pips each time the synthesized signal crosses one of the preset voltage levels, and these are applied to the cathode ray tube grid in place of the entire synthesis signal.

Fig. 1

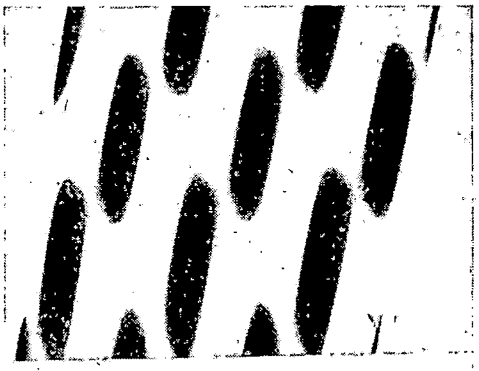

Fig. 2

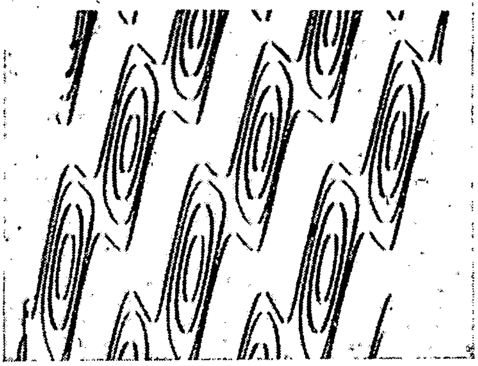

The contouring technique has been applied to the model synthesizer which was demonstrated at the Annapolis meeting of the Crystallographic Society of America on March 20, 1947[2]. Fig. 1 shows an intensity-modulated pattern corresponding to the superposition of (2, 0, 3) and (1, 0, $\bar{3}$) fringes, for a c-axis projection of a monoclinic cell with $a : c \approx 1 \cdot 0 : 1 \cdot 1$ and $\beta \approx 81°$. Fig. 2 shows a four-line contour map of the same projection. (It may be recalled that the axial ratio and angle of a projection can be adjusted at will on the synthesizer[1].) These photographs are obtained directly from the presentation tube.

The apparent difference in contours of some peaks in Fig. 2 is due to non-linearity of sweep in the model synthesizer. In the large synthesizer for a 20 by ± 20 matrix of terms, construction of which is in progress, these and other imperfections are removed. Co-ordinate lines (of controllable intensity) are also available in the large device, so that accurate location of peaks is possible. The size and conditions of operation of the final synthesizer will be such that as many contour lines as are desired can be accommodated. The zero-level of electron density can be set in through adjustment of the overall D.C.-level of the synthesized signal.

Development of the electronic Fourier synthesizer is supported by the Office of Naval Research, Navy Department, Washington, D.C., under Contract No. N7onr-377.

The simple contouring procedure grew out of conversations with Prof. A. L. Patterson, of Bryn Mawr College. The long-standing interest, support and valuable suggestions of Prof. Patterson in this entire development are much appreciated.

Low-Angle X-Ray Diffraction Pattern of Collagen

IT is generally accepted that the low-angle X-ray diffraction pattern of collagen is unidimensional in the direction of the fibre axis with a fundamental period of 640 A. [1]. Variations in the water content of the fibre, effected by a control of the ambient relative humidity during the X-ray exposure, alter this spacing from 628 A. at 2 per cent relative humidity to 672 A. at 100 per cent relative humidity. This continuous increase in spacing is accompanied by drastic fluctuations in the relative intensities of the various orders.

If the uptake of water by the collagen produced a uniform extension of the molecule, no change in the intensities of the orders in the diffraction pattern would be observed. The intensity variations of the reflexions which do occur can only be explained by a non-uniform alteration in the electron density. As the most significant intensity changes occur in the low-order reflexions, the increase in spacing brought about by water absorption could be interpreted as water entering between the collagen molecules, thus influencing molecular packing. Any non-uniform change in the molecular configuration, such as an alteration in the spacing of certain atomic groups, would occur over relatively short distance in the molecule and would affect the intensities of the high-order reflexions accordingly. Perutz[2] has observed similar effects in the variations in the intensities of reflexions in the X-ray diffraction patterns of crystalline proteins.

The source of collagen used for this X-ray diffraction study was kangaroo tail tendon, since a high degree of orientation is present in the natural state of the material. By staining all the samples with an unbuffered 1 per cent solution of phosphotungstic acid, the intensity of all the reflexions was increased (thus reducing the required exposure time), with no apparent alteration of the diffraction pattern.

Fundamental spacing in A.	672	666	655	646	636	630

The accompanying table indicates the humidities at which the diffraction patterns were photographed, the corresponding fundamental spacings, and the intensities of the various orders as measured by densitometric methods. Accurate comparison of these films is not possible because of variations in sample thickness and in film development. Recently, a second series of diffraction patterns has been photographed in which the same sample was used throughout, and all films were processed simultaneously. This procedure permits the desired accurate comparison of intensities. Further experiments are now in progress.

X-Rays and the Eigen-Vibrations of Crystal Structures

IN evaluating the effect of the atomic movements in a crystal on the propagation of a beam of X-rays through it, such of these movements as may be identified with the elastic modes of vibration of the solid may be taken up first for consideration. Each of these modes presents a distinctive pattern of nodal surfaces, the frequency of the oscillation being the same everywhere and the phase being opposite in every pair of adjacent cells in the pattern. The configuration of the nodal surfaces in any given mode is determined by various *macroscopic* factors, namely, the form of the crystal, the external boundary conditions and the elastic anisotropy, besides being dependent on the frequency of the mode. Hence, it would bear no particular relation to the atomic architecture of the crystal and would also be different for each of the numerous possible modes. These circumstances have important consequences in relation to the optical aspects of the problem. Each atom in the track of the X-ray beam may be considered as a source of secondary radiations of frequencies ν, $\nu + \nu^*$ and $\nu - \nu^*$, ν being the frequency of the X-radiation and ν^* that of the elastic vibration under consideration, and their effects have to be summed up over the illuminated volume. Since the amplitudes and phases of the radiations of modified-frequency depend on the amplitudes and phases of the atomic movements, they would vary from atom to atom in a manner determined by the configuration of the nodal pattern, and hence would be different for each different ν^* and in no case would be definitely correlated with the internal architecture of the crystal. It follows that these scattered radiations cannot possibly give rise to any geometric diffraction pattern exhibiting an observable relationship to the structure of the crystal.

It remains to consider the possible vibrations in the solid which cannot be described as elastic modes, but which, on the other hand, are specifically related to the structure of the crystal and may therefore be designated as its eigen-vibrations. That such vibrations exist is proved by spectroscopic investigations, and their number and nature have been investigated by me[1] with results which have found experimental confirmation in various cases[2]. Since these eigen-vibrations are specifically related to the structure of the crystal, the secondary radiations of modified frequency resulting therefrom should be capable of giving rise to geometric diffraction patterns having a recognizable relationship to the internal architecture of the crystal. Theoretical considerations thus lead us to recognize the fundamental connexion between the eigen-vibrations of crystal structures and the dynamic X-ray reflexions exhibited by them. The existence of such a relationship and the possibility of the eigen-vibrations being excited even in the absence of thermal agitation first become apparent from the experimental facts discovered in the case of diamond by the present writer and Dr. P. Nilakantan[3].

Observations of Scatter Clouds

THE observations made recently by P. Millman and his colleagues in Canada[1] are of particular interest to me. I have made many observations of these scatter clouds on waves of about 8 or 9 Mc./s. Thousands of photographs have been obtained, and an explanation of the effect of the clouds upon long-distance transmission has been given[2].

Although there is strong evidence that ultra-short-wave radar transmission is connected with meteors, the results of Millman and his colleagues show very clearly that scatter clouds are not only produced by meteors. I have shown that there is a large increase in these scatter clouds before a Dellinger fade (see Figs. 1 and 2). In Fig. 1 we see a number of scatter clouds which are not associated with visible meteors. The visible meteors are shown by marks at the edge of the film. In Fig. 2 we see a number of scatter clouds which occurred just before a Dellinger fade.

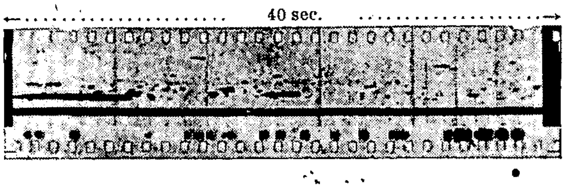

Fig. 1. G.M.T. 0130–0200, Nov. 15, 1937. ONGAR, GOX, 32·35 M.

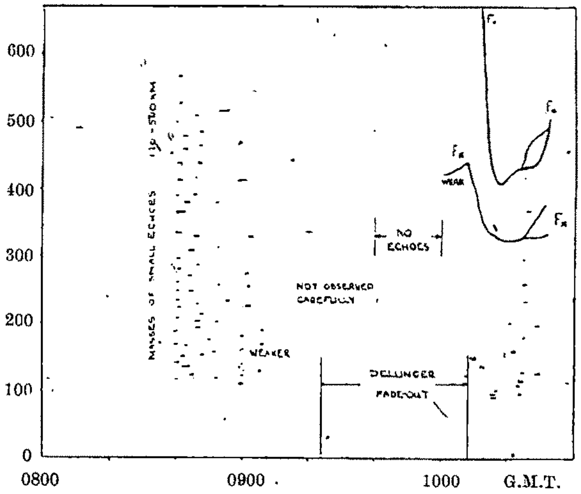

Fig. 2

The mechanism I conceive of the production of scatter clouds in Dellinger fade conditions is as follows. There is a disturbed condition of the sun before, during and after Dellinger fades, with a large amount of ultra-violet radiation from it. This will produce photo-ionization in the particles of cosmic dust suspended at about 100 km. height. Before a Dellinger fade, such particles will produce showers of photo-electrons, and these will produce localized scatter clouds.

There are four main effects observed by Millman and his colleagues, and they can all be explained by the theory of the evaporation of meteors[3], the conditions obtaining during Dellinger fades and the physics of scatter clouds. They are:

(1) The absence of correlation of scatter clouds with meteors. They can equally well be associated with Dellinger fades.

(2) The presence of two types of scatter cloud in and above the *E* layer. This implies that there must be two different types of particle. These are the evaporated meteors and the unevaporated meteors. Meteor effects are exaggerated on high frequencies.

(3) The inadequacy of the explanation of height constancy obtained geometrically when the line from the transmitter cuts the meteor orbit at right-angles. The height constancy is a definite consequence of my theory of scatter clouds, and is produced by the range of penetration of the molecules from the particles evaporated. In the Dellinger fade theory, it depends upon the range of the photo-electrons.

(4) The effect of wave-length. The wave-length effect can best be understood by referring to the mathematical form of the intensity of the waves scattered from a cloud. This is:

$$\delta\nu^2 (\lambda/a)^4 \exp\{-f(h)\},$$

where ν is the critical frequency corresponding to the density of the cloud, a is the radius of the cloud, and $f(h)$ is a function of the height of the cloud above the earth.

This has three factors, which show that the biggest effect is produced by a large number of particles, that the wave-length λ reduces the effect at a given height in proportion to λ^4, and that there is an attenuation factor which is dominant. This attenuation factor has much more effect than the λ factor, and we get observations when the attenuation is small and the λ^4 factor does not matter so much.

Observations show that the only wave-lengths on which scatter clouds are wholly associated with meteors, and not with Dellinger fades, are the short ones. On all others they may equally well be associated with either. A comparison between the results of long-wave and short-wave experiments is interesting.

My picture is this: Meteor clouds and meteors penetrate rather deeply into the atmosphere and can only be observed when the attenuation factor is small, that is, when sufficiently high frequencies are used. The result is that sufficiently short radio waves select the meteor-produced clouds. Those produced at a constant height, as in Dellinger fade effects, are not selected, and require long waves to disclose them.

Fig. 14 in my paper referred to earlier[2] shows that the field scattered from a cloud is proportional to λ^4. This is a complete experimental confirmation of the theory of scatter clouds.

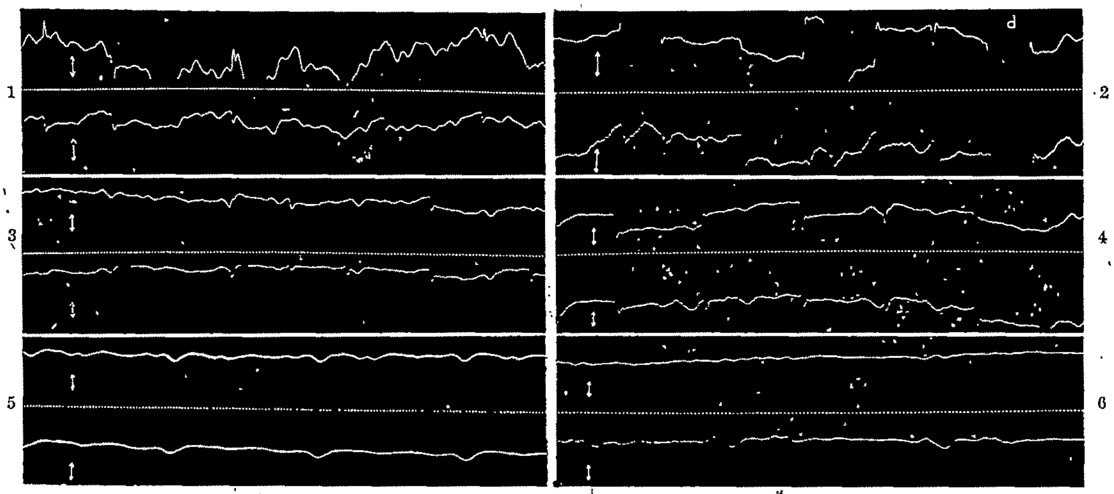
Eye Movements During Monocular Fixation

A METHOD of recording small eye movements during monocular fixation has been described by one of us[1], in which a beam of ultra-violet radiation (λ = 3650 A.) is incident on the cornea in such a direction that the fraction of the light transmitted through the cornea falls on the subject's blind spot when some test object is fixated by the illuminated eye; the subject is then, in effect, only aware of the fixation target. Part of the radiation, however, is reflected at the cornea; this reflected beam strikes a half-aluminized mirror and is there divided so that one part falls on a vertical straight edge and the other on a horizontal one. In each case, more or less of the radiation passes the straight edge as the eye moves, the fraction passed being focused on to an electron multiplier photocell. The output of each multiplier is amplified and fed to a cathode ray oscillograph, the time base of which is suppressed. The two oscillograph beams are in this way arranged to give vertical traces only, which are photographed simultaneously on a continuously moving film travelling in the horizontal direction. The eye movements can then be deduced from the two records on the film. The system is sufficiently sensitive to detect eye movements of 1 minute of arc; deflexions due to noise from the multipliers do not, in general, correspond to more than half a minute of arc.

To reduce head movements, the subject is placed in the prone position with the head resting on a firm foundation and partially supported in a sling. He also bites on a dental impression mouthpiece suspended above him from an adjustable mounting. Slight head movements, however, persist; their effect on the corneal reflex, apart from compensating eye movements, was first found by recording the reflexion from an artificial cornea supported on a spectacle frame just above the live cornea. Afterwards, a more rigid attachment of the artificial cornea to the skull was obtained by mounting it on an aluminium strip, the other end of which was fixed to a dental regulation band clamped round one of the front teeth of the upper jaw. This method, however, presents difficulties in the case of observers with closely set teeth.

Head movement records for W. D. W. are shown in Fig. 1, as obtained by the tooth attachment method. The movements are seen to be periodic and are evidently related to the beating of the heart. The longitudinal movements are appreciably greater than the sideways displacement; but, even so, the greatest movement shown in the record corresponds to a displacement of the head of only 0·01 mm. Subject M. P. L. was unable to use the tooth attachment, but her steadiest eye movement records show



1. HEAD MOVEMENTS OF W. D. W. 2. HEAD MOVEMENTS OF M. P. L. (DERIVED). 3 and 5. EYE MOVEMENTS OF W. D. W. FIXATION TARGET, BRIGHT SPOT ANGULAR DIAMETER 3 MINUTES: 4 and 6. EYE MOVEMENTS M. P. L. FIXATION TARGET, BRIGHT CROSS, ANGULAR WIDTH ARM 1 MINUTE, ANGULAR LENGTH ARM 20 MINUTES. TIME MARKED BY DOTS, 50 PER SECOND. AMPLITUDE SHOWN AT SIDE; HEIGHT OF ARROWED LINE REPRESENTS 10 MINUTES OF ARC. UPPER RECORD GIVES EYE MOVEMENTS IN VERTICAL PLANE, LOWER RECORD IN HORIZONTAL PLANE

a periodicity similar to that occurring in the head movement records of W. D. W. From a study of several of her steadiest records, it was thus possible to deduce her head movements indirectly, as shown in Fig. 2.

Records 3 and 4 show typical eye movements for each subject during monocular fixation, when the subject was at his steadiest. The main feature which distinguishes the eye movements from the head movements is the rapid flick lasting 0·02–0·03 sec. and indicating a momentary angular movement of the eye of amplitude ranging from about 3 to 14 minutes of arc, and an average frequency of about 2 per sec. for W. D. W. and 3 every 2 sec. for M. P. L.

Between these flicks most of the recorded movement could be attributed to head movements, although in the absence of simultaneous head and eye movement records this is not certain. After each flick, the records suggest that the eye may take up a slightly different fixation direction displaced some few minutes of arc from the previous direction. This effect might be due to slight irregularities building up on the corneal surface; however, after-image experiments, for example, observation of the after-image of a bright annulus during fixation of a point source of light, seem to confirm the first interpretation.

On the majority of occasions, however, it was impossible to obtain records as steady as those in Figs. 3 and 4, random eye movements of 10 or 20 minutes of arc commonly occurring, as shown in Figs. 5 and 6. The gap at P in record 5 is due to a blink and indicates obstruction at the centre of the cornea lasting for 0·2 sec., in general agreement with data presented recently by Lawson[2]; in this, as in most cases, little subsequent disturbance in fixation direction has been produced.

Tests made with various fixation targets showed no significant variation in fixation ability, relative to the day-to-day variation in ability to fixate on a given target. There is little evidence of any fine vibratory movements having a period of the order of 0·02 sec. as reported by Adler and Fliegelman[3] and discussed at length by Jones and Higgins[4] in connexion with the resolving power of the eye.

We wish to acknowledge with thanks the financial support of the Medical Research Council in this work, and also the help of Mr. J. Baird in connexion with the dental regulation band.

The Fundamental Colour Sensations

IF pressure, sufficient to be thoroughly uncomfortable, is maintained by the fingers on the eyeball, numerous violet dots will eventually appear in among the other entoptical phenomena. Each dot lasts a second or so. If the pressure is suddenly released, all the entoptical phenomena disappear except the violet dots, which are left for a few seconds against a dark background. They are fairly uniformly distributed over the field of view, and may number anything up to, say, 100. From the fact that all the violet dots are of exactly the same hue, saturation and intensity and of approximately the same size, one is probably justified in assuming that they are the fundamental violet sensation. By looking at a spectrum with the other eye (light-adapted) it is possible to match their hue against a spectral hue. They match 440·5 mμ, the standard deviation of each observation being ± 5 mμ and that of the mean being ± 0·5 mμ. They are considerably more saturated in colour than spectral violet. Their apparent angular diameters are of the order of 10′. From the tritanopic isocolour chart given by Pitt[1], which depends on a description by König of five pathological cases of tritanopia, one can deduce that the fundamental violet sensation is equivalent to the sensation produced by 435 mμ, except that it is more saturated. Considering the inadequacy of the data available to Pitt, the discrepancy between 440·5 mμ and 435 mμ is not significant.

Gentler pressure will, in suitable circumstances, produce a uniform green colour of low intensity throughout the field of view. If one continues with this pressure for a minute or so, a green patch of greater luminosity but of about the same saturation appears, usually in the temporal field. By suitable adjustment of the pressure, it may be made to grow into a broad elliptical halo surrounding the macula, which by comparison looks black. The horizontal axes of the halo are about 1·3 times the vertical, the inside horizontal axis subtending about 7° and the outside about 30°. Both measurements are very variable, and occasionally the hole in the centre of the halo is green and is surrounded by darkness. The halo is slightly more saturated than any spectral green and matches 555 mμ, the standard deviation of each observation being 3 mμ and that of the mean being 0·7 mμ. This does not agree with the value 505 mμ obtained from Pitt's colour triangle for the hue of the green fundamental sensation, nor is it sufficiently saturated. It seems, indeed, to be a most improbable value for a fundamental sensation on any trichromatic theory which disallows negative stimulation. As the halo gets fainter, it appears to become slightly bluer in the same way as spectral 555 mμ does, but it is doubtful whether it ever becomes as blue as 505 mμ. Hence, in terms of trichromatic theory, it is probably a mixture in fairly constant proportions of the red and the green fundamental sensations only.

Reddish spots can also be made to appear. They are apparently of two or more different kinds, the smallest being very much smaller than the violet dots. All types are so fleeting that it is difficult to match them against the spectrum, or even to see whether they are alike.

No colourless entoptical phenomena appear as a consequence of pressure. This result and the occurrence of the violet dots at approximately the position in the colour triangle predicted by Pitt are rather more readily explained on classical trichromatic theory than on Granit's[2] theory of dominators and modulators.

All the above results were obtained on one observer (male) with normal colour vision.

The high frequency of *Rh*-negative (*D*-negative) persons (30·5 per cent) and of the *d* gene (58·8 per cent) are in agreement with the findings of Etcheverry[1] and support the views recently put forward by one of us[2] regarding the history of the *d* gene. The low frequency of *cDE* is another notable feature. The excess of *Dd* heterozygotes and the deficiency of *MN* heterozygotes are clearly due to unavoidable errors of sampling. For this and other reasons steps are being taken to examine more persons. The combined results and a full discussion of them will be published elsewhere.

We should like to thank Prof. de Barandiaran and the members of the Basque delegations in London, Paris and Bayonne for their highly efficient organisation which alone made the collection of the specimens possible. One of us (J. N. M. C.) is in receipt of a Government Grant for Scientific Investigation through the Royal Society, and a grant from the Slater Fund at St. George's Hospital Medical School.

Evolution of Hydrogen from Ferrous Hydroxide

It is generally supposed that ferrous hydroxide in aqueous suspension can decompose, according to the equation

$$3Fe(OH)_2 = Fe_3O_4 + 2H_2O + H_2.$$

The experiments of Schikorr[1] suggest that this can occur, but only in presence of metallic iron or excess of ferrous salt in solution.

The matter is important in connexion with the attack of iron by pure oxygen-free water. Warner[2] showed that a reaction such as

$$Fe + 2H_2O = Fe(OH)_2 + H_2$$

is permissible on grounds of energy; it might, however, be precluded on grounds of geometry if a continuous film of ferrous hydroxide were built up, separating the iron from the water. Possibly this protection might fail if the hydroxide were converted to anhydrous magnetite (a denser substance, commonly produced in granular form).

Actually, Murata[3] found that oxygen-free water acting on iron powder evolved hydrogen for a month, yielding ferrous hydroxide crystals; but Thompson[4], also using iron powder, reported the formation of magnetite on the glass apparatus; Corey and Finnegan[5], starting from iron rods, obtained non-adherent magnetite. Gould[6], working in this laboratory, observed no granular magnetite when water at the boiling point acted on steel with exclusion of oxygen; hydrogen was evolved at first, but attack soon became negligible, evidently owing to the formation of a protective film. In other experiments, where oxygen was intentionally admitted, a mass of magnetite and rust was found adhering to the metal at a few points only; it was probably formed by secondary oxidation of the ferrous hydroxide, mainly at a distance from the metal; its removal revealed deep corrosion-grooving. There is no necessary inconsistency between these various results, but it is clearly important to decide under what conditions Schikorr's reaction can occur; hence some new experiments have been carried out.

Ferrous hydroxide, pure enough to be almost colourless, was precipitated by mixing ferrous chloride and potassium hydroxide solution in an atmosphere of hydrogen. These solutions were prepared by the electrolysis of a de-aerated potassium chloride solution between a platinum cathode and a pure iron anode; the design of the apparatus was such that premature mixing of anodic and cathodic products did not occur and that the two solutions could be mixed in any desired proportions. The de-aeration was carried out by boiling followed by the passage of hydrogen through the solution. After precipitation, the ferrous hydroxide and supernatant liquid were left in a flask connected to a manometer, so that any evolution of hydrogen might be detected by a pressure increase. No hydrogen evolution was detected under these conditions, even with ferrous chloride in excess.

Further experiments were then performed, following more closely those of Schikorr[1]. Here the ferrous hydroxide was prepared by precipitation from a ferrous sulphate solution with sodium hydroxide. Under these conditions Schikorr reported evolution of hydrogen at room temperature, when ferrous sulphate was in excess, but not when alkali was in excess. However, in our experiments, no evolution of hydrogen was observed even when the reactants were heated to 100° C.

It was nevertheless found that hydrogen was evolved at room temperature, in the presence of excess ferrous sulphate, if certain additions were made to the solution before precipitation with alkali. These additions included platinum chloride, colloidal platinum, nickel sulphate, nickel powder and copper powder. A smaller evolution was also produced by the addition of sodium sulphide. It is as yet uncertain whether these metals themselves or their ions in solution are the true catalysts, and no views on the mechanism of the reaction are here offered.

No hydrogen has yet been obtained after the addition of manganese sulphate—a matter of obvious importance in connexion with steel.

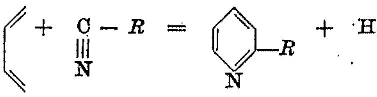
Reaction of Cyanogen and Related Compounds with Butadiene

Cyanogen and butadiene have been found to react at moderately high temperatures (400°–700° C.), forming as the main product 2-cyanopyridine. It has also been established that this behaviour of cyanogen may be generalized for the simple 1,3-dienes[1,2].

The present communication presents the results of some calculations and experiments with nitriles of the type R—CN, where R is H,CH_3,C_6H_5, as well as CN. In each case, the free-energy change for the reaction:



(1)

has been calculated over a range of temperatures in order to obtain information useful as a guide in the experimental investigation. These results are summarized in Table 1. The thermodynamic functions for 2-methylpyridine, 2-cyanopyridine and benzonitrile were calculated statistically, the vibrational frequencies of these compounds being assigned on a semi-empirical basis involving a consideration of the assignment for pyridine and benzene, and also the frequencies associated with the vibrations of the methyl and cyano groups. The functions for 2-phenylpyridine were estimated by a method of increments from the functions of 2-methylpyridine and benzene.

TABLE 1

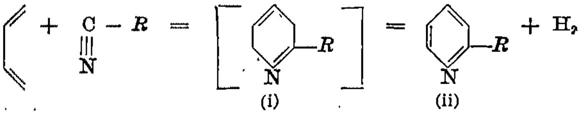
Reaction 1 with R as:	Product	ΔF (kcal.) for the reaction			
		T° K. 400	600	800	1000
H	Pyridine	−23·9	−20·9	−17·8	−14·7
CH_3	2-Methylpyridine	−18·9	−14·5	−11·1	−4·66
C_6H_5	2-Phenylpyridine	−7·07	−5·37	−4·05	−3·05
CN	2-Cyanopyridine	−30·1	−27·2	−25·6	−20·6

It is seen that the calculated free-energy change is quite favourable over the temperature range in question in each case; but since these results refer to equilibrium in ideal gaseous systems, a quantitative correlation with the experimental work has not been attempted. In Table 2 the data for three comparable vapour-phase experiments are given. The experiments were carried out at atmospheric pressure in an unpacked quartz reaction vessel, using continuous flow technique. The product in each case was identified by its known physical constants, and the melting point and analysis of the picrate. The yields are calculated on the amount of nitrile converted.

TABLE 2

Reaction 1 with R as:	Product	Temp. °C.	Contact time	Mol. ratio RCN/C_4H_6	Yield of product
H	Pyridine	595±5°	30 sec.	1·1/1·0	5–6 %
CH_3	2-Methylpyridine	599±5°	30 ,,	1·7/1·0	5–6 ,,
C_6H_5	2-Phenylpyridine	591±5°	31 ,,	1·7/1·0	12–16 ,,

These reactions may be explained as proceeding by a Diels – Alder mechanism in which the (—C≡N) has the role of the dienophilic component of the dienophile:



The intermediate (i) has not been observed among the products, and it would seem that it undergoes spontaneous dehydrogenation at these temperatures to form the thermodynamically more stable pyridinic product (ii).

A fuller account of this work is to be published elsewhere. The investigation is being continued.

We wish to thank Prof. C. K. Ingold and Dr. Albert Wasserman for helpful discussions, and Imperial Chemical Industries, Ltd., for some of the chemicals necessary for this investigation.

Rapid R_F Measurement in Chromatography

THE device described here has proved very useful for the rapid measurement of R_F values on paper partition chromatograms[1]. In the figure, AB is an aluminium strip 20 in. × ½ in. × ⅛ in., AC is a piece of white elastic 9 in. × ½ in. attached to the end A of the strip by sewing through a hole in the strip. The other end of the elastic C is attached to a small 'bulldog' clip. A scale (divided into 100 parts) is marked on the elastic. For use, the zero of the scale is placed at the origin line or spot and the 100 mark stretched out to coincide with the position reached by the solvent front. The R_F values of the spots can then be read off directly on the scale. While α-amino-acids can be recognized simply from their relative positions on a chromatogram, the device allows a quick check on isolated or unknown spots or the spread of a spot. A smaller apparatus on the same expanding-scale principle can be used for measuring the R value[2] of substances on a column where the ratio, movement of band/movement of sample of liquid in unpacked part of the column above, is employed.

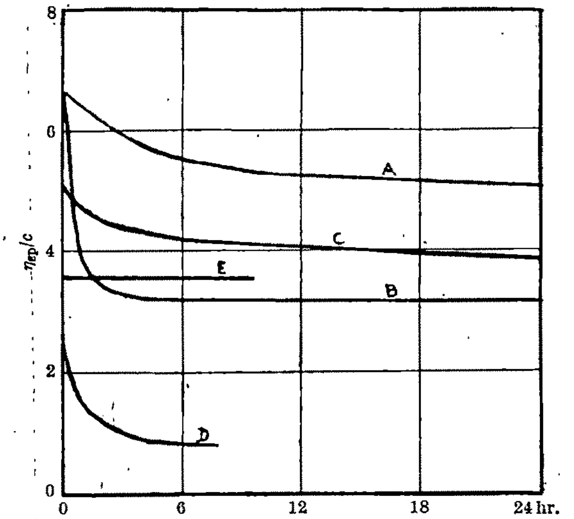
Degradation of a Vinylidene Chloride Copolymer in Solution

SOME observations have recently been made on the changes in viscosity of solutions of a copolymer containing approximately 85 per cent vinylidene chloride, 13 per cent vinyl chloride and 2 per cent acrylonitrile (by weight). The polymer was soluble in hot, but not in cold, tetrahydrofuran: once it had been dissolved by heating in the solvent at 60–65° C. for 2–3 min., the solution could be cooled to room temperature without gelling or precipitation.

Copolymer solutions of different concentrations, made up in redistilled tetrahydrofuran by heating as above, were aged in sealed glass tubes in contact with air for varying times at 50° C. and 75° C. Typical curves showing the changes in η_{sp}/c (where η_{sp} is specific viscosity and c is concentration in monomoles per litre) of the solutions with time are reproduced herewith (Curve A, 50° C., Curve B, 75° C.).

Investigation showed that the tetrahydrofuran used contained peroxides, and further work showed that: (*a*) a similar fall in η_{sp}/c was observed in cyclohexanone at 75° C., and in dioxane at 85° C., both in air (Curves C and D); (*b*) a slight reduction in η_{sp}/c took place in *peroxide-free* tetrahydrofuran at 75° C. in air; (*c*) little or no reduction in η_{sp}/c took place in *peroxide-free* tetrahydrofuran at 75° C. in nitrogen; (*d*) no reduction in η_{sp}/c took place in *o*-dichlorbenzene at 130° C. in air (Curve E).



AGEING OF VINYLIDENE CHLORIDE COPOLYMER SOLUTIONS

A. In tetrahydrofuran at 50° C.
B. ,, ,, ,, 75° C.
C. ,, cyclohexanone ,, 75° C.
D. ,, dioxane ,, 85° C.
E. ,, *o*-dichlorbenzene ,, 130° C.

These observations are consistent with the view that the viscosity decrease in these polymer solutions is due to a degradative attack on the long-chain molecules, not by oxygen directly, but by peroxides formed from the solvent and atmospheric oxygen. Tetrahydrofuran, cyclohexanone and dioxane are all known to peroxidize in the presence of oxygen (presumably with the formation of hydroperoxides at the carbon atoms adjacent to the ether oxygen or carbonyl group), while *o*-dichlorbenzene would not be subject to such an attack. Degradation of this type has previously been found to occur in the presence of oxygen[1–5], but the role of the solvent does not appear to have been appreciated.

That the changes in viscosity are most likely to be caused by polymer chain scission, rather than by any physical changes in the solution (breakdown of polymer aggregates, solvation[6], etc.) is also indicated by the fact that copolymer from a solution in tetrahydrofuran aged at 75° C. for 5 hr. (isolated by precipitation, washing and drying) could readily be redissolved in tetrahydrofuran at 25° C. to give solutions of η_{sp}/c identical with that of the *aged* solutions. Further, calculations of the approximate overall activation energy of the process, based on rates of change in η_{sp}/c of a solution in tetrahydrofuran at 50° C. and 75° C., gave a value of about 24 kcal. Neither of these observations is conclusive in itself, but, taken in conjunction with the results already quoted, they inevitably suggest that primary valency bonds are being broken.

Sufficient evidence is not yet available for a discussion of the mechanism of this degradation, but a study of the rate of change of peroxide content in tetrahydrofuran, in contact with air, both with and without dissolved copolymer, has given some indication that the initial attack on the polymer may be by a radical produced during solvent autoxidation reaction[5], or by hydroperoxide fission.

The number of points in the copolymer molecule at which attack is possible may be limited, because copolymer isolated from solutions which have been aged to constant η_{sp}/c value at a particular temperature, when redissolved in fresh solvent containing peroxide, undergoes little or no further change when aged at the same temperature.

One of the objects of publishing these results is to direct attention to the possibility of error arising during viscosity and other measurements performed on solutions of polymers in solvents able to form peroxides by autoxidation. Detailed results will be published elsewhere at a later date.

We acknowledge helpful discussions with Dr. H. P. Staudinger and Mr. C. E. Hollis in the course of this work.

Trichothecin: an Antifungal Metabolic Product of *Trichothecium roseum* Link

ANTAGONISTIC activity to other fungi by *Trichothecium roseum* Link (syn. *Cephalothecium roseum* Corda) has been reported by Whetzel[1], Boning[2], Koch[3] and Greaney and Machacek[4]. Culture filtrates of *T. roseum* have been shown to inhibit germination of *Botrytis allii* conidia[5]. We have isolated the substance responsible for this activity in crystalline form in yields of 20–30 mgm. per litre of culture filtrate. The name 'trichothecin' is suggested for the active substance.

The most satisfactory yields have been obtained by growth of the fungus for a period of 28 days at 25° C. on a modified Czapek–Dox medium, in which sodium nitrate was replaced by the equivalent quantity of ammonium tartrate. The medium contained 5 per cent of glucose and was supplemented by the addition of 1 per cent of corn-steep liquor. The development of antifungal activity was followed by means of a spore-germination assay using *Penicillium digitatum* conidia. Maximum concentration of trichothecin (40–50 mgm./l.) was attained after about 28 days.

Trichothecin was extracted from the culture filtrate with ether or chloroform and purified by chromatographic methods on activated alumina. It was finally recrystallized from light petroleum (b.p. 60–80°) and formed long, slender, colourless needles, m.p. 118°, which were optically active $[\alpha]_D^{18}$ + 44° (*c*, 1 in chloroform). It contains neither halogens, sulphur nor nitrogen. Microanalyses (Weiler and Strauss), found: $C = 68 \cdot 5, 68 \cdot 7, 68 \cdot 8$ per cent; $H = 7 \cdot 2, 7 \cdot 3, 7 \cdot 4$ per cent; mol. wt. (Rast) = 278. $C_{15}H_{20}O_4$ requires: $C = 68 \cdot 2$ per cent; $H = 7 \cdot 5$ per cent; mol. wt. = 264. $C_{15}H_{18}O_4$ requires: $C = 68 \cdot 7$ per cent; $H = 6 \cdot 9$ per cent; mol. wt. = 262. The compound is neutral and only slightly soluble in water (*c*. 400 mgm./l. at 25°) but readily soluble in most organic solvents. The molecule contains one ketonic group and one ethylenic group. These observations are supported by the ultra-violet absorption spectrum of trichothecin, which also suggests that the two groups are conjugated. No other functional groups have been detected. Methyl attached to carbon determination (Weiler and Strauss), found: $(C)CH_3 = 16 \cdot 4$ per cent; $3 \times (C)CH_3$ groups require $17 \cdot 0$ per cent. There is no evidence of an aromatic nucleus.

At a concentration of 400 mgm./l. and *p*H 7·0, trichothecin was inactive against *Staph. aureus*, *B. subtilis* and *Bact. coli*. Its antifungal activity is exhibited against Fungi Imperfecti, Zygomycetes and Ascomycetes. The growth of each of some twenty-five species belonging to the above classes was inhibited to a greater or lesser degree. *P. digitatum* is the most sensitive species so far examined; germination of conidia was completely inhibited by 1·25 mgm./l. of trichothecin, and 50 per cent germination took place at a concentration of 0·30 mgm./l. The corresponding data for *Botrytis allii* spores are 6·25 and 3·12 mgm./l. Growth of the following fungi on beer wort agar was completely suppressed by the trichothecin concentrations given in parentheses: *P. digitatum* (0·64 mgm./l.), *Fusarium graminearum* (16 mgm./l.), *Paecilomyces varioti* (80 mgm./l.), *Saccharomyces carlsbergensis* (16 mgm./l.), and *Mucor erectus* (80 mgm./l.). *T. roseum* showed a partial reduction of growth at a concentration of 80 mgm./l.

Aqueous solutions of trichothecin were stable at *p*H 1 to *p*H 10 for at least 48 hours at 20°. At *p*H 12 the antifungal activity was rapidly destroyed even at room temperature. Aqueous solutions at *p*H 7 were maintained for at least one hour at 100° without detectable loss of activity.

Full accounts of the preparation and chemical and biological properties of trichothecin will be given elsewhere.

Role of the *Y*-Chromosome in the Determination of Cell-size in *D. melanogaster*

I have already pointed out[1] that in wild stocks o *D. melanogaster*, Gaiano (Parma), Luino (Varese) Civate (Como), the unicellular hairs of the upper win surface, counted in a standard surface of 298 μ^2 fo each wing, show frequency differences. Furthermore there are sex differences of different kinds in the thre stocks, being highest in Gaiano, intermediate i Civate and lowest in Luino. This shows the possibilit of an action of the *Y*-chromosome, already proved b Mather[2] for the chætæ also in *D. melanogaster*.

For this purpose I considered the Oregon *R* stock which showed a very strong sex difference in additio to another cell character, namely, the eye corneolæ The surface was measured directly[3] in ten ommatidi of one eye (either the right or the left one, bot being significantly similar) in each individual, an the mean was calculated. (The complex of th corneolæ of one eye was prepared after treatment i potassium hydroxide of the entire eye, and mounte in glycerine; the wings also were mounted i glycerine.) The following figures are the mean fo thirty flies; the standard errors are indicated.

Oregon *R*:	*hairs*	♀ $16 \cdot 06 \pm 0 \cdot 58$	♂ $20 \cdot 60 \pm 0 \cdot 60$	Diff. 22·50% (significant)
	corneolæ	♀ $847 \pm 20 \cdot 7 \mu^2$	♂ $732 \pm 14 \cdot 9 \mu^2$	Diff. 13·70% (significant)
Luino:	*hairs*	♀ $21 \cdot 25 \pm 0 \cdot 28$	♂ $21 \cdot 83 \pm 0 \cdot 75$	Diff. 2·70% (not significant)
	corneolæ	♀ $681 \pm 30 \cdot 0 \mu^2$	♂ $697 \pm 29 \cdot 0 \mu^2$	Diff. 2·30% (not significant)
Gaiano:	*hairs*	♀ $15 \cdot 61 \pm 0 \cdot 24$	♂ $17 \cdot 43 \pm 0 \cdot 57$	Diff. 10·45% (significant)
	corneolæ	♀ $732 \pm 15 \cdot 30 \mu^2$	♂ $689 \pm 20 \cdot 05 \mu^2$	Diff. 5·90% (not significant)

The sex differences of the hair frequencies tested with Fisher's *Z* test are significant for Oregon and Gaiano, but not for Luino. The corneolæ are significantly different only in Oregon. Males from Luino and Gaiano were mated successively to Oregon females and the heterozygous males back-crossed to Oregon females for six subsequent generations, in order to make the stocks isogenic; they become in this manner 'oregonized', except for the *Y*-chromosome, if no crossing-over between *X* and *Y* occurred. This procedure was repeated twice, and every factor of the environment capable of inducing phenotypical variations (food, temperature, bottle volume, number of flies) was kept constant.

The mean values for both independently 'oregonized' stocks of Luino obtained from thirty individuals for each sex are:

Hairs	♀	(I) $17 \cdot 70 \pm 0 \cdot 59$	♂	(I) $18 \cdot 50 \pm 0 \cdot 51$	Diff. not significant
		(II) $17 \cdot 40 \pm 0 \cdot 29$		(II) $17 \cdot 80 \pm 0 \cdot 36$	,, ,, ,,
Corneolæ	♀	(I) $830 \pm 19 \cdot 0 \mu^2$	♂	(I) $801 \pm 19 \cdot 0 \mu^2$	,, ,, ,,
		(II) $783 \pm 14 \cdot 7 \mu^2$		(II) $744 \pm 16 \cdot 7 \mu^2$	,, ,, ,,

The results for Gaiano are intermediate between Oregon and Luino, also after the 'oregonization'. It is interesting that the sex difference for the corneolæ (♀ 847 ± 26; ♂ 744 ± 45) of Gaiano is significant in this stock only after 'oregonization'. Both characters were measured in subsequent 'oregonized' generations, and only insignificant differences were found.

The data may be summarized as follows. Both characters are similarly influenced by the *Y*-chromosome, because the amount of the sex difference remains of the same order of magnitude, even when the euchromatin has been profoundly rearranged by the crosses. The *Y*-chromosomes of Oregon and Gaiano make the cells of the females larger, whereas the *Y*-chromosome of Luino does not induce any appreciable difference. On the other hand, the values obtained before and after 'oregonization' are different, and both characters in Luino are nearer to the Oregon ones in the latter stage. This proves the participation of the euchromatic chromosomes in the determination of the cell size.

These results agree with those obtained by Mather, and make it possible to go further in the functional interpretation of the heterochromatin. Actually, owing to the type of the characters considered, a connexion is established between the *Y*-chromosome and cell size, that is, between heterochromatin and cellular growth. This connexion is the same as that pointed out by Caspersson[3] using a quite different method. In fact, my experiments prove genetically that heterochromatin has a role of the same kind as direct observations of the cellular polynucleotides permit one to infer[4].

Seaweed Culture

COMPREHENSIVE culture experiments of algal spores and ova have been carried out, and still more are in operation as part of the programme of research of the Scottish Seaweed Research Association. The principal object of this work is to ascertain the minimum requirements for the development and healthy growth of zoospores and zygotes of the brown algæ, yet at the same time departing as little as possible from natural conditions.

In the last experiment to be completed, zoospores of *Laminaria Cloustoni* were added to thirty small tanks containing either natural or artificial sea water, well aerated and circulated. Additional nutrients were dissolved in some tanks, light restricted in others, water remained unchanged in some cases and changed in others.

Among the many interesting results, it was found that the zoospores showed their greatest development when disodium hydrogen phosphate, sodium nitrate and sodium bicarbonate were added in combination to natural sea water unchanged during the experiment. Two embryo sporophytes, which have developed from the zoospore through the gametophyte to the sporophyte stages in the above solution in 28 days, are shown in Fig. 1. Up to 32-cell stages were found after 36 days.

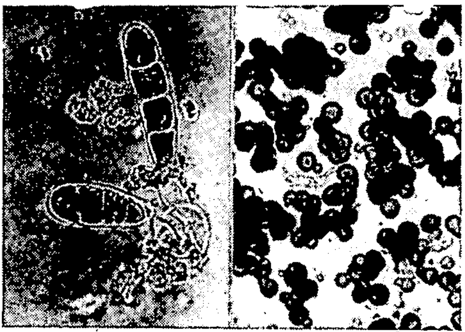

Fig. 1 Fig. 2

Fig. 1. SPOROPHYTE EMBRYOS OF *Laminaria Cloustoni*. 28 DAYS IN SEA WATER WITH ADDED PHOSPHATE, NITRATE AND BICARBONATE. × 350

Fig. 2. DEVELOPMENT OF *Laminaria Cloustoni* ZOOSPORES IN SEA WATER WITH ADDED URANIUM NITRATE. × 350

The surprising result of zoospore development of *L. Cloustoni* during the same experiments, when uranium nitrate was added to natural sea water unchanged during the experiment, is shown in Fig. 2. What was thought to be a precipitate of uranium proved to be a most prolific growth. More zoospores developed in this tank than in any of the others. The zoospores appear to have begun to develop into gametophytes at a rate far outstripping the normal. The nuclei in some cases have divided without subsequent development of the cell wall. The result is probably more 'cancerous than polyploid'. The nuclei are more conspicuous and take up a central position within the cell. The cell walls were hardened by the end of a month and the cells were killed at some time during this period, although their initial growth by division was stimulated. No living bacteria or protozoa were seen in this tank, although both were found active in most other tanks.

During the extensive seaweed survey of the Scottish coast[5] it was noticeable that the growth of Laminariæ was poor where *Ascophyllum nodosum* was abundant. It is also known that *A. nodosum* will ultimately dominate virgin substrata initially colonized by *Fucus vesiculosus*. The senior author has long considered it a probability that *A. nodosum* might exude something which inhibits the development of competitive algæ, and to test this, zoospores of *Laminaria Cloustoni* were grown in natural sea water with a piece of living, mature *A. nodosum*. The water of this particular tank was noticeably clearer than any of the others, and inspection after 28 days showed the zoospores to be completely decolorized. (Of the marine aquaria maintained in the laboratory, the water of one containing *A. nodosum* sporelings always remains the clearest.)

From this, three points emerge: (1) *A. nodosum* produces an antibiotic; (2) the effects of this antibiotic in decolorizing the chlorophyll serves a useful means for more easily studying the nuclei of *L. Cloustoni*, which unfortunately are structurally minute; and (3) is the zonation of the littoral Fucaceæ due to 'chemical claws'?

The nuclei of the normal spores, the spores grown with uranium nitrate and *A. nodosum* appear visually similar. They comprise two small stainable masses within a sac of clear material.

Full details will be published elsewhere with full bibliography.

F. T. WALKER

Growth of *Phytophthora infestans* (Mont.) de Bary on Artificial Media

IT appears from the literature on *Phytophthora infestans* that many workers have had difficulty in growing this fungus and in obtaining a supply of sporangia. The fungus grows and fructifies well on potato leaves and tuber slices, but such cultures require frequent renewal. Recently Snieszko *et al.*[1] in the United States described various media which supported growth, particularly a cereal grains – peanut hull mixture upon which the fungus spored freely. Peanut hulls are not readily available in Great Britain.

In this laboratory, media for the culturing of *P. infestans* have been made from germinated oats, wheat, maize and pea and from dried leaves of potato and tomato. At its best the dried potato leaf medium was much superior to all other materials tried. Sporulation was sometimes so abundant that cultures had a powdery rather than a downy appearance. Unfortunately, as with oat, wheat, maize and tomato, this medium was unreliable, often giving poor growth and sporulation. A reliable medium made from pea-flour has now been evolved. It is felt worth while to publish the information, although the method is by no means perfected.

This medium contains 2·5 per cent pea-flour, 2·5 per cent sucrose, 1 per cent agar and distilled water. The sucrose, agar and half the water are sterilized at 15 lb. pressure for 15 min., and to this is then added the pea-flour in the rest of the water heated to 40° C. After rapid and thorough mixing, the medium is tubed and plugged. The tubes are left at laboratory temperature for 18–24 hr., sterilized at 10 lb. pressure for 6 min. and sloped.

The pea-flour is made from garden peas grown in sand under glass. When the plants are 2–3 in. high, their leaves and stems are chopped up and dried on glass sheets in an electric oven at 55–60° C. The time taken for drying varies from two to three hours. The dried material is ground with a hand-mill and stored in screw-capped bottles in the dark.

This pea-flour medium has been in use for more than a year, and in no instance has the fungus failed to grow or sporulate on any batch of it. Some isolates of *P. infestans*, however, grow more rapidly and spore more freely than others. In test-tubes (6 in. by $\frac{5}{8}$ in., 5 ml. medium) at 18° C. the fungus usually covers the agar in a week and sporing begins in two to three weeks. Sporulation is greater if the cultures are stored in closed jars. The danger of mould contamination arising from these damp conditions can be avoided by exposing the cultures once weekly to room humidity for a few hours and replacing them in clean, dry jars. If the fungus is grown in boiling tubes (7 in. by 1 in., 15 ml. medium), good sporulation will take place even if the cultures are not kept enclosed. It is advisable, however, to keep them in jars until the fungus is well established.

Some isolates of the fungus survive longer in culture than do others. Test-tube cultures kept at 18° C. require subculturing every four to five weeks; at 10° C. every ten to twelve weeks. In boiling tubes, some cultures have remained alive for as long as seventeen weeks, whereas others have lasted only ten to twelve weeks.

Spores produced by *P. infestans* on this pea-flour medium have infected potato seedlings, tubers and adult leaves. The effect of continuous cultivation on the pathogenicity of the fungus is under investigation.

Hysteresis in the Swelling of Gels

HYGROSCOPIC natural fibres generally show sorption hysteresis, such that the vapour pressure at any given moisture content is higher on adsorption than on desorption, whereas no hysteresis is found in true solutions.

In 1942 I suggested[1] that sorption hysteresis in gels could be explained in terms of their plastic properties. This deduction is based on the fact that the vapour pressure of a gel is determined by the hydrostatic stress acting on it as well as by the moisture content. It can be shown[2] that, if either anatomical or molecular restraints oppose the free swelling and introduce plastic flow under shear stresses, the hydrostatic component p of the stress system, and therefore also the vapour pressure h, will be higher on adsorption than on desorption at any given moisture content m.

If, between adsorption and desorption, the difference in hydrostatic pressure is Δp, this must produce a change in volume of the gel: $\Delta V = -V\Delta p/k$, where k is the bulk modulus; while the value of

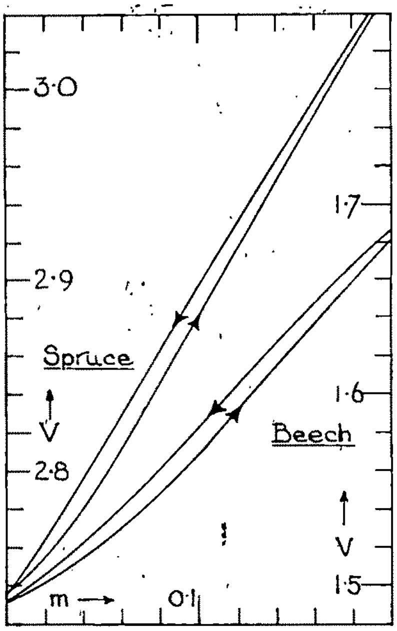
Units : $k \doteq 10^{10} \times$ dynes/sq. cm. ; V = c.c./gm. dry weight ; m = gm. water/gm. dry weight.

	Solid fibres V (dry) = 0·0661 k 0·86		Spruce V (dry) = 2·731 (75·3% void space)				Beech V (dry) = 1·492 (54·8% void space).			
m	s_p	ΔV (calculated)	s_p	k	ΔV (calculated)	ΔV (observed)	p	k	ΔV (calculated)	ΔV (observed)
0·05	0·73	0·0045	1·58	2·55	0·020	0·016	0·833	3·37	0·0144	0·0081
0·10	0·90	0·0016	1·74	1·20	0·048	0·015	1·041	1·80	0·0253	0·0105
0·15	0·95	0·0008	1·62	0·70	0·054	0·008	1·087	1·05	0·0216	0·0119
0·20	0·98	0·0003	1·50	0·55	0·042	0·000	1·071	0·82	0·0185	0·0027

Δp can be obtained from the vapour pressures, h' on adsorption, and h'' on desorption, from the approximate relation $\Delta p = -(RT/Ms_p) \log (h'/h'')$, in which $s_p = (dV/dm)_p$ the differential volume swelling of the gel. Thus, if the origin of sorption hysteresis lies in plasticity, the volume swelling should show hysteresis if plotted against the moisture content, such that the volume will be smaller on adsorption than on desorption.

Calculations of ΔV can be compared with experiment by using the measurements of Hermans[3] on solid fibres of regenerated cellulose, or those on beech[4] and spruce, made in this Laboratory. Approximate values of k may be taken from calculations made here. In the case of the solid fibres these are incomplete, since the variation of k with m is not known and a single mean value must be used for all moisture contents.

The table gives these estimates of ΔV. For the solid fibres all values of ΔV (except at $m = 0·05$, where k is most in doubt) lie below the limit of accuracy claimed by Hermans (0·002 c.c./gm.) and will therefore not be detectable. This agrees with Hermans' own statement that no volume hysteresis is found. For spruce and beech the values of ΔV lie well above the limit of accuracy and a hysteresis of this order of magnitude is found experimentally, as can be seen in the accompanying graph.



So far as I am aware, this graph records the only experiments so far made which show volume hysteresis in the swelling of gels. This is no doubt because in most solid gels, such as Hermans', k is large and the hysteresis is too small for easy detection ; whereas in porous gels such as wood, k is much smaller and the hysteresis therefore more prominent.

The above calculation has tacitly assumed that the gel is plastic to shear stresses and elastic to the hydrostatic stresses. It can be shown both by theory and experiment[2] that some plasticity to Δp occurs in complex porous structures such as wood, so that some relaxation in Δp is to be expected. This effect would be more marked at the higher moisture contents where the wood is more plastic, and would account for the observed fall in ΔV to very small values in this region.

A full discussion of this subject is given in an internal unpublished Laboratory report, No. P.82 (1948).

Fine Structure of the He II Line λ = 4686 A.

According to the Dirac theory of the energy states in hydrogen-like spectra, levels of the same principal quantum number n which have the same value of the quantum number of total angular momentum j should coincide. Lamb and Retherford[1] have shown that in the second quantum state of the hydrogen atom the 2 $^2S_{1/2}$-level lies 0·03 cm.$^{-1}$ above the 2 $^2P_{1/2}$ term. Bethe[2] has tried to explain this discrepancy by an interaction of the electron with the radiation field. His preliminary calculations show complete agreement with experiment for the hydrogen atom. For the He II spectrum he predicts a shift of the 3 $^2S_{1/2}$-level with respect to the 3 $^2P_{1/2}$-level by 0·13 cm.$^{-1}$.

We have investigated the fine structure of the He II line λ = 4686 A. ($n = 4 \rightarrow n = 3$) with a Fabry-Perot interferometer and have found that the 3 $^2S_{1/2}$-level lies 0·137 ± 0·015 cm.$^{-1}$ above the value given by the Dirac theory. Greater accuracy has not yet been possible because of the breadth of the lines.

THE CYTOLOGY OF THE HONEY BEE, *APIS MELLIFICA* L.

By Dr. ANN R. SANDERSON
AND
DAVID W. HALL
Zoology Department, University College, Dundee

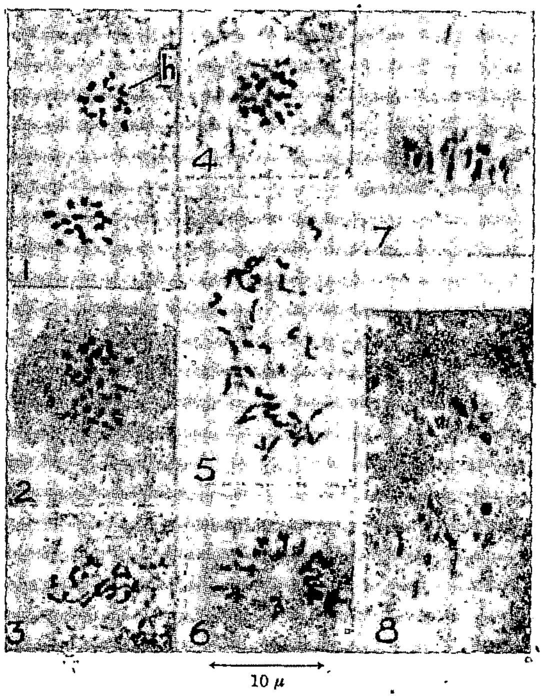
THE cytology of *Apis mellifica* L. has been investigated by Petrunkewitsch[1,2], Doncaster[3,4], Mark and Copeland[5], Meves[6], Nachtsheim[7,8], and Jegen[9]. Nachtsheim figures the chromosomes as spherical in shape, 16 in number in spermatocytes and oogonia, and reduced to 8 in the ootid. In his interpretation of the chromosome constitution of the male and female he resorts to a theory of "*Sammelchromosomen*", in which some chromosomes are said to be "*einwertig*" and others "*doppelwertig*". His cytological findings are so exceptional and the results of the workers mentioned above are so anomalous that they are open to criticism (see Sanderson[10]). Furthermore, on the basis of Nachtsheim's work, a theory that the drone bee is a diploid organism with a haploid germ tissue has been recently advanced by Whiting[11]. The problem obviously required re-investigation and this we have undertaken, using improved modern methods of fixation and of smear technique on abundant material.

The accompanying photographs of our material clearly show the chromosome number in male and female to be 16 and 32 respectively, and also the chromosomes to be mostly rod-shaped, not rounded as depicted by Meves, Doncaster and Nachtsheim.

Smears of larval testes fixed and stained in aceto-carmine or aceto-orcein yield convincing counts of gonial plates (Fig. 1). In these one chromosome is hooked and somewhat larger than the rest (Fig. 1, *h*); it is very striking in late anaphase. In oogonia two similar hooked chromosomes can be distinguished. These findings agree with the work of Granata[12,13] on the spermatogenesis of the carpenter bee, *Xylocopa violacea* L., where the 16 chromosomes are hooked and separate. In the honey bee we have never found the chromosomes lying in pairs in either male or female and we therefore suggest that the apparent pairing of chromosomes and formation of "*Sammelchromosomen*" found by Nachtsheim were due to the technique employed. Oogonial counts can be obtained from queen larvæ and pupæ (Fig. 4), and plates showing the same number, 32, can also be obtained from worker larvæ before the ovaries degenerate.

With regard to the abortive division of the spermatocytes, we confirm the observations of former workers that the chromosome number is not reduced during maturation, but we have not been able to confirm currently accepted views on bud formation.

Our investigation of egg maturation is still incomplete, but examination of some twenty spindles in smeared unfertilized eggs shows that maturation follows the usual method found in arrhenotokous saw-flies and other groups of insects. The first spindle lies near the margin in the broad end of the egg; in aceto-orcein squashes the chromosomes in metaphase and early anaphase appear to be viscous (Fig. 7); about 16 bivalents can be counted on the equator and, later, 16 chromosomes travel towards each end of the spindle; the daughter groups line up on two other spindles which appear to arise immediately, and some of these chromosomes already show chromatid formation (Fig. 8).



PHOTOGRAPHS OF MALE AND FEMALE TISSUES OF HONEY BEE, ALL TO SAME SCALE. FIG. 4 IS FROM A SERIAL SECTION STAINED WITH IRON HÆMATOXYLIN; ALL OTHERS FROM ACETO-ORCEIN SMEARS

Fig. 2. DIPLOID PLATE IN MALE FOLLICLE CELL; 32 CHROMOSOMES

Fig. 3. MALE BLASTODERM CELL; ABOUT 16 CHROMOSOMES

Fig. 4. OOGONIUM; 27 CHROMOSOMES SHOWN

Fig. 5. FEMALE BLASTODERM CELL, LATE PROPHASE; ABOUT 32 CHROMOSOMES

Fig. 6. FEMALE BLASTODERM CELL, METAPHASE; 31 CHROMOSOMES SHOWN

Fig. 7. EGG MATURATION, FIRST SPINDLE METAPHASE; ABOUT 13 BIVALENTS IN FOCUS

Fig. 8. EGG, SECOND MATURATION SPINDLES; 15 CHROMOSOMES SHOWN IN LOWER METAPHASE PLATE, AND 15 CHROMOSOMES IN UPPER METAPHASE PLATE (3 DISPLACED TOP LEFT)

Regarding evidence of somatic numbers, male and female blastoderm smears distinctly show 16 and 32 (Figs. 3, 5 and 6), and here the chromosomes by comparison with those of germ cells are much longer and thinner, so that size differences are more apparent. Though further work is necessary, our material gives the impression that blood and muscle cells in the pupæ show normal numbers. Somatic polyploidy does occur in hypodermal, malpighian and tracheal cells, and follicular epithelium cells of testis and ovary. In the male, follicle cells with 32 (Fig. 2) or more commonly occur; in the female, follicle cells with the gonial number are rare, but the actual degree of polyploidy is not yet determined. Likewise, embryonic serosa cells frequently become polyploid. In contrast to the non-social Hymenoptera, where the male is conspicuously smaller than the female, the drone and queen honey bee do not show such disparity; the relation of body size to polyploidy in the bee therefore requires further investigation. It is also necessary to ascertain in what particular tissues polyploidy arises.

Our evidence establishes beyond doubt that the male is haploid, at least at the beginning of cleavage, in blastoderm stages and in the larval testis. Whiting, basing his theory on Nachtsheim's figures, considers that the male and female honey bee are somatically diploid and tetraploid respectively, the haploid number being 8. Nachtsheim's results do not agree with those of Petrunkewitsch, who found 16 chromosomes in the oocyte, nor of Meves, who demonstrated 16 in the second spermatocytes, nor with our findings, especially those relating to oogonia and egg maturation. Furthermore, Nachtsheim's results have long puzzled cytologists, but since our new evidence clarifies the situation, Whiting's views on polyploidy in the bee appear inacceptable.

Our conclusions have been reached after a study of a wealth of material which permits us to stress the following points on honey bee cytology: (1) the well-defined shapes and individuality of the chromosomes; (2) their discrete arrangement at all times; (3) the haploid-diploid constitution of the male and female, the male having 16 and the female 32 chromosomes in gonial and in normal somatic cells; (4) the invalidity of Nachtsheim's evidence regarding "*Sammelchromosomen*"; and (5) the inacceptability of Whiting's theory on somatic polyploidy in the honey bee.

We wish to acknowledge indebtedness to Mr. D. Robb for the use of an observation hive, to Mr. D. Gauld, and to many other local beekeepers for their ready co-operation in supplying suitable material, and to Mr. H. R. Ness for invaluable help with the photography. Prof. A. D. Peacock, in whose department this work has been carried on, has throughout given helpful advice and criticism.

VENEREAL DISEASE CONTROL IN POLAND

POLAND is at present faced with a venereal disease problem against which the state of affairs in Britain appears insignificant. The incidence of venereal diseases has increased enormously over the war years and the number of fresh infections with syphilis is now calculated to be about 150,000 per year. There is a decrease in live births of about 40,000–50,000 per year, the mortality-rate from syphilis being about 11 per cent. The reason for this state of affairs is not far to seek. The Germans spared little attention for the Poles whether they were in Poland or displaced to other countries. Venereal diseases were prevalent among displaced persons, and although plans were formulated before D-day for the treatment of infected persons before they were repatriated, nothing was, in fact, ever done for them.

The Ministry of Health in Warsaw has now prepared a permanent programme for venereal diseases control and a temporary programme for immediate operations. The basic units are consultation centres for skin and venereal diseases in health centres distributed throughout the country, and there are, of course, clinics in the hospitals of the major cities.

The basis is a network of medical facilities free to all. The principle of the legal basis is that every citizen with venereal disease can, if necessary, be compelled to submit to treatment. Sources of infection are to be discovered and put under treatment. Auxiliary measures include periodic surveys of persons susceptible to infection; obligatory pre-marital examination; obligatory serum tests for syphilis in pregnant women; training of medical personnel; propaganda; control of prostitution and vagrancy; control of alcoholism; and collection of statistics. Every physician, regardless of his status, is required to determine, and report to the nearest centre, all the sexual contacts of his patients during the infectious period. Persons so named are requested to attend the centre within seven days, and if there is no response a health visitor is to be sent. If this is still unavailing, compulsion is used. Mobile ambulance units are to be used in isolated districts for treatment, propaganda, mass observation, training, etc. Training courses, to be attended at least once a year by the medical men in centres, are to be held in the main provincial centres and will include diagnostic methods, modern treatment and management of complications, control and organisation, and propaganda organisation. Propaganda will consist in popular lectures, films and slides, posters and pamphlets and anti-alcohol appeals.

This programme is directed to the rapid treatment of syphilis during 1948. The old long-term treatment is discarded in early syphilis because of the high rate of default and possibility of continuing infectiousness. Use of penicillin reduces treatment to about two weeks and the infectious stage to about the same period; but there is a risk of infectious relapse in 15 per cent of cases.

It is proposed to do sample surveys of fifteen groups of a thousand people in various areas to gain information on prevalence and distribution of disease.

The importance of accurate serological examinations is recognized and a standard (flocculation) test is to be used throughout the country. Private laboratories are to be checked each year to ensure efficiency. Serological examination is to be routine on first diagnosis of pregnancy, and for military recruits, students and workers.

In the rapid treatment scheme every doctor, in public or in private practice, is to be employed. High standards in diagnostic technique are required.

Rapid treatment is to be given to all cases of symptomatic early syphilis and to cases of asymptomatic early syphilis (up to three years from date of infection) which have not previously been treated or which have received less than one standard course of arsenic and bismuth. The treatment is to consist of 3,000,000 units of penicillin in oil-beeswax suspension given in doses of 300,000 units each day for ten days. 0·2 gm. bismuth subsalicylate is to be given on the first, fourth, seventh and tenth days of treatment. The bismuth is omitted in pregnant women. Children are to receive 200,000 units penicillin per kilo body weight.

Intensive propaganda on the necessity for early treatment and systematic follow-up and on the availability of free treatment facilities is to be carried on by posters, newspaper articles, radio and films.

The rapid treatment method is only intended for use in the early stages of syphilis, early cases of latent syphilis, in pregnant women at any stage of disease, and in congenital syphilis, inadequately treated, up to the third year. Diagnosis is to depend on the finding of *Treponema Pallidum* by dark-ground examination, a positive serum test in the presence of clinical signs, or two positive serum tests in the absence of clinical signs if the history suggests an infection of less than three years duration.

Drugs are always available at centres; but a private practitioner receives supplies only after notifying a case and sending a requisition form. This will inevitably lead to delay in starting treatment in many cases. Private practitioners may charge a fee for treatment, but have to inform the patient that the drugs are supplied free.

Follow-up after treatment consists in clinical and serological examinations once a month for the first six months, every three months in the second six months, and each six months in the second year. The cerebro-spinal fluid is examined six months and two years after treatment. Failures after rapid treatment are to receive four courses of arsenic and bismuth on the long-term plan.

The examining physician must obtain from the patient particulars of all his contacts from the time of contracting the disease (eight weeks before the first sign in the case of syphilis) until the time of diagnosis. The patient is asked to try to bring for examination all such contacts; but methods of compulsion can be used as a last resort if persuasion is unsuccessful.

The theoretical basis of this plan is excellent, embodying as it does the latest features of Anglo-American practice. It is complicated in practice by the necessity for a formidable amount of documentation on the patient, treatment, drugs, follow-up, contacts, statistics, etc. Indeed, the paper-work will consume more man-hours than diagnosis and treatment, as was the case in the Services during the War.

The choice of treatment schedule has been influenced, no doubt, by considerations of time and availability of drugs. I do not consider, personally, that the addition of 0·8 gm. bismuth subsalicylate will increase the 'cure' rate. I believe it will do no more than delay the appearance of signs of relapse in cases which will fail. There is nothing to show that bismuth and penicillin are synergistic in action. The effect of penicillin during a rapid treatment would be more likely to be enhanced by the addition of arsenic (as an arsenoxide for preference) to the schedule. This idea has, no doubt, been discarded because of the slight risk of arsenical toxic effects and because of its technical difficulties. Arsenicals have to be administered intravenously, and it is probable that Poland at the present time lacks the skilled personnel necessary to cope with these added difficulties in the vast numbers of cases to be treated.

The choice of 3,000,000 units as the total dose of penicillin is again, no doubt, governed by circumstances; but it is a minimal effective dose and ought to be doubled as soon as supplies are available. With an infectious relapse-rate estimated (conservatively in my opinion) at 15 per cent, the follow-up programme must be very carefully carried out and failures re-treated without delay if an end state worse than the original is not to follow an initial apparent success.

The Polish medical authorities are to be congratulated on a carefully prepared and ambitious plan which seems to cover the immediate needs and make a basis for a useful service in the future. The statistical service may prove of great value in the rapid assessing of any treatment schedule, and it is to be hoped that if it is a success the system will be used for comparative experiments in treatment.

JAMES MARSHALL

DECARBOXYLATION OF OXALACETATE BY BLOOD

By PETER M. NOSSAL

Department of Biochemistry, University of Adelaide

EVOLUTION of carbon dioxide from oxalacetate by washed rabbit erythrocytes at *p*H 7·4 has been reported previously[1]. Because of the solubility of carbon dioxide at that *p*H, this could at best be only a qualitative indication of the decarboxylation Working in either phosphate or 2*M* acetate buffer and measuring carbon dioxide formation by the standard Warburg technique, the process has been thoroughly investigated.

The process is found in the following constituent of rabbit blood, either freshly drawn or stored fo periods (up to several days) on ice: whole blood erythrocytes, erythrocyte hæmolysate, plasma and acetone powder extracts of all the aforementioned Hæmolysates were usually the most active, whole blood, erythrocytes and plasma roughly equall active, and acetone powder extracts all slightly less active.

At *p*H 6·5, no decarboxylation of either α-keto glutarate or pyruvate was observed, whereas oxal-acetate decarboxylation was considerable; thus the system seems to be specific for that substrate.

Dialysis for 20–24 hours against distilled wate caused reduction in activity. Whereas neither manganous ions (Mn^{++}) nor magnesium ions (Mg^{++}) ha any influence on the decarboxylation by any of the above preparations prior to dialysis, partial restoratio of activity in dialysed extracts was observed by fairl high concentrations (10^{-3} *M*–10^{-2} *M*) of manganou ions, and, less markedly, magnesium ions. Thiamine does not feature in the process under the experimenta conditions employed. Added pyruvate in no wa affects carbon dioxide output, so that the reactio does not seem to be a Krebs condensation to *ci* aconitate. The process is not markedly reduced b submersion of the enzyme in water baths at 70–75° C for periods of 1–4 min.

It must be noted that oxalacetate itself undergoe a quite rapid autodecomposition under the experimental conditions. This is very sensitive to *p*H an varies somewhat for each different oxalacetate solution, so that all experiments were invariably run wit duplicate blanks containing only the appropria buffer and the substrate. Influence of *p*H on autodecomposition of oxalacetate is shown below, that *p*H 7 being taken as 100 for comparative purposes

*p*H	3·5	4·0	4·5	5·0	5·5	6·0	6·5	7
Decarboxylation	300	280	250	180	150	150	130	1

All references made to decarboxylations are to be taken as *increases* above the autodecomposition rat obtained after duly correcting for autodecompositio blanks.

It is suggested from the following experiments that two different mechanisms (*apart* from autodecomposition) may operate in blood under certain conditions.

Examination of the effect of *p*H showed that decarboxylation occurred for the full range tested, namely, *p*H 8·4–3·5. No experiments were carried out at *p*H values lower than 3·5. It was seen that, at the latter *p*H, very great activity is still obtained in both hæmolysates and plasma. Actually, that of the hæmolysate is definitely greater at *p*H 3·5 than at any other *p*H tested, in spite of the very large correction due to the autodecomposition, whereas plasma seemed to show optimal activity between *p*H 4 and 5. Since it seems almost certain that an enzyme of this type would not have a *p*H optimum at 3·5 (or even below this value), the existence of a second, non-enzymatic mechanism is suggested under conditions of very low *p*H. This suggestion is very strikingly supported by the following experiments in which the system was first boiled at a certain *p*H, and the decarboxylative activity afterwards determined at the same *p*H (after readjustment, if necessary).

Boiling acetone powder extracts or diluted hæmolysates at *p*H 6·5 for less than 1 min. causes almost complete cessation of the ability afterwards to decarboxylate the substrate. However, boiling the same hæmolysate or plasma samples at *p*H 3·5–4·0 not only failed to cause such reductions in activity, but usually, especially in the case of hæmolysates, a *more rapid* decarboxylation for the boiled sample was observed when compared with an unboiled control.

To account for these consistent, unusual results, the following hypothesis is suggested. At physiological *p*H, decomposition of oxalacetate is brought about by an enzymatic, heat-labile process, in which manganous ions and, to a less extent, magnesium ions, but not thiamine, are involved. The system may thus be similar to the enzymes in pigeon liver described by Evans *et al.*[2] and in bacteria by Krampitz and Werkman[3]. In more strongly acid solutions, however, a heat-stable decarboxylation appears which is due to the liberation of some substance previously not present in a free state. *This liberation is definitely accelerated by boiling in acid solution*, so that boiled samples show a more rapid evolution of carbon dioxide than the corresponding unboiled controls.

The spontaneous decomposition of oxalacetate was then further investigated in order to throw some light on this second, non-enzymatic mechanism. It was found that both manganous ions (Mn^{++}) and magnesium ions (Mg^{++}) at concentrations of 10^{-2} *M* considerably increase the autodecomposition of oxalacetate at *p*H 6·5, the former up to 75 per cent, the latter up to 40 per cent. At a final concentration of 10^{-3}, however, these effects were much less pronounced. Ammonia, considerable amounts of which are undoubtedly released during boiling at strongly acid *p*H values, did not affect the process in concentrations of 10^{-3} *M*–10^{-2} *M*, and therefore does not feature in the second process. These experiments also were carried out at *p*H 6·5. Finally, it was thought that iron, which may well be formed from hæmoglobin at low *p*H values, might account for the increases observed. It was found that, for both ferrous and ferric ions at final concentrations of 10^{-2} *M*, increases of nearly 100 per cent over a period of one hour occurred. Ferric iron appeared to be the more active of the two, and dilution of both to 10^{-3} *M* did not reduce the effect nearly as greatly as was found with magnesium and manganous ions.

It thus appears that inorganic ferric iron may account for at least a part of the second, non-enzymatic decomposition of oxalacetate observed at very low *p*H values. However, other metals or factors, such as Breusch's heat-stable tissue extract[4], cannot as yet be excluded.

Full details of this work will appear in the *Australian Journal of Experimental Biology and Medical Science*, and further work in connexion with both mechanisms is still in progress.

I wish to express my gratitude to Prof. J. G. Wood for a generous supply of the substrate, to Prof. M. L. Mitchell for continuous advice, and to M. Wellby for technical assistance.

AMERICAN PHILOSOPHICAL SOCIETY

ANNUAL REPORT

THE yearbook for 1947 of the American Philosophical Society, Philadelphia, Pa., covering the year January 1–December 31, 1947, is a useful reference work, with its list of officers and committees, as well as of members, biographical memoirs (including those on Joseph Quincy Adams, Irving Fisher, M. Ganberg, P. Janet, H. S. Jennings and M. Planck) and reports of meetings. A brief history of the Society by E. G. Conklin, and the charter and laws are also included.

The report of the Committee on the Library records further accessions of more material relating to Benjamin Franklin and refers to progress during the year in the American Indian linguistic projects. At a conference called on October 18, 1947, to co-ordinate a programme in American archæology with that in linguistics, it was decided to restrict the area to be studied to the Iroquois and allied groups, and to compile a union list of Indian manuscript material as well as a manual for the use of amateur archæologists for the Iroquois area.

The report of the Committee of Publications gives some details of the foreign exchange list at December 31, 1947, revision of which has continued. In addition to the European libraries, a list is being drawn up of institutions in Latin America which should be placed on the regular exchange or on a temporary list for one year. Thirty-four papers were accepted for publication in the *Proceedings* during the year, as well as seven monographs for the *Transactions* and one book for the *Memoirs* ; two new volumes of the latter were issued in 1947. A list of publications during the year is appended to this report.

The report of the Committee on Research details the general principles adopted by the Committee in regard to grants and lists of the eighty-nine grants, totalling 80,103 dollars, made from the Penrose Fund during the year, with an analysis of the distribution by subjects and a summary of grants made from July 31, 1933, to December 31, 1947, totalling 846,605 dollars. A further nine grants, amounting to 8,300 dollars, were made from the E. R. Johnson Fund, and twenty-two grants, amounting to 46,610 dollars, from the Reserve Fund for Post-War Expenditures. Among the reports from recipients of grants included in this yearbook are those from E. Hille on studies in the theory of semi-groups; W. A. Hiltner on photo-electric observations of selected Wolf-Rayet stars, the polarization of the continuous radiation from early-type stars and selected eclipsing variable stars; and from F. B. Wood on photo-electric observations of eclipsing binaries. F. F. Cleveland reports on his studies on molecular spectra and molecular structure of olefins, acetylenic compounds, diastereoisomers, hexachloroethane, hexabromoethane and other compounds, C. P. Harnwell on the construction of a new type of beta-ray spectrograph to investigate the beta-ray spectra of radio-elements emitting electrons and positrons, and H. H. Nielson on high-dispersion measurements on the infra-red spectra of the polyatomic molecules of hydrogen sulphide, acetylene, difluoromethane, dimethylacetylene, arsine and deuteroarsine. Work is described by E. Berliner on the competitive bromination of alkylbenzenes for the purpose of ascertaining a possible conjugation of alkyl groups with the benzene ring, by J. L. and E. M. Irvin on the apparent acid dissociation constants, quinoline antimalarials such as 'Pamaquine' and other 4-amino- and 4-hydroxyquinolines, and by J. F. Mead on the action of lead tetra-acetate on amino-alcohols and amino-glycols.

Studies in chemical embryology are reported by J. L. A. Brachet, on the quantitative spectrographic analysis of salt metabolism in developing *Fundulus* eggs and senescent *Drosophila* by O. C. Glaser, and on isolated embryonic amphibian cells with special reference to cellular structure, motility, aggregation and differentiation, and embryonic cell inclusions, particularly of yolk, lipochondria and microsomes by J. F. K. Holtfreter. A serological investigation of speciation and evolution, using the Libby photron-reflectometer, has been made by P. A. Moody, and experimental studies on the development of structure and function in the central nervous system of *Fundulus* embryos by J. M. Oppenheimer indicate that metrazol has a selective action on the cell-layers nearest the central canal. C. W. Clancy's investigation of the development of eye colour in *Drosophila melanogaster* suggests that the wild type allele of the vermilion gene is not only concerned with the reactions leading to the formation of the brown pigment component but also in some unknown way with the formation of the red pigment. J. F. Crow reports on the different susceptibility to ether of several closely related *Drosophila* species, H. Geiringer on the theoretical genetics of multivalent organisms, H. P. Hansen on post-glacial forest migrations and climate in Western Canada, and Ching Tsao Wei on the seed-borne diseases of soya beans. C. R. Procter has made an ecological study of a group of ferns, *Dryopteris cristata* and its relatives, in the eastern United States, and E. Girden a phylogenetic comparison of experimental drug dissociation. The electrical responses of the human retina to stimulation by light of various wave-lengths has been studied by L. A. Riggs, the application of the concepts of servo-theory to biological systems by C. L. Kreezer; and the specificity and sensitivity of a further fifty colorimetric tests for eighteen amino-acids by A. P. Kline.

In the field of social sciences, studies of wholesale commodity prices in Philadelphia during the Revolutionary War and of industrial relations in Norway are reported; and, in that of the humanities, of the prehistoric archæology of the Tangier area of Morocco, preliminary excavations at Cottonwood Cave and Pueblo, Colorado, the distribution of petroglyphs in the United States and the archæology of Marajo Island, Brazil.

WEST AFRICAN SEA-FISHERIES

MR. G. A. STEVEN'S report of his work*, as the sole fisheries development officer, under acute difficulties of war-time conditions, in Sierra Leone, a Colony where the sea-fisheries were almost entirely undeveloped, has now been published. It should prove a most valuable guide to Mr. Steven's successors, and leaves one profoundly hoping that they will find their path made smoother for them.

There is little doubt that the sea-fisheries in these undeveloped regions could be made to yield a vastly greater contribution to the sadly inadequate proportion of protein in the local diet. The small-scale trawling experiments with the *Maid Honor* (Skipper R. E. Brown) showed a yield of 86 lb. per hour from a 64-ft. headline trawl, which is sufficiently encouraging. In pre-war years a large British trawler with (say) 110-ft. headline gear, and vastly more expensive to run, could pay her way on double that yield. Since the report was written, we have been verbally informed that *Maid Honor*, still working in the same locality, is paying her way handsomely.

Fish are there in trawlable quantity, building of vessels up to the size of small motor-trawlers seems to be possible in the Colony and—probably Mr. Steven's most valuable achievement—a local team of net-makers was speedily trained to make good trawls and trammels. Machinery, of course, must be imported, but the only weak spot in the local contribution towards an incipient industry would seem to be need for further training of African seagoing trawlermen in repairing nets at sea.

One big question concerning the ground-fish remains unanswered: in the absence of fundamental knowledge of the ecology of those seas, we have no idea how much fishing the stocks can stand. Hence should any considerable industry develop, it must be controlled by guess-work, until some marine biological survey is completed. Mr. Steven justly points out that such surveys are beyond the resources of the smaller individual Colonies, for a central laboratory of some size and an ocean-going research vessel would be essential. Probably the subsequent working-up of the material would be best carried out in Great Britain, for a long experience of marine biological work overseas has left the present writer painfully aware of the almost complete absence of library facilities outside Europe (and the United States), apart from a very few of the larger cities in the greater British dominions.

Until these essential long-term researches are well advanced (which must take years of patient endeavour), there is no practical alternative to Mr. Steven's view that development officers must just go ahead developing as well as they can, and controlling as seems locally expedient; but the danger of bad or inadequate controls, when the cart is thus put before the horse, is very considerable. Mr. Steven admits this; but having worked in an area that seems to be unusually rich (from what little one knows of the fish populations of warm seas) he does not emphasize the danger of over-fishing tropical stocks, on the sudden introduction of efficient European methods, so strongly as the reviewer would have done. Probably this was because it was only too obvious at the time of Mr. Steven's tour that there could be no suggestion of over-fishing with the inadequate equipment at the disposal of the Colony; but a recent example of the type of trouble that must be guarded against has been the very rapid development of an over-fishing problem in the Australian shark fishery.

---

* Report on the Sea Fisheries of Sierra Leone. By G. A. Steven (Freetown, 1945; London: Crown Agents for the Colonies, 1947.)

Mr. Steven's descriptions of existing native fishing practice are most interesting, and must be of great value to those about to undertake similar tasks in the Colonies. The Clupeoids, so far as is known, withstand intensive exploitation better than groundfish, and here development of the *bonga* fishery could probably proceed a very long way without danger to the stocks.

The great difficulties of preservation, processing and storage of fish in a climate which is very humid as well as hot should be more clearly visualized by all concerned in such matters (as, for example, those responsible for fixing the price of ice). The demonstration that dehydration may give better value than canning for local purposes amounts to a challenge to the technicians to devise economic means for the large-scale dehydration of fish under the most adverse climatic conditions.

The biologist will follow the report more easily after reading the very brief account of the principal food-fishes of the area, giving scientific as well as local names, in one of the previous Government publications by Hornell[1], to whose pioneer work Mr. Steven refers in his introduction. That so long an interval elapsed between Hornell's report and Mr. Steven's appointment to follow it up is most regrettable.

T. J. HART

CHEMICAL INDUSTRIES IN SCOTLAND

THE report of a committee appointed in May 1945 by the Scottish Council on Industry (20 George Street, Edinburgh. Pp. 39. 2*s.*) to inquire into the present conditions and post-war prospects of the chemical industries of Scotland and to recommend action to the Scottish Council is based on a survey made in 1945–46, and its publication has been considerably delayed. The section dealing with research has been rewritten; but the main recommendations and findings of the Committee remain unchanged in spite of the delay. The Committee made no attempt to define a chemical industry but limited the report to those industries covered under the various sections of *British Chemical Abstracts B*, excluding, however, those sections such as iron and steel, metallurgical industries and fuel, which were being studied elsewhere. Figures quoted in the appendix show that so far as explosives are concerned the proportion of operatives employed in Scotland is well above that calculated on a United Kingdom population basis, while in the chemical industry in general the proportion is well below this figure. The Committee, however, has throughout taken the view that Scotland cannot be treated as a separate entity when industrial development is under consideration. It has endeavoured to take a broad view and believes that any expansion of chemical industry in Scotland would have beneficial repercussions on the national economy of the whole of Britain. It also urges that a survey of an industry which so markedly depends on research involves consideration of the research facilities available in Scotland at present.

A survey of research facilities constitutes an important section of the report. This survey leads the Committee to believe that there is scope for a much more intensive application of research to problems of particular importance to Scotland, and that much of this research is of a kind which might properly be undertaken by a Government laboratory or by a research association. The principal recommendation of the report is, in fact, the formation of a chemical research committee, with representatives from industry, academic institutions and existing research associations, to formulate the problems of chemical research and development which require investigation to meet Scottish needs, to survey the facilities available for their investigation and to make recommendations for extending those facilities where required. Next, the Committee concludes that many firms have been, and still are, suffering from a shortage of labour and sometimes of technological skill. The diversity of the operations required of the workman in any manufacturing chemical process demands a high quality of labour, and on this point a conference is recommended between representatives of the Ministry of Labour and of the chemical manufacturers. Furthermore, chemical manufacturers on the whole do not yet appreciate the advantages to be derived from more adequate scientific control of chemical operations; and the Committee also recommends that their attention should be directed to the large number of graduates in pure and applied science who qualify at the Scottish universities and technical colleges every year, only ten per cent of whom at present find employment in Scotland.

Extension of the work of the Geological Survey so as to accelerate the rate of progress is recommended, and this should be given wider publicity. Indigenous raw materials such as limestone, quartz, felspar and baryta should be critically examined by the suggested chemical research committee and industrialists with the view of their utilization in new chemical development, and steps should be taken to bring the possibilities of chemical manufacturing development under the North of Scotland hydro-electric schemes before the industry. The refining and cracking of crude mineral oil in Scotland should be extended considerably and coupled with a more exhaustive utilization of coal tar as a source of chemicals. Further exploration of the potentialities of such processes as the Robinson–Brindley or the Fischer–Tropsch for organic synthesis is also recommended. Stress is laid on the importance of a substantial reduction in the cost of coal and of easing the situation in regard to Government control of raw materials and housing. Conditions for expansion of export trade are regarded as good, but conference with shipping interests is recommended on measures to avoid the burden on manufacturers caused by the tendency to transfer Scottish manufactured material to southern ports for shipment abroad.

In regard to particular industries, the Committee hopes that the newly formed Coal Tar Research Association will find a place within its organisation for a section operating in Scotland where, owing to differences in coal and methods of carbonization, special problems have to be tackled; and also that the enormous post-war demand for all types of glass will be met in part by a general expansion of the Scottish industry. Scotland should also have a considerable share in the expansion of the dyestuffs industry; but the future of the papermaking industry in Scotland is bound up with the renewed importation of esparto grass and wood pulp. The development in Scotland of viscose, other types of rayon, or entirely new fibres from vegetable protein or alginic acid, must depend entirely upon economic factors, but special attention is directed to glass fibre. There appears to be room for a steady expansion of the rubber industry in Scotland generally, in addition to developing the export market, and it is strongly urged that actual manufacture of synthetic resins should be established in Scotland. The extraction of natural drugs could well be expanded in view of the great opportunities for export, and synthetic vitamins should find a place in the well-established fine chemical industry.

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, July 5—Friday, July 9

IRISH CHEMICAL ASSOCIATION (in the Department of Chemistry, University College, Dublin), at 10 a.m.—Summer School in Chemistry.

Tuesday, July 6

SOCIETY OF CHEMICAL INDUSTRY, PLASTICS GROUP (at Manson House, 26 Portland Place, London, W.1), at 6.30 p.m.—16th Annual General Meeting; Dr. Emil Ott: "The Relation of Physical Characteristics and Chemical Structure of Cellulose Derivatives".

Wednesday, July 7

BRITISH SOCIETY FOR RESEARCH ON AGEING (at the Royal Society of Medicine, 1 Wimpole Street, London, W.1), at 11 a.m.—Conference.*

Thursday, July 8

SOCIETY FOR ENDOCRINOLOGY (in the Clinical Lecture Theatre, Middlesex Hospital Medical School, London, W.1), at 5 p.m.—Prof. Edwin B. Astwood: "Recent Advances in the Physiology of the Thyroid Gland".*

Thursday, July 8—Saturday, July 10

INSTITUTE OF PHYSICS, MANCHESTER AND DISTRICT BRANCH (in the Physics Department, The University, Oxford Road, Manchester). —Conference on "Semiconductors and their Applications".

Thursday, July 8

At 2 p.m.—"The Physics of Semiconductors".

Friday, July 9

At 9.30 a.m.—"Industrial Developments"; at 2 p.m.—"Applications".

Saturday, July 10

At 9.30 a.m.—Informal Discussions, Demonstrations and Exhibits.

APPOINTMENTS VACANT

APPLICATIONS are invited for the following appointments on or before the dates mentioned:

SCIENTIFIC OFFICER IN THE CHEMICAL RESEARCH DIVISION of the Ministry of Agriculture—The Assistant Secretary (Establishment), Ministry of Finance, Stormont, Belfast (July 9).

ASSISTANT KEEPER (Class II)—The Director, The London Museum, St. James's, London, S.W.1 (July 9).

ENTOMOLOGIST to work on the biology and control of the Pea Aphis, and an ENTOMOLOGIST to assist with investigations on the biology and control of the Pea Moth and to work on the development of methods of pest control—The Secretary, School of Agriculture, Cambridge (July 10).

SENIOR OBSERVER and a JUNIOR OBSERVER—The Director, The Observatories, Cambridge (July 10).

ASSISTANT PLANT PHYSIOLOGIST, ASSISTANT POMOLOGISTS (2), and an ORGANIC CHEMIST for fruit products investigations, at the Long Ashton Research Station—The Secretary and Registrar, The University, Bristol (July 10).

ASSISTANT LECTURER IN ZOOLOGY—The Registrar, The University, Leeds 2 (July 10).

LABORATORY ASSISTANT (Grade II) IN THE DEPARTMENT OF PHYSICS —The Secretary, Bedford College for Women, Regent's Park, London, N.W.1 (July 10).

SENIOR LECTURERS or LECTURERS (2) IN THE DEPARTMENT OF ENGINEERING—The Registrar, The University, Manchester 13 (July 10).

PUBLIC ANALYST—The Town Clerk, Town Hall, Bolton, endorsed 'Public Analyst' (July 10).

LECTURER IN THEORETICAL PHYSICS—The Registrar, King's College, Strand, London, W.C.2 (July 12).

LECTURER IN ARCHÆOLOGY—The Secretary, Queen's University, Belfast (July 13).

ASSISTANT IN GEOGRAPHY—The Secretary of University Court, The University, Glasgow (July 15).

SENIOR LECTURER or LECTURER IN THEORETICAL PHYSICS—The Registrar, The University, Manchester 13 (July 17).

SENIOR RESEARCH OFFICER or RESEARCH OFFICER (Ref. No. 1768) to undertake research into the chemical composition of Australian pasture plants, a RESEARCH OFFICER—Ecology (Ref. No. 1769)—to undertake research on pasture ecology, and a RESEARCH OFFICER —Agrostology (Ref. No. 1770)—to conduct research into the establishment and management of sown pastures, Division of Plant Industry, Canberra—The Secretary, Australian Scientific Research Liaison Office, Africa House, Kingsway, London, W.C.2, quoting appropriate Ref. No. (July 24).

CHIEF CHEMIST, and a RESEARCH OFFICER for enzyme chemistry, physical chemistry, X-Ray crystallography, and infra-red spectroscopy—The Secretary, Wool Industries Research Association, Torridon, Leeds 6 (July 24).

SENIOR ANALYST, an ANALYST, and an ANALYST (Biochemist), in the City Analyst's Department—The Town Clerk, Municipal Buildings, Dale Street, Liverpool, with the appropriate endorsement (July 26).

MECHANICAL ENGINEERS (3, Principal Scientific Officer grade) in the Royal Naval Scientific Service, for (*a*) design and development of torpedoes, (*b*) work on small control mechanisms, and (*c*) work requiring a sound knowledge, both practical and theoretical, of steam generating plant and prime movers—The Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2186 (July 31).

CHAIR OF ARCHITECTURE AT NATAL UNIVERSITY COLLEGE—The Secretary, Universities Bureau of the British Empire, 8 Park Street London, W.1 (July 31).

HEAD OF THE METALLURGY DIVISION at the Atomic Energy Research Establishment—The Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2184 (July 31)

CHAIR OF CHEMISTRY—The Secretary, The University, Aberdeen (July 31).

CHAIR OF PHYSICS in the University of Adelaide—The Registrar The University, Adelaide, South Australia (August 15).

MECHANICAL ENGINEERS, PHYSICISTS or METALLURGISTS for research on mechanical working problems generally, including rolling, drawing and forging, and MECHANICAL ENGINEERS to assist in research on mechanical working problems generally, in the Metal Flow Research Laboratory—The Personnel Officer, British Iron and Steel Research Association, 11 Park Lane, London, W.1, endorsed 'Metal Flow'.

LABORATORY ASSISTANT or TECHNICIAN with experience in some field of biological laboratory work, and a SPECIAL HISTOLOGICAL TECHNICIAN for a new research programme on radioactive tracer elements—The Professor of Zoology, The University, Bristol.

GOVERNMENT CHEMIST in the Medical Department of the Gold Coast—The Director of Recruitment, Colonial Service, 15 Victoria Street, London, S.W.1.

TECHNICAL RESEARCH ASSISTANT by the Professor of Physiology—The Secretary, King's College of Household and Social Science Campden Hill Road, London, W.8.

SCIENTIFIC OFFICERS and EXPERIMENTAL OFFICERS in Ministry o Supply Establishments concerned with the whole field of scientific research for the Services, for Civil Aviation and for a variety o industrial purposes, in the fields of: Chemistry (Ref. F.355/48) Biochemistry, Physiology, Pharmacology (Ref. G.184/48), Aerodynamics (Ref. A.160/48), Aircraft Structural Theory (Ref. C.301/48) Gas Turbines (Ref. C.299/48), Physics (Ref. A.159/48), Radar (Ref A.161/48), Aircraft Instrumentation (Ref. C.300/48), Metallurgy (Ref. F.356/48), Mathematical Applications (Ref. A.158/48)—Technical and Scientific Register (K), York House, Kingsway, London, W.C.2.

CHEMIST with research experience preferably, though not necessarily in field of protein fibres—The Director, British Cotton Industry Research Association, Shirley Institute, Didsbury, Manchester.

SENIOR TECHNOLOGIST—The Secretary, British Rayon Research Association, Bridgewater House, 58 Whitworth Street, Manchester 1

BIOCHEMIST (non-medical)—The Secretary-Superintendent, County Hospital, Lincoln.

ASSISTANT TECHNICIAN IN THE ZOOLOGY DEPARTMENT—The Registrar, University College, Southampton.

LECTURER IN LIVESTOCK HUSBANDRY—The Principal, Harpe Adams Agricultural College, Newport, Shropshire.

SENIOR LECTURER, and a LECTURER, IN PHYSICS, at the University of Otago, Dunedin—The High Commissioner for New Zealand, 415 Strand, London, W.C.2.

STATISTICIANS in the newly created Statistical Department of the Government of Nigeria—The Director of Recruitment, Colonial Service 15 Victoria Street, London, S.W.1.

LIMITATIONS OF PLANNING

OF the many repercussions in Britain of the fuel crisis of February 1947, the shock administered to the general belief in economic planning was among the most far-reaching. Those who then began to doubt whether the best way of ordering economic affairs was to place the responsibility for all crucial decisions in the hands of the State have since been joined by many others as a sequel to the balance of payments crisis of August. Behind the resentment originally aroused by the abolition of the basic petrol ration and the direction of labour lies uneasiness as to whether the method of cure is not bringing evils worse than the disease, and endangering precious and fundamental elements of our heritage of freedom.

This is no mere party issue, and while it may still be generally admitted that we must have more State intervention and direction in our economic life than we had before the War, there is probably less disposition to regard economic planning as a magic talisman by which our difficulties may be charmed away. The recent resignation of Sir Charles Reid from the National Coal Board arouses profound misgivings as to whether under the existing conditions the technical man will be allowed to make his all-important contribution to the improvement of technical efficiency and production. Those who believed that, given time, good technique might solve the worst of Britain's coal problems, are forced to admit that mining engineers, at the moment, are not in a position to make their full contribution to the rehabilitation of the industry.

If this is true in the coal industry, nationalization of which was accepted by almost everyone as essential and appropriate, doubts cannot but grow whether the programme of nationalization will make any positive contribution to the improvement of industrial efficiency and productivity, either in the narrower technical or in the wider social and economic context. While the recommendations of the Reid Report are not implemented, the scientific worker and the technologist at least can scarcely be convinced that nationalization as such is the answer to our economic problem, if indeed they do not see in national ownership a fresh obstacle to the technical reorganisation which may be needed in more than one industry. Those doubts will be further strengthened by the opinions voiced by Sir John Henry Woods, 'permanent secretary' to the Board of Trade, in a lecture before the Institute of Public Administration last December. Indeed, that lecture, now published in the *Journal of Public Administration* (26, 85; 1948), contains unmistakable evidence that nationalization of industry in Britain at the pace set by the present Government has seriously overstrained the administrative resources of the country, as indeed both Mr. Shinwell and the Lord President of the Council have admitted.

Despite, therefore, current discussions on the possibilities of securing a better utilization of the country's resources of scientific man-power through planning based on operational research, there is probably a much wider disposition than at any time since the end of the War to recognize that central planning has limits. That much was argued by Sir Oliver Franks in the very lectures to the London School of Economics and Political Science last year which Sir Hubert Henderson criticized in his Rede Lecture in May 1947. The question to-day is rather where is the frontier to be drawn between planning and freedom, given the techniques now at our disposal, the administrative possibilities and difficulties, and the social aspirations which lie behind so much of the programme of reconstruction to which the present Government no less than its predecessor is committed.

Prof. John Jewkes' recent book, "Ordeal by Planning"*, shows plainly that discussion is what is first required. Readable, fluent and clear in its diagnosis, it says much that was worth saying and will be read with approval by many who are becoming conscious that they are losing something they cherish and in danger of losing more. But its analysis is purely destructive, and Prof. Jewkes has thrown away an opportunity all the greater because the persuasiveness and clarity of his style should secure a firm hold on the reader's sympathy and understanding. He defends himself, it is true, on the plea, that it is necessary to clear a field of weeds before sowing a new crop; but sometimes his destructive analysis is more like pulling up the wheat with the tares, and handing over both to the destructor. Nevertheless, it is well that the relation should be established between the fall in the standard of living in Britain, the progressive restrictions on individual liberties, the ever-widening destruction of respect for law, the steady sapping of our instinct for tolerance and compromise, the sharpening of class distinctions and our growing incapacity to play a rightful part in world affairs; though it is going too far to attribute these interrelated changes to something that has happened in the last two years. The danger of liberties being filched away, of the residue of our liberal traditions disintegrating and a planned economy issuing in totalitarianism are plainly stated, but it does not follow, as Prof. Jewkes implies, that we must choose between further planning and a return to the free price mechanism.

It is, however, when he comes to discuss planning as a scientific method, planning and freedom and planning and prosperity, that Prof. Jewkes has most to say that is of direct interest to the scientific worker. Under the first heading his remarks bear closely on the organisation and activities of the nationalized industries and are given point by Sir Charles Reid's resignation and by the inability of members of Parliament to raise a question in the House of Commons regarding a recent widespread failure in power supply. The purely logical and intellectual difficulties of running a planned economy have not yet been solved, though it is pessimistic to assume as yet that they cannot be solved. Prof. Jewkes maintains, however, that central economic planning cannot be scientific. In the first place, he says, such a plan can only have a scientific purpose if it is designed to give the consumers what they want and when they want it, and to provide freedom for the consumer to decide whether he wishes to spend his money now or in the future. In the second place, the centrally planned economy is unscientific in that those who take the final decisions must always avoid the confession of failure.

It may be true that in practice the central planner does tend to avoid admitting failure, but nevertheless Prof. Jewkes' 'must' can well be challenged; similarly the fact that central planners have often disregarded the consumers is no valid reason for asserting that they must necessarily fail to provide the consumer with the freedom on which Prof. Jewkes quite correctly insists. Here as elsewhere Prof. Jewkes indicates the essential criteria for freedom; but, pointing to present failures to meet those criteria, concludes rather too readily that they can never be met. It is well that those weaknesses should be stressed. Britain clearly is ill able to afford the waste of man-power and materials that are inherent in some of the manifestations of planning we are at present witnessing. It is not merely the growth of the administrative staff or bureaucracy. The danger of retarded technical progress, and the deterioration of the atmosphere in which fundamental research is prosecuted to which Prof. Jewkes refers cannot be ignored, and should be seriously considered.

We have to remember that in the last analysis the answer to the problem depends upon which type of economic organisation will provide the greatest incentive to effort. Prof. Jewkes points out that whether planning can evoke sufficiently powerful incentives to enable it to match the economic results of a free economy depends upon many physical, psychological and even spiritual factors bound up with the reasons why men work at all. These factors are complex and difficult to assess; but Prof. Jewkes suggests that there are two groups of workers whose output is likely to be affected adversely in the planned economy of a socialist State. The first, and larger, is that which presses for socialism in the expectation that it will lead to an easier life and bigger returns for less effort. The second and more important group is that responsible for the highest intellectual effort, such as fundamental scientific research.

Prof. Jewkes believes that fundamental research must wither in a planned economy, both because it cannot proceed in such an environment and because those who are capable of it will be disgruntled by what appears to them the foolish policy of the State in failing to provide the only environment in which they can work. He cites in support of this view the wholesale resignation of the experts on jet propulsion when the Government took over this research; and while he is here on debatable ground, the importance of incentives in this context cannot be gainsaid. It must be admitted that the whole question requires very careful examination, for there is no doubt that under present conditions the real work of the world —the patient fostering of the efficient organisation of a factory, the cultivation of craftsmanship, the extending of scientific knowledge, the teaching of the young, the healing of the sick—does tend to fall in public esteem. Moreover, there is continuous erosion or destruction of the sense of responsibility, and this may be quite as serious in its results as the decrease in the differentials in reward in a planned as compared with a free economy.

---

* Ordeal by Planning. By Prof. John Jewkes. Pp. xi + 248. (London: Macmillan and Co., Ltd., 1948.) 12s. 6d. net.

Prof. Jewkes argues that the planned and centrally directed economy must inevitably undermine the economic freedoms, such as the choice of occupation, the disposal of incomes and the acquisition and tenure of property. These freedoms, while they can never be absolute, cannot be separated from the freedom of expression in all its forms or the freedom to choose and change the members of the governing body of the community, and their whittling away destroys the independent thought and criticism through which alone freedom can be preserved. However strongly we may feel that Prof. Jewkes is too pessimistic here, the danger is real; and it is well that we should be asked to consider more carefully how it is that planning, which sets out to control things, ends by controlling men.

Prof. Jewkes' argument is strongest at this point, where it directs attention to the dangers to man's moral and spiritual welfare which appear to be inherent in economic planning. Wherever the frontier is drawn between freedom and planning, the organisation we establish to serve the needs of society with the most effective techniques and administrative resources of to-day must take full account of them; we must never forget that the individual is more important than the organisation or plan designed to serve his needs.

This warning of the danger of over-organisation and of central planning is emphasized from another point of view by the lecture by Sir John Woods on the administrative problems of the Board of Trade; Sir John is frankly concerned as to whether the central machine of Government can stand for long a continuance of the pressure, and his lecture underlines all that was urged by the Select Committee on Estimates in its Fifth Report for the Session 1946–47, and by Prof. W. A. Robson in his article on "Machinery of Government, 1939–1947" in the *Political Quarterly* early this year and again in his inaugural lecture at the London School of Economics and Political Science, on the urgent necessity of reconsidering the whole pattern of the Government machine in the light of modern conditions. In particular, Sir John asks whether the work of the Board of Trade as it now stands is a business that can be administered at all; and the whole trend of his lecture suggests that the answer is that it cannot.

The trouble is generally congestion at the top, because in spite of the expansion of government departments the structure remains essentially one that was built up for much lighter and more leisurely tasks. The Board of Trade provides an excellent illustration of the position, but it also illustrates very forcibly one of the points Prof. Jewkes makes. In 1938 the Board of Trade had a staff of 2,400, of whom 60 were administrative officers: there are now 400 administrative officers and a total staff of 15,000. The main divisions of its work are in charge of fifteen 'under-secretaries', above whom are two 'second secretaries' and the 'permanent secretary', through whom theoretically all important questions pass to the president of the Board of Trade.

When the department was small, this system was a practical means of seeing that its policy as a whole was coherent; now it is what Sir John calls a 'super-bottleneck', and in practice it is not possible for everything to go to the president through the permanent secretary. Nevertheless, it is essential to keep in step the policies of some four hundred people, and in spite of all the elaborate methods already adopted to inform each section of what the others are doing, the range of activities is so wide that Sir John admits that it is still possible for somebody to go ahead with a policy only to find that it conflicts with some other line of policy being pursued elsewhere. The administrative confusion and public criticism which result involve further waste of time on remedial measures, and lead to an even greater danger: so much time is spent in being sure of keeping in step that advance is scarcely possible. In Sir John's words, "things that ought to happen do not happen while we are making sure that nobody will be upset if they do happen".

In this great department, the essential function of research or fact finding as a basis for the determination of long-range policy as distinct from day-to-day activities is not being discharged. It should also be remembered that even if we could find the able men outside the Civil Service to serve on a committee to investigate such matters, Civil servants would still have to collect the information. Whatever Prof. Jewkes may urge, and although the Government could avoid making fresh demands on the Civil Service and perhaps reduce some of the present demands, most of the work has come to stay.

Such observations emphasize the importance of such new ventures as the British Institute of Management and the Administrative Staff College, as well as the National Institute of Economic and Social Research, and the increased provision for research in social science at the universities recommended by the Clapham Committee. The training and exchange of staff, and research into problems of administration and government, will both be required before we can either evolve the most effective forms of organisation to serve our needs to-day in industry and in government, or say with certainty where the frontier between planning and freedom lies. The conclusion to be drawn from Prof. Jewkes' book, with its demonstration of the dangers and abuse of planning, is not that planning is impracticable, but rather, as Sir John's lecture indicates, that we have embarked on large schemes of planning and organisation before determining the nature of the organisation required, the precise purposes it has to serve and the limitations imposed by existing techniques and administrative ability, whether individual or collective.

This fresh warning of the dangers of planning and reminder that for the moment we have outstripped our administrative resources and capacity for organisation is really a challenge to creative thought and to fresh efforts to discover the ways of co-operation in which the vast material resources which technology has put at our command may be used for the benefit of the whole community. Whatever mistakes may have been made in planning—and they have been frequent and grievous—mankind cannot go back and abdicate the conscious control of his environment. The preservation of the rich cultural and spiritual heritage of mankind, on which Prof. Jewkes rightly lays such stress, depends on fresh advance in the patient study of human relations and institutions, and the evolution on the basis of past experience of new means to serve the more complex demands of modern society. The price of freedom is indeed eternal vigilance; but a part of that price must be the continuing, courageous and imaginative study of human organisation, inspired by a greater respect for human personality and the moral values of Western civilization.

THE MATHEMATICAL PRINCIPLES OF PHYSICS

Principia Physica

Von Hans Georg Küssner. Pp. 256. (Göttingen: Vandenhoeck and Ruprecht, 1946.) n.p.

IN this book the author presents a new conception of the general principles of physics by trying to construct an axiomatic system in which no descriptions of facts are used which are not "logically definable". Maintaining that the notion of the continuum does not fulfil this condition, he demands that metric geometry be excluded from physics altogether, and that the space-time system be put on a purely arithmetical basis. In other words, the universe is considered to be a discontinuous manifold or point lattice. Quaternion algebra is found to provide the most adequate mathematical description for such a system and to account automatically for the four-dimensionality of space-time and its splitting up into three space-like and one time-like dimensions. In contrast to the usual concept of a dynamic universe to be described by events, the new concept is that of a static universe to be described by its structure, which reflects itself in the group properties of the algebra used for this description. Accordingly, the fundamental laws of physics cannot have the form of differential equations but have to be expressed in the form of integral equations, that is, free of metric, the integrals used being essentially Stieltjes integrals, the definition of which also holds for a discrete set of variables.

These integrals extend over the whole space-time, which is in keeping with the fact that in classical physics both time directions are completely equivalent and that there is no actual difference between past and future. On the other hand, the classical concept of causality, namely, that the future as well as the past of a physical system ought to be completely predictable from a knowledge of its present state, is not compatible with this structural idea, as no exact statement at all can be made about the structure outside a certain finite region of the world lattice from a mere knowledge of the structure within. Thus only approximate extrapolations can be made, which is essentially the same as saying that in general only statistical statements about the future (or the past) of a physical system are possible. Quantum mechanics, which is of an intrinsically statistical nature, is therefore regarded by the author as only an approximation towards the real structural laws. The general theory of relativity is also rejected because it is essentially based on metric geometry.

The world (lattice) points can be classified in different ways. A class of points constituting a line of sufficient length is identified with an 'atom'. Thus the atoms have no geometrical structure and have the character of 'point charges', the charges being of two different types, electric and 'gravic', and of different magnitude. All atoms can be classified into classes of equal charge, and by the application of group theoretical arguments it is shown that only a finite number of such classes exist. Each atom is in integral interaction with every other atom. The laws of this interaction, which are the equivalent of the classical field laws of electromagnetism and gravitation, are supposed to be of the type of Maxwell's equations which, it is shown, can be formulated as integral equations of the above-mentioned character. These equations also comprise interactions between electric and gravic charges which, the author claims, are the explanation for the electric and magnetic fields of the stars. Experiments for the verification of these relations are proposed.

The principles mentioned so far cover the domain of physical laws in medium dimensions. In order to obtain the laws of macrophysics and microphysics other principles have to be added. In the first case a structural principle relating to the structure of the universe as a whole is formulated, which the author calls the "principle of equal surroundings". This, it is claimed, leads to an understanding of the expansion of the universe and a number of other cosmological phenomena, and it also disposes of the notion of an inertial mass, reducing it to the interaction with the total material content of the universe. The non-commutative quaternion algebra, on the other hand, lends itself to the introduction of quantum conditions in the form of commutation rules. In addition to Planck's constant for the electromagnetic interaction of atoms another constant for the 'gravic' interaction is introduced. This leads to a theory of a new kind of atomic disintegration which is believed to be the origin of the primary cosmic radiation, the extra-terrestrial nature of which the author denies.

The fundamental equations of the new theory contain altogether fifteen universal constants. It is well known that only three such quantities can be dimensionally independent. Hence twelve independent relations between these quantities can be established which contain only dimensionless arithmetical constants. These are identified with the twelve arithmetical group invariants of the particular kind of algebra used. This is put to the test by a comparison between the theoretical and the most reliable experimental values of the universal constants, which indeed shows most striking agreement within the limits of accuracy. Moreover, according to the above-mentioned ideas about the nature of the atoms it should, in the view of the author, be possible also to calculate, by similar methods, the masses and spins of all possible atoms in all states of excitation. The solution of this problem is also attempted but only a limited success is claimed.

Although the author repeatedly emphasizes that all new theoretical ideas must be subjected to the most rigorous tests by experiment, it is nevertheless evident that he is essentially of the opinion that complete understanding of the material world can be achieved by purely epistemological methods. This accounts for the frequent appearance of phrases like 'endgültige Erkenntnis' (final cognition). The many extremely close agreements between theory and experiment are presented as stringent evidence for the truth of the theory; but the same claims are made by other theories (like Eddington's) which are based on completely different epistemological principles. In the opinion of the reviewer none of these theories could have been developed without a previous knowledge of the experimental facts and the numerical results of the experiments. Indeed, a great number of recent discoveries about fundamental particles, etc., are definitely not 'predicted' by the theory simply because the author did not know them while developing his ideas. Thus in spite of its extremely interesting aspects the new theory can only be regarded as one of many attempts to restore order and harmony in he rather chaotic state of ideas about the material universe which has its parallel in the state of affairs concerning spiritual values. Every brave effort to achieve unification in both realms of thought is welcome, and therefore the detailed study of the ideas which are briefly outlined in this review can be warmly recommended.

R. FÜRTH

ESSAYS ON ECONOMIC RECOVERY

Britain's Industrial Survival

By Ian Bowen. Pp. 204. (London: Faber and Faber, Ltd., 1947.) 12*s.* 6*d.* net.

Co-operative Communities at Work

By Henrik F. Infield. (International Library of ociology and Social Reconstruction.) Pp. x + 182. (London: Kegan Paul and Co., Ltd., 1947.) 15*s.* net.

The World as an Economic Entity

By Business and Brotherhood and Res et Caritas. Pp. viii + 218. (Nicosia, Cyprus: Guebenlian Press, 1946.) 7*s.* 6*d.*

WITHIN a decade the concept 'economics' has gone out of vogue and 'political economy' has gain taken its place. This is perhaps not so surprising at a time when attention is turned from analysis to application. Mr. Bowen is definitely a political economist; and the use of this self-styled title is evidently a warning not to expect any systematic analysis. His examination of the necessary conditions for Britain's economic recovery unhesitatingly introduces biological and political factors. Indeed, any realistic approach to applied economic problems could scarcely fail to do so. But after having read the book through, the reader might well wonder what the formulation of "the two main world economic problems"—a declining population and unemployment—has to do with the future industrial organisation of Britain, dealt with in the concluding chapter. There is no attempt to analyse fully or assess the relevant problems facing Britain and to reach, through such an analysis, certain conclusions.

The book makes pleasant reading but gives little return for study. Yet despite its two hundred pages contains quite a wealth of economic information, presented in a rather kaleidoscopic form. There is a good section on distribution and imperfect competition and the devices used to restrain retail competition. There is also an interesting chapter on "Advertising in the Modern Economy", followed by a discussion of monopoly in manufacturing, the application of power to industry, industrial efficiency, the formation of capital, population, and overseas capital formation. Indeed, scarcely any of the chapters are without interest; but they would be improved were they treated as separate papers rather than as steps in a logical argument.

In many respects Mr. Bowen falls between two stools. The study is too factual and too detailed for the ordinary reader and not sufficiently analytical for the student. For example, in the section on the rigidity of retail margins, which is an excellent collection of informative data, it is a pity that it did not include any examination of war-time controls and the method of stabilizing prices which has not only perpetuated the fixed margin concept (and possibly petrified it, too) but also strengthened the position of retail associations. There are many other such examples, where the reader feels the study could have been pushed deeper. But this criticism at least shows that Mr. Bowen's writing provokes thought and discussion.

There are some illuminating statistics gleaned from various sources, but again one feels—possibly quite unjustifiably—that many of the correlations are perhaps just statistical freaks. Nevertheless Mr. Bowen's discussion of the organisation of the national boards makes amends. His comments are sound and his emphasis on joint consultative machinery in industry is correct, although one cannot help thinking that under his proposed organisation the influence of the State would penetrate into all spheres of the individual.

Mr. Infield's book is a study of co-operative communities in various parts of the world. This is another system of organisation for the post-war world; but it is the antithesis of nationalization. The communities are collections of individuals who are willing and able to work together as units to develop agricultural production and to promote higher standards of rural life. The purpose of the survey was to help organise co-operative communities as a vanguard of rural resettlement.

The two fundamental motives for all co-operative settlements have been religion and social reform, and the study covers a selection of communities falling into each group. There is a very illuminating analysis of the Hutterites, the New Llano Colony and the Sunrise Community, which also throws light on those communities in the past which have not survived. Examples of more recent ventures which have been included are the co-operative farms established by the U.S. Farm Security Administration (1937–43), the Mexican Ejido, the Russian Kolkboz and the Palestinian Kvutza.

The survey has been carried out in a masterly manner, and the appraisal of each type of community allows a comparison to be drawn. It discusses their economic policies, their political machinery and the results achieved. One conclusion which is immediately apparent in this study is that the absence of the co-operative spirit in any community brings a threat of failure, no matter whether those communities were founded by individuals or governments.

Mr. Infield is adverse to any rigid plan for post-war resettlement on co-operative lines, owing to the great variation in the physical conditions of each settlement and the character of the population. There is the need for a vital motive to knit the group closely together. Rational motives tend to lead to dissension.

In this context the survey discusses the requirements of membership, the administration and management and the degree of co-operation to be achieved. As a study it is both interesting and instructive; but the simple and easy style of the writer should commend this book even to the ordinary reader.

The third book under notice is a poor attempt to propound a fundamental truth—the need for Christian ideals (brotherly relationship, the author calls it)—in an economy run on business-like lines and activated by the profit motive. Some of the comments are certainly of value, but they are completely lost in the book, which is both badly written and badly printed. The reader would, indeed, have to feel very penitential to take the trouble to go through all 218 pages and winnow the chaff from the wheat.

SCIENCE AND PHILOSOPHY

Science and the Meanings of Truth

Studies Introductory to asking What is meant to-day by Physical Explanation of Nature, by Mechanisms of Cause and Effect, and by a Claim that Scientific Knowledge is True. By Dr. Martin Johnson. Pp. 179. (London: Faber and Faber, Ltd., 1946.) 12*s.* 6*d.* net.

As may be gathered from its sub-title, the central theme of this book is an examination of the meanings which have been or may be given to the word 'truth' in relation to recent developments in physics.

"Until the era of some recent researches in atomics and relativity, the advances of science were satisfactorily carried forward by alternation of simple hypothesis and experimental test; the quantities mentioned in the former were not unlike those measured in the latter, the nature of hypothesis being restricted to a certain kind which had served adequately from the Renaissance. In particular, the success of early modern astronomy, in replacing geometrical description of planetary motion as imaginary combinations of circles, by actual elliptic orbits linked causally with a theory of gravitation, had set a type of hypothesis in which a cause was assigned for activating a mechanical model or mental picture. In later uses of this kind of picture, the criterion of truth to be tested by experiment was whether the supposed and imperceptible substances underlying perceivable phenomena act in accord with the Newtonian laws found adequate for the behaviour of visible and tangible objects. Striking success followed the exploitation of this criterion of truth in the theory of gases and of heat, and the electromagnetic theory of light, and some of the simpler theory of metals."

But with recent researches in physics, this idea of cause in the sense of "forces causing changes in motion" broke down, because it became impossible to construct mechanical models. Such models have, in fact, been recognized as concepts, and scientific knowledge regarded as a system of formal relations instead of a correspondence with any external world imagined in a model.

After reviewing briefly the meanings of truth implied in the writings of Heisenberg, Dirac, Eddington, Milne, Whitehead and Russell, Dr. Johnson puts forward a view of his own. For him science rests on the postulate that Nature is intelligible, and the essential fact underlying this is fc him that scientific knowledge is communicabl That is, first, after measurements have been mad propositions are formulated in such a way that th results are repeatable and therefore verifiable secondly, such statements are further judged b 'coherence' in the sense of correlating the widel different physical situations within each of whic communicability has already guaranteed a degree truth. For example, the conic sections which replace the medieval circles in describing planetary motio could also describe the orbits of comets and were valuable though transient help in the suppose orbits of electrons within the atom. This criterion truth is thus a practical one—"coherence betwee communicable patterns of measurement". We n longer ask whether the 'wave-electron' or the 'particl electron' are true or false "in the sense of corr sponding to any permanent object with the mod properties of anyone's mental picture or concept" each theory is simultaneously 'true' as "each communicable over its own range of physical situ tions".

The second part of this book is concerned wit more general philosophical problems arising out the meanings given to truth in science and i particular with the relation of the physicist's min to the experience which comes to him from withou The discussion is confined to the types problems arising rather than with an attempt solve them.

This book is not easy to read, and the style involved and not always happy. It does, howeve cover many interesting topics and not its least val is that it is written by a practising physicist thinki his way through the implications of his subject.

A. C. Crombie

A GUIDE TO THE ASTROLABE

Traité de l'astrolabe

Par Henri Michel. (Ouvrage publié avec le concou de la Fondation Universitaire de Belgique.) P viii + 202 + 24 plates. (Paris: Gauthier-Villa 1947.) 1,200 francs.

There are not a few treatises, old and new, th concern themselves with that ancient a beautiful instrument, the astrolabe; but few, any, are of use to the student or collector possessi an astrolabe who wishes to know how old it is, hc it is used, and what are the principles that under its construction. The work under review mo admirably fulfils these functions, and its account the multifarious types of astrolabe is the cleare and most reliable of those known to the reviewer.

The book is divided into two parts. The former these deals briefly with the history of the astrola and goes on to a description and explanation of t various types, eastern and western. The auth discounts the generally accepted ascription of t invention to Hipparchus, largely on the ground th it was not known to Ptolemy, whose *astrolab organon* was something quite different from t instrument to which the name of astrolabe has be traditionally attached. He finds the first referen to this, the planispheric astrolabe, in the sixt century treatise of Philoponus, who tells us that h master Ammonius (c. A.D. 500) had written on t subject. M. Michel's view is clearly in accord wi he facts as known to us, though many students of ncient science will feel that an instrument so admirably devised and designed is unlikely to have emanated from the almost extinct fires of Greek culture. Very admirable is the author's clear account, in non-technical language, of the basic principle of the astrolabe, namely, the superposition of a movable map of the celestial sphere upon a map of the terrestrial as viewed from the locality of the observer. His explanation of the stereographic projection on which the instrument depends will be clear even to those whose geometrical equipment is of the slenderest. The book next considers the parts of the astrolabe, and enables the reader to discover the purpose of the networks of circles and arcs which are engraved on very part of these instruments; this is particularly valuable for the understanding of the oriental types. M. Michel devotes more than one section to the practical use of the astrolabe, to which some more preentious treatises give so little attention that the reader wonders whether their authors considered the instrument as a thing of use or only as a collector's iece: the reviewer, indeed, when first confronted with a collection of astrolabes, was forced to resort to Geoffrey Chaucer's little treatise on the ubject, which explains the essentials with admirable clarity.

Astrolabes, to-day, are the prized possessions of museums and connoisseurs, and their owners are reatly interested in a matter which seemed less mportant to their makers, namely, the date of their construction. In the second part of the book under otice, M. Michel has assembled the methods by which such dates can be estimated. To find a date on the instrument is eminently satisfactory, yet it is ot uncommon to find that this has been added and indicates the time at which the instrument was epaired or remodelled. The maker's name may be inscribed, and the book gives a very useful and full list of makers with their dates and brief notices of their work. But the collector's chief problem is the dating of the astrolabe which bears no inscription. Considerations of style and design are useful, and the series of full-page plates of astrolabes, twenty-four in number, at the end of the book is a valuable guide to those who have not been able to see a large ollection of these instruments. But the most useful feature is a discussion of the dating of the astrolabe from the astronomical data implied in its markings. Thus many astrolabes are engraved with a zodiacal calendar, and the date of the first point of Aries indicates the number of days by which the Julian calendar differed from the astronomical, and therefore the approximate date. The author makes the aluable point that the difference will depend on which of the four years of the leap-year cycle the instrument was constructed and that an uncertainty f about a century may thus result. Other methods, uch as those involving the alteration of the positions of the stars through the precession of the equinoxes, are more reliable, and the application of them should settle many hitherto doubtful cases.

The book concludes with a section on the use of the astrolabe for the elementary teaching of astronomy, in which connexion the late Prof. Jenkin's Oxford astrolabe, designed for such a purpose, might have received a mention.

All who have to do with the astrolabe will be truly grateful to M. Henri Michel for providing them with a valuable and much-needed instrument of research.

F. SHERWOOD TAYLOR

PUBLIC HEALTH TO-DAY

Recent Advances in Public Health

By Dr. J. L. Burn. Pp. viii+409. (London: J. and A. Churchill, Ltd., 1947.) 25*s*.

THIS book is well printed and illustrated, clearly written and, while full of factual data, is easy to read.

In a volume of this size much of necessity is omitted. We should have liked, for example, in Chapter 22 on venereal disease schemes to have had an account to show how modern methods of treatment by the sulphonamides and penicillin have changed the whole outlook on venereal diseases and advanced the prospect of their ultimate eradication. In the preface the author disarms criticism of this kind by pointing out that recent advances in public health have been on so wide a front, so quick in pace, so significant in nature, that he can only restrict himself to the task of summarizing selected features of recent progress, and has had to leave many advances of fundamental importance unnoticed.

Even with this self-imposed limitation, the field covered is very wide. The subject-matter is considered in three main parts: public health and the individual; public health and the community; and public health and the environment.

In the first part, admirable and succinct accounts are given of the Public Health Nursing Service in Britain; the care of mother and child; nursery care; the school health services, with desirable emphasis on the provision of school meals; health education; mental and dental health services; and social services, with special reference to the important work of the almoner. A chapter follows on the handicapped child; and here due weight is assigned to the work of J. Alison Glover, who for some twenty years, in the reports of the Chief Medical Officer of the Ministry of Education and elsewhere, has adduced cogent evidence to show that in the majority of cases tonsillectomy is an unnecessary operation. Yet still one quarter of a million tonsillectomies are said by Maxwell to be performed annually in Great Britain.

The advantage of dealing with the family in the interests of public health is set out, and an informative chapter on welfare of the aged follows. This is a topical problem of increasing importance and magnitude. Dr. Burn shows what can be done here and in other countries to deal with it. In the second part, chapters of special interest are: Chapter 19, diphtheria immunization, which the Ministry of Health with the co-operation of local authorities has done so much to promote for the past twenty years; Chapter 21, tuberculosis, with an able appreciation of the Papworth Colony and an account of mass radiography; Chapter 23, detailing the modern work on scabies; and Chapter 24, which describes the use of D.D.T. in the conquest of typhus fever, etc. The third part dealing with environment is the shortest in the book, but treats of such varied subjects as smokeless air, milk, road safety, cremation and garden cities. The references in each subject, together with suggested books and papers for further reading, are copious and useful.

The Medical Officer of Health of Salford has done good service to the cause he serves by writing this book, which will appeal to all those who wish to keep abreast of a progressive science.

ARTHUR S. MACNALTY

NATURE LOVER AND FISHERMAN

Travelling Naturalist

By Anthony Buxton. Pp. 224 + 31 plates. (London and Glasgow: Wm. Collins, Sons and Co., Ltd., 1948.) 10*s.* 6*d.* net.

A NEW book by Anthony Buxton is something very special for those who love Nature. He is a shrewd and careful observer, and he writes in charming, simple English prose. In this, his latest book, there is literally not one dull sentence from the beginning to the end. He permits himself a sly dig at naturalists who use long and learned words: he certainly steers clear of them himself.

The book takes us from Norfolk and Essex, Hampshire and Yorkshire, to Scotland, where he fishes the Loch of the Shieling of Angus with skill and profit. We are then taken over the sea on his magic carpet to foreign lands, and with him watch the izzard basking in the autumn sun on the high rocky ridges of the Pyrenees and, still farther afield, watch the snow partridge swing over the snowy slopes of the Caucasus at a height of 10,000 ft. above the sea. With him, we fish rivers in Norway and share his skill in hooking giant sea trout on the lightest of light tackle, and are scarce able to keep pace with him as he flies along the rocky bank of some swift-flowing, green-tinted torrent, or hurls himself, waders and all, into the icy water, to float downstream like one of his flies in order to avoid the arch of a bridge toward which a great sea trout at the end of his line is hurrying him. One of the most attractive things in an attractive book is the author's obvious joy in living. His affection and understanding for the wild creatures which he describes so well are obvious, and he deplores the effects of the prolonged Arctic spell of 1947 on wild life. His home county of Norfolk suffered as severely as any district, and the population of bearded tits has been almost wiped out. He mentions the toll taken of redwings, and this reminds me that for the first time I saw not a single redwing last winter or spring in the Isle of Skye, where numbers are usually to be seen during April on their migration to Iceland.

The story (page 62) of izzard jumping over a man's back recalls the story of a small herd of red deer in the Cuillin of Skye which were descending a steep pass when two climbers came in sight of them. The deer came straight on, and the climbers threw themselves flat on the rock, each member of the herd jumping over them on its headlong downhill rush. Anthony Buxton found that the dotterel was a tame bird, and mentions that he might perhaps have stroked it had he so desired (p. 153). It is true that some dotterel are without fear of human beings. I think the most remarkable experience I ever had was when a dotterel on the nest rose from its eggs, ran over to where I was sitting a few feet away, caught a crane fly on my clothes, then looked at me in a knowing way before hurrying back to the precious eggs. His story (p. 187) of marsh harrier chicks killing and eating their younger brothers and sisters reminds me of the prolonged and bitter attacks made by one golden eaglet on the other in the eyrie, and of another eyrie which I visited where one eaglet lay dead and the other, a particularly truculent bird, although still in the downy stage, attempted to attack the human intruder.

The author (p. 195) writes needed words of protest about the bird photographer who is too much in a hurry with his hide, or who enters his hide without taking a companion with him, in order to see him in and, at the end of his watch, to see him out. Birds with very few exceptions cannot count, and when two people go to a hide and one leaves it the bird does not realize that the other has been left behind. As he says, the interest of the birds should come first, that of the photographer second. I foresee many editions of this book, which is an oasis of sanity in the desert of a mad world.

SETON GORDON

ORGANIC SUBSTANCES USED IN INORGANIC ANALYSIS

Organic Analytical Reagents

By Prof. Frank J. Welcher. Vol. 1. Pp. xv + 442. 44*s.* net. Vol. 2. Pp. xi + 530. 40*s.* net. (New York: D. Van Nostrand Co., Inc.; London: Macmillan and Co., Ltd., 1947.)

THESE two volumes form part of a work which when complete should be a most useful compilation. The author's aim has been to collect information from the literature describing the uses of all organic substances in inorganic analysis. The term "analytical reagent" in the title is thus taken to include all incidental uses of organic compounds, if only, for example, as solvents in an extraction, a precipitation or a colour test. On the other hand, the operations listed are, in fact, all for the detection or determination of inorganic atoms and radicals (with the exception of tests for acetates, cyanides and cyanates) and applications to the detection or determination of organic compounds are not considered, although the title gives no indication of this.

Introductory chapters in the first volume give a useful résumé of the theory of valency with specia reference to co-ordination and chelate compounds and a discussion of the effect of structure on solubility The main part of the work is then arranged according to a rational classification of the organic compounds listed, all the various applications being included under each. Laboratory methods for preparing the reagents are given and the analytical procedures are described with sufficient working details. No attempt is made at a critical selection of the methods given the author's aim being to include everything so that the reader may be free, either to ignore, or to attempt the improvement of, any imperfect methods described References to the literature are given in every instance, though these cannot always be exhaustive

From the point of view of the practical analyst using these volumes to find an analytical method for a particular substance an arrangement unde analytical headings might have been more convenient. That actually adopted does, however permit of a general discussion of the uses of any group of substances or widely used reagent, and the practical usefulness of the book must depend on th indexing. Each volume is provided with two indexes one of organic reagents and one of analytical uses. In the latter, under each analytical problem the various organic compounds are listed alphabetically with references to the body of the work. It may b presumed that collective indexes of all the volume will be provided when the work is complete.

These volumes are excellently printed and produced and analysts will find in them a mine of usefu information and of references to the literature.

G. M. BENNETT

Země Krásná (The Beautiful Earth)

By J. K. Říha. Pp. 376. (Třebechovice, Czechoslovakia: A. Dedourek, 1948.) 540 crowns.

THE sub-title of this remarkable book states that it is "about Nature, civilisation and planning". The author is not only an architect and an engineer, but he also possesses a deep knowledge of the biological sciences and he has attempted to apply this knowledge in town and country planning. Moreover, Mr. Říha has searched old records to find out whether man had in the past attempted to co-operate with Nature in developing civilization.

It appears that in modern times, or at least in the last hundred and fifty years, the production of plant foodstuffs has increased fourfold in Bohemia. Potatoes and cereals have completely changed mankind's living conditions and made possible the extraordinary progress that is usually attributed to technology, though the author emphasizes the part played by biology in this development. He refers to an area in south Bohemia, north of Třeboň, that was converted from useless marshland to useful productivity as early as the twelfth and thirteenth centuries. Ponds and canals (one thirty-five miles long) were made, and the drained land cultivated and used to rear cattle and horses. In the eighteenth century, English influence led to the laying out of tasteful parks both here and elsewhere in Central Europe. This brings the author to his contention that modern civilization is not antagonistic to Nature and indeed succeeds best when planning is directed towards harmonizing the two. The work of the country architect should take account of climate, soil and biological laws so that a community fits naturally into its surroundings.

Other features of this nicely bound folio book, well printed on art paper, are the many fine photographs by the author and his scientific friends, and the 6,000 word summaries in Russian, French and English. J. G. F. D.

Faune de France

47: Hyménoptères tenthredoïdes. Par Lucien Berland. (Fédération française des Sociétés de Sciences naturelles: Office central de faunistique.) Pp. 496. (Paris: Paul Lechevalier, 1947.) 1500 francs.

THIS volume, the most recent in the Faune de France series, is well up to the standard of its predecessors. M. Lucien Berland is the author of the volumes on the Vespoidea and has placed hymenopterists further in his debt in having written the present monograph. Under the term Tenthredoïdes he includes not only the sawflies but also all other members of the Symphyta or Phytophaga, as they are variously known. As in other volumes in the series, illustrations are a special feature—whole insects figuring very largely and often accompanied by sketches of structural details, while larvæ are illustrated where necessary. Under each species will be found its chief synonyms, followed by a description of its external characters, the main facts regarding its habits, and its distribution in France and also in other countries. Diagnostic keys to both genera and species are particularly clear and easy to follow. Taking the book as a whole, it will also prove helpful to students of the British members of the Symphyta. At the end there is a tabular synopsis of larval characters in the different families and a list of species wherein parthenogenesis, in one form or another, is known to occur. This is followed by an enumeration of those species known to be injurious to cultivated plants and, finally, a catalogue of host plants and the species feeding upon them. This latter, it may be added, will be found particularly useful by many workers.

Birds on the Wing

By John Barlee. Pp. 128. (London and Glasgow: Wm. Collins, Sons and Co., Ltd., 1947.) 12*s*. 6*d*. net.

Birds of Malaysia

By Jean Delacour. (Pacific World Series.) Pp. xvi+382. (New York: The Macmillan Company; London: Macmillan and Co., Ltd., 1947.) 25*s*. net.

The Birds of Brewery Creek

By the Rt. Hon. Malcolm Macdonald. Pp. x+334+23 plates. (London, Toronto and New York: Oxford University Press, 1947.) 21*s*. net.

BIRD books come and continue to come, being for the most part very excellent, and the three here considered are well up to standard. In "Birds on the Wing", we are shown a number of fine snapshots accompanied by excellent notes from the camera and notebook of one of our younger naturalists. "Birds of Malaysia" is of different type, for in it Captain Delacour gives us a handbook to the birds of the interesting islands of Java, Sumatra and Borneo, the Malaya Peninsula, etc., with their wealth of bird life. Here are found such ornithological gems as the giant argus and Bulwer's wattled pheasants, the great hornbills, many sunbirds and so on. This volume with its excellent line drawings is a most helpful guide to them all. The third book, "The Birds of Brewery Creek", is of yet another type, though as good in its different way. In it Mr. Macdonald, High Commissioner for the United Kingdom to Canada, tells of his observations on birds in Brewery Creek, near Ottawa, and a very joyous record it is. The illustrations are from photographs and some of them are in colour, an especially excellent one being that of a snowy owl. FRANCES PITT

The Annual Register

A Review of Public Events at Home and Abroad for the Year 1947. Edited by Ivison S. Macadam, assisted by Hugh Latimer. Pp. xii+568. (London, New York and Toronto: Longmans, Green and Co., Ltd., 1948.) 42*s*. net.

FOR the first time in its hundred and eighty-nine years of publication, this volume has been compiled with the aid of an advisory board. The selection of the board has been entrusted to five organisations concerned with the subjects covered by the annual review. These are the English Association, the Arts Council of Great Britain, the British Association, the Royal Institute of International Affairs and the Royal Historical Society. These bodies have chosen the contributors. The "Year in Science", running to more than twenty pages, gives a wide and readable survey of the year's work and is an improvement on the articles of previous years. There is little change, however, in the general arrangement. The greater part of the volume is a review of the history of the United Kingdom, the British Commonwealth and foreign countries. Then follows a chronicle of events and reviews of literature, art, science, finance, industry, trade and law. A number of public documents include the Anglo-French Treaty, and those terms of the Yalta, Teheran and Potsdam agreements which remained secret until 1947. The volume is full, comprehensive and impartial and remains, as always, an indispensable survey of human affairs.

THE RONALD ROSS JUBILEE

ANNIVERSARIES and celebrations of medical discoveries have little except historical interest unless they have some direct bearing on present problems. In the case of malaria they have. Fifty years ago, medical men and sanitarians were given a new tool in the form of knowledge of the means of transmission of malaria from man to man. This was heralded as the immediate forerunner of a recession of malaria throughout the world. Forty years experience left these hopes unfulfilled, the new knowledge being applied on a relatively small scale and mainly to highly specialized communities such as towns, labour forces and armies, which are, of course, unrepresentative of the mass of rural tropical peoples. The last ten years work, which is now being brought together and appreciated, shows that there is no longer any reason why the original aim should not be rapidly achieved if the importance, and the limitations, of recent discoveries are fully realized by medical men, administrators, and others concerned in the health of the tropics. A restatement of past history, an emphasis on the lessons to be learnt from it, and a summary of present knowledge based on an appropriate occasion such as the fiftieth anniversary of Ronald Ross's discovery is therefore considerably more than a sentimental occasion. The Ross Institute of Tropical Hygiene, which is amalgamated with the London School of Hygiene and Tropical Medicine, has attempted this survey and assessment in the form of an exhibition open to the public throughout the past week.

Much controversy has surrounded the subject of Ross's discovery, which was finally completed on July 9, 1898. Briefly, the facts are that Laveran[1] first described the parasites of malaria in 1880, his discovery being much elaborated by Italian workers such as Marchiafava and Bignami[2]. In 1894 Patrick Manson, who had previously described a part of the cycle of development of *Wuchereria bancrofti* in a mosquito[3], suggested that this insect might in some way be an intermediary in the carriage of the malaria parasite[4], though he did not foresee the cycle as we know it. Meanwhile Ronald Ross, who had been in India since 1881 and had shown a passion for the preventive aspect of medicine, set out to discover the basic facts of malaria with the object of producing a method for its control. The present speed of dissemination of knowledge makes it difficult to accustom ourselves to the idea that even an earnest and serious worker such as he remained ignorant of Laveran's discovery, and worked on pointless side-issues, until 1894. In that year he met Manson, who demonstrated the parasite to him, set him to its study in the laboratory and in the new translation of Marchiafava and Bignami's book, and fired him with interest in his own mosquito theory. From that time these two men worked as patron and protégé, Ross carrying out all the experimental work to inquire into the theory formulated by Manson, from whom he received constant advice and encouragement.

During 1894–97 Ross worked mainly in Secunderabad, Hyderabad, on human cases of infection with *Plasmodium falciparum* and several species of mosquitoes. On August 20, 1897, he demonstrated the development of gametocytes of *P. falciparum* up to the stage of four-day-old oocysts in the gut wall of a 'dapple-winged mosquito', almost certainly *Anopheles stephensi*. This was recognized as complete proof that development of the parasite did occur in the mosquito, thereby incriminating that insect as a carrier and establishing Manson's theory, and was published in December of that year[5]. It stopped short at showing that man infected the mosquito without showing how the mosquito infected man, and again it is difficult for us to realize that this was by no means obvious.

At this stage, Ross's work was interrupted by his transfer to a remote non-malarious station. In February 1898 he was able to resume it in Calcutta, but without human material. He turned to avian material and *Culex* mosquitoes, and between February and July 1898 showed successively the ripening of the oocyst, the liberation of sporozoites into the body cavity, their invasion of the salivary glands, and the transmission of infection from an infected bird, through *Culex fatigans* to previously uninfected birds. Some parts of the story were published while the work was in progress, and the full one was communicated by Manson to a meeting of the British Medical Association on July 28, 1898, published by him shortly after[6,7,8], and after a further interval by Ross[9].

During the following six months, some Italian workers, Bastianelli, Bignami and Grassi[10], repeated Ross's observations using *P. falciparum* infections of *A. maculipennis*, and as the result of faults on one side or another an unnecessary and bitter controversy on priority ensued.

Ross left India where his discovery had been coldly received, joined the new Liverpool School of Tropical Medicine, immediately went to Sierra Leone and there in 1899 himself confirmed the full cycle of *P. falciparum* in *A. gambiæ* and *A. funestus*[11]. Manson, as the first item of work of the new London School of Tropical Medicine, confirmed the story by the celebrated Ostia experiment[12]. He and his fellow-workers lived safely in mosquito-proofed huts in the malarious Roman Campagna and brought back to England mosquitoes which infected volunteers who had never left the country.

The value of the discovery and the status of Ross were finally established by the evidence of Lord Lister[13]. Its practical value was soon demonstrated by pioneer work in Malaya[14], Ismailia[15] and Havana; but the record of its application up to 1939 was disappointing. Techniques were elaborated, mosquito larvicides such as Paris green were discovered, the possibility and value of adult mosquito destruction proved[16,17], new drugs such as 'Atebrin' produced[18] and much new knowledge of the epidemiology and entomology of malaria gained; but all this had little effect on the subject which interested Ross, namely, the prevention of malaria throughout the whole tropics including rural areas.

The period 1939–46 has seen the acquisition of much new knowledge, notably of insecticides, techniques of organisation, drugs and a further elaboration of the history of the malaria parasite[19]. For the first time this was brought together at the recent International Congresses on Malaria and Tropical Medicine in Washington, the proceedings of which are not yet in print, and considered by the Malaria Committee of the World Health Organisation[20]. The major interest of these meetings lay in the revelation that malaria control throughout whole countries, urban and rural areas alike, is not only possible but also has actually been put into practice. In Venezuela, British Guiana, Chile, the United States, Sardinia, Italy, Greece and Cyprus, malaria has either practically or entirely ended, as it has also in a rural area of Bombay Province holding some two million people, and in the extensive Kharga and Dhakla oases of Egypt. There have been marked reductions in other places, including the Union of South Africa, and invading foreign mosquitoes have been evicted from Brazil[21] and Egypt.

Two entirely separate principles have been concerned in this. The first is the total eradication of anopheline species (or anopheline genus in Cyprus), made possible by organisational techniques not dependent on new insecticides and ensuring perfection of local work; this has so far been used in areas with some natural protection against re-invasion in Brazil, Egypt, Cyprus and Sardinia. The other is the country-wide application of D.D.T. residual indoor sprays to all houses and anopheline shelters, producing control of anophelines at a level below that necessary for malaria transmission but not of the perfection needed for eradication; it is this process which is largely responsible for the recession of malaria in the United States, Venezuela, British Guiana, Chile, Italy, Greece, the Union of South Africa, and parts of Bombay Province.

The exponents of the two methods are in friendly rivalry; their methods too young as yet for accurate comparison, but both are practicable on a large scale. The tropical and subtropical world stands divided into two sections, one of which has, and one of which has not, attempted to apply either of these principles. It is regrettable to find tropical Africa in the latter group, though as yet unresolved doubt has been thrown on the value of D.D.T. in that country[22]. The Malaria Committee of the World Health Organisation has, however, agreed to support a large eradication scheme in the heart of that continent, and if D.D.T. should be valueless there 'Gammexane' (the gamma isomer of benzene hexachloride) could almost certainly take its place.

The story of these stages and of present trends was told in the Ross Institute Exhibition. If it succeeds in stimulating the British application of these new methods, the Jubilee will have been of real value.

THE POST OFFICE RESEARCH STATION

THE earliest experimental work in connexion with the telephone and telegraph services of the General Post Office is recorded to have taken place in 1878. It was, however, not until 1904 that one or two members of the Engineering Department were relieved of their administrative duties to enable them to pursue investigations of a purely experimental nature in a room set aside for the purpose in the Central Telegraph Office. In 1909, the 'Research Section' was recognized as a separate entity, and additional laboratories in a nearby building were allotted to it. Natural expansion of the section, curbed during the First World War, was accelerated when hostilities ceased, and a site of eight acres was acquired for a research station at Dollis Hill in north-west London and about seven miles distant from the Central Telegraph Office. The work was transferred to this site in 1921, when the accommodation took the form of ex-army huts; the present permanent buildings were formally opened in 1933. The activities of the Research Station expanded steadily during the inter-war period, and during the Second World War they were diverted to deal almost entirely with objectives having immediate military application. Arrears of normal development of research for the Post Office's services now require an accelerated expansion, which is being effected as rapidly as present circumstances permit.

There are at present about twenty buildings at the Research Station, used as laboratories, workshops and offices by the Research and the Radio Development Branches of the Engineering Department of the Post Office. The present staff totals about 860, of whom about 470 are directly engaged on experimental or theoretical work (including some 275 who are engineers or scientific workers with full professional qualifications or have nearly attained them). About two hundred are employed in the workshops and drawing office. The experimental work of the Department is not confined to the Research Station; there are small laboratories in other parts of the country, and some experimental work has to be done in the field.

The activities of this Research Station are mainly directed towards improved and economical working of Post Office services, especially the telecommunication services, because for these there is wide scope and need for the application of the development of physical science. Apart from some radio equipment, almost all the necessary plant for these services is obtained by purchase from manufacturing companies. For the development and introduction of new types of apparatus into service, the Post Office maintains close liaison with the principal British manufacturers' of telecommunication equipment, and a regular procedure exists for exchanging information concerning, and co-ordinating the development of, much of the equipment that is procured. There is also liaison and, when necessary, co-ordination with other Government research establishments and, on the international plane, with other telecommunication administrations. Broadly speaking, therefore, the main function of the Research Station at Dollis Hill is to contribute to advances in telegraphy, telephony and radio and to give guidance on their applications to Post Office services. Some of the investigations, important though limited in scope, arise from the day-to-day operation of the services and are concerned with existing plant; others are of a long-term character and represent, perhaps, seeds of the telecommunication plant of the future.

Many of the developments (to which the Research Station has contributed) produce results which are by no means immediately obvious to the users of the telecommunication services. The continued, and sometimes rapid, growth of the telephone network in Great Britain could not have been achieved, or only at much greater expense, without entirely new techniques in telephone transmission, such as the use of one pair of conductors to provide speech channels for many simultaneous conversations. Economies resulting from the introduction of more efficient types of equipment cannot be made to give immediate benefit to the users, in terms of lower charges, because, for the very large and dispersed plant which comprises the telephone network, any large-scale replacements must necessarily be spread over a very long period. When costs of labour and materials are tending to rise, the effect of such economies is more likely to appear as a lower increase in the charges for the service than would otherwise be necessary. On the other hand, some developments, for example, those which open up new services or facilities for the user, are more obvious; a case in point is the 'speaking clock'. This was the result more than eleven years ago of research into an electric drive starting from a 'free' pendulum and other research on sound-recording on glass disks.

Modern technique for telephone transmission over long land-line routes is to concentrate a number of telephone conversations on to a single pair of conductors, the conversations being separated on the route by occupying different bands of the frequency spectrum. Thus, the traffic capacity of a route is determined by the total band-width of frequencies it can carry rather than by the number of conductors it contains. With wide-band amplifiers (or 'repeaters') spaced at intervals of about six miles on a modern coaxial (or concentric) type of cable, two coaxial tubes can carry more than six hundred separate conversations simultaneously. This technique of wide-band transmission is being still further developed for the transmission of television to programme centres at different parts of Britain. Short lengths of wires in ordinary telephone cabling can be 'equalized' for carrying television signals locally, but for long-distance line transmission of television, the newer types of cable are essential.

By means of frequency separation, several telegraph transmissions can be sent simultaneously over a single telephone circuit independently of whether the telephone circuit is on a radio link, a coaxial cable, or by normal transmission over a pair of wires.

The Post Office Research Station has played a leading part in the development of semi-automatic means of switching long-distance telephone circuits. These enable the trunk operator at the calling end to actuate switches by dialling over the long-distance line and avoid the delay which arises when she is dependent on the assistance of other operators at the remote exchanges. The methods of dialling which are used in local areas could not be extended to the long-distance lines, and a system had to be worked out in which all the signals could be transmitted by currents in the speech frequency range without mutual interference between speech and signals. This system is now working on more than three thousand British long-distance circuits.

For telephoning overseas, either submarine cable (for the shorter distances) or radio links have to be used. In the case of the cable, a substantial advance has been made towards increasing the band-width of frequencies (and hence the number of simultaneous conversations) transmitted by inserting a submerged repeater. The repeater has to be capable of continuous operation under water without any maintenance for several years, with power for its valves supplied along the cable. The repeater which the Research Station constructed in 1943 for the Holyhead – Isle of Man cable was the first submerged repeater to be inserted in a working telephone cable anywhere in the world. The scheme is being developed to enable several repeaters to operate along a submarine cable, with facilities for testing and supplying power to each one from the shore ends.

Long-distance, short-wave radio links have been greatly improved since their inception by the use of single-sideband radio transmitters and receivers. On the trans-Atlantic link, reception from the United States has been made much better by the employment of special receivers and an aerial system, two miles long, installed at the radio station at Cooling (Kent). This equipment separates the mutually interfering waves by which the signals arrive after successive reflexions from ionized layers in the upper atmosphere, and so reduces the effects of distortion and noise. The study of other means for dealing with these effects has been facilitated by a laboratory device for simulating them under controllable conditions. Since 1934, radio links on much shorter wave-lengths have been used for extending the telephone network to islands around the coast of Britain; equipment operating on the frequency-modulation system was first installed on one of these links in 1942.

The Post Office not only operates radio telephone and telegraph services to all parts of the world, including ships at sea; it is also the Department responsible for control and regulation of radio communication. This responsibility involves the need for very exact measurements of any frequency which may be used. The applications of piezo-electric quartz crystal vibrators has been studied since 1925 for frequency control of radio transmitters and for frequency measurement, and the Research Station possesses one of the most comprehensive frequency standard installations in the world. It has provided quartz clocks, the most accurate timekeepers now known, to the Royal Observatory, Greenwich. Other piezo-electric materials are being studied for various applications, notably as components in the electrical circuits used for frequency selection and separation.

Telephone instruments are electro-acoustic devices, so there is need for acoustical as well as electrical measurements; the techniques for acoustical measurement have been developed much more recently than their electrical counterparts. The Research Station has contributed to these developments and it maintains a standard and equipment for the measurement of sound pressures at any desired point, in the open or in a confined space, so that objective measurements of the performance of telephone instruments of any type can be made in conditions appropriate to their use. It also has to set and maintain a standard of 'telephone transmission', which is based on subjective tests and is therefore of a less tangible nature, combining physics with physiology. Recording of sound is studied for special applications by the Post Office; two techniques have received particular attention, namely, sound tracks on glass disks for frequent repetitions of short announcements, and lacquer-coated metal disks for high-quality gramophone recording, usable (for short life) by direct play-back.

New developments and applications of electronic devices are of vital importance to telecommunications. Facilities for the manufacture of experimental types of thermionic valves enable, for example, knowledge to be built up concerning the causes of their eventual failure and may be helpful towards the provision of the very long-life valves required for submerged repeaters. Such facilities also open the way for development of a few special valves for special uses. Techniques of application, such as are used in electronic computers, are studied; in fact, an elementary form of electronic computer has been made for dealing with some specific problems of plant provision and arrangement at automatic exchanges.

The main exception to the concentration of effort at the Research Station on telecommunication problems is the work that is being done to explore the practicability of introducing more mechanical processes in the handling of mail. Machines incorporating photo-electric devices can be devised to work at high speed for stacking letters, all with the stamps in correct position to be fed into stamp-cancelling machines, and also for enabling sorters to direct letters into a much larger number of sorting compartments than can be reached by hand. Considerable experimental and development work is necessary before any machines of this kind can be proved to be practicable.

LAND AND POVERTY IN THE MIDDLE EAST

DURING the Second World War, the Middle East Supply Centre—the history and achievements of which should be made public before memory fades—acted in various directions as a regional authority over an area embracing about fourteen territories, and extending from Persia to Tripolitania, and from Cyprus to Ethiopia. One of its important short-term objectives was to encourage increased food-production in the Middle East territories, to offset the unavoidable restrictions due to war conditions. This immediate objective threw into sharp relief the need for a comprehensive regional survey of the basic underlying problems of the Middle East—in particular, land utilization, peasant economy and social organisation—and this task, among others, was given to an Anglo-American Scientific Advisory Mission, the reports of which have now been published by the Stationery Office*. War conditions threw the Middle East territories into close association, and emphasized the fact that they had many common basic obstacles to overcome before any post-war social and economic development was possible.

There were high hopes that some form of regional organisation would succeed the Middle East Supply Centre, to serve these non-political aims. But political inexperience and short-sighted nationalism were too strong. Chatham House has, not for the first time, attempted to fill the gap by publishing a series of studies on social and economic problems in the Middle East. The pamphlet* under review is the first of the series; it deals with Egypt and the Fertile Crescent—Palestine, Transjordan, Syria, Lebanon and Iraq. Dr. Warriner describes the vicious circle enclosing the peasant cultivator in these regions; but the description is equally true for other Middle East countries, and for India. It is essentially an absentee landlord system, with a form of land tenure under which the tenant suffers the maximum disadvantages. Government of the country is largely in the hands of the landlords, most of whom believe their immediate interests would be threatened by any measures designed to improve the tenants' lot. The tenant is wrapped in a fatalism, which is founded on his poverty and helplessness, and reinforced by the technical difficulties of agriculture—especially of peasant farming—in tropical and sub-tropical climates and soils. The social and environmental circumstances that brought about in England the change from the open three-field system to the four-course rotation on enclosed farms do not exist in the Middle East.

Dr. Warriner examines in detail the alternative possibilities. Although most of the suitable land and a good deal of the marginal areas are already settled to capacity or beyond, there are under-populated spaces in the Jezira region of Syria; in Iraq, with better regulation of water supplies, there could be absorbed some five million people, and she points out, as one item in the immensities of the Middle East problem, that this is an authoritative figure for the surplus rural population in Egypt alone.

On the question of quick technical improvements in agricultural methods, Dr. Warriner rightly concludes that these are strictly limited, first, by our present lack of knowledge of tropical agricultural science (a point that cannot be overstressed), and secondly, by the limitations of the existing system of peasant agriculture. Further, such improvements could only be short-range palliatives, for, in the present stage of social emergence of the peasant, any increase in output per acre is more than offset by an increase in the population. At present there appear to be two possibilities only for increasing the output: the development of irrigation under State ownership and control; and, in the drier areas, mechanized dry farming on a village co-operative basis. Both involve a basic change in land tenure customs, and the second especially calls for less, not more, workers per acre.

Dr. Warriner discusses my first proposal for a tripartite organisation that would circumvent the grave obstacles of land ownership and inheritance laws. The proposal is as follows. The Government takes over, on a long lease, land from its present owners, and sub-leases the whole area to a body of the public utility corporation type. This body reconditions the land, divides it into economic units and lets them to tenant farmers for whom it performs certain desirable services—such as bulk-marketing of any cash crops—and from whom it requires certain standards of farming as a condition of the lease. In concluding that this model would not be generally applicable, because it depends on the existence of a special market for which the corporation can finance sales and organise production in relation to the market, Dr. Warriner has rather missed the point of the proposal. It is true that in

certain of the examples given by me this aspect is prominent and that it even initiated some of them. But it is not the essential requirement, which is, of course, the circumventing of the land ownership laws: without some such device, an agrarian revolution, expropriation and the rest, are sooner or later inevitable. There is no reason why the proposal should not apply to subsistence crop production; the general financial level would be lower and the operations of the corporation more modest, approximating to what would be done by a co-operative buying and selling society, composed of the tenants themselves. Organisations of this type were working well among the Bulgarian peasant proprietors before the War, and their success was not dependent on the fact that the peasant owned his farm.

At the same time it is clear that lack of capital in the Middle East is an obstacle to rapid development, for it also causes peasant indebtedness to the landlord-moneylender class. Dr. Warriner examines two sources of supply: the war-time sterling credit balances and oil royalties. Both are wasting assets, and both are likely in the present conditions to enrich the few. A speculative possibility briefly mentioned by Dr. Warriner is to form, perhaps under the United-Nations, an international agency to promote investment and long-term economic development. This is, in fact, the public utility corporation referred to above, on a somewhat more ambitious scale.

The pamphlet sets a high standard for the succeeding ones. It is lucidly written and the author's personal knowledge of the area has enabled her to set out the essentials of a very complicated situation.

THE MEDICAL NOBEL INSTITUTES, STOCKHOLM

THE Caroline Institute in Stockholm, in all but name the medical university of the Swedish capital, appointed a committee in 1945 for the planning and building of new laboratories for the three departments of the Medical Nobel Institute. The Department of Biochemistry was founded in 1937 under the direction of Prof. Hugo Theorell; in 1940, Prof. Ragnar Granit was appointed to a research chair in neurophysiology, established with the aid of a gift from the Wallenberg Foundation in Stockholm, and also supported by the Rockefeller Foundation; this became a Nobel Institute in 1945. At the same time, a third department of the Nobel Institute was created, in cell research, under the direction of Prof. Torbjörn Caspersson.

During the academic year 1947–48, the three departments have been moving into their new and spacious buildings in the 'medical city' which is being created by the Caroline Institute in north-west Stockholm on an old estate known as Norrbacka. The administrative centre, the library and some of the laboratories have already moved out to the new site. The Departments of Physiology and Pharmacology are expected to move out in the autumn.

The Medical Nobel Institute was formally opened in May by the Crown Prince of Sweden and dedicated to the Nobel Foundation by Prof. Bergstrand, president of the Caroline Institute. In addition to Swedish representatives from universities and academies, Scandinavian, British and American guests were present. Great Britain was represented by Prof. E. D. Adrian, foreign secretary of the Royal Society. A dinner presided over by Dr. Ekeberg, president of the Nobel Foundation, concluded the ceremony.

In his speech, Prof. Bergstrand, president of the Caroline Institute, emphasized that the Caroline Institute needed full-time research laboratories engaged in work along the front lines of modern science, for its own sake as well as to enable it to fulfil the important task entrusted to it by the will of Alfred Nobel. The beautiful and well-equipped new laboratories, he went on to say, expressed the confidence of the Caroline Institute in the three directors appointed to lead them. Financially, the three laboratories were a joint effort: the buildings and part of the equipment came from the Nobel Fund, which also supported one of the chairs and part of its running expenses; the Government of Sweden supported the other two chairs and contributed to their annual budget; the Wallenberg and Rockefeller Foundations contributed generously to most items of the budget. Prof. Bergstrand concluded his speech by expressing the gratitude of the Caroline Institute to the donors, and, finally, extended a hearty welcome to the guests. Congratulatory addresses were presented by Prof. E. D. Adrian, Prof. W. D. Bronk, foreign secretary of the U.S. National Academy of Sciences, Prof. Linderström-Lang, director of the Carlsberg Institute, Copenhagen, Prof. A. I. Virtanen, director of the Valio Research Laboratory in Biochemistry, Helsinki, and Prof. Mohr, rector of the University of Oslo.

COLOUR TERMINOLOGY

THE Committee on Colour Terminology appointed in 1941 by the Colour Group of the Physical Society had originally two objectives: (*a*) to record definitions of terms current in the various groups of people concerned with colour; and (*b*) to examine the possibility of co-ordinating the terms commonly used. Later, in the light of the Committee's discussions, a third objective was added: (*c*) to recommend a consistent terminology. This was a significant step, as the subject of colour has very wide ramifications and there was every reason to expect very great difficulty in even approaching consistency. The report now published* shows that, provided a few key changes are made, the terms used by different technical groups can be embodied in a single scheme which avoids gross ambiguities while keeping the specialized terms of particular interests substantially intact. The nomenclature of colours themselves, as distinct from the terms used in describing and specifying them, was expressly excluded from the Committee's consideration.

In drawing up the basic list of current terms with their definitions or mode of use—a list which occupies about two-thirds of the 56 pages of the report—the Committee's net was thrown very wide. The fields covered were colour physics (general, photometric, subjective and colorimetric terms), colour vision, colour-atlas systems (Munsell and Ostwald), technologies involving colour (dyeing, paint and pigment, printing, photographic, glass and decorating industries), the painting art and the colour terms of everyday speech. The definitions are fully descriptive, and sufficient explanation of the underlying principles is given to make clear how certain expressions have come into use. In colour physics, once the distinction has been established between subjective terms describing the sensations produced and the corresponding objective terms specifying the stimulus, the definitions themselves present no serious difficulty. The case is different with technological terms. For example, in the paint and pigment industry, the term 'chalky' has a meaning which in the Committee's definition runs "An excess of white (in a match supposed to be close)". But, as is pointed out, in practice, 'chalky' frequently implies that by the addition of wrong pigments or otherwise, a pigment mixture has been made whiter than the sample and that the difference is irremediable.

---

* Physical Society. Report on Colour Terminology. By a Committee of the Colour Group. Pp. iv+56. (London: Physical Society, 1948.) 7*s*. net.

The colour terms used by contemporary artists are handled very gingerly by the Committee—the proper course for an exclusively technical body—and for these and for the terms of ordinary speech no recommended usage is put forward.

The interrelations of the terms of different groups are displayed in tabular form, and in the case of the dyeing and paint and pigment industries, the different meanings of comparative terms such as 'stronger', 'dirtier', 'brighter', etc., are indicated by vector lines in colour triangles of the Ostwald type with black, white and a particular colour at the vertices.

As a first step to co-ordination the Committee drew up a self-consistent list of essential terms that could be used by all colour workers without risk of confusion. The final recommendations are based on this self-consistent list and cover nearly a hundred terms. The main changes required of different groups are as follows. In colour physics, the term 'brightness' is to be replaced by 'luminosity' when the subjective aspect is in question, and by 'luminance' when brightness as an objective or stimulus quantity is intended. The term 'shade', which at present has several different meanings in the dyeing, paint and pigment and printing industries, is to denote "darker colour of same hue and saturation". The same groups are asked to reserve 'tone' for "any small variation from another colour". 'Duller' (paint and pigment industry) is not to be used to mean "containing more black" but as "less colourful" or "less saturated", while 'deeper' is to mean "containing less white".

In a concluding section the recommended terms are compared with those proposed in the recent Colorimetry Report of the Optical Society of America. Among the comparatively few points of disagreement may be noted the American retention of the term 'brightness' for the subjective meaning of the word, while the corresponding term recommended by the British committee—'luminosity'—is used in the American report for the "ratio of the luminous flux to radiant energy flux". The latter quantity is called 'visual sensitivity' in the British scheme. It is probable that the terms 'luminosity' and 'visual sensitivity' will prove the most controversial in the Committee's recommended list.

Discussions on terminology often appear to non-participants as rather unproductive. But whether or not the changes recommended in this report are adopted, there can be no question that the careful exposition of present usage which it contains will be of the greatest value to workers on colour problems.

W. S. Stiles

NEWS and VIEWS

Geology at the University of Liverpool: Dr. R. M. Shackleton

Dr. Robert Millner Shackleton, who has been appointed to the George Herdman chair of geology at Liverpool, vacant by the resignation of Prof. F. Coles Phillips, returns to the University from which he graduated in 1930 and at which he was awarded the degree of Ph.D. in 1933 for researches into the complex structure of Moel Hebog, Caernarvonshire. On leaving Liverpool, Dr. Shackleton went to the Imperial College of Science and Technology, London, with a Beit Fellowship, and joined the staff of the Geology Department of the College in 1934, becoming senior lecturer in charge of petrology in 1946.

Dr. Shackleton's field-experience has been extraordinarily extensive and varied. He has travelled widely in South and Central Africa and in Russia and Siberia. In 1935–36 he made a reconnaissance survey of Viti Levu in the Fijis, where he discovered that the plutonic rocks, previously thought to be an old basement, are of Tertiary age. During 1940–45, he served on the Geological Survey of Kenya, his chief work dealing with economic problems connected with the Migori gold-belt, the phosphate possibilities of North Kavirondo and the water supply of the Aberdare Range and Mount Kenya areas. In 1946 he returned to Kenya and made a one-man expedition to the Rift Valley, where the sequence of the artefact-bearing beds of the Pleistocene was determined and the structure of a section of the Rift Valley elucidated. Last year he took part in the Royal Society Expedition to Rusinga Island in Lake Victoria, Kenya, from which important results concerning the succession and structure of the Miocene beds in which hominoid remains occur are expected. It is to be hoped that Dr. Shackleton will find time to prepare for publication a part at least of these important results of his field-studies.

Dr. Shackleton has been a member—and largely director—of a research team from the Geology Department, Imperial College, that has been working for a number of years on a project to compare the two sides of the North Atlantic and to test the continental drift theory and in particular to determine the magnitude of any drift that may have occurred. As soon as the grasp of the structure and stratigraphy on the eastern side of the Atlantic is sufficiently firm, it is intended to proceed to the examination of Eastern Newfoundland and the coast of Labrador. His new sphere at Liverpool will provide Dr. Shackleton with increased opportunities for the continuation and completion of this attractive study.

Physiology at the Queen's University, Belfast: Dr. A. D. M. Greenfield

The Queen's University of Belfast announces the appointment of Dr. A. D. M. Greenfield to the Dunville chair of physiology in succession to Prof. H. Barcroft, now at St. Thomas's Hospital Medical

School (see *Nature*, 160, 704; 1947). Dr. Greenfield was a scholar of St. Mary's Hospital, and obtained first class honours in physiology in the B.Sc. examination of the University of London. After holding posts at St. Mary's in both medicine and pathology, he was appointed to the Department of Physiology, under the direction of Prof. A. St. G. Huggett. A year ago he became senior lecturer in experimental physiology. Dr. Greenfield at first worked with Dr. Killick (now Professor) on acclimatization to chronic carbon monoxide poisoning. More recently, he has shown great ingenuity in devising methods for the study of the circulation both in man and animals. During the War, these were used on behalf of the R.A.F. to study the effect of variations of *g* on the blood pressure. Since then Greenfield has worked with Huggett on fœtal physiology and found a method for determining the rate of the blood flow in the umbilical cord. At a recent meeting of the Physiological Society he showed how the movements of a large bubble could be photographed and used to indicate the rate of the blood flow in a part of the body, as, for example, the hand. Dr. Greenfield's special knowledge of the physiology of the circulation will be of great value in Belfast, where work in this field has been in progress for some years.

Anatomy at the University of Glasgow: Prof. G. M'C. Wyburn

George M'Creath Wyburn has been appointed regius professor of anatomy in the University of Glasgow in succession to Prof. W. J. Hamilton, who has been appointed to the chair of anatomy at Charing Cross Hospital Medical School, London. Dr. Wyburn is a pupil of the late T. H. Bryce, and graduated at Glasgow in 1925: after holding appointments in various hospitals, he returned to Glasgow as demonstrator in 1929. He became senior lecturer in anatomy in 1936, and was acting head of the Department during 1944–45. His researches include work on embryology, with special reference to bone formation, on the endocrinological aspects of reproduction, and on tissue-grafting (of skin, cartilage and cornea in particular). He was awarded the Struthers Gold Medal and Prize in 1939 for embryological research, and again in 1947 (with Dr. Paul Bacsich) for work done during the War on the repair of peripheral nerve injuries.

Mathematics at Queen Mary College, London: Dr. G. C. McVittie, O.B.E.

The appointment of Dr. G. C. McVittie to the new chair of mathematics at Queen Mary College, University of London, is of considerable interest, not only because he will be the first professor of mathematics at this College, but also because his appointment will go a long way towards strengthening the present somewhat meagre representation of applied mathematicians among the appointed teachers of the University. In pre-war days, Dr. McVittie was well known for his researches into relativistic theories and in particular for his trenchant criticisms of some aspects of certain forms of the cosmological theory. During the Second World War, Dr. McVittie was seconded for special service with the Meteorological Office. Here he was engaged in a number of important problems. As a result of his successful activities both as a man of science and as an administrator he was recently awarded the O.B.E. Since his return to academic life, Dr. McVittie has developed a new interest in the theoretical basis of meteorology and has been made a member of the Meteorological Research Committee. He has also become, with Prof. Ferraro, one of the editors of the new *Quarterly Journal of Applied Mathematics and Mechanics*, the first number of which has recently appeared, and which seems destined to have an important influence on the future development of applied mathematics in Great Britain. Dr. McVittie has also been very actively interested for many years in problems of theoretical astronomy and has been one of the editors of *The Observatory*.

Mathematical Statistics at the University of Sao Paulo: Mr. W. L. Stevens

Mr. W. L. Stevens has been appointed professor of mathematical statistics in the University of Sao Paulo, Brazil. Mr. Stevens worked under Prof. R. A. Fisher, at the Galton Laboratory, University College, London, during 1935–41. He then joined the staff of the Statistical Department, Rothamsted Experimental Station, for a few months on urgent war work prior to leaving for Portugal to take up a lectureship in statistics at Coimbra at the request of the British Council and the Foreign Office. In 1944 he returned to Britain and took a post as statistician with Imperial Chemical Industries, Ltd., Billingham. In 1947 he joined the staff of the Admiralty Statistical Department under Mr. H. L. Seal. He has been chiefly concerned with the development of statistical methods in the fields of biological and agricultural experimentation, and has also made contributions to the methods applicable to quality control of industrial products.

New Atomic Pile at Harwell

Rather less than a year has passed since the Atomic Energy Research Establishment at Harwell put into operation 'Gleep', the first atomic pile to be built in Great Britain. Now a second and more powerful pile has been completed and put into operation. Its rated output is 6,000 kW., and it has been designed primarily as an experimental tool, to provide as many facilities as possible without unduly complicating the engineering of the structure. In addition, when operating at rated output, the pile should be able to produce, by transmutation of inactive elements, all the artificial radioactive isotopes required in Britain by medical and other research workers. Like 'Gleep', the new pile is a graphite-moderated air-cooled pile. The uranium rods are enclosed in aluminium cases which lie in channels in the graphite. Cooling air is drawn through the channels by several large electrically driven exhausters. The whole pile is surrounded by a concrete shield several feet thick, to protect workers from radiations, and the cooling air is discharged up a chimney stack 200 ft. high. There are about forty holes in the shield, giving access to the strong fluxes of neutrons in the interior of the pile. These neutron fluxes, many times more intense than can be obtained in any other way, are required for many experiments in nuclear science, both in fundamental and in applied research. Thus, for example, the applied research programme will include an investigation of the effect of irradiation by neutrons on the properties of materials, to provide information about materials used in the construction of piles. The experimental holes are also the means by which inactive elements are placed in the pile for transmutation into radioactive isotopes. Surrounding the pile structure are the control rooms and laboratories used by the scientific and operating staff. The operation of the pile is controlled by two sets of neutron-absorbing rods; the first set of rods is adjusted to keep the pile operating at a constant-power level, and the second set is available to shut the pile down in any emergency. The basic calculations for the Harwell pile were begun in 1945 by a team working under Sir John Cockcroft in the laboratories of the National Research Council of Canada, and were continued when the team moved to the newly formed Atomic Energy Research Establishment at Harwell. It was the first task of the Department of Atomic Energy at Risley, under the direction of Mr. C. Hinton, to undertake the design of the pile, based on the information provided by the Harwell team. This work began in April 1946. The actual construction of the pile was made the responsibility of the Ministry of Works, assisted by their contractors, Messrs. Chivers.

Earthquakes in Japan

At about 8 p.m. local time on June 28, four severe earthquakes affected the sea and land areas around the town of Fukui, on the west coast of Honshu Island, Japan. The epicentres of the shocks appear to have been near lat. 36·1° N., long. 136° E., though news from the Japanese observatories has not yet been received. An area within a radius of about 30 miles from Fukui was destructively affected. The population of Fukui (about 85,000) was largely engaged in the textile industry (mostly silk), as more than one quarter of the looms of Japan were in the town. There were some ferro-concrete buildings in the town, but most of the buildings were made of wood and these were soon set alight by the fires scattered by the shocks. The fires were difficult to check owing to earthquake damage to the water supply, and it is estimated that nearly 40,000 buildings were damaged beyond repair. A cinema collapsed, burying alive a large number of people, and many casualties were caused by falling debris at the railway station. Six other towns and thirty-nine villages in the neighbourhood were severely affected, including Marouka, Mikuni, Matsuoka, Daishoji and Kanaza. Communications were severely affected and an important railway bridge was destroyed, making relief work difficult. Huge waves lashed the coast. Altogether, some 3,200 people are believed to have lost their lives, and there are thousands of others injured. Aftershocks continued for some days.

In the whole of the densely peopled islands of Japan, there are about five hundred earthquake shocks of varying intensity every year, and although probably the greatest of the world's earthquakes have not happened there, yet there have been tremendous Japanese disasters from time to time. Examples include the Mino-Owari earthquake just after 6 a.m. local time on October 28, 1891, and the shock which almost destroyed Tokyo and Yokohama on September 1, 1923. The present shock is estimated to have been about three quarters of the strength of the latter. Between the smaller shocks of July 16–17, 1941, in the Nagano Prefecture and the shock of May 9, 1947, in Hida, there has been little news, and for part of the time some of the Japanese observatories closed down. Mr. Ernest Tillotson states that news of this period is, however, beginning to arrive: thus between December 18, 1943, and December 1945, to the accompaniment of hundreds of seismic disturbances, a 1,200-ft. high mountain called the 'New Showa Mountain' arose with volcanic eruptions on the fringe of Lake Toya, Hokkaido, similar to the Paricutin Mountain in Mexico. Further news of these tremendous earth movements is awaited.

Scientific Advisory Council to the Minister of Fuel and Power

The Minister of Fuel and Power has appointed the following to be members of the Scientific Advisory Council which will advise him on the scientific aspect of his statutory duties: Sir Alfred Egerton (chairman), Eng. Vice-Admiral Sir Harold Brown, Dr. H. Roxbee Cox, Sir Charles Ellis, Prof. F. H. Garner, Sir Charles Goodeve, Dr. E. S. Grumell, Mr. J. Hacking, Dr. H. Hollings, Prof. D. M. Newitt, Sir Harry Ricardo and Prof. S. Zuckerman. The terms of reference of the Council will be: (1) to advise the Minister of Fuel and Power on the scientific aspect of problems which he may remit to them in connexion with his statutory duty of securing the effective and co-ordinated development of coal, petroleum and other sources of fuel and power in Great Britain, and of promoting economy and efficiency in the supply, distribution, use and consumption of fuel and power, whether produced in Great Britain or not; (2) to advise the Minister of new scientific knowledge or developments which in the opinion of the Council should be taken into account in the performance of his statutory duties; (3) to keep the whole field of fuel and power under continuous review with the object of identifying problems needing scientific investigation and advising the Minister of those problems.

Ordnance Survey Maps of Britain

The initiation of an entirely new ordnance map series on a scale of 1 : 25,000, or about 2½ inches to the mile, was one of the chief recommendations of a departmental committee set up in 1935. It was felt that the gap between the 1-inch and 6-inch was too wide for many users. In the areas already covered there are signs that the new scale is growing in popularity. Some five hundred sheets, or about one fifth of the projected total, are now published, and it is hoped that the remainder will be ready in about three years time. The new map is based on the old six-inch map, to which has been added certain revisions made for war purposes. In this sense only is it provisional: the final edition will incorporate 50-in. re-surveys of built-up areas, now in hand in many towns, and an overhaul of 25-in. plans in rural areas. The sheet edges lie along the 10 kilometre grid lines of the national grid, and each sheet is known by the 10 km. grid reference of its south-west corner. The new map is sold in three styles, the fully coloured, the outline and the administrative areas. In the first, contours and main roads are in brown, water in blue, black for outlines of roads, buildings and railways, and solid black for public buildings. The outline edition is in grey monochrome without contours and is printed on specially heavy paper suitable for drawing offices. The administrative areas edition has all such boundaries shown by a red overprint on the outline edition; apparently it is being considered whether or not to continue the production of this edition. The following areas are now in the course of being covered by the 1 : 25,000 map: Greater London, Edinburgh, Glasgow, Dundee and Aberdeen; Plymouth and Dartmoor; Purbeck, New Forest, Southampton and Portsmouth, and most of the south coast; South Wales and Bristol; Gloucester, Oxford, Reading and Luton; East

Anglia and the Broads; Birmingham and district; Tyneside and Lancashire, Yorkshire and Cheshire. These maps, with the 6-in. to the mile, are known as 'medium scale'. Full descriptions of other Ordnance Survey maps, with illustrations and indexes, are given in two pamphlets, one dealing with small-scale maps and the other large-scale maps, issued by the Director General, Ordnance Survey Office, Chessington, Surrey (1*s.* 6*d.* each).

Research in Telecommunications

THE past decade has demonstrated the great importance of efficient and rapid communication as an essential part of modern civilization. Although in certain directions spectacular advances have been made in the development of telecommunications, which includes both radio and land-line signalling, there is more need now than hitherto for pursuing that fundamental research which underlies all the many applications of these techniques. In order to meet this need, the Department of Scientific and Industrial Research formed in 1946 an *ad hoc* Telecommunications Research Committee under the chairmanship of Sir Stanley Angwin, for the purpose of defining the basic problems in the whole field of telecommunications that would require investigation in the next few years. The Committee, which consisted of representatives of the radio industry, of those Government departments directly concerned with this subject, and of the British Broadcasting Corporation, drew up a report which has recently been published by the Department of Scientific and Industrial Research ("The Fundamental Research Problems of Telecommunications", London, H.M. Stationery Office, 1948. 1*s.* 6*d.* net).

This publication contains both the full reports and abstracts of the nine 'working parties' set up by the Committee to deal with the various phases of the subject. These working parties surveyed existing knowledge in their various fields to determine what deficiencies in that knowledge required attention; and they have indicated in considerable detail the specific items of research which appear to require investigation. It is believed that the formulation of these problems will prove a very useful step forward in the development of telecommunications research in Great Britain, and it is to be emphasized that university research laboratories, as well as those of government and industry, will find in the document many items suitable for their attention. With the issue of this report, the Committee has completed the task assigned to it: but the Department of Scientific and Industrial Research has already constituted a Standing Conference on Telecommunications Research, the function of which is to survey periodically the progress being made in this subject, and to provide a means for consultation between the Department's Radio Research Board and industry on these and other such matters of common interest.

Air Routes

THE advent and growing use of air transport has done a great deal to alter geographical values. Speed has reduced the importance of distance and thus recast many political, economic and social relationships. In a small pamphlet recently published ("Air Transport and Geography." London: Royal Geographical Society, 1947. 1*s.*), Mr. W. G. V. Balchin refers to many of the aspects of geography that touch on the course and uses of air routes. After referring to the vexed problem of air maps and their projections, he inserts a world map on an oblique zenithal equidistant projection centred on London and its antipodal point; on this the chief civil routes are shown. These maps show that 94 per cent of the world's population, and nearly all the world's manufacturing industry, fall in one of these hemispheres, and the central hub is in western Europe with London or Paris the actual centre. The distribution of population, especially of large urban growths, determines the course of the chief air routes. There are some forty-four world areas each of more than a million inhabitants, of which the largest are in Europe and the Atlantic side of North America and fewest in Africa and in Asia, outside China and Japan. The greatest number are on a great circle track through London and Melbourne. Major flying routes do not cross the Pacific, and contrary to often expressed belief, do not pass through north polar regions. Mr. Balchin goes on to consider other factors influencing the course of air routes.

Strawberries and Watercress as Commercial Crops

BULLETIN 95, "Strawberries" (London: H.M. Stationery Office. 2*s.* net), was originally published by the Ministry of Agriculture in 1937, but since that time so much new knowledge about the crop has become available that a new edition became necessary. This has now been accomplished with gratifying completeness, by co-operation between the scientific staffs of Long Ashton and East Malling Research Stations. All aspects of culture are discussed; but such items of practice as relate to the propagation and maintenance of healthy stocks receive special mention. One section deals with newer methods of out-of-season production, and an appendix describes the recognition of varieties. The section on diseases and pests is adequate; but prompts the gentle criticism that it is scarcely complete enough to deal with some troubles which are common in the northern part of Britain. Twenty-seven good half-tone figures add greatly to the value of the bulletin.

Watercress cultivation is a fascinating speciality. Bulletin 136 (London: H.M. Stationery Office. 1*s.* net) is written by Mr. Charles H. Sansom, and gives details of all aspects of this crop. Continuous growth is given by water at about 50° F., and it is often best to obtain this by boring through chalk to a depth of 300 ft. This special crop brings special pests, for the freshwater shrimp (*Gammarus* sp.) and caddis fly larvæ cause some damage, as well as the mustard beetle. Eight plates and diagrams show details of establishment and management of the beds.

Mushroom Diseases

BULLETIN No. 10 of the Mushroom Growers' Association (Yaxley, Peterborough. 2*s.* 6*d.* net) contains a brief note by F. C. Atkins and C. J. La Touche on *Pseudobalsamia microspora*, an ascomycete which may compete with the mushroom on commercial beds. It is almost certainly introduced with the surface soil and so can possibly be eliminated with care. Boards and the house-structure should be sterilized and flies kept down, as they spread the trouble. The same bulletin contains reprints of Dr. W. M. Ware's paper on "*Clitopilus cretatus* as an Invader of Mushroom Beds" (*Gard. Chron.*, May 18, 1935), and Dr. W. F. Bewley's work on mushroom casing soil (Cheshunt Exp. Sta. Ann. Rep., 1946). A separate leaflet lists useful volumes on mushroom culture in the Association's library.

Philosophy of Science

At a meeting held at University College, London, on June 1, a Philosophy of Science Group was formally constituted and affiliated with the British Society for the History of Science. The Group adopted the following statement of aims: "The purpose of the Group is to study the logic and method of science as well as of the various special sciences, including the social sciences. The main emphasis is upon an approach through the various special sciences to the philosophy of science." The Group intends to hold meetings for the reading and discussion of papers and to publish an account of its activities in a supplement to the *Bulletin of the British Society for the History of Science*, which will be circulated to members. The Group has elected the following Committee: Prof. H. Dingle (chairman), Dr. K. R. Popper, Mr. F. I. G. Rawlins, Dr. G. J. Whitrow and Dr. A. C. Crombie (honorary secretary), Department of History and Philosophy of Science, University College, Gower Street, London, W.C.1. It is hoped to hold the first ordinary meeting in the autumn of this year.

Conference on Noise and Sound Transmission

The Acoustics Group of the Physical Society, in association with the Royal Institute of British Architects, is holding a three-day International Conference on Noise and Sound Transmission during July 14–16. This is the first major international discussion of the subject for many years, and papers will be read by European and American investigators in addition to the contributions from Great Britain. Among those reading papers are L. L. Beranek (United States); T. Vogel, R. Lehmann, P. Chavasse, F. Canac (France); W. Fürrer (Switzerland); W. K. Westmijze, C. W. Kosten, J. van den Eijk (Holland); F. Ingerslev, V. L. Jordan, P. V. Bruel (Denmark); E. Meyer, A. Schoch, L. Cremer (Germany); N. Fleming, R. S. Dadson, H. L. Kirke, W. A. Allen and A. J. King (Great Britain). The papers will cover the subjects of sound insulation in buildings, aircraft and ships; impact sound; resilient suspension systems; proposals for standardization of measurement, and the measurement of noise. Those who desire to have copies of summaries of papers in advance of the meetings should send requests to the Joint Honorary Secretaries of the Acoustics Group at 1 Lowther Gardens, Prince Consort Road, London, S.W.7.

International Congress of Industrial Medicine

The ninth International Congress of Industrial Medicine will be held in London, at the Caxton Hall, during September 13–17. The last congress was held in Frankfurt in 1938. The congress will meet in six sections devoted respectively to social aspects, environment, nursing, clinical studies, practice and legal and miscellaneous topics. Among the subjects announced for discussion are incentives, work and skill, dust hazards, pneumokoniosis, physical, biological and psychological effects of environment, effects of working with the newer chemicals and metals, hazards of radiant energy, etc. Further particulars can be obtained from the secretary of the Congress, Room 501, Garden Court Wing, B.M.A. House, Tavistock Square, London, W.C.1.

Congress on Biological Chemistry

The Société de Chimie Biologique will hold its eighth congress in Paris during October 6–8. This will be the first international congress on the subject in France for ten years, the previous meeting having been held at Liège in 1946. Subjects for special consideration at the Paris congress are: proteins and hormones (reports by Profs. Theorell and Fromageot); biological organic chemistry and plant biochemistry (reports by Profs. Stoll and Janot); vitamins and hormones (reports by Profs. E. C. Dodds and Horeau). Sessions will also be reserved for communications outside these subjects, and provision will be made for experimental demonstrations. Further particulars can be obtained from the secretary-general of the congress, M. Jean Courtois, 4 Avenue de l'Observatoire, Paris, VI^e.

Science and Industrial Practice in the Iron and Steel Industry

The British Iron and Steel Research Association is arranging two conferences to be held next autumn at Ashorne Hill, nr. Leamington. The first, in which the Institute of Physics is also interested, will be held on September 8 and 9, and is to discuss non-destructive testing of castings. Three sessions will be arranged to discuss papers on X- and gamma-ray methods and on X-ray equipment, radioactive materials and radiography abroad; magnetic and ultrasonic methods; recent work by the Non-Destructive Testing Sub-Committee of the Association on the comparison of X-ray, gamma-ray and ultrasonic methods, and a paper on acceptance standards. It is intended that the papers shall deal essentially with the practical aspects of the subject and be of interest to executives not conversant with the methods, but who might be considering their use. The second conference is planned for October 21 and 22, and is to discuss foundry core bonding agents. The object is to bring to the notice of founders the wealth of information that has been obtained in recent years on the new materials that may be used for the bonding of foundry cores. The use of such materials, in many cases with an appreciable reduction in cost, would enable the linseed oil used hitherto to be diverted to alleviate the shortage of edible fats. There will again be three sessions: natural resources of the materials, recent work by the Association on the practical and fundamental aspects of bonding, and the properties of new materials such as plastics and petroleum products; experience of founders with such materials; and the impact of these materials on matters such as core-blowing, and dielectric and infra-red heating.

International Scientific Film Congress

The second congress of the International Scientific Film Association will be held in London during October 4–11. It is being convened by the Scientific Film Association of Great Britain, with the help of the British Film Institute. Three days will be devoted to business meetings of the Association, and three days to a festival of scientific films, when it is hoped to show many contributions from all the participating countries to members of the general public. The congress will close with a general assembly of the delegates on October 11. The Association was constituted last year in Paris by delegates from twenty-two countries who had accepted the joint invitation to the inaugural congress from the Scientific Film Associations of Great Britain and France. The primary aim of the Association is: "To raise the standard and to promote the use of the scientific film and related material throughout the world in order to achieve the widest possible understanding and appreciation of scientific method and outlook, especially in relation to social progress". Further details may be obtained from the Scientific Film Association, 34 Soho Square, London, W.1.

Annual Reviews of Psychology and of Physical Chemistry

AN "Annual Review of Psychology" is to be published under the auspices of Annual Reviews, Inc., Stanford, California, the first volume to appear early in 1950. Prof. Calvin P. Stone and Donald W. Taylor, of Stanford University, will serve as editor and associate editor, respectively. The editorial committee will consist of the following: John E. Anderson, Institute of Child Welfare, University of Minnesota; John G. Darley, University of Minnesota; Clarence H. Graham, Columbia University; Carl I. Hovland, Yale University; James G. Miller, University of Chicago. The subject-matter of each volume will consist of critical appraisals of research proceeding in the major divisions of the field. Subjects of greatest activity will be reviewed annually, while those of lesser activity, together with any topics which encompass small divisions of the field, will be reviewed biennially.

Organisation of an "Annual Review of Physical Chemistry" of a similar type, operating under the same editorial policies and characterized by a corresponding recurring list of topics, is also announced by Annual Reviews, Inc. This will be edited by Prof. G. K. Rollefson, of the University of California, Berkeley, and will be directed in the selection of topics and authors by an editorial committee consisting of Henry Eyring, University of Utah; George Glockler, State University of Iowa; W. F. Libby, University of Chicago; J. W. Williams, University of Wisconsin; and E. Bright Wilson, jun., Harvard University. The first volume will also appear in 1950. Annual Reviews, Inc., is a non-profit corporation which was first constituted in 1932 to publish the "Annual Review of Biochemistry". Since then it has initiated the "Annual Review of Physiology" (jointly with the American Physiological Society) and the "Annual Review of Microbiology".

Zoological Society of India

THE following have been elected members of the Executive Council of the Zoological Society of India: *President*, Dr. S. L. Hora; *Vice-President*, Prof. D. R. Bhattacharya; *Secretary*, Dr. M. L. Roonwal; *Editor*, Prof. K. N. Bahl; *Treasurer*, Dr. B. S. Chauhan; *Members*, Dr. K. Panikkar, Prof. M. A. Moghe, Dr. B. N. Chopra, Dr. Bhattacharya, Dr. G. D. Bhalerao, Dr. D. V. Bal, Dr. T. J. Job. It is intended to bring out the first volume of the *Journal of the Zoological Society of India* this year. Papers intended for publication, which should be original contributions or critical reviews of current researches not published elsewhere, should be sent either to the Editor (at the Zoology Department, Lucknow University, Lucknow) or to the Secretary (at the Zoological Survey of India, Banaras Cantt., U.P.).

University of Glasgow

THE University Grants Committee is supporting the development of electrochemistry in the University of Glasgow; and Dr. J. C. James, at present at Battersea Polytechnic, London, has been appointed lecturer in chemistry under this project. Similar support is to be given to zoological taxonomy. Other recent appointments in the University of Glasgow are: Mrs. Rhoda M. Ainley, assistant in anatomy; J. Highet, lecturer in sociology; A. W. Sloan, lecturer in physiology; Bruno Toushek, a Nuffield fellow in physics; Mrs. Jean A. Wapshaw, part-time assistant in biochemistry; and A. Williams, lecturer in geology (with a year's leave of absence while holding a Commonwealth fellowship).

Work has been begun on the final portion of the new Chemistry Department at Glasgow, and on the building which is to house the 300-MeV. synchrotron. A 30-MeV. instrument is already in operation in the Department of Natural Philosophy.

Announcements

PROF. T. DALLING, director of the Veterinary Laboratory of the Ministry of Agriculture and Fisheries at New Haw, Weybridge, has been appointed chief veterinary officer to the Ministry from August 21 on the retirement of Sir Daniel Cabot, who has reached the age of sixty. Sir Daniel Cabot's services will be retained part-time in a temporary capacity in connexion with certain international veterinary organisations.

MR. ALFRED EASTHAM, chief officer of the Official Seed Testing Station since 1923, retired on June 30 and the Council of the National Institute of Agricultural Botany has appointed Mr. C. C. Brett to this post. Mr. Brett has been senior assistant to the chief officer since 1922, and during the past eighteen months has been seconded as executive officer of the Seed Production Committee.

THE following have been appointed to readerships in the University of Edinburgh: Mr. E. G. Dymond (natural philosophy), Dr. W. L. Edge (mathematics), Dr. Alexander Nelson (botany) and Dr. E. G. V. Percival (chemistry).

THE autumn meeting of the Deutsche Physikalische Gesellschaft in der Britischen Zone will take place at Clausthal-Zellerfeld/Harz during September 9–12.

THE fourth Commonwealth Mycological Conference will be held at the Imperial College of Science and Technology, South Kensington, during July 19–24. Plant pathologists from all parts of the British Empire will be present, and the topics to be discussed include the control of virus diseases, with special reference to swollen shoot of cacao, measures to be taken to avoid the transmission of seed-borne parasites through the seed, the certification of healthy planting material of certain vegetatively produced crops, new developments in fungicides, including their application from the air, and forest pathology.

AT the annual general meeting of the Institute of Welding on June 30, the following were elected honorary officers for 1948–49: *President*, Dr. J. H. Paterson; *Vice-President*, O. V. S. Bulleid; *Honorary Treasurer*, W. E. Harriss.

THE Governing Body of the Imperial College of Science and Technology has decided that the schemes for the international exchange of students during summer vacations, initiated by its Vacation Work Committee in 1946, shall be broadened in 1949 to include university students from other colleges in Great Britain. The exchange is operated through the recently established International Association for the Exchange of Students for Technical Experience, which at present includes Belgium, Czechoslovakia, Denmark, Finland, France, Netherlands, Norway, Sweden and Switzerland.

Antibiotics Produced by Fungi, and a New Phenomenon in Optical Resolution

It was reported earlier[1] that a strain of *Fusarium lateritium* produced an antibiotic, lateritiin-I, which was representative of a group of related compounds in presenting several remarkable chemical features. These features were elaborated in a communication to the Eleventh International Congress of Pure and Applied Chemistry held in London in July 1947, in which it was stated that lateritiin-I gave rise on hydrolysis to $D(-)$-α-hydroxy*iso*valeric acid and $L(+)$-N-methylvaline (II). The different configurations of these products were an indication, taking their configurational stabilities into account, that these units had an individual existence in the original antibiotic. This conclusion was supported by the isolation from lateritiin-I, after mild alkaline hydrolysis, of a lactone from which a crystalline methyl ester was prepared, the properties of these compounds being compatible with the structures (III) and (IV) respectively.

$CHMe_2.CH(OH.)CO_2H$ (I) $CHMe_2.CH(NHMe)CO_2H$ (II)

(III)

$$\begin{array}{l}CHMe_2.CH.CO.NMe.CH.CHMe_2\\ \quad\;\; | \qquad\qquad\qquad\;\; |\\ \quad\;\; O\text{———————}CO\end{array}$$

(IV)

$$\begin{array}{l}CHMe.CH.CO.NMe.CH.CHMe_2\\ \qquad\;\; | \qquad\qquad\quad |\\ \qquad OH \qquad\quad\; CO_2Me\end{array}$$

Meanwhile Gaumann, Roth, Plattner, Ettlinger and Nager[2] had, unknown to us, reported the production by a strain of *F. orthoceras* of enniatin, which appeared to be closely related to, if not identical with, lateritiin-I. After exchanging samples of the two materials, it is agreed by Prof. Plattner and by us that a mixture of them is undepressed in melting point and that they must be regarded as identical. However, in a paper which has only recently reached us[3], it is concluded that the simple nitrogenous acid hydrolytic fragment of enniatin is probably identical with the higher homologue of (II), namely, N-methylleucine.

It seems, therefore, desirable to report that the structure of the fission product under discussion has been completely established by oxidation and by synthesis. Oxidation afforded *iso*butyraldehyde, which was identified as its 2 : 4-dinitrophenylhydrazone and 2 : 4-dinitrophenylsemicarbazone. Interaction of methylamine and lævo-α-bromo*iso*valeric acid afforded $L(+)$-N-methylvaline, identical in all respects with the material of natural origin; this was also obtained by the methylation of $L(+)$-valine in the usual way. Any remaining structural doubt has been removed by the synthesis of the lactone (III) and the derived ester (IV) in the following way. *lævo*-α-Brom*iso*valeryl chloride and DL-N-methylvaline were condensed together and the product was refluxed with pyridine and water, when the hydroxy-acid condensation product was formed. This was extracted and heated for several hours on the steam bath under reduced pressure, when the lactone (III) was obtained as a viscous oil similar to the natural material. This had the rotation $[\alpha]_D = +52°$ (ethanol); but on passing it through an acid-washed column in ethereal solution, about half the material was lost and the remainder had the rotation $[\alpha]_D = +79°$ (ethanol). The natural lactone has the rotation $[\alpha]_D = +82°$ (ethanol). On mild alkaline hydrolysis the synthetic material reverted to the hydroxy-acid, which on treatment with diazomethane gave the methyl ester (IV) identical in melting point with the ester of natural origin, with which it gave no depression on admixture; it was identical in all other respects with the material obtained by degradation, both showing the same optical activity, $[\alpha]_D = -128°$ (chloroform). Finally, the synthetic material yielded $L(+)$-N-methylvaline on hydrolysis.

The above reactions virtually constitute a facile resolution of N-methylvaline; apparently the lactone derived from D-α-hydroxy*iso*valeryl-D-N-methylvaline is more strongly absorbed on the alumina than that derived from D-α-hydroxy*iso*valeryl-N-methylvaline and undergoes hydrolysis. The lactone and derived hydroxy-acid pairs are, of course, not mirror images and no new theoretical principle is involved, nor is this an asymmetric synthesis in the conventional sense. The process is, however, unexpectedly simple; it might have considerable utility if it were general, and it clearly offers interesting speculation on the genesis of optically active amino-acids from existing optically active compounds.

Using the same procedure and starting with DL-α-brom*iso*valeryl chloride and DL-N-methylvaline, a crystalline optically inactive lactone was obtained, which was also formed by mixing equal amounts of the natural lactone with that derived from L-α-hydroxy*iso*valeryl-D-N-methylvaline.

A number of lactones similar to (III) have been made and are being studied, and full details of the present and related work will be published elsewhere.

Note added in proof.—Since the above was written a further communication (Plattner, Pl. A., and Nager, U., *Helv. chim. Acta*, 31, 665; 1948) has come to our notice in which 'enniatin A' and 'enniatin B' were described. Of these 'enniatin A', which appeared to be identical with lateritiin-I, afforded N-methylleucine, while N-methylvaline arose from 'enniatin B'. The above authors suggested that lateritiin-I was highly contaminated with 'enniatin B'. It must be emphasized, however, that we find no evidence to support this contention, the various degradation products affording no sign of heterogeneity.

The Antibiotic Agent from *Marasmius ramealis*

It has earlier been shown that species of the genus *Marasmius* produce substances inhibiting the growth of *Staphylococcus aureus*[1]. Our investigations now show that *Marasmius ramealis* Fr. exercises an antibiotic effect upon various pathogenic bacteria *in vitro*.

The *Marasmius* strain used was isolated and investigated for nutritional requirements by Lindeberg[2]. The fungus was grown upon different media, the most suitable one being a modification of the Czapek-Dox substrate. Erlenmeyer flasks containing 25 ml. of the nutrient solution were inoculated and incubated at 25° C., and the culture liquid tested for antibacterial activity at different intervals against: (1) bacteria named in the accompanying table (State Bacteriological Laboratory) and (2) human tubercle bacilli (Institute of Physiological Botany).

The inhibitory action against the former bacteria was tested on solid media using a modification of the cylinder plate method due to Schmidt and Moyer[3], and in dilution series in broth. The solid medium was buffered with phosphates to neutralize the bacteriostatic effect caused by an acid solution. The bacterial concentration in the surface layer was 10^{-4} or 10^{-5} of a 20-hr. broth culture, giving a confluent growth. The plates with porcelain covers were kept at room temperature two hours before incubation at 37° C. overnight. The zones of total inhibition were read to the nearest 0·5 mm. The action on different bacteria is shown in the table.

Dilution tests were performed in broth with inocula of about 10,000 organisms per ml. The last tube showing no visible growth was determined after 20 hours incubation at 37° C. (see table). It was evident from secondary platings of the tubes that the antibacterial action was a bacteriostatic one.

	Inhibition zone (mm.)	Max. dilution for inhibition
Staphylococcus aureus, *H*	23·0	1/32
Staphylococcus aureus, 209 *P*	22·0	1/16
Streptococcus hæmolyticus, S.B.L.	0	
Diplococcus pneumoniæ, S.B.L.	28·0	
Klebsiella pneumoniæ, Friedländer *C.G.* 8	27·0	1/8
Salmonella typhi, *I.S.* 57	13·0	1/4
Salmonella paratyphi B, *I.S.* 3	10·0	1/2
Escherichia coli, *C.G.* 16	0	
Aerobacter aerogenes, *C.G.* 4	15·0	1/2
Shigella sonnei, S.B.L. 5	9·0	1/2
Proteus vulgaris, S.B.L. 2	19·0	1/2
Fæcalis alcaligenes, S.B.L.	14·5	1/8
Pseudomonas æruginosa, S.B.L.	0	
Bacillus subtilis, 219 *P*	42·0	1/256
Bacillus anthracis, S.B.L. 1	30·0	1/16
Corynebacterium diphtheriæ mitis, S.B.L.	0	
Hemophilus pertussis, S.B.L.	0	

For the tubercle bacilli, the serial dilution method was used. The *Mycobacterium* cultures employed were two strains of *M. tuberculosis* var. *hominis*: the *H* 37 *Rv* strain (obtained through Dr. Lagergren, of the State Bacteriological Laboratory, Stockholm) and the 1354 strain (isolated by Dr. Zetterberg, Institute of Hygiene and Bacteriology, University of Uppsala). The inhibitory effect upon *H* 37 *Rv* was studied only in Dubos' medium[4]; with the 1354 strain, the dilutions were made in different media: veal broth, Long's and Dubos' solutions. After the addition of the active filtrate to the substrate, the *p*H of the liquid was adjusted to about 7 with sodium hydroxide. The flasks with Dubos' medium were inoculated with a suspension of the bacteria, the other substrates with small floating pieces of the pellicle. Control flasks containing dilutions of the basal fungus nutrient solution were also seeded. The flasks were incubated at 37° C.

Dilutions of 1/3, 1/5 and 1/11 in Erlenmeyer flasks were used for routine tests. The flasks were examined at intervals of three days; but no visible growth could be detected in any medium after two months of incubation. In the controls the bacteria grew vigorously. Dilution experiments were also carried out in glass tubes, the growth being measured photometrically. After about three weeks a slight growth was found in the 1/50 dilution. In the tubes with the 1/30 dilution bacterial reproduction was completely inhibited (two months of observation). The two *Mycobacterium* strains tested behaved in a similar manner.

The antibacterial material has been separated from the culture medium in two different fractions, both showing an inhibitory effect against the two *Mycobacterium* strains. On distillation of the culture filtrate *in vacuo* (bath temperature 15° C.), a colourless, aqueous distillate of *p*H 6·5, showing activity, was collected in the receiver. The distillation was continued, while maintaining the volume in the distillation flask constant by adding water, until the distillate showed no activity. The aqueous distillate, containing the active principle, was extracted with small portions of ether or chloroform and the solvent removed under reduced pressure, leaving an oily residue, soluble in ether, petroleum ether and chloroform, and fairly soluble in water. All the active material could not, however, be removed by distillation; the rest was extracted with ether from the culture medium left after distillation, the *p*H being adjusted to 1·5–2·5. The ether was removed under reduced pressure leaving an orange-yellow residue, not volatile but readily soluble in water, ether, chloroform and ethyl alcohol.

The *volatile* substance can also be isolated from the antibacterial filtrate by extraction with chloroform, which does not remove the *non-volatile* principle, or by adsorption on activated charcoal ('Norit'), followed by elution with chloroform or ether.

Aqueous and ethereal solutions, or a dry preparation of the *volatile* substance, undergo a chemical change on standing at room temperature, yielding an inactive, yellow residue, which is no longer soluble in water or ether. Stored at + 2° C., however, an aqueous solution can keep its activity for at least one month. Potassium permanganate solution and bromine water are decolorized by the substance in question, which also gives a precipitate with a mercuric chloride solution.

These preliminary investigations of the *volatile* substance indicate a certain resemblance to allicin, the antibacterial principle of *Allium sativum*[5,6]. As to the *non-volatile* substance, it can be extracted with ether only from acidified aqueous solutions. If it is kept at room temperature in a dry state or in solution, there is no appreciable change in its inhibitory effect for at least five weeks.

Utilization of Mineral Constituents of the Egg-shell by the Developing Embryo of the Stick Insect

THE presence of a relatively large quantity of mineral material, mainly calcium carbonate, in the egg-shell (exochorion) of Phasmidæ has been established by Pantel[1] (in eggs of *Donusa prolixa*). Extending his examinations to the egg content, Pantel found that the Malpighian tubules of fully developed embryos contained calcium salts far in excess of the quantity which he was able to demonstrate in the yolk of freshly laid eggs. Pantel interpreted this finding by assuming that most of the calcium in the yolk was organically bound and therefore not responsive to his methods of detection.

The egg-shell of *Bacillus libanicus* Uv. contains, besides calcium carbonate, also calcium oxalate and smaller quantities of aluminium, magnesium and potassium salts. Most of the calcium carbonate is concentrated in a white crystalline layer covering the inner surface of the shell. In freshly laid eggs, this white layer appears dense and opaque, its compactness and structure being the main cause of the rigidity of the egg-shell. It was observed that in the shells of fully developed or hatched-out eggs, the white layer is much reduced in thickness, the whole shell being less opaque and more brittle. A similar appearance could be produced in shells of freshly laid eggs by emptying them and immersing in water acidulated with carbon dioxide.

Considering these differences in thickness of the white layer, and in view of Pantel's observation, there arose the question whether during embryonic development mineral material from the egg-shell might not be passing into the egg-content. The possible occurrence of such a process in insect eggs was originally suggested by Needham[2], in view of the fact that in some avian and reptilian eggs utilization of egg-shell calcium by the developing embryo had been demonstrated[3,4].

To test this possibility, the quantities of ash in shells and in contents of eggs at various stages of development were determined and compared. As eggs laid by different females may vary considerably with regard to their ash content, only eggs of the same parentage were used for comparative measurements.

Material	% of ash in terms of dry weight in	
	Shells	Egg contents
Freshly laid eggs	38·4	0·7
Eggs entering diapause (age, 80 days)	35·4	1·1
Post-diapause eggs (10 days before hatching)	32·7	2·3
Eggs at hatching	30·8	3·5* (Neonate nymphs)
One-year old, undeveloped eggs	38·0	0·6

* The actual rise in ash quantity is somewhat lower, there being a corresponding decrease of about 6·4 per cent in the dry weight of the egg due to the development of the embryo.

The accompanying table summarizes some of the results concerning changes in the relative quantity (in terms of dry weight) of the mineral components in shells and in contents of developing and undeveloped eggs laid by one female. It shows clearly that in the shells of developing eggs the quantity of the mineral components decreases continuously, its percentage in dry shell weight diminishing by about 8 per cent; no such change is observable in shells of eggs which do not undergo development. Further, the quantity of the mineral material in the developing embryo rises markedly, there being no such rise in the undeveloped one-year-old eggs.

Thus it seems safe to conclude that during development of the egg of *B. libanicus*, a transfer occurs of mineral material from the egg-shell to the developing embryo. Although it was not possible to carry out a quantitative identification of the transferred minerals, the morphological observations mentioned above suggest that it is mainly calcium carbonate from the white layer of the shell that is absorbed by the embryo.

A more detailed account will be published elsewhere.

Function of Hyaluronidase in Fertilization

Pincus[1] and Pincus and Enzmann[2] observed that the mass of follicle cells surrounding the freshly ovulated rabbit egg could be dispersed by means of sperm suspensions, and they inferred the presence of a proteolytic enzyme. Gilchrist and Pincus[3], describing the events taking place during *in vivo* fertilization in the rat, state that the freeing of adherent follicle cells is "an inevitable accompaniment of sperm penetration . . .". Afterwards, McClean and Rowlands[4] and Feketé and Duran-Reynals[5] produced evidence to show that the enzyme is probably hyaluronidase. They also expressed the view that the denudation of the egg is a necessary preliminary to the penetration of the sperm, and this theory, and the important role thus ascribed to hyaluronidase, have become widely accepted.

It should be noted, however, that Lewis and Wright[6] concluded from their investigations on the mouse egg that sperm penetrate to the vitellus "long before" the dissolution of the surrounding mass of follicle cells. Their evidence consisted chiefly in the finding of sperm in the perivitelline space of the freshly ovulated egg, and the extrusion of the second polar body when the eggs were kept in culture. They were, however, unable to observe pronuclei or sperm within the vitellus in their material. For some reason the evidence presented by Lewis and Wright appears to have been overlooked by the protagonists of the present concept of the function of hyaluronidase in fertilization.

During an investigation of fertilization in the rat, it has been observed that if females are killed when the copulation plug is found, the eggs are recovered in cumulus masses of varying degrees of integrity. Frequently the cumuli are indistinguishable under the microscope from those obtained from unmated rats. Nevertheless, most of the eggs show sperm within the vitellus, and when examined under the phase-contrast microscope, the male and female pronuclei can also be discerned. This means that an appreciable time, perhaps an hour or more, has elapsed since sperm penetration. In other cases, eggs observed in cumuli in varying degrees of disintegration show pronuclei of progressively greater size and more complex structure. It is clear, therefore, that in the rat the disintegration of the cumulus occurs over a period following fertilization.

A similar state of affairs appears to exist in the cat, for Prof. E. C. Amoroso (personal communication) has demonstrated the presence of sperm in the zona pellucida of the cat's egg while the latter was still surrounded by an apparently intact layer of follicle cells.

It is concluded that the penetration of the intact cumulus by the sperm as envisaged by Lewis and Wright does, in fact, occur, and that denudation of the egg, at least in some species, is not a prerequisite of fertilization. Clearly, therefore, the destruction of the cumulus prior to sperm entry is not an essential function of hyaluronidase, though the local presence of the enzyme may conceivably assist the passage of the individual sperm.

Illustrations of fertilized eggs in apparently intact cumuli, together with details of microscope technique, will be included in a full paper being prepared, in collaboration with Mr. J. Smiles, for submission to the *Journal of the Royal Microscopical Society*.

I wish to record my grateful acknowledgments to the Medical Research Council and Dr. C. R. Harington for the hospitality of the National Institute for Medical Research, Hampstead, and to Dr. A. S. Parkes and Prof. E. C. Amoroso for their valuable criticism and advice.

Metabolism of Aminohydroxybenzoic Acids

We have recently been studying the metabolism of some aminohydroxybenzoic acids. In view of the interest in these compounds which has been stimulated by the observations of Lehmann[1], Vallentin[2] and of Dempsey and Logg[3] of the beneficial effects of 4-aminosalicylic acid (*P.A.S.*) on patients with various tuberculous lesions, a preliminary statement of some of our results seems opportune.

We have already identified some aminohydroxybenzoic acids (or amides) as metabolites of aminobenzamides in the rabbit[4]; for example, 3- and 5-hydroxyanthranilic acids from *o*-aminobenzamide, 5-aminosalicylic acid from *m*-aminobenzamide and 4-amino-3-hydroxybenzoic acid from *p*-aminobenzamide. It is our intention to study the metabolism of the ten isomeric aminohydroxybenzoic acids, and so far we have carried out a preliminary examination of four, namely, 3-, 4- and 5-aminosalicylic acids and 3-amino-4-hydroxybenzoic acid. The three aminosalicylic acids appear to be metabolized by the rabbit in similar ways, being excreted partly unchanged and partly as acetamidosalicylic acids, all three of which have been isolated from the urine. No increase in ethereal sulphate excretion was observed. (Salicylic acid itself is not excreted as ethereal sulphate[5].) 3-Amino-4-hydroxybenzoic acid, however, does appear to be conjugated with sulphuric acid to a slight extent (about 4 per cent), as well as being excreted unchanged and as 3-acetamido-4-hydroxybenzoic acid.

Owing to its clinical interest and to the kind co-operation of Mr. D. E. Seymour, of Herts Pharmaceuticals, Ltd., in supplying us with the compound, we are examining 4-aminosalicylic acid in somewhat greater detail. In the rabbit, approximately 50 per cent of a dose of 1–2 gm. is excreted unchanged and 50 per cent as 4-acetamidosalicylic acid (m.p. 238–239°), which has been isolated and characterized. There has, so far, been no evidence of the formation of ethereal sulphate or of glucuronides of either ester or ether type. 4-Acetamidosalicylic acid has also been isolated from human urine after oral administration of 3 gm. sodium 4-aminosalicylate. Considerable amounts were excreted unchanged.

A fuller account of this work will be published elsewhere.

Lipoid Content of the Oxyntic Granules of the Rat's Stomach

There have been a few suggestions in the literature that the granules of the oxyntic cells of the stomach might consist in part of a lipoid material. The evidence for this view has, up to date, been circumstantial, having been based on (*a*) the tendency of these granules to show some blackening after fixation in fluids containing osmium tetroxide[1], and (*b*) the assumption that, since they can be readily demonstrated by the Altmann – Regaud technique[2] and can be supravitally coloured by Janus Green *B*[3] they are mitochondria, and therefore contain lipoid.

Recently, more positive evidence for a lipoid component has been forthcoming. Foster[4], using a method by Baker[5], has shown that these granules have, in frozen sections of formol calcium chloride fixed rat's stomach, a strong affinity for Sudan Black (Fig. 1),

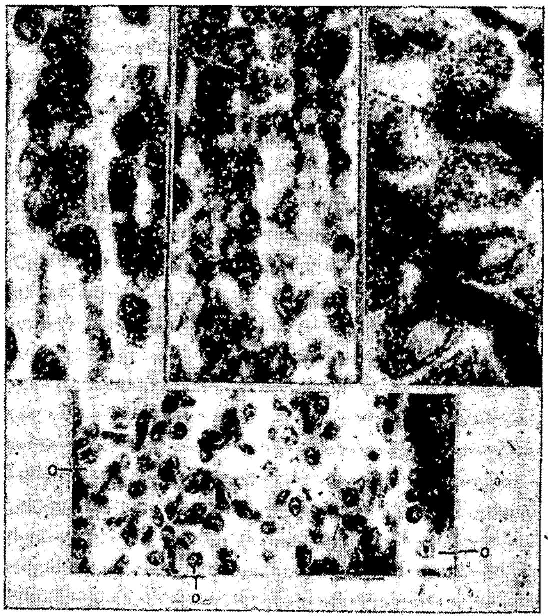

Fig. 1 Fig. 2 Fig. 3

Fig. 4

Figs. 1, 2 and 4. × 375. Fig. 3. × approx. 800. Fig. 4. O, OXYNTIC CELL. NOTE POSITIVE REACTION OF NUCLEI AFTER PYRIDINE EXTRACTION a fact strongly indicative of the presence of lipoid. I have confirmed these observations, and extended them by the use of Baker's acid hæmatin test[6] for lipines.

The oxyntic cells of the rat's stomach are strongly positive to the acid hæmatin test (Figs. 2 and 3) and therefore very probably contain lipine, although some oxyntic cells at the bases of the fundic glands are negative, showing only the unstained refractile granules. There is reason for believing that this is not a fixation artefact, or some similar effect, related to the technique employed, but that it represents a specific functional state of the cells in these positions.

After removal of the lipoids by the pyridine extraction method[6], the acid hæmatin test gave negative results (Fig. 4). It was quite clear, however, that the cells still contained refractile granules, comparable in numbers to those of the non-extracted cells, and it was possible to stain these with Heidenhain's iron hæmatoxylin. It seems reasonable to suppose, at this stage of the investigation, that these extracted granules consist partly of protein. If this is so, the oxyntic granules appear to be of a duplex nature, consisting of a protein core and a lipine (and perhaps non-lipine lipoid) envelope. In this respect they resemble not only mitochondria, but also the lipoid-invested vacuoles of the Golgi complex.

A preliminary study of the behaviour of these granules under certain experimental conditions that stimulate gastric secretion has shown (*a*) that in some cells there is a very marked enlargement of the granules, and an intensification of their positive reaction to acid hæmatin, and (*b*) that in others, perhaps the majority, there is a negative reaction to the acid hæmatin test, suggesting that in these cells the granules have lost their lipine component.

A full account of these and other observations on oxyntic and other chloride-secreting cells, their probable relation to mitochondria and the Golgi complex, and their possible relation to the mechanism of hydrochloric acid secretion, will be given elsewhere.

Discriminating 'Athrocytes' in the Reticulo-endothelial System

'ATHROCYTOSIS' can be defined as the property of some types of cell (termed 'athrocytes') of absorbing and storing in granular form extraneous substances, mostly electronegative colloids. Lison[1] showed recently that the Kuppfer cells of the frog and toad liver do not all have this property to the same extent. Some—provisionally termed '*G*' cells—store certain electronegative dyes, namely, those in which the diameter of the particles is greater than 60–80 A. Others ('*F*' cells) accumulate preferentially those of smaller diameter. This behaviour is clearly seen when a frog is injected intraperitoneally with a mixture of two acid dyes the particulate diameters of which are respectively greater and less than 80 A.; for example, a mixture of soluble Prussian blue (228 A., calculated by means of Einstein's formula from the diffusion coefficient measured with a Nistler's diffusion microscope) and ammonium carmine (20·5 A.). In these conditions, the '*G*' Kuppfer cells take up only the blue, the '*F*' cells only the carmine.

Both cell types are 'discriminating athrocytes' according to the definition of Cordier, Gérard and Lison[2]: they select among the athrocytable substances, taking and storing some of them, neglecting the others. In this case, it was shown conclusively that the main factor controlling the selection is the dimension of the particle in solution (other types of discriminating athrocytosis have been described by Lison[3]).

The purpose of this communication is to present evidence of the existence of such discriminating athrocytes in the reticulo-endothelial system of mammals. The technique used in our experiments was the intraperitoneal injection into the rat of suitable mixtures of acid dyes. In contrast with the common practice in the investigations on the reticulo-endothelial system, one single injection was made, and the quantity of the dye injected was relatively small—in most experiments 0·01 gm. of each dye. Preliminary experiments showed that high doses of dyes and repeated injections result in strong reaction of the reticulo-endothelial system, involving mobilization of many cells and fundamental changes in the characteristics of its components. The dyes used were all non-dialysable electronegative dyes; and they can be divided into two groups: 'high-dispersion' dyes, for which the diffusion coefficient is less than $0\cdot050 \times 10^{-5}$ cm.^{2}/sec., corresponding to theoretical particulate dimensions less than 80 A.; and 'low-dispersion' dyes, for which the diffusion coefficient is greater than this value. This classification is merely a question of convenience and is adopted for reasons of clarity only.

The most striking results are obtained with mixtures of one 'high' and one 'low' dispersion dye. After one day, the two components appear to be nearly quantitatively separated and are found stored in granular form in different cells. The high-dispersion dye is accumulated in fine and medium-sized granules in elongated, spindle-shaped cells. These fixed cells are found throughout the connective tissue surrounding or penetrating the organs and must be regarded as 'histiocytes'. The low-dispersion component of the mixture is stored in medium- or large-sized granules in large polymorphous mobile cells with rounded or reniform nuclei. These cells, which are rather scarce in the common connective tissue, but are very numerous in the medullary of the lymphatic nodes and in the omentum, must be identified with 'free macrophages'. The greatest part of the dyes injected is found separately in these two cell types. In addition, a few cells store both components in the form of mixed granules. These cells, macrophagic in aspect, must be considered as transitional elements between histiocytes and macrophages for the following reasons: they occur in the regions where the production of free macrophages is intense, such as the medullary of the lymphatic nodes and the omentum: the granules are formed of various relative proportions of the two dyes, in such a way that all the transitions can be observed.

The high-dispersion dye appears in the histiocytes throughout the whole body, while the athrocytosis of the low-dispersion dye is restricted to the area near the point of injection, that is, in the abdominal and sometimes mediastinal lymphatic nodes, in the omentum, and in the connective tissue in the immediate neighbourhood of the abdominal cavity. It is evident that the resorption and the transportation of the low-dispersion dyes are much slower than those of the high-dispersion ones, resulting in a more restricted area of athrocytosis. It must be emphasized, however, that the storage of the two dyes in different types of cell is not the result of circulatory conditions, preventing the access of one dye to one type of cells, since both types of athrocytes can be seen in the same location closely packed together.

In the liver, also, the two dyes are found in separate cells. The Kuppfer cells selecting the high-dispersion dye are scattered equally in the whole lobule, while the cells which store the low-dispersion dye are restricted to the periphery of the lobule, near the interlobular veins. Thus the two types, '*G*' and '*F*', of the Kuppfer cells previously described in amphibians occur also in mammals, but their location is different.

When the two components of the mixture used in the previous experiments are injected separately their location is the same as if they were injected simultaneously.

When mixtures of two high-dispersion dyes are injected, the two components are not separated, but are stored in the same cells, mainly in the form of mixed granules; these findings are in accordance with the observations of von Möllendorff. When mixtures of two low-dispersion dyes are injected, the two components are found both in the same macrophages, sometimes in the form of mixed granules, more often in the form of separate granules; cells with only one component are not found.

The present experiments afford evidence that the athrocytes in the reticulo-endothelial system of mammals act selectively towards different substances, and that the main factor controlling the selection is the dimensions of the particle in solution. Therefore, substances of different dispersions are stored in different cell types, the critical value of the dispersion corresponding approximately to a diffusion coefficient of $0{\cdot}050 \times 10^{-5}$ cm.^{2}/sec.

A Further Example of the Anti-*S* Agglutinin

A SECOND example of the human hæmagglutinin, anti-*S*, discovered by Walsh and Montgomery[1] has been identified. This agglutinin was shown by Sanger and Race[2] to be connected with the *MN* blood-group system, and to define either two more allelomorphs, *MS* and *NS*, at this locus, or else a second locus *S*, very closely linked to that for *M* and *N*. For practical purposes there is no difference between these two alternative possibilities.

The present example was found together with an anti-*D* agglutinin in the serum of a patient whose second pregnancy terminated in a stillborn hydropic fœtus at twenty-eight weeks gestation. The serum was first tested with a series of 48 *Rh* negative bloods, of which 22 were found to be agglutinated. It showed no relationship to *ABO*, *P*, Lewis or Lutheran blood groups, though there was suggestive evidence that it was connected with the *MN* groups, for, of the bloods of group *M*, eight were positive and five negative, and of those of group *N*, two were positive and six negative. Differential absorption was successfully achieved with three out of four *Rh* positive bloods chosen at random, the fourth donor removing all agglutinins.

The bloods of 250 unselected non-related people have been tested with the absorbed serum, and the results are given in Table 1 with the two previously published series. Dr. R. R. Race has also tested the bloods of 21 known *S* positive and 15 *S* negative individuals with the new serum, with complete agreement in all cases.

TABLE 1

	M		*N*		*MN*			
	S+	*S*−	*S*+	*S*−	*S*+	*S*−	Total	*S*+%
Walsh and Montgomery[1]	30	9	13	21	40	27	140	59·3%
Sanger and Race[2]	36	14	15	30	57	38	190	56·9%
Oxford series	55	20	12	33	67	63	250	53·5%
	28·28%		21·38%		50·34%		580	56%

A total of 580 bloods have now been tested with the two examples of the anti-*S* antibody, and the distribution of the *MN* groups is in good agreement with that expected in England. Prof. R. A. Fisher has very kindly recalculated the gene frequencies[3] for the combined data (Table 2).

TABLE 2

	S+	*S*−	Total
M	0·25585	0·27863	0·53448
N	0·08113	0·38439	0·46552
Total	0·33698	0·66302	1·00000

From these gene frequencies the expected genotype frequencies can be calculated (Table 3).

TABLE 3

Phenotypes		Genotypes	Expected	Observed	χ^2
M	*S*+	*MSMS* *MSM*	120·6921	121	0·000
	S−	*MM*	44·9958	43	0·088
MN	*S*+	*MSN* *MSNS* *MNS*	164·3819	164	0·000
	S−	*MN*	124·2390	128	0·113
N	*S*+	*NSN* *NSNS*	39·9928	40	0·000
	S−	*NN*	85·6983	84	0·033
			579·9999	580	0·237
					d.f. 2 $p = 0\cdot$

It will be seen that the agreement between the calculated figures and those actually observed is very close indeed, and provides additional evidence of the correctness of the genetical interpretation of Sanger and Race.

The blood groups of the family are as follows:

Mrs. M.G.	Group *A* *R*″ (*cdE*/*cde*) *M* *S*− Lutheran− Lewis−
Mr. G.	Group *O* R_1R_2 (*CDe*/*cDE*) *MN* *S*+ Lutheran− Lewis−
C. G., son	Group *A* *Rh*+ *M* *S*+
Stillborn infant	Group *A* *Rh*+ Direct Coombs' Test +++

The anti-S titre of the serum rose from 1 : 1 three days before delivery to 1 : 16 three weeks after delivery, and by six weeks *post partum* had fallen to 1 : 8. The antibody was active at 37° C. and 20° C., though slightly more intense reactions were obtained at 37° C. The thermal range and the familial incompatibility of S groups suggest that this is an immune agglutinin, though the presence of the anti-D agglutinin (titre 1 : 16) does not allow of any evaluation of the part it may have played in fœtal morbidity. It is unlikely that the agglutinin has been previously encountered in this laboratory, as the donor of the *Rh* negative cells which were first found to be agglutinated by this serum has been one of the standard *Rh* negative controls for antibody investigations since 1943.

I should like to thank Dr. R. R. Race for his interest and advice, and Mr. J. A. Morton and Mr. W. Penfold for technical assistance.

Variations in Spermatogenesis of Oligospermic Men

Zondek, Bromberg and Polishuk have suggested[1] that oligospermia in men can be divided into two types, constant and periodic; and that it is only men in the latter group who are likely to produce pregnancies. While agreeing that individuals differ in the range of variation of their sperm counts, we do not think this is either a clear-cut or a useful distinction.

It is, of course, impossible to draw conclusions about the reaction of a patient to treatment for oligospermia unless several specimens have been examined before treatment is given. It is also essential that specimens for comparison should have the length of the period of abstinence since the previous ejaculation controlled in both directions. Zondek *et al.* give only a minimum of length of interval. An interval of two or three weeks may result in sperm counts five times as high as those obtained after three to five days. As the number of motile spermatozoa does not increase with a long interval to anything like the same extent as does the total number of spermatozoa present, and as their viability is frequently impaired, the increase in sperm density cannot be regarded as improving the chances of fertilization. A possible cause of apparent periodic oligospermia is the occasional loss of the first few drops of the ejaculate, the majority of the spermatozoa being in the first fraction[2]. In our experience this is often the cause when men, whose sperm density is usually more than 60 million per c.c., produce specimens with counts less than 20 million.

Case	Sperm densities (M./c.c.)	Corresponding interval since previous ejaculate (days)
I	0·4, 1·0, 0·1, 0·2	3, 3, 3, 3
II	5, 3, 5, 4, 5, 10, 2, 5	3, 4, 3, 7, ?, 13
III	10, 6·5, 6·5	5, 4, 2
IV	8, 2	11, 3
V	6, 5, 17	2, 8
VI	1·5, 0·5	28+, 2
VII	1·5, 1·5, 1·0, 2·0, 0·65	?, 8, 4, ?, 4

It is not necessary to postulate periodic, as opposed to constant, oligospermia to explain pregnancies in wives of oligospermic men. The lower limits of sperm count usually stated as necessary for fertilization are definitely too high. In a series of more than seven hundred sub-fertile marriages, seven women whose husbands constantly had sperm densities less than 20 million per c.c. have conceived. Details are given in the accompanying table. In cases II–V conception took place shortly after the last semen analysis; in case I the last count was done a month after conception occurred. Cases VI and VII are less convincing, as conception did not take place until more than a year after the patients stopped attending the clinic, and the husbands may have improved in the interval. A further seven conceptions occurred in women whose husbands had, in a single seminal analysis, sperm densities less than 20 million per c.c.

Relation Between Fountain Pressure and Heat Current in Helium II

Allen and Reekie[1] directed attention to the fact that the fountain-pressure difference ΔP at the ends of a narrow slit or capillary produced by a temperature difference is, in the absence of mass flow, exactly proportional to the heat current W appearing simultaneously with the fountain pressure.

For very narrow slits (up to 10^{-4} cm.) the heat current is proportional to the temperature difference at all temperatures up to the immediate neighbourhood of the λ-point. For wider slits (greater than 10^{-3} cm.), the linear relation between heat current W and temperature difference ΔT changes gradually over to proportionality between W and the cube root of ΔT. These deviations from linearity are greater for wider slits, and for higher temperatures and greater gradients at any constant slit width.

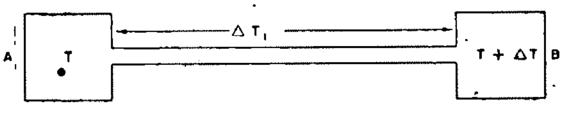
Keesom and Duyckearts[2] and Mellink[3] confirmed that the Allen – Reekie proportionality between fountain pressure ΔP and heat current W is retained no matter what the relation between W and ΔT, including the regions where this dependency approaches the cube root law.

This is difficult to understand so long as the factors responsible for the deviation from linearity between W and ΔT are regarded as operative in the slit itself where the fountain pressure gradient must exist.

A simple explanation can be given in terms similar to the model proposed recently[4] for the anomalous mechano-caloric effects in the super-critical mass flow of helium II through slits.

The experimental arrangement for measuring W and ΔP may be represented schematically as in the accompanying figure.

A narrow slit of from 0·1 to 20 μ, or a capillary filled with emery powder, connects two temperature



baths A and B containing bulk liquid at temperatures T and $T + \Delta T$ respectively.

The anomalous heat effects accompanying mass flow could be explained by the assumption that the temperature difference ΔT between A and B is greater than the temperature difference ΔT_1 between the ends of the slit itself, if the velocity of the particles emerging from the slit (or entering the slit) is greater than the critical velocity of the superfluid flow.

In the present problem there is no net mass flow. But according to L. Tisza and F. London[5], the heat flow in a narrow slit can be considered as a viscous back-flow of normal particles under the fountain-pressure difference. The velocity u of the normal (excited) particles can be estimated from the equation $W = \rho Q u$, where ρ is the density and Q the heat content of helium II. u is actually about equal to the critical velocity for values of W in the region where the first deviations occur from the linear relation between W and ΔT. These deviations from linearity may thus be due to the appearance of temperature differences $\Delta T_b = (\Delta T - \Delta T_1)$ in the bulk liquid near the ends of the slit, caused by the normal particles emerging from the slit at a velocity higher than the critical one.

The fountain pressure can only depend on the temperature difference ΔT_1 between the ends of the slit itself. For narrow slits it obeys the relation given by H. London[6],

$$\Delta P = \rho S \, \Delta T_1, \qquad (1)$$

and generally (see S. R. deGroot[7])

$$\Delta P = k_f \, \Delta T_1, \qquad (2)$$

where k_f falls to lower values than ρS for capillaries of such a width that some excited particles can also pass, and the heat of transportation Q^* is less than TS.

The heat current, on the other hand, depends on the total temperature difference $\Delta T = \Delta T_1 + \Delta T_b$; but the thermal resistance consists of two resistances in series, namely, the resistance in the bulk adjacent to the ends of the slit, and the resistance in the slit. It is assumed that W is proportional exactly to ΔT_1 within the slit in accordance with the model of viscous back-flow, and that all deviations from linearity are due to the resistance in the bulk liquid. From the fact that the heat flow in wide tubes is proportional to $(\Delta T)^{1/3}$, we may assume the same dependency to be valid for the resistance in the bulk liquid.

The condition for continuity of heat flow states that

$$W = k_1 \, \Delta T_1 = k_2 (\Delta T_b)^{1/3}, \qquad (3)$$

with

$$\Delta T = \Delta T_1 + \Delta T_b.$$

Comparing the first part of (3) with (2) yields exactly the Allen – Reekie relation

$$W / \Delta P = k_1 / k_f = \text{constant}. \qquad (4)$$

This result holds no matter what the relative importance of the different series resistances, remaining true even when the heat current follows almost the cube root law. Thus for wider slits the fountain pressure may be very small because $\Delta T_1 \ll \Delta T$, so that $\Delta T \doteqdot \Delta T_b$ and W is almost exactly proportional to $(\Delta T)^{1/3}$; for narrower capillaries the fountain pressure and ΔT_1 both become appreciable, so we get values intermediate between linearity and the cube root law. For the narrowest slits the fountain pressure assumes its maximum value, $\Delta T = \Delta T_1$, $\Delta T_b = 0$, because the particles emerge from the slit at velocities smaller than the critical one and no temperature gradient appears outside the ends of the slit. So W is now exactly proportional to ΔT.

In consequence of this interpretation, the transition probability relation derived by us previously to account for the cube root law[8] can hold only in the bulk liquid, and not in very narrow slits or capillaries. The proximity of the wall apparently inhibits the relaxation effects, a circumstance which is probably related with the fact that the superfluidity of helium II appears near walls and in narrow slits.

High-Frequency Resistance of Superconductors

MEASUREMENTS of the high-frequency resistance of superconducting tin, extending previous work[1] at 1,200 Mc./s., have now been carried out at frequencies around 9,200 Mc./s. (wave-length 3·2 cm.). The experimental technique is in principle the same as at 1,200 Mc./s., with the twin-wire resonator replaced by a half-wave coaxial resonator. The variation of the resistivity, R, with temperature is shown in the accompanying graph, together with the results of the earlier measurements for comparison. For convenience, R is expressed in terms of the resistivity, R_n, of normal tin just above the transition temperature. The experimental points plotted are those taken with one of the five specimens actually measured; the points for the other specimens are in close agreement.

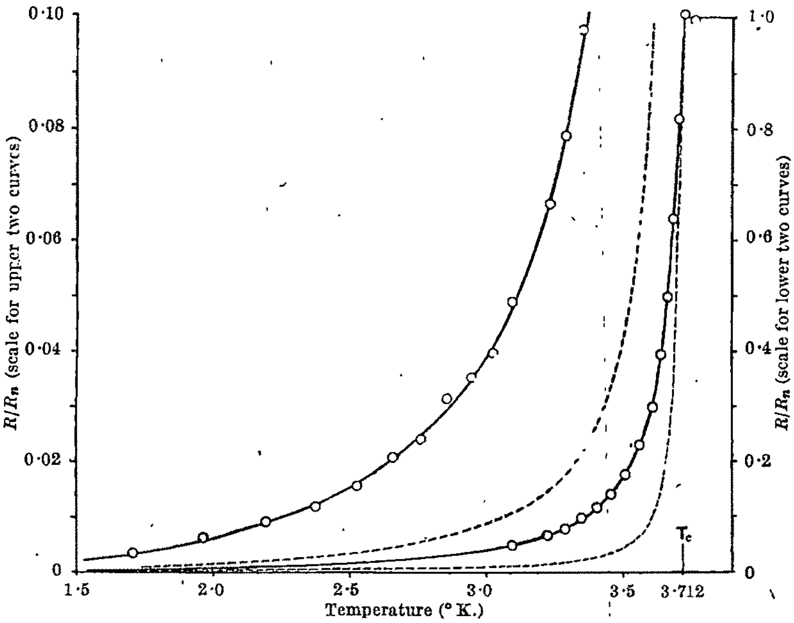
If the usual assumption[2] be made that a superconductor contains both 'superconducting' and 'normal' electrons, which react independently to an applied field, certain predictions about the frequency-variation of r $(= R/R_n)$ may be made by means of general arguments. In the first place, it may be shown that the initial slope dr/dT, just below the transition temperature, T_c, should vary with frequency as $\nu^{-2/3}$. The experimental results are not in agreement with this prediction. For the two frequencies used, the ratio of the slopes is 2·95 instead of the predicted 3·9.

It may further be shown that at temperatures sufficiently far below T_c that $r \ll 1$, the resistivity R at a given temperature should vary as ν^2. A separate experiment has shown that $R_n \propto \nu^{2/3}$, in accordance with the theory of the anomalous skin effect[3], so that it would be expected that $r \propto \nu^{4/3}$ at any temperature well below T_c. It may therefore be predicted without any but general arguments based on the model that, for $r \ll 1$,

$$r = Af(T), \qquad (1)$$

where

$$A \propto \nu^{4/3}. \qquad (2)$$



RESISTIVITY OF SUPERCONDUCTING TIN: FULL LINES, AT 9,200 Mc./s.; BROKEN LINE, AT 1200 Mc./s. THE UPPER CURVES ARE ON TEN TIMES THE SCALE OF THE LOWER CURVES

Now it has been found empirically that for $T < 3·3°$ K. the experimental curves for both frequencies, in agreement with equation (1), are closely fitted by the expression

$$r = A' \cdot \frac{t^4(1 - t^2)}{(1 - t^4)^2},$$

in which t is the reduced temperature T/T_c.

The experimental values of A', however, show a marked departure from the frequency-variation of equation (2). Thus, $A' = 0·0195$ at 1,200 Mc./s., and 0·0865 at 9,200 Mc./s.

The ratio of these two values, 4·43, is very different from the predicted ratio of 15·12. A discrepancy of this magnitude cannot be accounted for by observational errors, and it must be concluded either that some relevant factor has been omitted from the general arguments, or that an incorrect model has been used. Further experiments are in progress to discover the cause of these anomalies, and the measurements are also being extended to mercury, which appears from preliminary results to exhibit similar anomalies, though to a lesser extent.

A full account of this investigation will be published elsewhere.

Oxidation of Uranium Dioxide (UO_2)

IN connexion with earlier investigations on uranium oxides in this Institute, it was observed that uranium dioxide (UO_2) can react with oxygen at so low a temperature as 120° C. To obtain more exact information about this low-temperature oxidation of UO_2, the oxide was heated in purified oxygen at different temperatures from 100° to 265° C. and the reaction products examined by the X-ray powder method[1].

At 150° C., UO_2 takes up oxygen at least to the composition $UO_{2·34}$. This oxidation causes a displacement of the X-ray interference fringes and a broadening of some of them, indicating a change to lower symmetry. As an approximation the lattice of the new structure was considered to be cubic. A specimen with the composition $UO_{2·34}$ was found to have the lattice constant $a = 5·40$ kX. (for UO_2, $a = 5·468$ kX.). It is difficult to decide whether or not the structure of UO_2, the β-phase, changes continuously as the oxygen content increases. If the change is discontinuous, the two structures belong to different phases.

The experimentally found density of UO_2 is 10·80 gm./c.c. and of $UO_{2·34}$ 11·05 gm./c.c. The increase of the density from UO_2 to $UO_{2·34}$ can only be explained by the assumption that oxygen, at least partly, enters into interstitial positions of the UO_2 lattice. Nevertheless, the lattice contracts; this must be due to the fact that the expected increase of lattice dimensions due to interstitial addition of oxygen is overcompensated as some of the uranium ions change their charge from + 4 to + 6 (or + 5).

By raising the temperature to 200°–250° C. the oxygen content exceeds the formula $UO_{2·34}$, and another new phase, the δ-phase, is formed. X-ray photographs indicate that the δ-phase has a narrow range of homogeneity around $UO_{2·40}$. The phase is found to be tetragonal, a specimen with the composition $UO_{2·43}$ having the following lattice constants: $a = 5·37$ kX., $c = 5·54$ kX. and $c/a = 1·03$.

TABLE 1. CALCULATED DENSITIES OF THE δ-PHASE

Phase	Formula	Density in gm./c.c.
AB_2-addition	$UO_{2·43}$	11·46
AB_2-substitution	$U_{0·88}\ O_{2·12}$	10·04
AB_2-subtraction	$U_{0·82}\ O_2$	9·44

Table 1 gives the densities calculated for a preparation with the composition $UO_{2·43}$ if the lattice is derived from that of UO_2 by: (1) addition of oxygen; (2) substitution of uranium with oxygen; or (3) subtraction of uranium. On comparing these densities with the observed one, 10·00 gm./c.c., only assumption (2) provides agreement between observed and calculated values. The lattice of the δ-phase must then be regarded as derived from that of UO_2 by substitution of uranium with oxygen. The formula of the specimen $UO_{2·43}$ must therefore strictly be written $U_{0·88}.O_{2·12}$.

The intensities of the X-ray interference fringes indicate that the uranium atoms form a face-centred lattice (000 ; 0 ; $\frac{1}{2}\frac{1}{2}0\frac{1}{2}$; $\frac{1}{2}0\frac{1}{2}\frac{1}{2}$). In Table 2 intensities are calculated for the uranium atoms in the usual way, including corrections for absorption, but without temperature factor. Observed and calculated intensities are in good accord.

The existence of a uranium oxide with the composition U_2O_5 has often been assumed, and recently by R. Lydén[2], who prepared it by the action of potassium hydrogen carbonate on U_3O_8. In the tensimetric phase diagram of W. Biltz and H. Müller[3], an oxide U_2O_5 had no observable range of existence. In our investigations, however, a phase near the composition U_2O_5 was found; but the oxide exists only at temperatures below 260–270° C. as a tetragonal deformed substitutional UO_2 phase and has a composition which does not seem to exceed the formula $U_{0\cdot 88}\ O_{2\cdot 12}$.

X-ray photographs of products prepared according to Lydén exhibit a slightly modified U_3O_8-structure. The products were found to have a composition in the region of $UO_{2\cdot 60}$ although approximately a third of the uranium had gone into solution. By reduction of U_3O_8 with hydrogen at 330° C., similar X-ray photographs were obtained, indicating that U_3O_8 has a range of homogeneity between $UO_{2\cdot 67}$ and $UO_{2\cdot 56}$.

P. Jolibois[4] has recently published results on the oxidation of UO_2 which also show the existence of a phase with a composition close to U_3O_7 ($UO_{2\cdot 33}$) but without giving further information on the properties of this phase.

Crystal Structure of Uranium Oxide (U_3O_8)

THE uranium oxide U_3O_8 can be obtained by heating UO_2 as well as UO_3 in air or oxygen to red heat. So far as we know, however, no determination of the structure of this oxide has been published; the difficulty in preparing single crystals of U_3O_8 may be the reason.

While preparing UO_2 crystals, F. W. Hillebrand[1] got some small green-olive-greyish crystals. They seemed to be orthorhombic and were perhaps U_3O_8 crystals. V. M. Goldschmidt and L. Thomassen[2] reported that U_3O_8 did not crystallize regularly.

We did not succeed in preparing U_3O_8 single crystals; but one of the preparations gave X-ray photographs on which reflexions with indices $00l$ only were sharp and well defined, and this has enabled us to put forward a hypothetical crystal structure. All lines on the X-ray photographs can be identified as belonging to an orthorhombic cell with the dimensions: $a = 6\cdot 703$ kX., $b = 3\cdot 969$ kX., and $c = 4\cdot 136$ kX.

The density of U_3O_8 was found pycnometrically to be 8·34 gm./c.c. On comparing this density with those calculated under different possible assumptions as given in Table 1, one finds for U_3O_8 that with three uranium atoms in the elementary cell the density is not in agreement with that observed. The observed density is only compatible with U_3O_8 as an AB_3 subtractive phase (or an AB_2 interstitial phase). The elementary cell then contains two uranium atoms.

TABLE 1. CALCULATED DENSITIES OF U_3O_8

Phase	Formula	Mol.	Density in gm./c.c.
$AxBy$	U_3O_8	1	12·63
AB_3-addition	$U_{1\cdot 12}\ O_3$	2	9·46
AB_3-substitution	$U_{1\cdot 09}\ O_{2\cdot 91}$	2	9·18
AB_3-subtraction AB_2-addition	$UO_{2\cdot 67}$	2	8·42
AB_2-substitution	$U_{0\cdot 82}\ O_{2\cdot 18}$	2	6·88

Here we will not give a general discussion of the space groups which can be considered, but only state that the intensities of the lines on the X-ray photographs indicate the uranium atoms to have the positions a : 000, b : $\frac{1}{2}\frac{1}{2}0$. The arrangement of the atoms may then be referred to the space-groups D_{2h}^{19}, D_{2h}^{13}, D_{2h}^{9}, D_{2h}^{7}, D_{2h}^{5}, D_{2h}^{4}, D_{2}^{6}, C_{2v}^{14}, C_{2v}^{11}, C_{2v}^{8}, C_{2v}^{6}.

The observed intensities were estimated visually. Intensities were calculated in the usual way, including corrections for absorption in the powder rod, but without the temperature factor. The structure factor was calculated for the uranium atoms only. As seen from Table 2, observed and calculated intensities are in good agreement.

* Coincides with β-reflexions.

Oxygen ions scatter X-rays so slightly that with visually observed intensities we cannot draw conclusions regarding their positions. It is probable, however, that the U_3O_8 structure is related to the ReO_3 structure, but with deformed UO_6^{-4} octahedrons with anion vacancies. If the distribution of these vacancies is statistical, the cell already mentioned can be considered as the elementary cell, or else it would be larger. The ReO_3 structure type is, according to K. Meisel[4], the highly symmetrical form of an AB_3 structure, with which the CrO_3, MoO_3 and the WO_3 structures[5] are also closely related.

Structure of Abraded Surfaces

THE importance of surface conditions in the fatigue of metals and alloys has led to an investigation in this Laboratory into the effect of abrasion on the hardness and microstructure of surface and sub-surface layers.

Hardness measurements were made with a 'Tukon' microhardness tester and a load of 25 gm. on metallographically polished 2° taper sections prepared in a manner described by Nelson[1], and more recently by Moore[2], except that the bulk of the metal was used as a backing for the hardness impressions instead of thin wedges. The mechanical magnification obtained was of the order of 20, thus allowing hardness impressions to be spaced at effective distances of 0·5 μ below the surface.

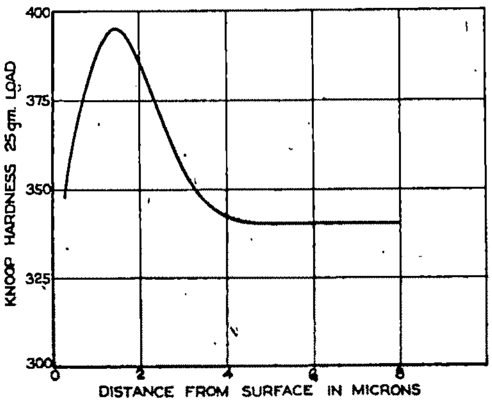

Fig. 1

In the case of chromium-molybdenum steel, heat-treated to a uniform sorbitic structure and to an average bulk hardness of Knoop 340, it was found that abrasion caused an increase in hardness in the surface layers to a depth of 3·5–6 μ according to the degree of abrasion. The maximum hardness obtained was approximately constant at Knoop 400 and occurred at a depth of 1·5 μ in all cases (Fig. 1). However, the most notable feature of the curves of hardness against depth was the fact that the hardness increase diminished progressively from a depth of 1·5 μ to the surface.

Metallographic examination of the taper sections at high magnifications (× 2,500) revealed a layer, corresponding in thickness to the depth of 'softening', in which a modification of the original structure of the steel was evident. Similar structural changes have been observed by Wulff[3] and his associates, in stainless steel, and by Benard, Lacombe, and Chaudron[4], in 'Armco' iron, and have been explained as being due, principally, to the plastic deformation accompanying abrasion. However, the 'softening' effect in the surface layers of steel specimens used in this investigation indicated that plastic deformation cannot be responsible for all the effects observed. The probable cause for this 'softening' was tempering or recrystallization due to the frictional heat of the abrading process, since decarburization of the surface was proved to be absent, and structural alteration during the polishing of the sections was overcome by using a polish-etch technique.

To obtain further information on this point, a series of severely abraded alpha-brass samples (containing 35 per cent zinc) were sectioned after various annealing treatments at temperatures up to 350° C. In the unannealed specimen, the hardness curves were of the same form as previously described, while metallographic examination revealed a layer of fine crystallites at the surface extending to a depth of 1–2 μ (Fig. 2), followed by a deformed layer to a depth of 35 μ. The crystallites were resolved at a magnification of 2,500, the average size being 0·5–1 μ (Fig. 3). No change from the above microstructure was observed in specimens annealed up to 240° C., but annealing at 249° C. caused an increase in the depth of the layer of fine crystallites, indicating that recrystallization of the deformed sub-surface layers had commenced (Fig. 4).

The similarity between the structure obtained by recrystallization of the deformed layers on annealing, and that existing in the extreme surface layer of the unannealed specimen, indicated that the 'softening' observed was due to recrystallization during abrasion. Annealing at still higher temperatures produced considerable grain-growth in the already recrystallized zones and progressive recrystallization into the more lightly deformed regions.

It is concluded from these experiments that, during abrasion, the temperature of the extreme surface layers is raised sufficiently to cause recrystallization. It has further been shown that recrystallization in an alpha-brass, containing 35 per cent zinc, when deformed as in abrasion, occurs at a temperature of 249° C. with the formation of crystallites of approximately 10^{-4} cm.

These results are important in relation to the failure of metals by fatigue. Since fatigue cracks normally start at the surface, the recrystallized and deformed layers produced by surface grinding should be removed before testing, to ensure that endurance curves characteristic of the material are obtained.

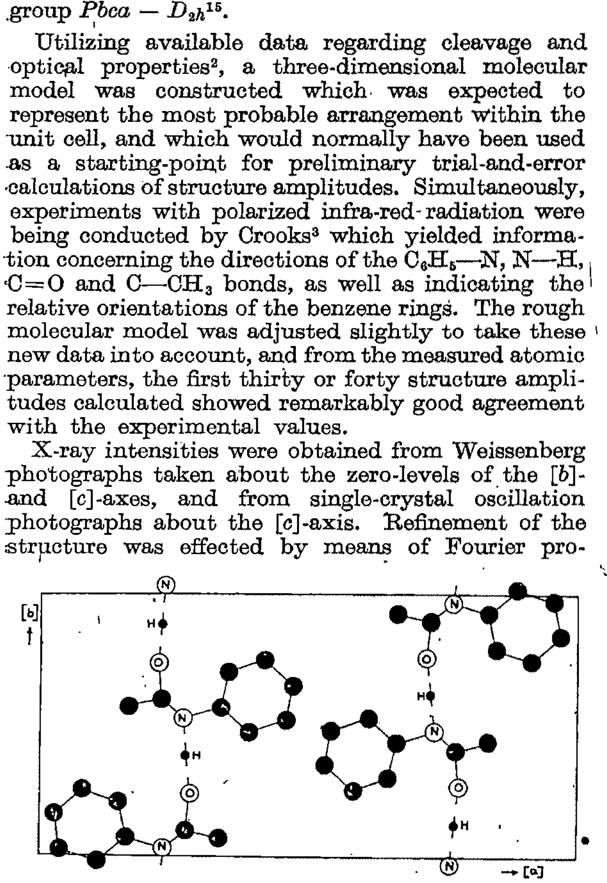
Crystal Structure of Acetanilide: Use of Polarized Infra-Red Radiation

THE crystal structure of acetanilide has been determined[1] by classical X-ray diffraction methods, making use of information derived from polarized infra-red radiation technique as a time-saver in the trial-and-error process. The crystals from water or ethanol vary in form from plates {100} to truncated bipyramids {111}, but growth from the molten state results in acicular crystals, elongated along [*b*] and tabular on (100). The orthorhombic unit cell contains eight molecules and has dimensions:

[*a*] = 19·50, [*b*] = 9·46 and [*c*] = 7·96 A.; space group $Pbca - D_{2h}^{15}$.

Utilizing available data regarding cleavage and optical properties[2], a three-dimensional molecular model was constructed which was expected to represent the most probable arrangement within the unit cell, and which would normally have been used as a starting-point for preliminary trial-and-error calculations of structure amplitudes. Simultaneously, experiments with polarized infra-red radiation were being conducted by Crooks[3] which yielded information concerning the directions of the C_6H_5—N, N—H, C=O and C—CH_3 bonds, as well as indicating the relative orientations of the benzene rings. The rough molecular model was adjusted slightly to take these new data into account, and from the measured atomic parameters, the first thirty or forty structure amplitudes calculated showed remarkably good agreement with the experimental values.

X-ray intensities were obtained from Weissenberg photographs taken about the zero-levels of the [*b*]- and [*c*]-axes, and from single-crystal oscillation photographs about the [*c*]-axis. Refinement of the structure was effected by means of Fourier projections on (010) and (001) and by means of appropriate lines and sections of a three-dimensional synthesis, with the result that the phases of about three hundred structure amplitudes are now known with certainty. The structure is depicted in the accompanying diagram; bond-lengths appear to be within the accepted values; the length of the hydrogen bond distance N—H—O is 2·9 ± 0·1 A. It is hoped that further refinement will be carried out later; but since this is by no means certain, the following list of co-ordinates is here placed on record.



ARRANGEMENT OF MOLECULES IN UNIT CELL BETWEEN $z = 0$ AND $z = 1/2$. THE OTHER FOUR MOLECULES IN THE CELL MAY BE OBTAINED BY REFLECTING THESE FOUR ACROSS THE PLANE $y = 1/4$ AND GLIDING THEM *c*/2

	X	*Y*	*Z*
C_1	0·16	0·07	0·12
C_2	0·11	0·98	0·17
C_3	0·04	0·02	0·14
C_4	0·03	0·16	0·06
C_5	0·08	0·25	0·01
C_6	0·15	0·21	0·04
N	0·23	0·03	0·15
C_7	0·27	0·10	0·25

C_8	0·33	0·07	0·29

The use of polarized infra-red radiation promises to be of great assistance in crystal structure determinations, but further trials with more complex substances will be necessary before a full assessment of its value can be made. It is probable that the infrared technique will require further development so that small single crystals may be used. In some work with crystals containing water of crystallization it has been found that strong water-bands tend to obscure that part of the spectrum which would yield most information, but it is expected that more complete polarization would enable this difficulty to be overcome. In a crystal where several similar bonds are distributed in different directions, it may not prove possible to analyse the results adequately without a considerable increase in sensitivity of the infrared apparatus.

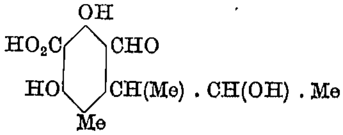
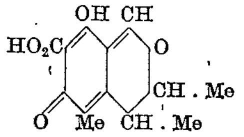
Structure of Citrinin

IN view of the recent communication on this topic by Cram[1] to the editor of the *Journal of the American Chemical Society*, we wish to record that in the course of an extensive investigation on the chemistry of citrinin initiated in these laboratories in 1945, the synthesis of 4-methyl-5-ethylresorcinol[2], m.p. of anhydrous material 94–95°, was effected in 1946, and the orientations of the two isomeric phenols '*A*' and '*B*' $C_{11}H_{16}O_3$ afterwards established. From these results, *inter alia*, together with a study of the degradation products of methylated citrinin and of dihydrocitrinin and its ether, evidence has accumulated which leads to the conclusion that citrinin in all probability is best represented by the expression (II).

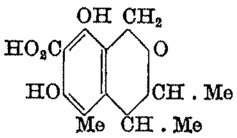
The claims of competing structures, including those of the quinol (*cyclo*hexadienolone) type, have been considered; but so far as our evidence goes it would seem that formula (II), which is an anhydro



I



II



III

form of (I), most satisfactorily explains (*a*) the ready aromatization of the compound in warm acid or alkaline media with the extrusion of formyl (as formic acid) and carboxyl (as carbon dioxide) groups; (*b*) the formation of formic acid and not formaldehyde or glyoxylic acid on the ozonolysis of citrinin and its ester; and (*c*) the formation of a stable dihydro derivative (III) with simultaneous aromatization. The structure (III) ascribed to the latter compound is in agreement with its blue ferric reaction, which is characteristic of γ-resorcylic acids. On the basis of formula (II), the phytochemical formation of citrinin may conceivably proceed by way of the intermediate (I).

It would seem that the claim by Cram[1], that the isolation of authentic 4-methyl-5-ethylresorcinol from citrinin completely eliminates the formula proposed for the latter by Robinson *et al.*[3], can scarcely be sustained at present. The above formula retains the original suggestion of a hemi-quinone type of kernel.

Nitration of Simple Heterocycles

IN a recent letter in *Nature*[1], Schofield and Swain comment, *inter alia*, upon the failure of resonance theory to explain non-nitration of *iso*quinoline in position 7: the following results may be of interest.

In the course of work in these laboratories we have been led to investigate the nitration products of 3 : 4-dihydro*iso*quinoline derivatives and have found, for example, that 1-*p*-nitrophenyl-3 : 4-dihydro*iso*quinoline gives an 80 per cent yield of the 7-nitro derivative, this structure being proved by comparison with the product of cyclization of N-*p*-nitrobenzoyl-2-(4′-nitrophenyl)ethylamine. On the other hand, 1-*p*-nitrophenyl*iso*quinoline yields 85 per cent of 1-*p*-nitrophenyl-5-nitro*iso*quinoline, identified by conversion to 1-*p*-chlorphenyl-5-chlor-*iso*quinoline and comparison with a synthetic sample. Such substitution in the *iso*quinoline ring may be compared with that of quinoline which is nitrated in the 5 and 8 positions, whereas tetrahydroquinoline has been shown to nitrate in position 7 [2], a result compatible with expectation since *o*-toluidine yields 4-nitro-2-aminotoluene[3]. Similarly, *iso*quinoline is nitrated principally in the 5 position with a small proportion of the 8-isomer[4]. Nitration of reduced *iso*quinoline has escaped attention, and investigation of the products of nitration of 3 : 4-dihydro- and 1 : 2 : 3 : 4-tetrahydro*iso*quinoline is now being undertaken, when we expect to isolate the 7-nitro derivatives in accordance with the above result and by comparison with the nitration of *o*-cyantoluene, which yields 4-nitro-2-cyantoluene[5], and of 2-phenylethylamine, which has been shown to give 45 per cent of the para and 18 per cent of the meta isomer[6]. Results will be reported in detail elsewhere.

We wish to thank the directors of May and Baker, Ltd., for permission to publish these results.

Production of Quinolyl and Pyridyl Anions during Decarboxylation

IT has been shown[1,2] that when picolinic and quinaldinic acids are decarboxylated in the presence of aldehydes and ketones, α-pyridyl and α-quinolyl carbinols of the type Py(Qy).CH(OH).*R* are produced in good yields (40–80 per cent). The course of this reaction has been formulated in terms of the intermediate formation of α-pyridyl and α-quinolyl anions, which are formally of cyanide ion type[1,3]. The possibility that the cyanide function might by conjugation be extended to the γ-position has been confirmed recently by Mislow[3], who has obtained γ-pyridyl diphenylcarbinol by the decarboxylation of *iso*nicotinic acid in benzophenone. We now report that we have prepared γ-quinolyl diphenylcarbinol, m.p. 247°, from cinchoninic acid and benzophenone in yields of 7–10 per cent; we are developing the reaction as a possible route to quinine analogues.

We also find that, in the presence of decarboxylating quinaldinic and picolinic acids, it is possible to exchange the alkoxy groups of esters for pyridyl and quinolyl groups and to effect substitution by these groups at cationoid (electrophilic) centres in aromatic molecules; we take this to confirm our view that quinolyl and pyridyl anions are produced during the decarboxylation process.

Ecology of Sponges

THE statement has often been made that sponges can be found growing almost up to high-tide mark. As a result of close observation over miles of shore in a dozen different localities on the south and west coasts of Britain during the past twelve months, I have no hesitation in saying that only exceptionally are sponges found above mid-tide level. Even then, the most to be seen are a few undersized specimens of *Hymeniacidon perlevis* (= *H. sanguinea* Auctt.) in damp sheltered crevices protected from swirl and direct sunlight; and these are no more than a foot above mid-tide.

The second current statement proved to be false is that sponges are capable of surviving considerable desiccation. Careful observation shows that rarely are they found growing where there is no drip, or where they are not overhung with seaweed. I have found a few specimens of *H. perlevis* exposed to the strong rays of a spring sun. After exposure of two hours or more, between the ebb and flow of the tide, they have appeared dry and the surface shrivelled. The following day they have appeared completely regenerated. By marking such specimens and inspecting them at intervals, the following sequel has been established. They can appear regenerated after several such exposures; but in due course they disintegrate by stages, and after a month, instead of a sponge 50 mm. square, there are found a few small growths each about 5 mm. across. In two to three months time, depending on the amount of sunshine, even these feeble residues are gone.

The third, oft-repeated, fallacy is that sponges have no enemies apart from the nudibranchs that feed on them. I have often found *Patella, Littorina littorea* and *L. obtusata* on sponges, and have found their stomachs to contain spicules. At least two other gastropods are suspect. *L. obtusata* feeds more particularly on *Grantia compressa* and can often be found on it with its mouth closely fixed on the rim of a large hole in the wall of the sponge. There is sufficient circumstantial evidence for the view that these holes, commonly found in the sides of *Grantia*, are entirely the work of *Littorina obtusata*.

The fourth fallacy is that *Halichondria panicea* is the sponge most commonly found on the shore. *Hymeniacidon perlevis* grows higher up the beach and is more abundant; but because it is usually tan, or a dull brick-red, as against the conspicuous green or yellow of *Halichondria*, it is less readily seen. In some places it is a hundred times more plentiful, bulk for bulk, often twenty times, and, at a rough but conservative estimate for all British coasts, not less than ten times as plentiful. This last low average allows for any occasional restricted areas there may be where *Halichondria* is as abundant, or slightly more abundant, than *Hymeniacidon*, and of which I have not had experience.

Finally, there is clear evidence of a zoning of sponges. From mid-tide level there is usually (in my experience, always) a zone of *Hymeniacidon perlevis*. This gives place, at a depth varying with local circumstances, to a mixed *Hymeniacidon perlevis–Halichondria panicea* zone, extending approximately to the shallowest low-water neaps. In this zone, but of sporadic occurrence, may be found *Sycon ciliatum, Leucosolenia coriacea* and *L. complicata*. The next zone contains predominantly *Grantia compressa*, with scattered *Hymeniacidon, Halichondria, Sycon*, and the two species of *Leucosolenia*, rarely anything else. The *Grantia* zone is bounded roughly by the shallowest and deepest low-water neaps. In the last zone, of the low-water springs, we find the richest crop. Here thirty or more species may occur, including those already mentioned for the first three zones.

This zoning, although like all zoning it is not absolutely invariable, is sufficiently consistent to serve as a working guide. To the experienced eye it is a good enough (the word infallible might almost be used) index to the state of the tide.

The fallacious ideas referred to above may individually seem unimportant; but in any study of the ecology of sponges they can, if not corrected, lead badly astray.

Neurotic Behaviour in Ants

WHILE investigating ant learning with maze apparatus, behaviour was observed in one individual which is similar to that described by Cook[1] and Maier[2] as psychopathic or 'neurotic' behaviour in rats. What are thought to have been early symptoms of similar behaviour were later observed in a virgin female of the same colony of *Formica fusca* Latr.

The particular worker ant concerned was one of several which had already several times successfully completed this maze. On completion of the run, the ants were normally picked up in the experimenter's fingers (an act to which they were habituated and against which they did not struggle) and returned to the observation nest in which they were kept; that is, in effect, to their fellow-workers and a female which was at that time laying eggs.

On this occasion the worker ant had already successfully run the maze almost immediately after being placed in the starting chamber, making few errors and quickly correcting those which it did make. It was then placed back in the nest; but about five minutes later was once more taken from the nest and replaced in the starting chamber. It at once exhibited slight jerking movements of the legs and antennæ, but soon commenced to run the maze, moving very quickly and without error or returning, until halfway through, when it missed one of the solution-turns and followed an error-path until it reached its blank end. At first it made no movement back along the error-path, but with rising physical excitement and an increasing jerking of the limbs and antennæ constantly touched the three glass sides of the maze in the immediate vicinity of the blank end. After about a minute it returned along the error-path until near its commencement, where for a few seconds it remained standing while exhibiting constant and increasing limb and antennæ jerking. It then turned until facing down the error-path, and still jerking moved with a staggering motion backwards (the limb-jerking, which appeared to be completely out of its control, made ordinary movement a matter of difficulty) and almost at once commenced to circle, still backing, in a small area of the intersection of the tracks. The rapidity of the circling increased and the jerking became even more pronounced, and a few seconds later the ant was rescued, since it was, for other reasons, of experimental value. It was quiescent while held firmly in the experimenter's fingers, but was placed under a tap of cold running water for about ten seconds before being returned to the nest. In the nest it still exhibited slight tremors of the legs and antennæ, but soon ran about normally. On the next day the ant ran the maze successfully with some errors, but no sign of its earlier behaviour. On one following occasion, however, it showed pronounced jerking movements of limbs and antennæ after making the same error, and commenced trying to clean itself. It was, however, at once rescued and returned to the nest. This particular individual is one of the most active workers of that particular colony, and also proved to be among the three workers of the colony (which consisted of 23 workers and two females) which were most successful at maze-learning.

A virgin female which was originally taken from the same colony but which had been isolated for nearly two months exhibited similar marked jerking movements of antennæ and legs on being placed in a strange plaster nest (she had previously been in a glass one containing earth). These movements soon stopped, however, when another virgin female was placed in the nest with her about one minute later.

I know of no previous records or accounts of similar behaviour in ants.

Distribution of Lugworms

ON the muddy sand of the Whitstable flats the casts made by the large population of *Arenicola marina* L. do not appear to be distributed in random manner at all times of the year. During the summer months there are straight lines, a foot or two wide, along which the casts, and very probably the worms, are more numerous than they are on the adjacent parts of the shore. There is no mistaking these lines, which appear clearly in photographs of the shore. They may be a hundred yards long and are apparently arranged in all directions, being neither all parallel with, nor all at right angles to, high or low tide marks.

We have been unable satisfactorily to account for this grouping; but a few preliminary tests suggest that the layer of soil worked by the worms and which overlies the clay substratum is deeper along the lines than on either side of them. We have not yet been able to discover what is the cause of the difference in soil depth.

We should be very interested to hear if this grouping phenomenon has been noticed on other *Arenicola* shores and we should be grateful if anyone who has observed it would write to us, especially if he has any explanation to offer.

Life-History of *Splachnidium rugosum*

THE peculiar brown alga, *Splachnidium rugosum*, has been a subject for investigation on a number of occasions. Early workers considered that it should be classed with either the Laminariales or the Fucales. In 1920, Skottsberg[1] pointed out that the resemblances to those orders were more apparent than real and that its proper position should be near to the Chordariaceæ. Skottsberg went on to suggest that there should be a sexual generation, as he considered the commonly known plant to be asexual, reproducing by zoospores from sporangia borne in the conceptacles.

I have spent some time investigating the life-history of this alga, and I can now confirm Skottsberg's suggestions. The sporangia, which are unilocular, give rise to numerous swarmers which do not fuse and must therefore be zoospores. These swarmers settle down and germinate to give a dwarf, microscopic, branched, filamentous thallus so characteristic of many members of the Ectocarpales and allied orders. This thallus, which is presumably the gametophyte, has been maintained in culture now for more than a year: so far, however, no gametangia have been produced.

The account will be published later in full elsewhere. I wish to express thanks to Prof. V. J. Chapman for his advice during the course of this investigation.

A Method of Distinguishing between Young and Old Colorado Beetles

PREVIOUS records do not appear to give any indication of how to distinguish between young and old Colorado beetles, except during the first few days following the emergence of the young beetle. I have found evidence that it is possible to separate young and old beetles for a period of at least fourteen days after the emergence of the young adult by means of colour changes in the membranous wings. This fact is of considerable practical importance and assistance to entomologists, especially in countries where the beetle has not yet become an endemic pest.

Trouvelot states (private communication, 1946) that it is only possible to distinguish between young and old beetles for several days after emergence, (1) by the fact that the chitinous integuments remain soft for the first two to three days, after which they become hard like those of the mature beetle, and (2) by the fact that the yellow colour of the elytra takes several days to reach that bright hue so characteristic of the mature adult.

In looking for a more satisfactory method whereby young and old beetles could be separated for a longer period of time, I found the colour difference between the membranous wings of the freshly emerged and mature beetles was very marked, and appeared to remain distinguishable, although to a decreasing extent, for approximately fourteen days.

The membranous wings of the fresh emergent are transparent and devoid of colour, while those of the mature beetle are red except for the apex and anal border of the wing. The wings remain colourless for at least four to five days after emergence, and afterwards develop a pink colour which gradually deepens and diffuses over the greater part of the wing surface, especially along either side of the nervures, until the pink colour has given place to a distinct red hue. On an average it takes fourteen to twenty days for the colour intensity to equal that of the mature beetle. This colour change is probably due to the carotene absorbed by the beetle when it commences to feed. Therefore the period taken for the wing to reach the maximum colour intensity will vary within certain limits, according to the temperature and intensity of feeding.

It is hoped to publish fuller details of these findings at some future date.

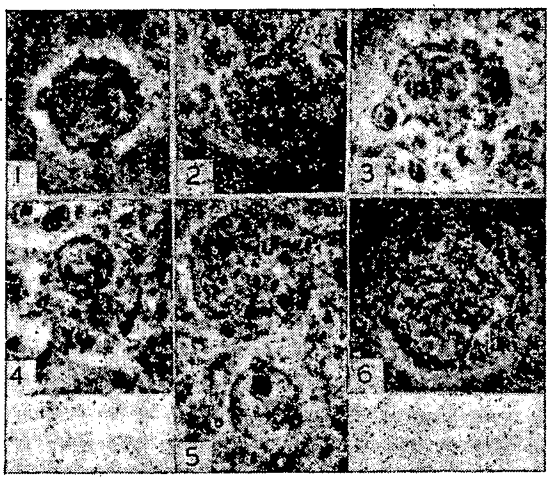
GOLGI APPARATUS OF LIVING HUMAN TESTICULAR CELLS SEEN WITH PHASE-CONTRAST MICROSCOPY

By A. G. OETTLÉ
Medical School, University of the Witwatersrand, Johannesburg

It was pointed out previously that in the unstained living human spermatid the Golgi apparatus is sometimes discernible with bright-ground illumination, as an area slightly differing in refractive index from the remainder of the cytoplasm[1]. Recently, I have been able to confirm and extend these observations with the phase-contrast microscope. This instrument was of the phase-accelerating or positive type, so that dark and light regions in the image indicated higher and lower refractive indices, as a rule.



FIGS. 1–6 ARE UNRETOUCHED PHOTOMICROGRAMS OF LIVING HUMAN TESTICULAR CELLS TAKEN WITH A COOKE PHASE-CONTRAST SYSTEM, OBJECTIVE N.A. 1·30, MAGNIFICATION × 1,000, KODAK CONTRAST PROCESS ORTHO FILM. TRACINGS OF THESE FIGURES ARE GIVEN ON THE RIGHT AND INDICATE IN ADDITION STRUCTURES REVEALED BY CHANGE OF FOCUS

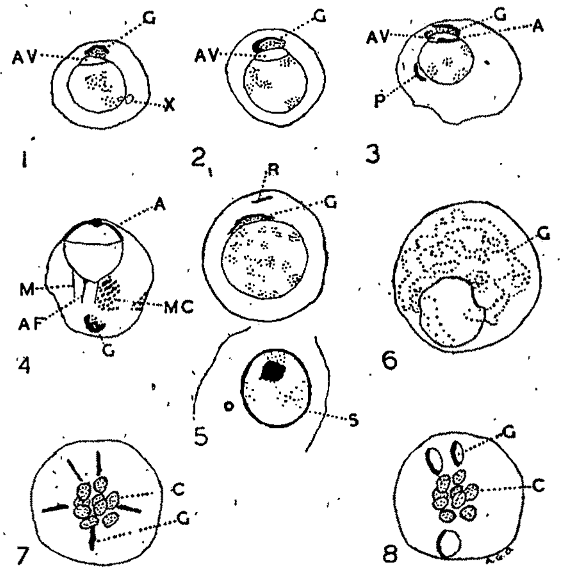
Figs. 1–4. Spermatids. Fig. 5. Primary spermatocyte and Sertoli cell. Fig. 6. Interstitial cell

Fresh testicular tissue was obtained from a European aged twenty-nine, at operation, and three Bantu, two aged twenty-eight and one aged twenty-three, less than half an hour after sudden and violent death. The biopsy specimen was preserved in plasma and also in Ringer–Locke solution, and the post-mortem material in pericardial fluid. Examination of the teased cells began within two or three hours after removal and extended over a period of ten hours.

In the earliest spermatids (Figs. 1 and 2), with phase-contrast microscopy, the acrosomal vacuole appears as a clear hemispherical space, slightly indenting the nuclear membrane. External to this lies a smaller dark hemisphere composed of a darker cortex and a lighter medulla. In some spermatids this cortex forms a continuous rind; in others it is interrupted and seems to consist of separate segments (Fig. 3). In older spermatids, the acrosomal granule and acrosomal cap can be seen within the acrosomal vacuole (Fig. 3). This vacuole gradually diminishes in size and, simultaneously, the dark bilaminar hemisphere comes to lie on its margin. In still later stages (Fig. 4), the acrosomal vacuole can no longer be seen, and the dark body, still composed of cortex and medulla, can be found lying free in the cytoplasm caudal to the nucleus, outside the area enclosed by the manchette.

Near the posterior region of the nucleus of the early spermatids, another dark cytoplasmic body is often evident (Fig. 3). This is probably identical with the postnuclear body. It has roughly the same size as the bilaminar structure already described, but it may be differentiated from it by its situation and the absence of two distinct zones.

It is relatively certain that the dark bilaminar body described in the spermatid is identical with the structure usually regarded as the Golgi apparatus in fixed tissue impregnated with silver or osmium tetroxide[2]. The body seen in living spermatids resembles the Golgi apparatus of impregnated spermatids in size, situation and behaviour, and such morphological differences as may be observed can quite easily be explained by known effects of impregnation[3].



FIGS. 7 AND 8 ARE DRAWINGS OF A SINGLE DIVIDING PRIMARY SPERMATOCYTE. FIG. 8 WAS DRAWN FOUR HOURS AFTER FIG. 7. *A*, acrosome and acrosomal granule; *AF*, axial filament; *AV*, acrosomal vacuole; *C*, chromosomes; *G*, structures presumed to be identical with the Golgi apparatus; *M*, manchette; *MC*, mitochondria; *P*, presumed to be the post-nuclear body; *R*, rodlet; *S*, Sertoli cell; *X*, artefact, an extra-focal image of an extracellular granule

In testicular cells other than spermatids definition of the Golgi apparatus is difficult, since in these cell types it presents fewer distinctive characteristics. A Golgi element was not recognized in the few secondary spermatocytes examined, nor in cells undergoing second meiotic division. Near the nuclear membrane in primary spermatocytes (Fig. 5) a dark crescentic structure was observed, in which a dark cortex and thin inner medulla could sometimes be distinguished. In addition, a single straight rodlet was often visible in the cytoplasm. This rodlet may be an isolated dictyosome. In several cells undergoing the first meiotic division a number of similar rodlets were observed, lying outside the spindle area, quite distinct from the chromosomes. In one cell in Ringer–Locke solution these rodlets were first observed at the sixth hour after removal (Fig. 7). Four hours later the cell was found to contain several lenticular vacuoles, each bearing a distinctly curved rodlet on one side (Fig. 8), very like dictyosomes. It is not certain that these are Golgi bodies, but they were quite unlike astral rays or mitochondria.

In the unstained spermatogonium the Golgi apparatus could not be satisfactorily distinguished from mitochondria, though occasionally a crescentic body like that of the primary spermatocyte was present. The Golgi element was not observed in living Sertoli cells.

In interstitial cells there was no evidence of a dark Golgi element; but a 'canalicular' network ramified through the cytoplasm (Fig. 6). This network is larger than the Golgi apparatus of impregnated interstitial cells, but has a remarkable similarity to the 'negative Golgi' which sometimes is produced in silver impregnations.

We may conclude, therefore, that with phase-contrast microscopy, in living testicular cells, structures are revealed which resemble the Golgi apparatus of impregnated cells. It would seem that no constant structure can be assigned to the Golgi element: it may appear as straight or curved rodlets, bilaminar crescents, or as a reticulum, depending on cell type.

Finally, it must be remembered that, invaluable as the phase-contrast method is in the study of living cells, interpretation of appearances will require experience and understanding, since spurious images are common (Fig. 1).

I am indebted to Dr. Jonathan Gluckman for the loan of the Cooke phase-contrast microscope used in these studies.

PERMEABILITY OF THE MEMBRANES OF THE HEN'S EGG

By Prof. N. KLISSIUNIS

Biochemical Section, School of Hygiene, Athens

Permeability to electrolytes. Under normal conditions the membranes of plant cells are impermeable to electrolytes. But under abnormal conditions (transfer to solutions of pure electrolytes) the electrolytes can pass through (deplasmolysis). In this connexion, if one compares solutions of different electrolytes, one can observe that they follow the Hofmeister series. The series in which the hypotonic solution of electrolytes can cause hæmolysis of the red corpuscles is the same as the Hofmeister series. We have examined these conditions, using hen's egg membranes. According to the experiments of A. Orru[1], the permeability of the vitelline membrane to water was influenced by hydrogen and hydroxyl ions and by the presence of different electrolytes, and that complex ions can pass through as well.

We have examined fresh hen's eggs only a few hours old. In order to establish the permeability of the vitelline membrane to different neutral potassium salts, iso-osmotic solutions were prepared from potassium oxalate, phosphate, sulphate, chloride, bromide, iodide and thiocyanate at − 1·45° C. of an approximate strength of 0·4/mol. The yolk of the egg, contained within an unbroken membrane, was placed in a flask and washed thoroughly with distilled water. 115 ml. were used to form the iso-osmotic solution for each experiment.

At the beginning of each experiment 15 ml. of the solution were extracted from the bottle for the examination of the content in anions of the salt. The bottle was kept throughout in a refrigerator at + 6° C. 5 ml. were taken from the bottle at forty-eight hours and after four days to determine if any fixation of anions had taken place through the yolk. By subtracting the values, which were found after forty-eight hours and four days, from the values of anion obtained at the beginning of the experiment, we could calculate the quantity fixed through the yolk. Also we found that albumin emerges from the yolk when this is in an electrolyte solution. This quantity of albumin was determined in the outer solution. To each 5 ml. of samples that were taken out of the flask, 1 ml. of 20 per cent trichloracetic acid was added. The filtered albumin precipitate was washed until the filtrate showed no detectable traces of the anion under test. The albumin precipitate was then dried at 105° C. and weighed. The determination of chloride, bromide, iodide and thiocyanate in the filtrate was carried out by precipitation methods. The sulphate was determined by the benzidine method, the oxalate through the oxidation method. For examination of permeability outwards the yolk was placed in 100 ml. of distilled water. The flask was also kept at a temperature of + 6° C. The chemical examination of the outer liquid after one, two and twenty-four hours has proved that the albumin reaction with sulphosalicylic acid and the reaction for chloride with silver nitrate was positive and had become far more positive twenty-four hours afterwards. For examination of the permeability of the cuticle we filled the shell with 20 ml. of a cold saturated solution of potassium ferrocyanide and we placed this shell in a cold saturated ferri-ammonium sulphate solution.

The volume of the yolk was increased in the iodide, thiocyanate and oxalate solution. Sometimes a bubble developed full of the liquid in the upper pole of the yolk and the yellow substance was repelled. The outside solution became either yellow or remained clear. The vitelline membrane after remaining for eight days in the potassium iodide solution became harder and split with difficulty. The internal substance became much more viscous. The fixation of anions in the yolk followed the Hofmeister series. The iodides were more fixed than their place in the Hofmeister series would allow. The oxalates were also more fixed, perhaps by damage of the membrane caused by calcium precipitation (see accompanying table). The diffusion of potassium ferrocyanide through the cuticle placed in a ferri-ammonium sulphate solution led to the formation of Prussian blue spots corresponding to the outer exits of the air tubes of the cuticle.

Anion	Anion fixed gm. % ml. 48 hours	Anion fixed gm. % ml. after 4 days	Albumin gm. % ml. 4 days
Oxal.	0·35	0·42	3·0
SO_4	0·04	0·12	0·49
PO_4		0·11	1·34
Cl	0	0·06	0·19
B_2	0·08	0·13	0·14
I	0·25	0·22	0·33
SCN	0·07	0·11	0·99

Permeability to electrolytes in the presence of narcotics. In these experiments, which were made chiefly with potassium iodide, the same materials and methods were used as in the above, the only difference being that the outer solution instead of being pure salt solution was saturated with a narcotic. If we compare the above results with the pure potassium iodide solution and those with the same solution saturated with a narcotic, under the above-mentioned experimental conditions, we do not find significant differences in the fixation of iodine through the vitelline membrane. The differences found are within the range of the individual variations in the permeability of the vitelline membrane of different eggs. In the case of the albumin, in some of the above experiments but not in all, more of it was found in the outer solution than in an experiment with a pure water solution of the salt.

Thanks are due to Prof. Joachimoglu for advice during these investigations.

EXCAVATIONS OF A ROMAN HOUSE

DR. FELIX OSWALD has now carried further the story of his years of excavation at Margidunum*. So little remained of the buildings of the first-century camp after the Roman demolitions in Hadrian's reign that at first the excavator seemed faced with a hopeless task; but by the painstaking investigation of every foot of the area concerned, down to the level of the undisturbed subsoil, the greater part of the plan of a building identified as the Commandant's House was revealed. Unfortunately, the eastern rooms of this house lie beneath the Fosse Way, which crosses the centre of the camp at this point, and possibly a hypocaust may lie buried here, as none was found elsewhere.

The usual sequence of two buildings, one of timber and one of stone, was found, the first dating from the time of the foundation of the camp by Ostorius Scapula in A.D. 48, and destroyed during the Boudiccan rebellion, and the second erected, after the lapse of a few years, during the reign of Vespasian or Titus, and remaining in use until the end of the occupation of the camp. The surviving post-holes were too few for the plan of the timber building to be recovered, but the plan of the later house is of a type allied to that of houses known from other forts, and several of the plans of these are illustrated, drawn to the same scale for purposes of comparison. Stables may have existed to the north of the house, and an interesting feature is a pit contemporary with the timber building, which in view of a parallel at Hofheim, the excavator thinks may have been used for preserving oysters in salt water.

The major part of the report is devoted to the description, discussion and illustration of the pottery found on the site. The Terra Sigillata showed no very unusual features; but among the coarse wares of the earliest phase (Claudius–Nero), a large store-jar with an impressed stamp of three stars above two rosettes on its lower half was an unusual discovery, and it is suggested that this may indicate a measure of quantity. The coarse ware of the succeeding phases shows considerable development, and includes frequent imitations of Terra Sigillata forms. Evidence was also found showing that some of the pottery of Vespasianic date was made at the Castor potteries. Any discoveries which help to tie down the dating of the products of these potteries are of particular interest owing to their increasingly wide-spread distribution. Altogether this report makes important additions to the mass of valuable comparative material with which Dr. Oswald has already provided us.

* The Commandant's House at Margidunum. By Dr. Felix Oswald. Pp. 41 (17 plates). (University College, Nottingham, 1948.) 7s. 6d.

SOUTH-EASTERN UNION OF SCIENTIFIC SOCIETIES

ANNUAL CONGRESS, 1948

AT the invitation of the Mayor and the Corporation of Great Yarmouth, and with the co-operation of the Great Yarmouth Naturalists' Society, the South-Eastern Union of Scientific Societies held its fifty-third annual congress during June 14–19 at Great Yarmouth, under the presidency of Mrs. Jacquetta Hawkes. The Mayor, in his welcome to the Congress at the Town Hall, where accommodation was provided for meetings by the Corporation, said that those who were not versed in 'old buildings' could not appreciate the beauty of them, and that societies such as he was addressing opened the eyes to the reasons why such old buildings as those on the South Quay at Yarmouth should be preserved. Capt. Dannreuther inducted the president, and congratulated her upon being the first lady to hold the office since the foundation of the Union more than fifty years ago.

Mrs. Hawkes, in delivering her address upon "Archæology and the Present", said that two world wars had disturbed the faith in the certainty of progress in a way resembling the questioning of the story of Genesis by the theory of evolution. She believed that archæology provides a sense of comfort by comparisons, such as life in a palæolithic cave with life at Versailles or the compositions of Beethoven. The popularity of the subject is perhaps due to the solace obtained from the study of the solidity of the past compared with the flimsiness of the present and the uncertainty of the future. An education based on classical studies has been a great force in Britain, and it is of utmost importance to salve what is valuable and to adapt it to the changing conditions. Archæology can play its part by saving classical studies from exclusiveness and isolation. It can add intimacy and humanity to the classics to make them acceptable to a greater number.

Mrs. Hawkes said she believes that if the archæological method, in the widest sense of the study of material things through all the periods, can become an accepted part of teaching, the distaste of people of all classes for vulgar architecture and badly designed utensils would lead to an improvement of our environment and thus to the general betterment of all. Archæology could display a vast array of cultures which would help us to decide how to search for new values and to teach us that mechanical gadgets are not essential to the fulfilment of valuable lives.

The Archæological Section of the Union was addressed by its president, Lieut.-Colonel S. E. Glendenning, on "Local Materials and Craftsmanship in Norfolk Buildings", and a paper on "Roman Britain as seen in the Yarmouth Neighbourhood" was read by Mr. P. E. Rumbelow, who also conducted an excursion to the Roman Station at Burgh Castle. Mr. H. J. Howard delivered the presidential address to the Botanical Section on "The Mycetozoa of Sanddunes and Marshland", and Mr. F. O. Whitaker's paper on "The Botany of the Cromer Forest Bed" was read. Joint excursions, with the Zoological Section, were conducted to Fritton Lake, Wheatfen Broad and Norwich.

The Geological Section elected Mr. C. D. Ovey as president, and his address was upon "Foraminifera in Stratigraphy with special reference to the Ecology of Living Forms". A paper was read on "The Geological and Archæological Problems of the Red Crag" by Mr. S. Hazzledine Warren, and Mr. J. E. Sainty gave a paper upon "The Geology of Norfolk". He also arranged and conducted successful excursions to the Norwich and Cromer areas in illustration of his views upon the formation of the district.

The Zoological Section's presidential address was given by Major Maxwell Knight on "The Study of Bird Pellets as a Subject of Interest and Instruction to Amateur Naturalists". A paper was read by Dr. Malcolm Smith on "Some Undetermined Points in the Life-Histories of the British Reptiles".

An evening conversazione was arranged by the Great Yarmouth, Lowestoft and Norwich Naturalists' Societies. A very successful Young Naturalists' evening was held at the Town Hall. Coloured Nature films, specially taken at the London Zoo by Mr. Douglas Fisher, were exhibited. The commentary on the first two, dealing with snakes, lizards, newts, frogs and toads, was given by Dr. Malcolm Smith, and that on the third, concerning the behaviour of the tarsier, was given by Major Maxwell Knight. The remainder of the evening was devoted to a naturalists' brains trust, the arrangements for which were in the capable hands of Major Maxwell Knight, who also acted as question master. His 'brains' were: Capt. T. Dannreuther, Mr. E. A. Ellis, Mr. David Seth-Smith and Dr. Malcolm Smith. Questions were selected from those sent in by schools in the area, a request having been made that they should be debatable rather than factual. Although admission was limited by the issue of tickets, more than a hundred additional young people got into the hall, which, besides giving encouragement to the organisers, should also give hope to those whose theme is the rejuvenation of the local natural history societies. The question master suggested to the delegates present that each of the seventy societies affiliated to the Union might, with advantage, arrange similar evenings.

After the general assembly, the discussion on "The Functions and Organisation of Local Societies", in continuation of that initiated by the British Association, was opened by Mr. G. Gosnell.

The next congress of the Union will be held at Canterbury during Easter 1949.

SMITHSONIAN INSTITUTION

ANNUAL REPORT

THE report of the Secretary of the Smithsonian Institution, Washington, D.C., for the year ended June 30, 1947, which includes reports on the newly established National Air Museum and on the Canal Zone Biological Area, recently placed under the administration of the Institution, records the resumption and, in some directions, expansion of much of the normal research and field-work suspended during the War. Accessions to the National Museum are back to pre-war levels, and the International Exchange Service has considerably reduced the accumulation of material for foreign exchange built up during the war years, and the service will soon be again on a current basis. The two greatest needs of the Institution are additional staff and more building space.

Under the Canal Zone Biological Area Advisory Board, a wide range of studies and tests has been carried out under tropical conditions. Those in progress include an extensive organisation for testing the proofing of wood to termites, the tropical deterioration of plywoods, textiles, and packaging containers, and the effect of fungi on optical glass. Some four hundred publications have been issued on research carried on here in entomology, forestry and medicine with special reference to the control of termites, fruit flies and mosquitoes.

Appended to the secretary's report is the Financial Report of the Executive Committee of the Board of Regents, as well as separate reports on the National Museum, the National Gallery of Art, the National Collection of Fine Arts, the Freer Gallery of Art, the Bureau of American Ethnology, the International Exchange Service, the National Zoological Park, the Astrophysical Laboratory, the National Air Museum, the Canal Zone Advisory Board, the library and publications.

The report from the National Museum refers to the resumption of investigations of fifteenth-century historic Indian village sites and some of the early Spanish settlements in the West Indies, to the continuation of the survey of the fishery resources of Guatemala, a botanical survey of St. Vincent, and to field work on the lower cryptogams as part of a biological survey of the Patuxent Research Refuge. Systematic researches under the Bureau of American Ethnology recorded during the year include the River Basin Surveys, aimed at recovering such archæological and palæontological information and materials as will be lost through the construction of dams and creation of large reservoirs in many of the river valleys of the United States. Papers prepared for publication deal with the State names of Mexico, the province names of Canada, and the detailed ethnographical description of the projecting rocks and islands off the coast of California, while a bibliographic project has been initiated having as objective the compilation of an annotated, fully indexed bibliography covering the descriptive, geographical and other scientific literature on the Arctic from the earliest historical writings to those of the present time. A roster of Arctic specialists is also being compiled which will afford a comprehensive record of the experience and specialized knowledge of scientific men, explorers, writers, and Arctic residents who possess first-hand information of value concerning the Arctic and sub-Arctic regions. A joint expedition with the National Geographic Society made an archæological survey of the Pacific coast of the State of Chiapas, Mexico, and the Viru Valley Expedition, attempted to survey thoroughly a single valley of the Peruvian coast as a living unit through some three thousand years, including archæological, geographical and modern community studies.

The report on the National Zoological Park, in addition to listing accessions during the year, gives a complete list of animals in the Park at June 30,

1947. At the Astrophysical Laboratory, the Division of Astrophysical Research has been concerned mainly with appraising the solar-constant values received from its field stations and planning and developing improvements in instruments and methods. Eighteen months of continuous measurement of sun and sky radiation have been completed at Camp Lee, Virginia, and the work is being extended to include measurements and exposures at a wet, sea-level and a dry, high-altitude station. The Division of Radiation and Organisms was concerned with the role of light, especially the wave-length effects on the fixation of carbon by green plants, and with the mechanism of dormancy in seeds sensitive to light and the study of the developmental physiology of grass seedlings. A critical review of the literature dealing with the germination of lettuce seed is in preparation, and studies are in progress on the identification of volatile substances responsible for inhibiting the germination of several species of seeds.

The report on publications lists the titles of twenty-six papers in the Smithsonian Miscellaneous Collection, twenty-two in the general appendix to the Smithsonian Annual Report, and three bulletins from the National Museum.

FORTHCOMING EVENTS

(*Meeting marked with an asterisk * is open to the public*)

Monday, July 12—Saturday, July 17

SOCIETY OF CHEMICAL INDUSTRY (at the Assembly Rooms, George Street, Edinburgh).—Annual General Meeting.

Wednesday, July 14

At 9.45 a.m.—Sir John Anderson, F.R.S.: "Science in relation to the Public Services".

Thursday, July 15

At 9.45 a.m.—Sir Robert Robinson, F.R.S.: "The Device of Imitation of Molecules in the Biological Field" (Lister Memorial Lecture).

Wednesday, July 14

ASSOCIATION OF OPTICAL PRACTITIONERS (at the London School of Hygiene and Tropical Medicine, Keppel Street, London, W.C.1), at 2 p.m.—Dr. Matthew Luckiesh: "Factors Concerned in Vision, Light and Seeing".*

Wednesday, July 14—Friday, July 16

PHYSICAL SOCIETY, ACOUSTICS GROUP (joint meeting with the ROYAL INSTITUTE OF BRITISH ARCHITECTS, at 66 Portland Place, London, W.1), at 10 a.m. and 2.30 p.m. each day—International Conference on "Noise and Sound Transmission".

Wednesday, July 14

At 10 a.m. and 2.15 p.m.—"Sound Transmission".

Thursday, July 15

At 10 a.m.—Papers of Architectural Interest.

Friday, July 16

At 10 a.m.—"Measurement of Noise and Vibration"; at 2.30 p.m.—"Applied Acoustics".

Saturday, July 17

NUTRITION SOCIETY (in the Barnes Hall, Royal Society of Medicine, 1 Wimpole Street, London, W.1), at 10.30 a.m.—Conference on "The Nutrition of Athletes".

APPOINTMENTS VACANT

APPLICATIONS are invited for the following appointments on or before the dates mentioned:

LECTURER IN PHYSIOLOGY (Grade I or II)—The Secretary and Registrar, The University, Bristol (July 17).

ASSISTANT LECTURER (Grade III) IN THE DEPARTMENT OF PHYSICS—The Registrar, The University, Liverpool (July 17).

UNIVERSITY LECTURER IN BOTANY, to lecture on Mycology or Mycological Plant Pathology—The Secretary, Faculty of Biology "A", Department of Zoology, Downing Street, Cambridge (July 17).

LECTURER IN PHARMACOLOGY—The Registrar, The University, Leeds 2 (July 17).

CHEMIST or PHYSICIST for testing of refractories, a PHYSICIST for physical work connected with gasworks practice, a CHEMIST or PHYSICIST for abstracting, collating and reporting from technical literature, and a CHEMIST to join research staff dealing with problems connected with gas manufacture—The General Manager and Secretary, City of Birmingham Gas Department, The Council House, Birmingham 3 (July 19).

LECTURER IN SURVEYING for Department of Civil Engineering—The Secretary; University College, Gower Street, London, W.C.1 (July 23).

SENIOR LECTURER IN MATHEMATICS in the Department of Aerodynamics—The Registrar, The College of Aeronautics, Cranfield Bletchley, Bucks, marked 'Senior Lecturer in Mathematics' (July 24)

LECTURER IN BIOCHEMISTRY for the Department of Physiology—The Secretary, Royal (Dick) Veterinary College, Summerhall, Edinburgh 9 (July 26).

SENIOR LECTURER or LECTURER IN BOTANY for the University o Melbourne—The Secretary, Universities Bureau of the British Empire 8 Park Street, London, W.1 (July 31).

PROFESSOR OF BOTANY at Rhodes University College, Grahamstown, South Africa—The Secretary, Universities Bureau of the Britis Empire, 8 Park Street, London, W.1 (July 31).

ASSISTANT DIRECTOR OF RESEARCH with practical experience o computation to work in the Mathematical Laboratory, and a UNIVERSITY DEMONSTRATOR whose primary interest is statistics—The Secretary to the Appointments Committee, Trinity College, Cambridg (July 31).

SENIOR LECTURER or LECTURER IN ANATOMY (Histology)—Th Registrar, The University, Sheffield (July 31).

KEEPER OF ANTIQUITIES—The Director, Museum and Art Gallery New Walk, Leicester (August 30).

CHAIR OF APPLIED MATHEMATICS—The Registrar, Universit College, Southampton (September 20).

AGRICULTURAL EDUCATION ADVISER—The Secretary for Education County Buildings, Shrewsbury.

ASSISTANT LECTURER and DEMONSTRATOR IN THE PHYSIOLOGY DEPARTMENT—The Secretary, King's College of Household and Socia Science, Campden Hill Road, London, W.8.

CURATOR at the Municipal Museum—The Town Clerk, Town Hall Tunbridge Wells, Kent.

LABORATORY STEWARD at the College, Swindon—The Boroug Education Officer, Education Office, Civic Offices, Swindon, Wilts.

LECTURER IN BIOLOGY—The Clerk to the Governors, South-Eas Essex Technical College and School of Art, Longbridge Road, Dagenham, Essex.

LECTURER IN BIOLOGY in the Senior Technical College—The Principal, Technical College, Luton, Beds.

LECTURER IN CHEMISTRY for Science Department, Municipa Technical College—The Director of Education, Education Offic St. Helens, Lancs.

LECTURER IN MATHEMATICS (male)—The Principal, Acton Technical College, High Street, Acton, London, W.3.

METALLURGIST to take part in investigations on casting of ingot and on ingot mould design and performance—The Personnel Office British Iron and Steel Research Association, 11 Park Lane, Londo W.1.

METEOROLOGICAL FORECASTERS for the East African and We African Meteorological Services—The Director of Recruitment (Coloni Service), 15 Victoria Street, London, S.W.1.

PHYSICIST or CHEMIST to undertake research on adhesional an related properties of rubber, and a PHYSICAL CHEMIST to undertak research on latex—The Research Association of British Rubber Manufacturers, 105 Lansdowne Road, Croydon, Surrey.

RESEARCH FELLOWSHIPS (2) IN EDUCATION, within the Institut of Education—The Secretary, The University, Edmund Stree Birmingham 3.

SENIOR ASSISTANT IN THE ENGINEERING DEPARTMENT, Coun Technical College, Wednesbury—The Director of Education (Dep F.E.), County Education Offices, Stafford.

SENIOR LECTURER in component and detail STRESSING OF AIRCRAFT STRUCTURES in the Department of Aircraft Design—T Registrar, The College of Aeronautics, Cranfield, Bletchley, Buck marked 'Senior Lecturer in Aircraft Stressing'.

TECHNICIAN FOR THE DEPARTMENT OF PHYSIOLOGY AND PHARMA COLOGY—The Secretary, St. Mary's Hospital Medical School, Paddin ton, London, W.2.

TIMBER MARKETING OFFICER by Government of Nigeria, Commer and Industries Department—Crown Agents for the Colonies, 4 Mil bank, London, S.W.1, quoting M/N/17860/3E.

LECTURER IN CHEMISTRY and a LECTURER IN PHYSICS—The Pri cipal, County Technical College, St. James's Road, Kingston-upo Thames, Surrey.

LECTURER IN CIVIL ENGINEERING—The Director, Robert Gordon Technical College, Aberdeen.

LECTURER IN MATHEMATICS and a LECTURER IN CHEMISTRY f Municipal Technical College—The Director of Education, Educati Offices, Library Street, Blackburn.

LECTURER IN MECHANICAL ENGINEERING—The Principal, Hand worth Technical College, Golds Hill Road, Handsworth, Birmingha 21.

LECTURER IN MECHANICAL ENGINEERING—The Principal, Technic College, Queen Street South, Huddersfield.

LECTURER IN PHYSICS—The Principal, Birmingham Central Tec nical College, Suffolk Street, Birmingham 1.

LECTURER IN PHYSICS—The Clerk to the Governors, Chelsea Pol technic, London, S.W.3.

SENIOR ASSISTANT LECTURER IN THE DEPARTMENT OF MECHANIC ENGINEERING—The Principal, Borough Polytechnic, Borough Roa London, S.E.1.

ABBREVIATIONS

In one of those fanciful stories for children included in the "Just So Stories", Rudyard Kipling takes us in imagination back to Neolithic times and describes how an alphabet might have been devised. A stranger came upon a man and his small daughter, and the little girl thought she could send a message back to her mother by the stranger. Her message consisted of 'pictures' scratched on birch bark, but unhappily the pictures were completely misunderstood, with sad consequences for the stranger. As a result of this misadventure, the little girl started to draw signs to represent sounds, and in a short time with the help of her father produced an alphabet —it may seem curious that this alphabet should consist of the very letters used in modern English, but any other would clearly be pointless in a child's story written in English. Kipling must have realized when he wrote these two fascinating little stories, one showing the inadequacy of the picture language, and the other purporting to describe the origins of writing, the natural attraction of signs and symbols for children. The simplicity of the symbol in contrast with the complexity of a pictorial representation for conveying a message has always attracted children, and in these stories he gives the child struggling with the alphabet something tangible on which to base the written characters it is trying to recognize and reproduce.

The primary difficulties of spelling and writing simple words are normally overcome at an early age, and then comes a phase when they are used in play. 'Secret messages' become a feature of games, which very soon develop into the construction of simple codes, with all the delights of conveying information from one to another without their elders' understanding. The obvious development in the world of adults is the preparation and use of more elaborate codes for various purposes. Mention must also be made here of the anagrams adopted by the alchemists and other natural philosophers for concealing their results from all but the initiated. With the growth of knowledge the use of anagrams died out ; but what are we to make of the tendency in much modern scientific and other writing to sprinkle the page with symbols and abbreviations ? Has the pendulum swung back again ?

Going back to the child's delight in the use of 'secret messages', it is worth while recalling the pleasure with which many have learned the recognized symbols of the chemical elements, and delighted in their use with algebraic symbols to formulate chemical equations describing chemical reactions—alas, at first, many reactions which could never take place in man's chemical laboratories. But with this use of symbols came the warning of the careful teacher, that the symbols had a quantitative meaning, and while they might pass as abbreviations in private notes, they must not be used in writing up descriptive accounts of chemical work. With the progress of chemistry, and particularly of organic chemistry, it became extremely useful to denote certain definite groups of elements which pass from compound to compound apparently as units with special symbols; thus in addition to the symbols of the elements, we have 'Me' to represent the methyl group or radical, 'Ph' the phenyl group, and so on. Nevertheless, it was unusual to find such abbreviations in the text of chemical books and papers. Even more complicated substances are now being identified, particularly in the field of biochemistry, and with each new compound the urge to find and use abbreviations seems to grow. Adenosine triphosphate soon became 'ATP'; then there was 'ADP' (adenosine diphosphate); many others will come to mind. No one can blame workers in the rush of discovery jotting down abbreviations in their own notes, or even using them in writing down a reaction in symbols. But should they be used in the text of a paper? The symbols of the elements are internationally recognized, but many of these new groups of letters represent merely the initial letters of the English names of parts of a compound. Can it be accepted that such names will receive international approval, even if the constitution indicated be not disputed?

This use of symbols as abbreviations is, however, going further than the naming of compounds. Authors sometimes adopt their own abbreviation for a substance and seem to think that because they have defined it once at the beginning of a paper, they can then use it freely—and sometimes they do so without even the formality of a preliminary definition; we have seen in a communication submitted as a "Letter to the Editors" the symbol 'F', which on careful study was found to signify 'formaldehyde'. Another tendency is to use symbols as nouns, with the result that we find such phrases as 'an R_u of higher value'; the use of *p*H as a noun is perhaps sanctioned by long usage. It is apparently overlooked that very often a pronoun could adequately be used in place of the abbreviation. Attention to such matters might go some way towards meeting recent criticisms that scientific workers are unable to write intelligible English.

It must not be thought that chemists are the only offenders. Physicists have for many years used E.M.F., A.C., D.C., and more recently we have had 'h.f.' for 'high frequency' and 'r.f.' for 'radio frequency'; and there are symbols common to all the physical sciences such as N.T.P. and the various abbreviations, most of them well known and widely accepted, for weights and measures. But there does not seem to be the same urge to devise new abbreviations in this field.

The practice of using initial letters instead of the full names has come into increasing use in daily life during recent years. It is difficult to suggest where it started, though perhaps the Services must take a share in the blame; its placarding of camps with notice-boards having perhaps up to half a dozen letters indicating the whereabouts of officials whose functions were thereby indicated must have initiated many a recruit into the habit. Indeed, it became a point of honour to be able to talk to one's fellows in these 'letter' terms—whether this was a return to the secret-message game or due to the need for brevity need not be discussed. The names of institutions and bodies in civilian life have been similarly treated. We need only mention the Association of Special Libraries and Information Bureaux, widely known as 'ASLIB', or the Universities Federation for Animal Welfare, which is reduced to 'UFAW'. The ugly appearance of a succession of capital letters in a line of printed text is apparent, and possibly for this reason the tendency has been to use an initial capital letter only; the abbreviation then becomes a word, but not an elegant one in appearance or sound. The Department of Scientific and Industrial Research and the National Physical Laboratory are perhaps fortunate in that the initial letters do not form pronounceable words. The examples quoted are, of course, British, but equally curious names have been invented in other countries.

In the international field the same tendency has been apparent. The United Nations Organisation quickly became 'UNO' and then 'Uno'; the United Nations Relief and Rehabilitation Administration became 'UNRRA' and 'Unrra'. The United Nations Educational, Scientific and Cultural Organisation has become 'Unesco'. Now we have the World Health Organisation, which is heading its publications 'WHO'. The Students International Clinical Congress now in session in London, Oxford and Birmingham opens a descriptive programme with an article entitled "A welcome to SICC delegates"!

The examples, from many fields of activity, could easily be multiplied. What is the remedy? Or, perhaps, what can be done to check the appearance in various languages of artificial words, which usually happen to be ugly in appearance and uncouth in sound? Words which have already passed into general use will no doubt stand or fall by virtue of their suitability to express a particular function or object. In devising titles of new institutions or bodies, however, consideration should be given to the possibility that initial letters may be used in abbreviation, and suitable steps taken. It should not be beyond the wit of man to provide titles which are conveniently short or capable of reasonable abbreviation.

THE ART OF WRITING

The Alphabet

A Key to the History of Mankind. By Dr. David Diringer. Pp. 607. (London: Hutchinson's Scientific and Technical Publications, n.d.) 50*s*. net.

THIS exhaustive work incorporates the substance of the author's "L'alfabeto nella storia della civiltà" (Florence, 1937) and includes all non-alphabetic systems of writing, as well as the great family of true alphabets derived, so the author believes, from a single source in Phœnicia or North Syria. The two systems are curiously separate in their history, and it is no accident that the true alphabet originated in one of the very few regions where, by a series of historical accidents, the Cuneiform, Hieroglyphic, and probably also the Minoan systems overlaid each other, and set people thinking about a revolutionary change.

Each group of scripts is introduced by a short account of their region and people of origin, and supplied with a select bibliography. Theories of origin or derivation are summarized, and usually Dr. Diringer has his own reasoned conclusions. On the priority of Egyptian or Sumerian pictorial writing, he reserves judgment. He shows (p. 61) how narrowly Egypt missed a truly alphabetic script, and by what steps, having done so, they supplemented their mperfectly syllabic script.

The account of the Cretan or 'Minoan' scripts is disappointing, for it has escaped recent revision, and does not mention Pugliese-Carretelli's admirable edition of the 'Linear A' tablets from Hagia Triada, or the discovery of 'Linear B' archives near Pylos on he Greek mainland. The tables of signs are imperfect and confused with commodity-signs, masons'-marks, ligatures, and other symbols. Dr. Diringer describes the unique Phaestos Disk as a 'stamp or big die', whereas it is itself printed with movable ype. He confuses 'Pictographic Class A' with Linear Class A' (Fig. 7*a*), and exaggerates the number of tablets found at Knossos (p. 76). He regards he Cretan system as essentially indigenous, though nfluenced by Egyptian hieroglyphic. Of the source of clay-tablet writing, with punctuation, in Crete, he says nothing. He is probably right in regarding the language as not Indo-European, but akin to languages of later Asia Minor, like many words in Greek; and he notes, without emphasis, the resemblances of Cretan to Phœnician signs. On Hrozny's Indo-European theories he reserves judgment. In the account of Cretan ethnology (p. 74) 'Hawkes' should be 'Hawes', as in the bibliography.

It is still too early to write confidently about the script of the Indus Valley civilization. Dr. Diringer nclines to the lower dates proposed by Frankfort and Piggott (middle third millennium); and rejects de Hevesy's comparison with the inscriptions of Easter Island (p. 198).

For Hittite script—a thorny subject—Dr. Diringer inclines to a deliberate imitation of Egyptian writing, but with Anatolian or Syrian pictographs, about the middle of the second millennium. He mentions, without favour (p. 96), resemblances with Cretan signs, noting the discordant dates.

The immense duration and complexity of Chinese writing are clearly set out, down to modern attempts o simplify or supersede it, and there is a concise urvey of the scripts of Central America and Mexico, of Southern China, of West Africa, and Easter Island. Fully syllabic writings, at Byblus, in Bronze Age and Classical Cyprus, in Japan, and among ribes of West Africa and North America, are treated summarily, and lead to the Persian and Meroitic cripts which are described as quasi-alphabetic only, and are therefore discussed separately here.

The alphabetic systems, very numerous and widepread, offer fewer problems, except the central question, 'where did alphabetic writing originate?' After reviewing older theories, Dr. Diringer adopts Dunand's derivation from the 'pseudo-hieroglyphic' script of Byblus (pp. 158, 205), which is traced back to the twelfth or thirteenth Egyptian dynasty (c. 2000–500 B.C.). If this is maintained, the current 'Sinaitic' derivation falls into place as one of several attempts o adapt Egyptian writing to local needs; and probably the Minoan script is another, modified, however, profoundly by the adoption of clay-tablet technique.

It is impossible here to examine in detail the relations between the derivative alphabets. The main thesis that they all go back to the Syrian archetype seems to be well founded, in contrast with the multiple origins of hieroglyphic and syllabic writing.

Though not without weak points, this book will be the main work of reference in this field for some time to come.

J. L. MYRES

WAR-TIME RADIO RESEARCH AT HARVARD UNIVERSITY

Very High-Frequency Techniques

Compiled by the Staff of the Radio Research Laboratory, Harvard University. Vol. 1. Pp. xvii+554. Vol. 2. Pp. viii+555–1057. (New York and London: McGraw-Hill Book Co., Inc., 1947.) 2 vols., 84*s*.

IN compiling the text of these two volumes, the staff of the Radio Research Laboratory of Harvard University has followed the practice established in some recent books by which the different sections are written by separate authors, each being a specialist in his own domain. In this case the individual contributions have been welded together into a fairly comprehensive treatment of the whole field under the editorship of Dr. H. J. Reich and a group of assistant editors. As mentioned by Dr. Reich in his preface, the book should not be regarded as a text-book but rather as a reference work or hand-book which will serve as a valuable source of information to research physicists and engineers working in this field, and to future authors of text-books.

The Radio Research Laboratory at Harvard was primarily responsible for developing counter-measures to enemy radar: thus, throughout the work, particular emphasis has been given to conditions permitting broad-band or tunable operation of the techniques described, in contrast to the fixed-frequency operation of radar. In this way a new and interesting point of view is brought to bear upon the problems involved in the generation, transmission and reception of very high-frequency electromagnetic waves.

Volume 1 contains twenty-two chapters, of which the first eight are chiefly given to a discussion of the various types of antennæ in use at frequencies greater than 100 Mc./sec., with the overriding requirement of broad-band frequency characteristics. The principles of direction finding are then introduced, followed by a description of antennæ and indicators suitable for radio direction finding and of the devices employed in the rather specialized form of the latter known as 'homing'. These twelve chapters may be regarded as a part of the book sensibly complete in itself, and the remaining sections of Vol. 1 are concerned, in turn with the various types of very high-frequency oscillators for use in transmitters giving relatively medium- and high-power outputs. Attention is also given to the requirements for amplitude and frequency modulation, and in the last three chapters the principles and characteristics of the magnetron are enumerated and discussed.

The externally tuned magnetron oscillator is treated at the beginning of Volume 2; afterwards, the methods of ultra-high-frequency power measurement are reviewed and the general principles of receiver performance dealt with. At this stage, transmission line filters are introduced, leading to a consideration of tuning systems for microwave receivers and an adequate discussion of detectors, mixers, local oscillators, and intermediate frequency amplifiers. In conclusion, some examples of receiver circuits and associated measuring equipment are given, together with a supplementary bibliography of recent articles relating to the matters discussed.

The difficulties confronting the editors of a book of this nature, which covers a wide field in great detail, are admittedly formidable, and much thought has obviously been given to the arrangement and integration of the various sections. Nevertheless, there is some repetition of material in the separate contributions which could have been avoided had the basic work been presented in certain chapters of a general introductory character. The second chapter, dealing with ultra-high-frequency measurements, might well have served as an introduction to the section devoted to antennæ arrangements, while discussion of the latter prior to a consideration of the methods of generating and detecting very high-frequency waves appears to be somewhat out of place.

Some of the subject-matter has already appeared, scattered throughout the technical literature of the past few years, and the authors are to be complimented for having produced in an integrated form the information and experience which they and their colleagues have gained during the war-time years of intense activity in the microwave field. Also, some of the material is new, and as such constitutes a valuable addition to the knowledge of these recently acquired techniques.

Having been compiled by a group of specialists, the book is essentially practical in content, and the experimenter will undoubtedly find therein many useful guides towards the design and successful operation of his apparatus; this, in a more academic treatise, might have been overlooked.

Although the reader may sometimes be critical of the way in which the material is presented, he will not dispute that the numerous techniques are discussed in a complete and concise manner. The authors are clearly masters of the methods which they describe, and many readers will be grateful to them for having produced this detailed account of their technical experiences.
JOHN LAMB

THE PIGMENTARY EFFECTOR SYSTEM

Animal Colour Changes and their Neurohumours

A Survey of Investigations, 1910–1943. By George Howard Parker. Pp. x + 377. (Cambridge: At the University Press, 1948.) 30*s*. net.

THIS is a very valuable compilation of literature on chromatic function which, together with previous reviews by Fuchs (1910) and Hogben (1924), makes readily accessible all references on the subject from antiquity to recent times. The introductory chapter deals with distribution and types of chromatophores, with their activities and methods of measuring them. This is followed by a systematic survey of chromatic response in cephalopods, Crustacea and cold-blooded vertebrates; seasonal coat changes in birds and mammals are not discussed. The final chapters consider development, genetics and 'special activities' of vertebrate chromatophores. The bibliography of more than 1,200 titles is conveniently arranged under three heads, namely, surveys, publications (chiefly historical) before 1910, and a complete list from 1910 to 1943 inclusive. As we have learned to expect from Prof. Parker, the script is lucidly and persuasively written.

This review is particularly valuable at present because, despite Prof. Parker's modest disclaimer, it is evident that he has had access to much material that has escaped the notice of most British workers during the war years. But this work is, of course, much more than a compilation, and woven into the review is the author's well-known neurohumoral interpretation of pigmentary activity. The critical part of the work is clearly, and for the most part impartially, stated, but it calls for criticism on several counts.

The introduction makes it clear that Parker is now less intransigent with regard to the value of the Hogben melanophore index for obtaining data essential for critical judgment on certain disputed issues; but his criticism of Neill's work on the ground that he confused 'morphological' and 'physiological' changes makes it equally clear that the value of the melanophore index for discriminating between these two types of change has escaped him. Neill used the melanophore index and consequently his plottings represent physiological change only.

From a statement on p. 104, in which Prof. Parker says the *W*-hormone "appears to be the effective agent in the blanching of many elasmobranchs", it would appear that he has weighed the evidence for the two-hormone ('*B*' and '*W*') hypothesis and is now more sympathetic towards it, but on p. 206 we find that because "the blood of a normally pale frog when injected into a dark one will not cause the dark one to blanch", he concludes that "the blood of a normally blanched frog contains no agent concerned with the concentration of its melanophore pigment". This shows (as is admitted by implication on p. 97) failure to grasp the full implications of the two-hormone hypothesis. According to this hypothesis, on a black background '*B*' is being secreted maximally, and on a white background both '*B*' and '*W*' are secreted maximally; but (as shown by melanophore index readings) '*W*' does not fully override '*B*'. Hence, an intact pale animal will never have an effective excess of '*W*' and so it could not be demonstrated in the way proposed by Parker.

Prof. Parker has re-stated his experiments on nerve-cutting. The novel feature of his interpretation of these is his belief that when nerves are cut in a pale teleost the dark bands evoked are due to persistent prepotent stimulation of 'expanding' fibres. Much ingeniously devised evidence is marshalled in favour of this view and it may well prove correct; but a quantitative study after similar procedures on hypophysectomized fish would dispose (or otherwise) of a simpler interpretation, namely, that when released from nervous stimulation the melanophores expand under the influence of pituitary hormones in circulation.

Parker's writings on neurohumoralism fall into two distinct categories: (*a*) experiments on teleost specie in which there is undoubtedly 'direct' nervous control of melanophores—it is claimed that nerve ending in close proximity to the melanophores influenc their effectors by liberation of neurohumors; (*b* arguments to show that there is no valid distinctio between humoral and nervous co-ordination. I melanophores are influenced by the liberation o drug-like substances (neurohumors) from nerve end ings in close proximity to them, the fact is of considerable physiological importance and Parker's work in this connexion is of great interest. But co-ordination by a blood-circulated hormone has different physiological attributes from nervous co-ordination; and it is therefore a purely verbal compromise between issues which are not factually consistent to claim that in the light of the neurohumoral hypothesis the distinction of a nervous and humoral excitation really vanishes "because both rely for their effectiveness on liberated substances which from a near or far source reach and excite a given colour cell".

The book is attractively produced on paper of unusually high quality. It is certain to remain the standard work on the subject for several years.

H. WARING

NUMERICAL METHODS

The Differential Analyser

By J. Crank. Pp. viii+137+4 plates. (London, New York and Toronto: Longmans, Green and Co., Ltd., 1947.) 10*s*. 6*d*. net.

Computing Mechanisms and Linkages

By Antonín Svoboda. Edited by Hubert M. James. (Massachusetts Institute of Technology: Radiation Laboratory Series, No. 27.) Pp. xii+359. (New York and London: McGraw-Hill Book Co., Inc., 1948.) 27*s*.

THE growing importance of numerical methods in scientific research is reflected in the beginnings of a separate literature. These two books are concerned not with methods, but with tools, and are welcome additions to the small number of books dealing with this field. They are both concerned with what have been called analogue machines, and not with the digital type of calculator which is now exciting a good deal of attention. Although they are both concerned with analogue devices, the scope of the two books is very different. Mr. Crank describes the differential analyser, which is used for the solution of differential equations, and is purposely designed to cover a wide variety of problems, and Prof. Svoboda is concerned with the design of simple mechanisms to represent specific functions.

Mr. Crank's little book is adequate without being heavy, and not unreasonably expensive. The author worked on the differential analyser at the University of Manchester, and later took charge of the very similar machine at Cambridge. He speaks with the authority of working experience of this equipment, and the description both of the machine and methods of its use is simple and clear. The needs of the research worker who wishes to understand and use the differential analyser have been fully met, so far as they can be without practical demonstration on the machine itself; and the author goes a long way to help the isolated worker, without access to an existing machine or to experienced guidance, who wishes to design a machine of moderate accuracy and cost for himself. The amount of useful knowledge packed into this small book is quite remarkable.

Two minor points of criticism, which are rather matters of personal preference, might be noted for a future edition. The long list of references at the end of Chapter 6 on 'applications' would be more convenient if arranged in alphabetical order of the authors; and in his description of the new differential analyser at the Massachusetts Institute of Technology, the author would have done well to include a reference to Prof. S. H. Caldwell's D.Sc. thesis; in this thesis there are also some interesting remarks on method which should not be forgotten.

Prof. Svoboda's book is No. 27 of the Massachusetts Institute of Technology's Radiation Laboratory Series, and is, in fact, an essay in the neglected subject of kinematics devoted to a severely practical need. Prof. Svoboda is concerned with bar linkage mechanisms and their use for the approximate generation of functions required in connexion with fire control, in particular gun predictors. He shows that with two basic mechanisms, the harmonic transformer and the three-bar linkage, it is possible to perform the fundamental operations of arithmetic, addition, subtraction, multiplication and division, and to generate ballistic functions. The interesting point that arises in this book is that although the field of functions which can be generated exactly by a combination of these two mechanisms is limited, if one is satisfied with an approximate description and works to definite tolerances, a wide variety of functions can be generated within these limits of accuracy. Prof. Svoboda describes a definite design method. He shows how a crude approximation may be refined in successive stages until the desired degree of accuracy is reached.

The theory of these mechanisms is fully developed in the book, and excellent charts and tables are given for those who wish to use its methods. The book also has the virtue of being complete in itself. Although well written and clearly expressed, it might be difficult reading for the engineer. Nevertheless, the reviewer is convinced that the theory here developed will have useful engineering applications apart from the war-time applications described.

JOHN WOMERSLEY

WILD ANIMALS AND THE LAND

Wild Animals and the Land

By F. Howard Lancum. Pp. 136 + 29 plates. (London: Crosby Lockwood and Son, Ltd., 1947.) 10*s*. 6*d*. net.

MR. HOWARD LANCUM in this book writes primarily for men of the land who wish to know something of the status of British wild animals in relation to agriculture, horticulture and food production, and has produced an attractive book, illustrated by excellent photographs. Some of the animals he describes are the fox, the badger, the otter, rabbit and hare, the hedgehog and squirrel, rat, vole, mice and shrew. It is good to see that he mentions the good, as well as the harm, animals do. For example (p. 32), we are told of the fondness of the badger for wasps' grubs. When a wasps' nest had to be tackled, "it was a common occurrence for a deputation of youngsters to present itself at the door of the house of Brocky's [the tame badger's] master, with the request, 'Can we borrow Brocky, please?' Brocky was ever ready to be borrowed, for none knew better than he what was afoot. He would be duly led away with collar and chain until the company came within sight of the offending wasps' nest. As soon as he saw the flying wasps his hackles would rise, and he was released from the chain while the children remained at a safe distance. In an almost incredibly short time Brocky would have that nest out of the ground, and would be feasting royally on fat, juicy wasp grubs, meanwhile uncaring for, or impervious to, the stings of the outraged wasps."

The author (p. 33) has investigated during his life nearly a hundred supposed instances of the killing of poultry by badgers, and in only two instances was it possible to prove that the damage was the work of badgers—in most of the other instances he discovered that a fox was the culprit. He therefore makes a strong plea for the better protection of this, one of the most attractive of British mammals. He mentions (p. 57) that owing to the setting of its eyes the hare is often unable to see right ahead of it. I recall a remarkable example of this in the blue hare, which on one occasion allowed three persons to approach and photograph it in the open without apparently being aware of their presence; then, after about half an hour, became suddenly conscious of it and rushed off in a panic. Hares, usually timid, can be brave in defence of their young, and on page 59 the author mentions that on a memorable occasion he saw a doe hare kick a stoat to a distance of several feet. His account of a squirrel 'freezing' (p. 64) on the appearance of a buzzard seems to point to the fact that the buzzard, like the golden eagle, may on occasion take squirrels for food. I recall a pair of golden eagles which regularly brought squirrels to the eyrie for food for their two eaglets.

Mr. Lancum's account (p. 73) of a stoat swimming reminds me that on one occasion when fishing I saw a stoat unhesitatingly take to the water on a cold spring day in order to avoid a scramble up a grassy bank. The author has a good word even for the stoat, because it can kill a rat without difficulty, and kills mice in great numbers. SETON GORDON

UP-TO-DATE TREATMENT OF VENEREAL DISEASES

The Venereal Diseases

A Manual for Practitioners and Students. By Dr. James Marshall. Second edition. Pp. xvi+370. (London: Macmillan and Co., Ltd., 1948.) 21s. net.

OF making many books there is no end, but this is not true of text-books on venereal diseases published in Great Britain; for this reason Dr. Marshall's manual is particularly welcome, more especially as it is full of sound teaching which should be valuable both to the student and to the practitioner. Venereal diseases have been with us since time immemorial, nor have they changed very much; but their treatment is constantly changing, and this has been most marked since the introduction of the sulphonamides and penicillin. No doubt this was largely the reason for the production of a second edition so soon after the first. This second edition contains a number of minor changes and improvements, but is of chief importance in that it brings the therapeutic use of penicillin up to date and at the same time introduces new matter on intensive and semi-intensive arsenotherapy, non-gonococcal urethritis, which was so prevalent in most armies during the War, and Reiter's syndrome, which, if it is not venereal in origin, certainly brings many patients to venereal diseases clinics. Those who are not familiar with this condition will do well to read what Dr. Marshall has to say about it, because no doubt it is one which has been frequently missed in the past and is probably commoner than many suppose; moreover, treatment is far from satisfactory, and patients are often rendered incapable of work for many weeks by the painful arthritis which is one of the prominent features.

What will appeal most to readers, however, is the latest information about the use of penicillin in treating venereal diseases; for the treatment of acute gonorrhœa the author prefers four or five injections, each of 50,000 or 40,000 units in aqueous solution, given at intervals of three or two hours, though he admits that a single injection of 300,000 units in oil-wax suspension is permissible, and no doubt this is much the most convenient method in a civilian venereal disease clinic, because few patients are willing or able to wait several hours or visit a clinic several times in one day. The objection to the penicillin treatment of gonorrhœa is the risk of masking a concurrently acquired syphilitic infection; by no means all patients can be relied on to attend regularly for blood tests for a period of six months. For this reason there is much to be said for treating acute gonorrhœa with sulphonamides and only resorting to penicillin if these fail. Where complications are present, much larger doses of penicillin are necessary, and in such cases it is pointed out that there is a good deal to be said for giving an amount, such as 3 mega units, which will have a reasonable chance of curing an incubating syphilis.

For the treatment of early syphilis it is recommended that arsenic, bismuth and penicillin should be employed concurrently; ten weeks of arsenic and bismuth together with 3 mega units of penicillin in aqueous solution by means of three-hourly injections—but for ambulant patients, and these will represent the vast majority of cases, he advises 300,000 units in oil-wax daily for ten days.

Very wisely the views expressed concerning the treatment of late syphilis, including neuro-syphilis, are extremely guarded because not enough time has yet elapsed to assess results; but, in general, penicillin in heavy dosage is recommended in addition to arsenic, bismuth and, if necessary, fever.

Of the arsenicals, mapharside or neohalarsine is preferred to neoarsphenamine if the patient can attend for injections twice weekly; in this the author tends to follow American rather than British custom; the two former may be safer from the point of view of toxic reactions, but it is doubtful if they are as therapeutically effective as neoarsphenamine, and there are many advantages, particularly from the patient's point of view, in attending only once weekly. Non-gonococcal arthritis is so common and so difficult to cure that many readers would welcome more details of treatment, and much the same applies to *Trichomonas vaginalis* infestation, which may account for half the attendances at a female clinic; no doubt limitations of space had to be taken into account, for it must be very difficult to deal adequately with all the venereal and allied conditions in the space of three hundred and fifty pages. The average reader is not concerned with the structural formulæ of the various arsenicals and sulphonamides: the omission of these would give room for matter of more practical interest.

If this book is not a literary masterpiece it is certainly full of sound teaching, gives the practitioner all the information which he requires for the management of his patients suffering from venereal disease and, if carefully studied, will get the student through his examinations; the section devoted to "Practical Instructions" is particularly helpful.

T. E. OSMOND

Introduction to the Theory of Equations

By Assoc. Prof. Lois Wilfred Griffiths. Second edition. Pp. ix+278. (New York: John Wiley and Sons, Inc.; London: Chapman and Hall, Ltd., 1947.) 18*s.* net.

THE contents of this volume fall into three clearly marked sections. Chapters 1–4 (pp. 1–105) lead up to the location and calculation of the real roots of a real algebraic equation; the cubic and quartic equations are studied in Chapter 2, as a preliminary to theorems on the general equation. Sturm's theorem provides for locating the roots of the general equation, but the only method of calculation expounded is that of Horner, explained very lucidly with attention to the justification of contracted processes. Chapters 5–7 (pp. 106–235) deal with determinants, introduced for orders 2 and 3 and extended to order *n*, and with systems of linear equations. The connexion between a set of solutions of such a system and the rank of the augmented matrix of the system is set out carefully; but some hints on what can be done to alleviate the tedious process of solving a numerical set of linear equations would have been welcome. Chapter 8 sets out the axiomatic theory of the complex number, familiarity with the technique having been assumed in the early chapters. Chapter 9 deals with symmetric functions of the roots of an algebraic equation, a topic the academic elegance of which has caused it to be over-elaborated in some text-books; Prof. Griffiths rightly relegates it to the subordinate position it should occupy in an introductory account.

Chemical and Physical Investigations on Dairy Products

By H. Eilers, R. N. J. Saal and M. van der Waarden. (Monographs on the Progress of Research in Holland.) Pp. xv+215. (New York and Amsterdam: Elsevier Publishing Co.; London: Cleaver-Hume Press, Ltd., 1947.) 21*s.* net.

THE series of publications, of which this book on dairy research is one, deals with the investigations carried on by Dutch scientific workers during the German occupation of the Netherlands. The Dutch are a pertinacious people, and the 'mere trifles' of enemy occupation, oppression and near-starvation do not seem very seriously to have depressed the high quality, although they may have somewhat diminished the quantity, of their research in dairy chemistry and physics.

This volume contains, in effect, three communications. The first, by Eilers, deals with the colloid chemistry of skim milk, and includes studies of the calcium-casein-phosphate complex, the proteins in milk denaturable by heat, and the physical and physico-chemical changes occurring in skim milk on concentration. The second, by Saal and Heukelom, is concerned with the oxidation-reduction potential of the complicated biological system of milk and the only slightly less difficult system of butter-plasma. The third, by van der Waarden, approaches the commercially important, as well as academically interesting, group of problems associated with the chemical processes underlying the deterioration of butter.

Each article provides a short but well-documented survey of the field (though for obvious reasons there are few references after 1939) and each presents a considerable body of original research. This well-written and eminently readable volume is commended to every chemist or physical chemist interested in dairy research or dairy technology. H. D. K.

The Skyscraper Hive

By Father M. Dugat. Authorized translation of "La Ruche Gratteciel à Plusiers Reines" by Norman C. Reeves. Pp. xvi + 78 + 4 plates. (London: Faber and Faber, Ltd., 1948.) 8*s.* 6*d.* net.

ALTHOUGH no competent beekeeper is likely to disagree with the general statement that "The secret of large surpluses (of honey) is large colonies", a good many beekeepers will heartily disagree with M. Dugat's system of colony management. His system is indeed little more than an extension of the two-queen system of management which has been tried out very thoroughly in the United States and other countries since at least the beginning of this century, and has not been found to yield any notable increase in honey crop *per queen* over various single-queen systems.

All the data at present available as a result of much experimentation lead one to suggest that the success which M. Dugat has achieved is not so much due to his multi-queen system as to those other methods of management which he employed with his 'skyscraper' hives, and which are equally applicable to single-queen colonies. Such methods, which involve the partial separation of young bees from the older field bees and, by giving the queen every encouragement to lay to her full capacity, lead to the development of very powerful colonies, and at the same time help to control swarming, have long been known to give good results.

One cannot help but feel that M. Dugat might have obtained even larger crops of honey if he had avoided the once popular but now largely discredited practice of completely de-queening his colonies just before the honey-flow, a practice which frequently results in a loss of what may perhaps be termed 'colony morale'. COLIN G. BUTLER

Principles and Practice of the Rorschach Personality Test

By W. Mons. Pp. 164. (London: Faber and Faber, Ltd., 1947.) 12*s.* 6*d.* net.

SINCE the Swiss psychiatrist, H. Rorschach, published his fascinating "Psychodiagnostik" in 1932, considerable effort has been devoted in several countries to elaborating the methods of scoring and interpreting the test responses. Nevertheless, the somewhat forbidding notation in current use has given the accumulated mass of data the semblance of esoteric lore and the test itself has acquired what the late William Stern called a "monosymptomatic despotism". It is refreshing, therefore, to read Dr. Mons' clear and restrained account of the techniques and interpretation of the Rorschach 'ink-blot' test, an account based on extensive experience with Service and civilian patients and on the examination of a thousand clerical records.

With the difficulties of the novice in mind, Dr. Mons painstakingly explains how to administer the test, how to classify the responses according to a widely used, though somewhat pretentious, notation, and how to evaluate the significance of the responses so as to yield an assessment of the personality, particularly its 'structural' features. Several new formulæ useful for diagnostic purposes are suggested.

It is to be hoped that this useful manual will stimulate workers to pursue much more rigorously than hitherto methods of validating the test which could greatly improve its potential value as a diagnostic tool. JOHN COHEN

SPECIFIC CRYSTALLINE PROTEIN AND NUCLEOPROTEIN FROM A PLANT VIRUS HAVING INSECT VECTORS

By Dr. ROY MARKHAM, Dr. R. E. F. MATTHEWS
AND
Dr. KENNETH M. SMITH, F.R.S.
Agricultural Research Council, Plant Virus Research Unit, Molteno Institute, University of Cambridge

Introduction

IT is now more than ten years since Bawden and Pirie[1] showed that the tobacco mosaic virus is a nucleoprotein. Since that date several other plant viruses have been isolated, and as all seem to be nucleoproteins, the nucleoprotein nature of viruses has been widely accepted.

From plants infected with the turnip yellow mosaic virus[2,3], we have isolated and crystallized both a nucleoprotein and a protein free from nucleic acid, both specific to the disease and similar in many ways. In this virus disease we appear to have a borderline case, a naturally occurring link between the virus proteins and the non-virus proteins, and we have obtained direct evidence for the widely held belief that nucleic acid is essential for the multiplication of plant viruses.

The turnip yellow mosaic virus is also of interest in its mode of transmission. As already reported[4], it is unique among crystallizable viruses in being transmitted by an insect—and a biting insect at that. It now appears that it may be transmitted by a large variety of insects provided that they have biting mouth parts and, apparently, no salivary glands. The insect–virus relationship does not seem to be purely mechanical, as a preliminary delay in the development of infective power of about one day is usually necessary. Using purified virus mixed with sucrose, it is possible to feed the insects artificially and to study the host-virus relationships in this way.

Properties of the Virus Proteins

The original method of purification of the turnip yellow mosaic virus described by Markham and Smith has been found unsuitable during the summertime, so a simpler method has been developed which is reliable at all times of the year and is not dependent upon the temperature of the laboratory. The sap from turnip or Chinese cabbage is clarified by the addition of exactly 300 ml. of 90 per cent alcohol to each litre, followed by spinning. Under these conditions the virus is still in the supernatant liquid, and is precipitated from it as octahedral crystals by the addition of half a volume of saturated ammonium sulphate solution. Further purification may be effected by recrystallization from salt solutions, a large number of salts being suitable for this purpose, all depositing the virus as octahedra, or by recrystallization from an acid solution (pH 3·8) of the virus in 20 per cent ethyl alcohol. The latter crystallization must be carried out in the cold at a temperature of 5° or less. The virus is then deposited as fine needles which frequently form globular clusters. These pack down on the bottom of the container, and after a couple of days the mother liquor may be decanted without loss of crystals. Yields of as much as 1 gm. per litre of sap have been obtained from field turnips by these methods.

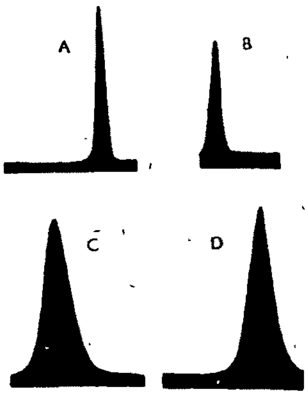

Fig. 1. Electrophoretic patterns obtained on the Tiselius apparatus: concentrations 5 mgm./ml. *A* and *B* stationary at pH 3·78 after 3 hr. at 2·33 volts/cm. *C* descending and *D* ascending at pH 4·16 after 5 hr. at 5·48 volts/cm.

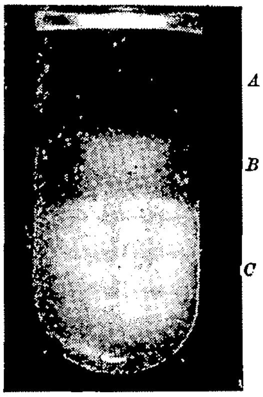

Fig. 2. Celluloid centrifuge tube after spinning at 12,000 r.p.m. for two hours, photographed by light scattered from virus proteins. *A*, solvent layer; *B*, virus protein; *C*, virus protein plus nucleoprotein

Virus preparations of this type are highly infectious and are quite uniform in composition. They contain some 15 per cent nitrogen, 2·15 per cent phosphorus and 5 per cent of purine-bound pentose, the latter two being entirely in the form of nucleic acid. On electrophoresis the solutions are isoelectric at pH 3·75 and contain only one homogeneous component at several pH's (Fig. 1). The examination of this material in the ultracentrifuge, carried out by R. Cecil and A. G. Ogston at Oxford, revealed the presence of two components differing in the ratio of about 1 : 2 in sedimentation constant, the slower or 'top' component comprising some 20 per cent of the whole.

The Oxford workers were kind enough to prepare for us about 8 mgm. of pure (95 per cent) top component using the separation cell of Tiselius, Pedersen and Svedberg[5]; and when we examined it, it was evident that the top and bottom components were different in some of their chemical properties.

Eventually we found that, when solutions containing more than 10 mgm./ml. of virus-protein were spun in a Sorvall S.S.1 centrifuge, boundaries formed (Fig. 2) and were sufficiently stable to allow the top component to be removed by a pipette. The material so obtained is only 75–80 per cent pure top component, but this purity may be increased to 80–85 per cent by a second spin. In this case only the top boundary forms, and the top half of the solution is sampled.

By this means we were able to prepare large quantities of the top component in a state of purity sufficient for most work, and in a similar way we have increased the purity of the bottom component to 90–95 per cent.

Top and bottom components of turnip yellow mosaic virus are similar if not identical in the following respects. Both crystallize from salt solutions as octahedra (Fig. 3) and under the electron microscope are spheres of similar size, while they both can form micro-crystals on the electron microscope grids (Cosslett and Markham[6], and unpublished). In solution, too, they seem to be the same size, and both are resistant to digestion by pancreatic enzymes. The bottom component, however, is the only one containing nucleic acid, and the absorption spectra of the two are consequently very different (Fig. 4). Although complete amino-acid analyses are not yet available, preliminary paper chromatography[7] using several solvents indicates that both proteins contain the same amino-acids in similar proportions. All the evidence which we have suggests that the protein parts of both components are identical and that the bottom component differs only in having some 28 per cent of pentose nucleic acid by weight embedded in it in such a way that it takes no part in forming the electrostatic surface of the molecules. The comparatively acid isoelectric point of both proteins seems to be due to the relative preponderance of the dicarboxylic amino-acids in the protein, a fact which may seem in contradiction to the orthodox conception of nucleoproteins. The top component is therefore the first native virus protein which has been obtained free of nucleic acid.

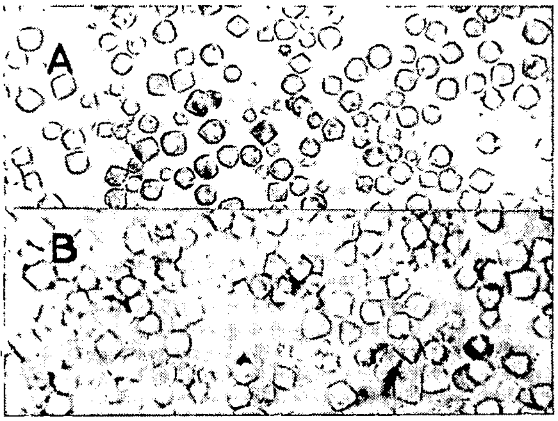

Fig. 3. *A*, CRYSTALS OF TURNIP YELLOW MOSAIC VIRUS PROTEIN ; *B*, CRYSTALS OF THE VIRUS NUCLEOPROTEIN

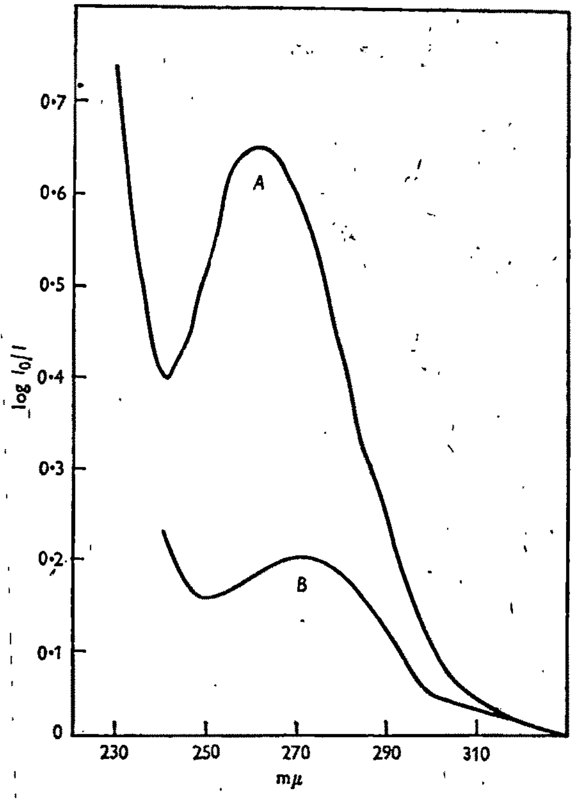

Fig. 4. ULTRA-VIOLET LIGHT ABSORPTION SPECTRA OF WHOLE VIRUS PREPARATION, *A*, AND TOP COMPONENT, *B*, AT A CONCENTRATION OF 0·1 MGM./ML. IN A 1-CM. CELL

By comparing the properties of these two proteins, we have discovered two distinct biological functions of nucleic acid in a plant virus nucleoprotein. First, all the infectivity of our preparations appears to reside in the nucleoprotein fraction, since the top component, even when freshly prepared, does not seem to be infectious. However, experiments using different isolation techniques which control the effects of our isolation procedure at each stage indicate that infection with the nucleoprotein results in the production of the top component as well as a larger quantity of nucleoprotein. As yet we can only speculate as to the origin of the top component. It may represent a stage in the synthesis or the breakdown of the nucleoprotein, or might even be the result of an abortive attempt at multiplication. Secondly, a single intravenous injection into rabbits of as little as 0·01 mgm. of the nucleoprotein results in the production in a fortnight of a precipitating serum of titre about 1 : 16. Sera of extremely high antibody content result after injection of larger quantities. On the other hand, the top component is very much less antigenic, the antibody production in response to an injection being not appreciably greater than could be accounted for by the small but inevitable quantity of nucleoprotein contaminating even our best preparations. When solutions of the two proteins are made up in equivalent concentrations, however, it is not possible to distinguish between them by means of antisera produced in response to the injection of the nucleoprotein.

Using several antisera from different rabbits, the times for precipitation and the position of the optima are the same for both components. Over a range of antiserum-virus protein ratios in the region of antibody excess, the weight of antibody combining with unit weight of *protein* is the same within the limits of the experimental methods. Thus there is no indication that there are any antigenic groupings in the nucleoprotein in which nucleic acid is involved. This is difficult to reconcile with the fact that presence of the nucleic acid greatly enhances the power of the protein to stimulate antibody production.

Although the two proteins are found in our preparations, we have been unable to convert the nucleoprotein into native protein plus nucleic acid. In every case where nucleic acid is liberated, the protein is denatured. It is of interest to note here that the protein is denatured in the cold at pH 7 in solutions containing more than 30 per cent alcohol by volume, and the nucleic acid is left in solution. When prepared in this way, the nucleic acid solutions evidently contain large thread-like molecules, and if the concentration is as much as a few milligrams per millilitre they set into jellies. In this way the nucleic acid resembles that of tobacco mosaic virus[8]; but the method of isolation is even less drastic and is, in fact, the mildest method for the isolation of a pentose nucleic acid which we know.

Insect Relationships of the Virus

The method of transmission of this virus in the field differs from that of all other known plant viruses; the insect vector being a flea beetle (*Phyllotreta* spp.) with biting mouth parts instead of the usual sap-sucking type of insect, such as aphides or leaf-hoppers. This is also the first time a crystallizable plant virus has been shown to have an insect vector. The relationship between the virus and the insect which transmits it has not yet been completely worked out, but certain interesting facts have been elucidated. Whereas in Nature the transmitting insects are one or more species of flea beetle which feed on the turnip plant, under experimental conditions several entirely different types of insect will transmit the virus. These include three or four species of beetles, including *Phœdon cochleariæ*, the mustard beetle and its larva, the common earwig and two species of grasshoppers. These insects have, however, one characteristic in common, namely, they all have biting mouth parts. A large number of transmission experiments, mostly with the larva of the mustard beetle, including some using artificial feeding methods, have been carried out. For the artificial feeding the larvæ were desiccated slightly by starving them for twenty-four hours. They were then allowed to feed upon drops of purified virus solution to which had been added a little sucrose.

These experiments have shown that, as a rule, an insect does not become infective after feeding on a source of virus until after the lapse of a period of 24–48 hours. On the other hand, there are exceptions to this, in which the processes of feeding on the source of virus and infecting the healthy plant can be carried out in a total period of ten to fifteen minutes.

For these two types of virus transmission, we suggest the following explanation. The rapid type of infection can be explained on the assumption that the mouth parts are contaminated with virus which is thus passively transferred to the healthy plant. Some other explanation, however, is necessary for the delay of 24–48 hours before infection and the subsequent retention of infective power by the insect for one or two days more. It seems to be a fact that most beetles and their larvæ do not possess salivary glands, and digestion of plant tissue is aided during mastication by regurgitation of some of the contents of the foregut. During this process some of the virus previously ingested would be brought into contact with the healthy tissue and thus cause infection of the plant. This would explain both the delay in the development of infective power and the retention of the ability to infect. Some support for this hypothesis is given by the fact that in most of the transmitting insects, besides the beetles, the salivary glands appear to be missing or rudimentary.

Detailed accounts of this and other work on this virus will be published elsewhere.

Our thanks are due to Mr. R. Cecil and Dr. A. G. Ogston for their co-operation in this work.

Summary

(1) Some of the unusual properties of turnip yellow mosaic virus are described.

(2) This virus is transmitted by biting insects only, and there appears to be a correlation between the ability of an insect to transmit the virus and the absence of salivary glands which necessitates regurgitation of the contents of the foregut. Artificial feeding methods have been successful.

(3) Two proteins have been isolated from plants infected with this disease and both have been crystallized. One is a nucleoprotein containing 28 per cent of pentose nucleic acid, and the other appears to be the same protein without the nucleic acid.

(4) The nucleic acid may be obtained from the virus by a method milder than any so far employed for the isolation of a pentose nucleic acid. The nucleic acid is a very large molecule, probably rod-shaped.

(5) It is not possible to differentiate between the two proteins by means of serological precipitation, but, when injected into rabbits, the nucleoprotein is many times as antigenic as the protein.

(6) Only the nucleoprotein is infectious to plants and the presence of combined nucleic acid would appear to be necessary for virus multiplication.

(7) Both proteins are the same size and shape and have identical electrophoretic mobilities.

(8) This is the first time that a virus protein has been obtained in a native condition, free from nucleic acid.

CHEMICAL RESEARCH LABORATORY, TEDDINGTON

THE Chemical Research Laboratory of the Department of Scientific and Industrial Research has again held a very successful series of 'open days'. On June 29 the Laboratory was visited by the Lord President of the Council, Mr. Herbert Morrison, who was received by Sir Edward Appleton, secretary of the Department, Dr. R. P. Linstead, director of the Laboratory, and Sir Norman Haworth, chairman of the Chemistry Research Board. During the remainder of the week there were nearly a thousand visitors, including chemists from industry, university laboratories, technical colleges, research and trade associations and Government establishments. These visits serve to keep the chemical community aware of the work of the Laboratory, and enable problems of common interest to be discussed. They supplement the published reports of the Laboratory and its Advisory Board. It may be noted that the reports for the years 1938–46 have recently appeared*.

The exhibits on view in the Laboratory covered the whole range of its activities, which include organic chemistry; inorganic chemistry, including radiochemistry; corrosion of metals, including microbiological corrosion, and high polymers and plastics. The semi-scale laboratories and engineering workshops were also open to inspection.

The research work of the Corrosion Section attracted a large number of visitors. The main equipment of the Section, namely, the high- and low-speed rotor assemblies and the moving-belt apparatus for achieving accelerated corrosion, were on show. In the field of atmospheric corrosion, attention was particularly directed to a new 'condensation' type of test whereby comparisons can be made of protective methods; also to studies of special alloy steels. Electrochemical studies of immersed corrosion were on view, and recent advances in the technique of stripping natural protective films were demonstrated. Interesting discoveries have recently been made at the Laboratory on organic corrosion inhibitors. The inclusion of these in cooling liquids for internal combustion engines and wrapping materials was demonstrated. A particularly interesting exhibit showed the incorporation of an organic inhibitor into rubber latex.

The Microbiology Section illustrated the problem set by the external corrosion of iron pipes in clay soils. This is especially serious to-day because of the extensive post-war programme for laying rural water mains and gas and water systems for new housing estates. The virulent type of corrosion which occurs in clay is due primarily to the activity of anaerobic sulphate-reducing bacteria. Recent work at Teddington suggests that these bacteria may also be responsible for much of the internal corrosion experienced with soft moorland waters. The exhibits illustrated the fundamental properties of the bacteria, which are facultative autotrophs. Their remarkable morphological changes were shown by electron micrographs. Laboratory and field work on protective measures were also demonstrated.

Research in organic chemistry at the Laboratory covers a wide field, and investigations in coal tar have been in progress for more than twenty years. This work is now being concentrated in three directions. One group is concerned with the isolation and identification of the individual constituents of various coal tar fractions. For this purpose extensive use is made of high-efficiency fractional distillation. A notable exhibit comprised a battery of packed distillation columns all operating at pre-selected constant pressures and capable of a very high standard of performance. A second team is concerned with the collection of fundamental reference data for pure compounds.

Chemical processes and the design of chemical plant depend to-day to an ever-increasing extent on the availability of reliable physico-chemical data. These are very scanty in the field of coal tar constituents, and this part of the Laboratory's programme aims at filling the gap. Research in this field was illustrated for pyridine of 99·9 per cent purity. The composite all-glass apparatus used for the manipulation and transference of pure compounds under vacuum and for the measurement of boiling point, freezing point, vapour pressure, etc., was on view. This equipment incorporates an automatic barostat which will maintain pressures constant to at least 0·025 mm. mercury. Other apparatus displayed included an automatic recorder for freezing point determination and an ebulliometer, both of which employ a thermistor for the detection of small temperature changes. In this way differences of temperature of 0·001° C. can readily be recorded, and the equipment can be applied to the measurement of chemical purity. One exhibit which excited special interest was a miniature platinum resistance thermometer capable of reading temperatures to 0·001° C. This has been constructed in collaboration with the Physics Division, National Physical Laboratory.

The objective of the third group is to develop new industrial outlets for neglected constituents of coal tar. This was illustrated by work on the dehydrogenation of acenaphthene and the conversion of the product, acenaphthylene, into polymers of interest to the plastics industry. Among the exhibits by this group was a reference collection of more than a hundred pure coal tar compounds.

The Laboratory is now preparing to synthesize organic intermediates on a small scale in order to assist in the application of isotopic tracers to chemical, medical and biological problems. Work is in hand on both heavy and radioactive carbon; this involves the synthesis of useful compounds from simple carbon sources such as barium carbonate or potassium cyanide in which a proportion of the carbon consists of C^{13} or C^{14}. Syntheses with the radioactive isotope C^{14} have been undertaken in collaboration with the Radiochemical Centre, Amersham, members of the staff of which are at present working at Teddington. The elaborate apparatus required for these studies was on view; it demonstrated the value of the Laboratory's skilled glass-blowing service.

Other exhibits in the organic chemical field illustrated the part played by the Laboratory in the early development of the new synthetic fibre 'Terylene' (polyethylene terephthalate). The work of the Laboratory in the preparation and purification of methyl-silicon intermediates was illustrated and samples of a heat-resistant material were on show. The ability of methyl chlorosilanes to render glass and cellulose water-repellent were strikingly demonstrated.

Inorganic chemistry has of late been a comparatively neglected branch of the science; but many recent technological developments, including the discovery of atomic energy, have helped to revive interest greatly. This revival was illustrated at the Laboratory by a number of exhibits, prominent among which was one on recent work on the analytical chemistry of uranium and thorium. Examples of the increased interest in very pure and less common metals were provided by exhibits of recent work on pure vanadium, gallium and germanium.

Great interest was shown by visitors in the Laboratory's work on high polymers and plastics. Recent research on ion-exchange resins, originally discovered at Teddington in 1935, was illustrated. An attractive exhibit showed the preparation of sulphonated cross-linked polystyrene in bead form. Work on the problem of swelling of polymers, and on the mechanical properties of reinforced plastics, was also on view; and the very successful recent development of synthetic adhesives at the Laboratory was illustrated.

---

* Chemistry Research, 1938 to 1946. (London: H.M. Stationery Office.)

Special attention is given at the Laboratory to the development of physical and other special techniques of general usefulness. This was illustrated by demonstrations of spectrographic equipment, including a double-beam infra-red spectrograph, radiometric methods, microanalysis, chromatography, polarography and other modern techniques.

IMMUNITY TO VIRUS DISEASES

ON July 1 at Cambridge, during the course of the scientific meeting of the British Medical Association, the Section of Pathology discussed "The Prophylaxis of Virus Infections with Special Reference to the Use of Vaccines".

For some human virus infections, such as rubella and infectious jaundice, there is not yet available a susceptible laboratory animal—or even a susceptible egg !—and vaccines are thus at present unattainable. For others, such as (within limitations) influenza, inactivated vaccines are available; these are safe, but do not give enduring immunity. For others, such as smallpox and yellow-fever, living attenuated viruses are available, and these give rise to immunity of longer duration. Dr. C. H. Andrewes, who opened the discussion, held up the 17*D* strain of yellow-fever as an example of an ideal vaccinating agent, a standard to which we should like all vaccines to attain. It gives but trifling reactions, and immunity is long-lasting after a single dose. Later in the discussion, however, Dr. G. W. M. Findlay pointed out one flaw in its perfections—a difficulty in preserving its potency without rigorous attention to technique.

Dr. Andrewes devoted chief attention to the complications introduced by the existence of serological races of some viruses, particularly influenza and poliomyelitis. Within the two distinct groups of influenza viruses, *A* and *B*, there exist serological races, sufficiently divergent to be of importance from the points of view of epidemiology and vaccine-prophylaxis. Very potent vaccines can be made from embryonic fluids of infected fertile eggs, inactivated with formalin. In 1943 such vaccines effected four-fold reduction in the incidence of influenza *A* in trials in a number of centres in America; in 1945–46 they had done even better in a *B* outbreak, apparently decreasing incidence ten- to twenty-fold. In 1947 they were quite, or almost, useless against the prevailing influenza *A* both in America and in Britain. This failure was almost certainly due to an antigenic divergence of the current *A* strain from those incorporated in the vaccine. More work on the potentialities of the influenza viruses for antigenic variation is necessary, before one can advocate general use of vaccines. In particular, there is ignorance as to whether there are limited numbers of defined types or whether the viruses are antigenically labile; also as to whether 'new' races spread about from country to country. To study this latter aspect, the World Health Organisation has lately set up a World Influenza Centre in London with the function of collecting, distributing and studying strains from all over the world.

Dr. Andrewes briefly discussed the possible application of the 'interference phenomenon' in control of virus infections and mentioned experiments in ferrets by Dr. Gledhill and himself; in these an innocuous influenza *B* strain had suppressed the symptoms of infection by an active *A* strain given within the next two or three days.

Prof. R. Hare, who followed, took a very pessimistic view of the prospects of successful vaccination, particularly against influenza. He emphasized past failures, particularly of vaccine trials in 1947, even going so far as to wonder whether killed viruses would ever be of value in immunizing man. Various methods of improving their activity have been reported—the use of the intradermal route, adsorption on to calcium phosphate and other substances, and mixture with oil. The amount of virus in vaccines has been increased by various concentrating procedures. Yet no consistent success can be reported. Antigenic variation among the viruses further confuses the issue. Prof. Hare felt that, if this is all vaccines made in eggs can do, he would rather have the eggs to eat. Despite his gloom, he did not dispel the thought that if the vagaries of antigenic variation of influenza virus could be understood, the prospects might be a good deal brighter.

Prof. W. I. B. Beveridge, the recently appointed professor of animal pathology at Cambridge, thought that much depends on how effective is the contact between an attacking virus and antibody. Against general infections such as the exanthemata and most insect-borne virus diseases, such contact is good and prompt; immunity is enduring and the possibility of vaccination good. Viruses like the common cold and influenza, which probably never reach the blood-stream, make poorer contacts and the prospects are, therefore, less favourable. He believes that allergy plays an important part in mobilizing the body's defences quickly, and he discussed methods of procuring such a favourable allergic state. Attenuation of viruses to make an effective, safe vaccine is a noble ideal, but is a process difficult to control. There may, as in rinderpest, be a rapid transit from a state of insufficient attenuation to one in which immunizing power also is lost. A degree of attenuation just right for some breeds of cattle may be too drastic or not drastic enough where other breeds are concerned. He thinks that, as regards living viruses, recall or 'booster' doses of vaccine may achieve no immunity-boost unless and until the recipient's immunity has fallen to quite a low level.

Dr. Stoker discussed reasons for failures of immunization against smallpox, such as neglect of many people to be revaccinated after infancy. He particularly stressed that the so-called immune response was an index of sensitivity, not immunity, and should be regarded as equivalent to failure to 'take'. Only with vesiculation accompanying a take of primary or accelerated type does immunity rise satisfactorily. Vaccinia preparations contain an agglutinin for certain red blood cells, and antibodies to this hæmagglutinin develop in immune people. Increase in such anti-hæmagglutinin titres of serum may be a useful guide to what is happening after revaccination. Vaccinia grown in fertile eggs should be given more trials. It is perhaps less stable than calf lymph, but on the other hand could be produced much more rapidly in an emergency. Dr. Stoker also referred briefly to Kaposi's varicelliform eruption, some cases of which he thinks are due to generalized vaccinia in eczematous contacts of vaccinated people. Some of Dr. Stoker's remarks might have afforded useful propaganda for an anti-vaccinationist, had he not begun with the warning that they applied only to failures of vaccination in individuals: its value in inducing herd-immunity was not in doubt.

In the subsequent discussion, Dr. Findlay ranged over several centuries in search of apt news-items about viruses. He also pointed out that yellow-fever immunization in West Africa had been of crucial strategic importance during the Second World War. There was discussion by several speakers of the twenty-year-old theory that immunity persists only while live virus persists in the body—a theory which may be held as a dogma but certainly awaits proof. The role of contaminating hyaluronidase-producing cocci in improving vaccinia 'takes' was discussed by Dr. Lack and others. A number of speakers emphasized that future progress in active immunization against viruses is closely bound up with exploitation of the fertile hen's egg. Progress hitherto has been chiefly noteworthy overseas. Speakers hoped that commercial firms in Britain would see to it that we do not lag behind in this important field of endeavour.

This was an active and useful discussion, not least because, unlike those in some other sections—or so we are told—speakers commendably kept within the prescribed time-limits for their speeches.

OBITUARIES

Sir D'Arcy Thompson, C.B., F.R.S.

WHEN D'Arcy Wentworth Thompson died at the age of eighty-eight, in his home in St. Andrews on June 21, his passing left a gap in many circles that had few points of contact with each other, for he had a wider range of intellectual interests and attainments than almost any other scientific man of our time. By profession he was a zoologist, and there have been few more learned; but he had a quite unusual familiarity with the whole circle of the sciences, joined to an inherited aptitude for, and love of, the classical tongues, and he was constantly surprising his friends by his unexpected knowledge of recondite corners of literature, history and art. He wrote and spoke in a style of effortless felicity, a trifle Victorian perhaps, but, as some of us think, none the worse for that. He loved teaching and he taught to the very last, for even in his final illness he gathered his honours students in his sick-room for talks that none of them will forget.

It is impossible here even to summarize the activities, so varied, of so long a life. He was born on May 2, 1860, at Edinburgh. His father, also D'Arcy Wentworth, was classical master in the Edinburgh Academy and afterwards professor of Greek in Queen's College, Galway; he is still remembered by lovers of a polished style and of liberal ideas on education for his "Day-dreams of a Schoolmaster". His mother, Fanny Gamgee (who died when he was born), belonged to a family distinguished in science and in medicine. After preparatory schooling (which included informal 'Nature study' on Saturday afternoons long before the term was invented) he was sent to Edinburgh Academy, a school the pupils of which have gained fame in all walks of life. He himself has recorded that of his own classmates one was awarded the Victoria Cross, one received a peerage and a seat in the Cabinet, four became fellows of the Royal Society and one a Royal Academician.

On leaving school at the age of seventeen, he matriculated as a medical student in the University of Edinburgh, where he was introduced to scientific zoology by Sir Wyville Thomson, then lately returned from the *Challenger* expedition. But it was with a classical scholarship that, two years later, he went up to Trinity College, Cambridge, and while there he helped to 'work his passage' by coaching men in Greek. He was one of the band of eager students who gathered round F. M. Balfour and Michael Foster, then laying the foundations of the modern Cambridge school of biology. He took a first class in Part II of the Natural Sciences Tripos and for a year demonstrated in Michael Foster's laboratory.

In 1884, at the early age of twenty-four, D'Arcy Thompson was appointed professor of biology (later altered to natural history) in the recently founded University College in Dundee. When, in 1897, after embittered disputes and litigation, the College was made one of the constituent colleges of the University of St. Andrews, he became a member of the Senate, and, twenty years later, on the retirement of Prof. W. C. M'Intosh, he was translated to the senior chair in the United College at St. Andrews. His tenure of the chairs at Dundee and St. Andrews extended to sixty-four years, a record that, under modern conditions, will not be repeated.

Some dates alone must stand for the stages of his scientific career. In 1896 and again in 1897 he went to the Bering Sea as member of the British – American inquiry into the fur-seal fishery, and in the latter year he was British representative on the international conference on the subject at Washington. For these services he received the C.B. in 1898. In the latter year he was appointed to the Fishery Board for Scotland and remained a member until the abolition of the Board in 1939. He was one of the British representatives on the International Council for the Study of the Sea from its beginning in 1902, and he edited and contributed largely to the Scottish section of its reports. He also wrote many papers on fishery statistics and oceanography in the "Scientific Investigations" of the Scottish Fishery Board from 1913 until 1931.

When D'Arcy Thompson went to Dundee, he at once began to assemble a teaching collection for the illustration of his lectures, which were never bound by the fetters of the 'type system'. At that time the Dundee whaling industry had not quite come to an end, and several of the whaling skippers were persuaded to bring back to him a large amount of vertebrate and invertebrate material, much of it of great value and interest. With the addition of collections obtained on his visits to the Bering Sea he got together a museum of arctic zoology which at the time had no equal in Britain.

It was in 1908 that a short paper in *Nature* on "The Shapes of Eggs and the Causes which Determine Them" gave the first published intimation of a line of inquiry that had long engaged his thought and on which he had accumulated masses of notes. In 1917 he published his book "On Growth and Form". This remarkable work at once attracted attention, not so much for the novel ideas it contained (though these were many) as for the mass of illustrative material it brought together from writers ancient and modern, many of whom the average zoologist had never heard of. The perfect pellucidity of its writing and the way in which it made problems, essentially mathematical, comprehensible to the non-mathematician, attracted many readers. It speedily went out of print and had the distinction, rare for a scientific book, of appearing in second-hand book catalogues at ten times its published price. Its central theme is the inquiry how far the form and structure of living things can be interpreted in terms of the physical forces acting within the life-time of the individual organism. It appeared at a time when increasing attention was being paid to this 'causal morphology' as distinguished from the 'historical morphology' which was the almost exclusive study of the period that preceded it. Sir D'Arcy was much too wise and experienced a naturalist to imagine that such an interpretation would take us all the way, but some of his followers were less cautious. In his second, much enlarged, edition, published in 1942, he has to add a warning; in the end, he says, "the twofold problem of accumulated inheritance, and of perfect structural adaptation, confronts us once again and passes all our understanding".

A striking testimony to the influence of this book on a younger generation of biologists is given by the volume of "Essays on Growth and Form presented to D'Arcy Wentworth Thompson", edited by Prof. W. E. Le Gros Clark and Prof. P. B. Medawar, published by the Clarendon Press in 1945.

This is not the place, even if I had the knowledge necessary, to assess the value of Sir D'Arcy's studies on the natural history of the ancient world. His "Glossary of Greek Birds" appeared in 1895, and a second edition in 1942: his translation of Aristotle's "Historia Animalium" was published in 1910 and his "Glossary of Greek Fishes" in 1945; the repute of these and his numerous shorter papers on classical subjects may be gathered from the fact that he was president of the Classical Association in 1929 and of the Scottish Classical Association in 1935. The list of his honorary degrees, honorary memberships, lectureships, medals and so forth is far too lengthy to be given here, ranging, as it does, from Aberdeen to Johannesburg and from Boston to Delhi. He was elected to the Royal Society in 1916, was a vice-president during 1931–33, and awarded the Darwin Medal in 1946. He was president of the Royal Society of Edinburgh during 1934–39. He flew to India at the end of 1946 as one of the four delegates sent by the Royal Society to the meeting of the Indian Science Congress in Delhi; but the strain of the journey was too much for his years and he never completely recovered his health. He was knighted in 1937.

Sir D'Arcy was a man of very striking presence with a resonant and beautifully modulated voice which made his lectures and addresses a pleasure to listen to.

Lady Thompson and her three daughters are assured of the sympathy of his innumerable pupils and friends in all quarters of the globe.

W. T. Calman

Sir D'Arcy Thompson was not the only man of science in his generation who 'kept up his classics' and pursued them in connexion with his professional work. Other biologists were Sir Edward Poulton and Dr. F. A. Dixey. But Sir D'Arcy's studies were on an ampler scale. Both his "Glossary of Greek Birds", published forty years ago and recently in a well-groomed second edition, and his "Glossary of Greek Fishes", reviewed in these columns only a few months since, are the classical books of reference in their subject, and illustrate his wide range of literary scholarship as well as his tireless industry. They are supported by a rich flow of smaller articles and notes covering a wider field, and by invaluable services as a member of the staff of the revised "Liddell and Scott". Two examples will illustrate his range and versatility. He was the first to make geometrical sense of Herodotus' description of the Great Pyramid, and to show how its form was related to the processes of its construction. And his knowledge was at his instant disposal. I referred to him some years ago, at the request of a distinguished surgeon, the Homeric description of the death-struggle of Nestor's chariot horse, struck through the forehead by an arrow. The reply came by return of post—"written in the laboratory": the arrow had grazed the cerebellum, and the convulsive movements of the limbs, causing the horse to roll over and over, were precisely what were to be expected. He had seen the same death-struggle in a rabbit, and dissected out the fatal pellet from an identical wound.

On the low shore of Lake Superior, the train nearly left behind three of the party, plucking wild raspberries. My snapshot bears the legend, "Berries and beavers".

John L. Myres

Prof. B. E. Livingston

With the passing of Burton Edward Livingston early this year, plant physiology in the United States has lost a distinguished figure. Himself an indefatigable investigator, he devoted much time and energy to the stimulation of scientific research and the promotion of co-operation and intercourse among his fellow men of science. From 1920 onwards he was a member of the executive of the American Association for the Advancement of Science, for fourteen years as secretary, and became its chairman in 1941. He served on the National Research Council. Among many other activities he took a prominent part in the foundation, in 1924, of the American Society of Plant Physiologists; he was elected one of its first vice-presidents and was the first to be elected life member under the Charles Reid Barnes Foundation. The esteem in which the Society held him as an investigator was very appropriately indicated when in 1946 it conferred on him the Stephen Hales Award, since his chosen field was the quantitative study of the water relations of plants, in which Stephen Hales was the pioneer.

Livingston's interest in this aspect of plant physiology was established at the very beginning of his career. Having graduated at Michigan in 1898, he went to Chicago as fellow and assistant in plant physiology. Five years later, at the age of twenty-eight, he published his book on "The Role of Diffusion and Osmotic Pressure in Plants". A visit in the summer of 1904 to the recently established Desert Laboratory of the Carnegie Institution at Tucson, Arizona, provided the material for his "Relation of Desert Plants to Soil Moisture and to Evaporation" (1906), in which the scheme of his later work was foreshadowed. A short period with the U.S. Bureau of Soils and three years at Tucson preceded his appointment in 1909 to the chair of plant physiology at the Johns Hopkins University, which he occupied until his retirement in 1940.

Livingston's contributions were marked by comprehensive grasp and clarity of analysis. He emphasized from the first the dynamic aspect of the relations between plants and their environment. His approach was primarily that of a physiological ecologist: the influence of Schimper is evident in his early work. He was impressed by the complexity of the environment and the interaction of factors in their influence upon the plant. He held the separate measurement of those factors to be insufficient in the study of plant distribution and adaptation; so he sought methods of assessing their integrated effects. He introduced the dynamic concepts of the water-supplying power of the soil and the evaporating power of the air. His porous porcelain atmometers (evaporimeters) with standardized spherical bulbs have been very widely used. He sought to measure the water-supplying power of the soil by inserting osmometers in it. Although he may have over-estimated the mobility of capillary water, his experimental approach was sound and stimulating. Connected with these investigations was his introduction of the auto-irrigator, a porous pot supplying water to the soil at a predetermined capillary potential.

As physiologist he sought to express the water relations of plants in terms of quantitative physical laws, as affected by variations of water content and internal resistances as well as by external factors. As ecologist he aimed at correlating the distribution of vegetation with the quantitative data and at giving precision to otherwise vaguely defined distinctions. This is the keynote of "The Distribution of Vegetation in the United States as related to Climatic Conditions", which he published with Forrest Shreve in 1921.

The long series of papers which emanated from Baltimore during the thirty years of his tenure are ample proof of the stimulus of his leadership.

D. Thoday

NEWS and VIEWS

Egyptology in the University of Liverpool: Prof. A. M. Blackman

With the retirement, on reaching the age-limit, of Dr. Aylward M. Blackman from the Brunner chair of Egyptology, which he has held since 1934, the University of Liverpool loses a fruitful teacher and a valued contributor to a number of branches of ancient Egyptian studies. Born at Norwich in 1883, and a keen student of Egyptology from the age of sixteen, Dr. Blackman was educated first privately, then at St. Paul's School, London, and Queen's College, Oxford, where in 1906 he took a first class in Oriental Studies. During 1906–14 and 1920–21 he took part in or directed excavations and recording in Egypt (Oxyrhynchus, Abydos, Meir, El-Amarnah) and the Sudan (Survey of Nubia, Buhen, Faras, Sesebi). During 1912–18 he was Laycock Student of Egyptology of Worcester College, Oxford. Since 1935 he has been joint editor, with Prof. J. P. Droop, of the *Annals of Archæology and Anthropology*, and during 1922–35 was a member of the Council of the Royal Asiatic Society. From 1936 on he has been special lecturer in Egyptology in the University of Manchester. His publications have been numerous; chief among them are four volumes on "The Rock Tombs of Meir" (1914–24), with about eighty plates drawn by himself, and volumes on the Lower Nubian temples of Dendûr, Derr and Bîgeh. Other works deal especially with Egyptian myth and ritual. He has done much to present Ancient Egypt to a wide public. All Egyptologists will hope that it will be possible for Dr. Blackman to continue his Egyptological researches for many years to come.

Mr. H. W. Fairman

Dr. Blackman's successor is Mr. Herbert Walter Fairman, who has been an active worker in the field since 1929 (war-service excepted). Mr. Fairman was born at Clare, Suffolk, in 1907; but he spent his early years in Egypt, where his father was a missionary. He was educated at Goudhurst School, Kent, going eventually to the University of Liverpool, where he studied Egyptology under the late Prof. Peet. For the next ten years he took part in excavations conducted in Egypt and the Sudan by the Egypt Exploration Society—at the cemetery of the Buchis bulls at Armant, 1929–31; at El-Amarnah, 1930–36; at Sesebi, 1936–38; at Amarah West, 1938–39 and 1947–48. In 1937 he became the Society's field director. At Armant and El-Amarnah he was primarily responsible for the publication of the inscriptions. The need to interpret the difficult late writing of the Ptolemaic and Roman inscriptions relating to the Buchis bulls led him to specialize in the texts of those periods, and he has become one of the very few contemporary authorities on them. During 1940–47 he was engaged in war-time duties at the British Embassy, Cairo, and while there he gave many lectures on Ancient Egypt to troops in his spare time. It is hoped that his teaching duties at Liverpool will leave him opportunities to continue his researches into the texts of the latest periods, which contain many remarkable matters not generally known even to Egyptologists.

Chemistry at the University College of North Wales, Bangor: Dr. Stanley Peat, F.R.S.

Dr. Stanley Peat, reader in organic chemistry in the University of Birmingham, has been elected to the chair of chemistry at the University College of North Wales, Bangor, University of Wales, in succession to Prof. E. D. Hughes, who is going to University College, London (*Nature*, April 3, p. 511). Dr. Peat had a distinguished career as a student of King's College, Newcastle, University of Durham, which he entered with a State Scholarship and the Earl Grey Scholarship in 1921. He graduated with first-class honours in the University of Durham in 1924 and was awarded the Saville Shaw and the Freire-Marreco Medals on graduation. He there joined the research school of Sir Norman Haworth, and eventually followed him to the University of Birmingham. His first joint publication in 1926 was on a revision of the structural formula of glucose. After obtaining his doctorate he was appointed lecturer in the Department of Physiology in the Medical School of Birmingham under Prof. I. de Burgh Daly, and published several papers in physiological journals on histamine. In 1934 he transferred to the teaching staff of the Department of Chemistry at Birmingham and engaged in constitutional studies of the polysaccharides. Outstanding among his publications are: his proof by synthesis of the configuration of glucosamine, the constitution of maltose, the studies of the mechanism of inversion of configuration in the sugar group, and especially the study of the enzyme systems responsible for the synthesis and degradation of starch. This latter work has led to the isolation of the *Q*-enzyme which is responsible for the biosynthesis in the presence of phosphorylase of the major component of starch, amylopectin. He has shown, moreover, that the *Q*-enzyme from potato converts the amylose to amylopectin, and he has devised an elegant method for the separation of the two components of starch. His more recent work has been on the photochemical degradation of carbohydrates, which has opened up what is practically a new field of investigation, the main features of which appear to be an indication of the reversal of the photosynthesis of starch. He has served as the English editor of the international publication "Advances in Carbohydrate Chemistry".

Royal Society of Medicine : Sir Henry Dale, O.M., G.B.E., F.R.S.

THE Royal Society of Medicine elects its president annually, and he may be re-elected for a second year. The practice has been to offer the presidency in turn to a physician, a surgeon and a specialist. This year it has been the turn of the specialist, and Sir Henry Dale, the distinguished former director of the National Institute for Medical Research, and president during 1940–45 of the Royal Society, has been elected; this is the first time that a man whose chief claim to distinction has been in the field of pure science has been elected. The Royal Society of Medicine, like so many learned bodies, originated from meetings of a group of young men in London eager to discuss their work. It was founded in 1805, and its chief purpose has always been "the cultivation and promotion of physic and surgery, and all the branches of science connected with them". It received a Royal Charter in 1834. During its first century, the Society was mainly active in London, but in 1907 a number of medical societies joined forces with the Royal Medico-Chirurgical Society of London, as it was then called, to form the present well-established body, and a Supplemental Charter was given it. The Society now has some 9,000 fellows, of whom more than 1,200 are overseas ; all nationalities are represented. The Society functions through twenty-four specialized sections, which hold some two hundred meetings between them every year. Members of the Society are justly proud of its library, which has a record of great activity. Apart from the provision of books, it has been able, through a grant from the Rockefeller Foundation, to give substantial assistance in the restoration of medical libraries which had suffered through the War, by providing microfilm copies of journals now out of print.

Air Photography and Archæology

THE importance of air photography for the archæologist cannot be exaggerated. Not only does it permit accurate plotting of the visible monuments of an area to be made when detailed maps of the district are inaccurate or non-existent, but further it frequently indicates where ancient monuments now disappeared had once stood. Let us suppose a building, say, a Roman villa, once occupied an area of ground. Where the foundations had been dug the soil would have been disturbed, and, though perhaps nothing is visible now above ground, below the soil much brickwork, etc., would still occur. Corn or other crops on the field where the villa had been would grow somewhat differently as to height and density where the foundations lie, and would thus mark out as it were on a plan where they were. On the ground nothing can be seen ; from the air the whole is clearly set out. Messrs. Kodak are to be congratulated on the exhibition of such photographs which has been arranged at their premises in Regent Street, London, and is open to the public until July 21. An excellent explanatory pamphlet by Dr. J. K. St. Joseph, illustrated by a number of actual air photographs, has been issued. There are also maps showing where the various sites appearing in the exhibition occur. Such well-known localities as Stonehenge and Avebury have been included.

Biological Research Institute, Tihany

THE Director-General of Unesco, Dr. Julian Huxley, during his four-day visit to Hungary as guest of the Hungarian Government, spent June 13 at the Biological Research Institute at Tihany, Lake Balaton (see *Nature*, **158**, 456 ; 1946). Dr. Huxley was interested in the success of the efforts, made immediately after the cessation of fighting and during the inflation, which have resulted in a Research Institute capable of publishing, each year since 1945, the Archiva Biologica Hungarica, containing some thirty-five papers in congress languages (mostly in English). He approved the idea which had here been followed of assembling in one Institute the greatest possible variety of biological disciplines, and showed himself keenly aware of the many advantages of such a system, especially in small countries. Dr. Huxley was interested to hear that several research workers were to go to the Institute for a period. Two places are reserved for invited Russian biologists ; two English men of science are going for the summer and autumn and two Finnish biologists are also expected.

Exchange of War-time Periodicals with Germany

EFFORTS are still being made by the Foreign Office to make possible the exchange in bulk of periodicals issued during the Second World War by British learned societies, universities, and other institutions with those published by similar bodies in Germany. These efforts are more likely to be effective if information concerning the numbers of publications involved can be supplied. Interested librarians are accordingly asked to notify either the Director of the Association of Special Libraries and Information Bureaux, 52 Bloomsbury Street, London, W.C.1, or the Secretary of the Library Association, if they have not already done so : (*a*) of the total number of volumes or parts of periodicals issued during the War and held by them for exchange with German institutions, and (*b*) of the numbers which they should receive in return, indicating clearly whether it is known that these German publications are available for exchange purposes. The returns should be headed : "German exchange". It should be understood that the information asked for relates only to the war-time accumulation of periodicals for exchange. Future exchanges must be arranged by institutions in the two countries privately.

Benjamin Franklin as Printer and Publisher

VOL. 92, No. 2 of the *Proceedings of the American Philosophical Society* (1948) is devoted to studies of historical documents in the library of the Society at Philadelphia. Chief among these is a paper by W. E. Lingelbach on new source material regarding Benjamin Franklin's activities as printer and publisher both during the first half of his life and in his later years. Much of the material relates to his interests in Philadelphia during 1728–66, the most interesting being concerned with his printing activities in Passy. This latter includes a unique collection of more than four hundred brass stencils, apparently used by Franklin in the study and designing of type, as well as inventories of fonts cast at Passy and of type and other printing materials purchased from the leading English, French and possibly Dutch type-founders. Other articles in this number include Prof. G. Chinard's study of Franklin as negotiator, December 1777, Prof. P. A. W. Wallace's appreciation of H. E. Muhlenberg's work as botanist, Prof. T. D. Cope's note "Collecting Some Material about Charles Mason and Jeremiah Dixon", the astronomers and geodetic surveyors, and Prof. I. J. Cox's account of the Freeman Red River Expedition of 1806.

Establishment of Hardwoods in Britain

MANY will welcome the small Forestry Commission pamphlet No. 2 of the Forest Operations Series (who invents these cumbersome titles ?) on the "Establishment of Hardwoods" (London : H.M. Stationery Office. 9*d.* net). The small area of 35,000 acres only was afforested or replanted in Britain with various hardwoods during the first twenty-five years of the Forestry Commission. A bulletin recording the information so far gathered on the subject of sowing and planting to form the new plantations was in the press just before the outbreak of war, but was destroyed during the bombing of London. The present one has been prepared from a report of Mr. A. H. Popert, acting conservator in the south-west of England, as a result of a tour of the Commission's hardwood plantations. It is perfectly well known that the raising and tending of young hardwood crops, save in exceptionally favourable circumstances of habitat, are more difficult and call for more experience than is required for conifers. The bulletin gives notes on the chief timber species—oak, beech, ash, sycamore, sweet chestnut, birch and alder. It also deals with the treatment of coppice woods and devastated woodlands ; on these latter subjects, some who have lived with and studied coppice areas may differ from the views contained in the paper. As a result of war-time and present-day fellings of the fine hardwoods, it is noted that the "Establishment of broad-leaved trees is likely to assume increasing importance in British Forestry".

"Not poppy, nor mandragora . . ."

"An Index of Modern Remedies", by William Mair, has, since it was first published in 1941, been useful to the medical and pharmaceutical professions, to whom alone it is issued. The appearance of a new edition (Fourth Series, 1948. *Scottish Chemist*, 240 Albert Drive, Pollokshields, Glasgow, S.1 ; and from Messrs. H. K. Lewis and Co., Ltd., 136 Gower Street, London. 3*s.*) will therefore be welcomed. This new edition contains, as well as a few recently coined names of remedies, a valuable article on the 1948 edition of the British Pharmacopœia, with lists of the 250 new admissions to this publication and of the omissions from it. There is also a useful list of costly and essential drugs now exempted from the purchase tax. As Mr. Mair rightly says in his introductory note, no physician or pharmacist can nowadays be familiar with the names, composition and action of all the pharmaceutical preparations on the market, and he has set out to give this information in a handy and well-indexed form. He also gives, by means of a key, the names and addresses of manufacturing chemists and the preparations which they make. Using this book, one realizes how many names some drugs nowadays have, the changes these names have undergone and how different they may be in different countries. Pentothal, for example, is now thiopentone soluble B.P. and U.S.P., and aminacrine hydrochloride B.P. used to be, and no doubt still is in some quarters, acramine, monacrin or acramine yellow. The maze of names given to the antimalarial drugs and to the sulphonamides and their derivatives are here sorted out, and a short supplement lists special injection solutions for parenteral therapy. More than half the book is devoted to a classification of various remedies according to their mode of action. In this section the statement that phenothiazine is an anthelmintic of low toxicity needs modification. As Prof. J. H. Gaddum says in his foreword, this book is a valuable guide and provides information not easily obtained elsewhere, even in more expensive books.

Pfund Issue of the *Journal of the Optical Society of America*

THE October 1947 issue of the *Journal of the Optical Society of America* is the largest issue of the journal ever to be published and was specially called the "Pfund Issue". It consists of articles written by Prof. A. H. Pfund's former students and colleagues and is a tribute to him on his retirement from active teaching at the Johns Hopkins University. An advance copy of this issue, together with a 'scrap-book' containing the letters which accompanied the manuscripts of the articles when they were submitted for publication, was presented to Prof. Pfund at the dinner held during the thirty-second annual meeting of the Society in October last. A photograph of Prof. Pfund is on the opening page, and the first of the twenty-three articles in the issue is by Prof. R. W. Wood, who writes on "The Use of Echelette Gratings in High Orders". Two of the articles are actually by Prof. Pfund himself and co-workers, but he was unaware that his colleagues had submitted the papers for a special issue of the *Journal.* They deal with selective infra-red gas analysers and with optical scattering by dielectric powders. The other articles include : a historical note on the rate of a moving clock by H. E. Ives ; a spark light-source of short duration by J. W. Beams and others ; an optical study of acoustic fields near diffraction edges by J. C. Hubbard and others ; and practical methods of making and using multilayer filters by Mary Banning.

Hot-wire Vacuum Switches

SUNVIC CONTROLS, LTD., 10 Essex Street, Strand, London, W.C.2, manufacturers of vacuum switches, temperature control and associated equipment, have recently issued a 16-page illustrated pamphlet describing their hot-wire vacuum switches. The Sunvic hot-wire vacuum switch is contained within an evacuated glass tube not much larger than an ordinary radio valve, and is a non-arcing electric relay, the operation of which depends on the fact that when an electric current is interrupted by the separation of two surfaces in a vacuum no arc is formed. The movement necessary to close or open the switch is quite small and is provided by the thermal expansion of a special steel wire through which a control current of some 25–60 m.amp. is passed. The switch contacts are tungsten and are normally held apart against a compressed spring, which is released by the expansion of the hot wire. The operating characteristics of many different forms of hot-wire vacuum switches with various time delays, closing currents and current-carrying capacities are listed, and twelve different standard circuit and wiring diagrams are shown. The hot-wire vacuum switch is capable, in various sizes, of handling up to 10 kW. at 440 volts, and is suitable for controlling alternating or direct currents up to 30 amp. and voltages from 10 to 600.

J. J. Thomson on "Cathode Rays"

THE text of J. J. Thomson's historic Royal Institution lecture of April 30, 1897, on "Cathode Rays", has been reproduced in full in the November–December issue of the *American Journal of Physics* as the contribution of the American Association of Physics Teachers to the Electron Jubilee celebrations (see also *Nature*, **160**, 776; 1947). It will be recalled that it was in this lecture that J. J. Thomson, after discussing Lenard's, Perrin's and some of his own experiments on the charges carried by cathode rays, concluded that "the size of the carriers [of electrical charge] must be small compared with the dimensions of ordinary atoms and molecules". Further, that from his experiments on the deflexion of cathode rays, he was able to deduce a value for m/e which, quoting from the final words of the lecture, was "of the same order as the value 10^{-7} deduced by Zeeman from his experiments on the effect of a magnetic field on the period of the sodium atom".

Italian Polar Research Institute

A NEW polar institute, Istituto Geografico Polare, has been formed in Italy under the directorship of Dr. S. Zavatti. The *Polar Record* for January–July announces that the aims of the institute are: (1) to widen knowledge of all polar areas; (2) to encourage interest in polar affairs in Italy and to publish Italian contributions to polar knowledge; (3) to form a polar library; (4) to publish a monthly periodical, *Il Polo*; and (5) to publish maps of scientific value on polar regions and a series of "Polar Classics". The first number of *Il Polo* came out in February 1946. The address of the new institute is Istituto Geografico Polare, Porto Potenza Picena, Macerata.

Pathogenicity of *Aspergillus nidulans*

THERE are numerous reports in medical literature of infection of man and other animals by species of the fungal genus *Aspergillus*. Pathogenicity of *A. fumigatus* is comparatively well known, and *A. nidulans* has occurred in circumstances which seemed to implicate it as a cause of disease. Dr. Charles H. Drake has studied the latter species in a recent paper (*Mycopathologia*, 4, Fasc. 2, pp. 103; 1948). He finds that the fungus is pathogenic to rabbits, causing initially a purulent inflammation with abscess formation. Subsequent injections may give rise directly to tubercles, in which the fungus changes morphologically to give actinomycetoid granules. Cell-sap of *A. nidulans* is not toxic to rabbits, but stimulates the formation of precipitins. This species does not appear to be pathogenic to guinea pigs, which fact might explain some earlier uncertainty about its disease-producing character.

Land-mine Detectors

FOLLOWING a request, received early in 1940, by the Scientific Advisory Committee of G.H.Q. Middle East for work to be undertaken on the design and construction of land-mine detectors, Dr. Lawrence Balls, then chairman of the Committee, together with Mr. J. H. Cole, and with the assistance of military personnel, produced, and tried out in actual operations, several successful models. In an article entitled "Land-mine Detectors designed at Giza", which Dr. Balls contributes to the June number of *Reme*, the journal of the Corps of Royal Electrical and Mechanical Engineers, details are given of the construction, performance and characteristic features of these land-mine detectors. They were of various sizes, the large models suitable for road clearance, and the smallest for surgical applications, such as shrapnel detection in wounds. The Mark IV design was first used, but was superseded by an original design due to Dr. Balls, consisting of twin search-coils, thus giving double sensitivity. Coils of about 12-in. diameter were found convenient for ordinary field detectors, and of about ⅜-in. for surgical use. Operating on the heterodyne principle, a frequency of one megacycle per second proved most useful, with a frequency ratio of two-thirds to produce the audio-frequency beat-note. Segmented screening, twin oscillators, and a low-loss chassis were the three main characteristics of the 'twin' design. The earthed screen surrounding a search-coil was cut, usually, into twelve segments, each segment being separately connected by a thin wire to a central earth on the chassis. The two identical search-coils, mounted together in the same plane, were inductances of separate oscillatory circuits, driven from a single twin-triode valve. Passage of the coils over a metal object caused the beat-note, somewhat lower than middle C, to be altered downward by one coil and upward by the other, thus causing the headphone note to change suddenly from a progressively lowering growl to a falling high shriek as the object passed from one coil to the other. The weight of a one-man detector is naturally a matter of practical importance, and a prototype, of which two copies were flown to Britain in 1943 but too late to be considered for production, and which was made of wax-boiled wood though designed for production in plastics, weighed only 14½ lb., of which the batteries accounted for more than half.

Mathematical Tables for Science and Industry

THE lack of the relevant mathematical tables for investigations in the physical, chemical and engineering sciences, in mathematics and in industry may well delay progress, and steps are being taken to meet the difficulty. Much work in this field has been done, and tables of a fundamental nature have been produced by the British Association through its Mathematical Tables Committee. These activities have now been transferred to the Royal Society on the invitation of the British Association, and a special Royal Society Mathematical Tables Committee has been established to continue and extend the earlier work. The Committee would be glad to receive suggestions from industrial research groups, from individual investigators and from Service departments relating to existing needs in their special fields. Requests for assistance may be met either by advice as to the most economical way of producing the desired tables, or by an undertaking to produce the tables under the auspices of the Royal Society, or, in exceptional cases, by a grant towards the cost of tabulation or to make possible the publication of important tables which may exist only in manuscript. In the first instance inquiries should be addressed to the Assistant Secretary, Royal Society, Burlington House, London, W.1.

Congress of the Universities of the Commonwealth

THE sixth Congress of Universities of the Commonwealth will be held at Oxford during July 19–23. Some three hundred delegates are expected to attend, and observers have been appointed by Unesco, the United States and various learned institutions. Among the topics to be discussed are: relations of the State and the universities; inter-university relations; a critical review, from the points of view of a historian, a philosopher and a sociologist, of the structural and moral changes produced in modern society by scientific and technological advance; the balance of research and teaching in universities; general plan for colonial higher education; extension of the university secondment scheme. The Congress s being preceded by a private conference, held at Bristol during the past week, of executive heads of universities.

Fifth Commonwealth Entomological Conference

PRIOR to the War, Imperial Entomological Conferences were held in London at five-yearly intervals, but because of the War it is now thirteen years since the last one assembled. The Fifth Commonwealth Entomological Conference, to be held in London during July 22–30, will be attended by forty-wo delegates, eleven representing the United Kingdom, nine the Dominions and twenty-two the Colonies, Protectorates, Dependencies and Southern Rhodesia. All meetings, with the exception of certain business meetings to be held on July 22 and 30, will be open to the public. The Conference has been convened by the Executive Council of the Commonwealth Agricultural Bureaux and organised by the Commonwealth Institute of Entomology, which is one of the constituent bodies of the former organisaion. With the exception of one meeting to discuss plant quarantine, all other topics selected for discussion have been chosen because they relate to some branch of applied entomology in which outtanding developments have occurred since the last Conference which met in 1935; they include insecticides, biological control, estimation of insect populations in the field, control of insects in stored products, tsetse control, locusts and grasshoppers. Further particulars can be obtained from the director of the Commonwealth Institute of Entomology, British Museum (Natural History), Cromwell Road, London, S.W.7.

Conference on Biology and Civil Engineering

A Conference on Biology and Civil Engineering will be held at the Institution of Civil Engineers during September 21–23. This conference is intended primarily for members of the Institution and others engaged in civil engineering work where the problem of the effect of vegetation is an important factor. Papers will deal with research and other work carried out not only in Great Britain, but also in New Zealand, South Africa, Holland and the British West Indies. Among the topics for discussion are: causes, effect and prevention of soil erosion; effect of vegetation on drainage and floods; effect of vegetation in stabilizing artificial slopes; use of vegetation to tabilize sand dunes; effect of vegetation on the settlement of roads and structures; algal growth and ngineering design. All meetings will be held at the nstitution of Civil Engineers, from which further particulars can be obtained.

University of London: Appointments

THE following appointments in the University of London have been announced: Dr. J. L. D'Silva, reader in physiology at St. Bartholomew's Hospital Medical College, to the University chair of physiology tenable at the London Hospital Medical College, as from October 1; Mr. C. H. Gray, lecturer in biochemistry at King's College Hospital Medical School, to the University chair of chemical pathology tenable at the School, as from April 1; Dr. H. A. Magnus, director of the Pathology Department and morbid anatomist to King's College Hospital and to the Medical School, to the University chair of morbid anatomy tenable at King's College Hospital Medical School, as from April 1.

University of Sheffield

MR. S. C. GOODWIN has provided £600 per annum, under covenant for seven years, to provide, through the Cutlers' Company, a fellowship in the University of Sheffield which will be known as the Goodwin Fellowship for postgraduate work in engineering or metallurgy, to be offered in each of the next seven years. Each fellowship will be awarded by the Cutlers' Company, on the recommendation of the Senate of the University. The value of each fellowship will be £300 a year, tenable for two years.

The Council of the University of Sheffield has made the following appointments: C. R. K. Blundell, lecturer in geology; T. Summerfield King, lecturer in anatomy; A. A. Carlyle, lecturer in physiology; John Fiddes, assistant lecturer in physics; Gilbert Y. Kennedy, research worker in the Department of Pathology under the auspices of the British Empire Cancer Campaign.

University of Aberdeen

THE honorary degree of doctor of laws has been conferred by the University of Aberdeen on the following, among others: Dr. G. A. Currie, vice-chancellor of the University of Western Australia; Lord Dudley Gordon, president of the Institution of Mechanical Engineers; and Sir John Boyd Orr, director-general, United Nations Food and Agriculture Organisation.

The degree of doctor of philosophy has been conferred on the following, the title of the thesis presented appearing in brackets: C. H. Gimingham ("Life-Form in Plants and the Structure of Plant Communities"); N. Grassie ("A Study of the Thermal Degradation of Polymethyl-methacrylate"); H. G. M. Hardie ("Studies on Phosphate Fixation in Soil"); R. J. Hay ("The Kinetics of the Gas Phase Polymerisation of some Vinyl Derivatives"); Shih-Chen Liang ("The Study of Wood Anatomy within the Genus *Larix* and the Influence of Internal and External Factors Thereon"); Muriel Mackay ("Some Aspects of the Photo-polymerisation of Methylmethacrylate"); A. McLaren ("Certain Aspects of Free-radical-initiated Polymerisations"); C. R. Masson ("Osmometry of High Polymer Solutions"); Gargestwari Narayana Subba Rao ("Physico-chemical Investigations on the Muscle Proteins of some Commercial Species of Fish caught in North-East Scottish Waters"); J. C. Robb ("The Kinetics of the Interaction of Atomic Hydrogen with Olefines"); J. D. Stewart ("A Comprehensive Survey of the Mathematical Education of Engineers"); R. B. Whyte ("The Photosensitisation of Polymerisation in the Liquid Phase"); G. W. Youngson ("The Synthesis of Branched-chain Polymers").

Royal Commission for the Exhibition of 1851: Awards

The Commissioners for the Exhibition of 1851 have announced the award of Overseas Science Research Scholarships for 1948 to the following (the subject and place of research are given in brackets). On the recommendation of the University of Toronto: A. C. Hollis-Hallett (physics, University of Cambridge). On the recommendation of the University of Melbourne: N. N. Greenwood (physical chemistry, University of Cambridge). On the recommendation of the University of Sydney: Miss D. C. Davison (plant biochemistry, University of Cambridge); and P. B. Treacy (nuclear physics, University of Cambridge). On the recommendation of the University of New Zealand: C. F. Coleman (nuclear physics, University of Cambridge or Birmingham); D. S. Coombs (geology, University of Cambridge); and E. O. Hall (physics, University of Cambridge). On the recommendation of the University of Delhi: R. P. Bambah (mathematics, University of Cambridge or London). On the recommendation of the University of the Punjab: Miss M. Mehtab (cytology, University of Edinburgh).

Institution of Electrical Engineers: Officers for 1948–49

The following officers and new members of Council of the Institution of Electrical Engineers have been elected to take office on September 30: *President:* Mr. T. Graeme N. Haldane; *Vice-Presidents:* Mr. A. J. Gill, Col. B. H. Leeson; *Honorary Treasurer:* Mr. E. Leete; *New Members of Council:* Mr. S. E. Goodall, Mr. H. W. Grimmitt, Mr. J. Hall, Dr. W. G. Radley, Dr. H. W. H. Warren, Mr. E. L. E. Wheatcroft, Mr. M. W. Humphrey Davies, Mr. A. V. Milton.

Douglas Lea Memorial Lecture

As a memorial to the late Dr. Douglas Edward Lea, the Hospital Physicists Association has decided to found a memorial lecture, to be given biennially during one of the meetings of the Association, by a worker of distinction in the field to which Dr. Lea had made many outstanding contributions, namely, the actions of radiation on living cells. The lectures will be open to the public, and the Association has set up a Trust Fund to cover the expenses of these lectures in perpetuity. Any income in excess of that required to meet the expenses of the lectures will be devoted to scientific research or publication. Friends of the late Dr. D. E. Lea who may wish to contribute to this Fund are asked to communicate in the first place with Mr. J. W. Boag, Medical Research Council, Hammersmith Hospital, London, W.12, who will notify them of the way in which contributions should be made.

Announcements

The King in Council has approved of a charter granting full university status to the University College of Nottingham. Lord Trent, president of the College, will be the first chancellor; Mr. B. L. Hallward, head master of Clifton College, will be vice-chancellor.

The Hungarian Academy of Science has established an Eötvös Medal in commemoration of the hundredth anniversary of the birth of the famous Hungarian physicist, Loránd Eötvös. The first Eötvös Medal has been awarded to Prof. J. Barnóthy and Dr. M. Forró for their outstanding achievements in the realm of cosmic radiation.

The James Scott Prize for 1948 of the Roya Society of Edinburgh was presented to Prof. Herber Dingle at the ordinary meeting of the Society held o July 5, 1948, at which, in terms of the Prize, Prof Dingle delivered an address on "The Nature o Scientific Philosophy". The Neill Prize (1945–47 was presented *in absentia* to Dr. Robert Broom, fo his contributions to our knowledge of the foss vertebrates of the Karroo Beds of South Africa.

Dr. S. L. Hora, director of the Zoological Surve of India, has been appointed an honorary member o " 's Lands Plantentuin" by the staff of the scientifi institutes of south-east Asia constituting this body The letter from Dr. L. G. M. Bass Becking, directo of the Botanic Gardens, Buitenzorg, giving this announcement, makes appreciative reference to Dr Hora's contributions to tropical zoology, to the spiri of co-operation and friendship he is always able t convey to colleagues abroad, and to the need fo scientific men in south-east Asia to join forces in promoting reconstruction measures.

The managers of the Royal Institution have mad the first appointment to the Science Researc Scholarships of the Institution offered to candidate from overseas universities. One of these scholarship is to be awarded each year on the advice and recommendation of the Science Scholarships Committee o the Royal Commission for the Exhibition of 1851 and the award for 1948 has been made to Mis Philippa Marion Glasgow; Miss Glasgow is a physica chemist, and holds the degree of M.Sc. of the University of New Zealand.

The following have been elected to Beit Fellowship for Scientific Research of the value of £400 pe annum each, tenable at the Imperial College o Science and Technology: P. W. M. Jacobs, fo research in physical chemistry under the directio of Prof. H. V. A. Briscoe; M. J. M. Bernal, fo research in applied physical chemistry under th direction of Sir Alfred Egerton.

The Flatford Mill Field Centre of the Council fo the Promotion of Field Studies, 10 Exhibition Road London, S.W.7, will be formally opened by the chairman of the Carnegie United Kingdom Trust, Mr E. Salter Davies, on July 23.

We have received a copy of No. 1 of Vol. 2 o *Quarterly Reviews*, published by the Chemical Societ (price to non-fellows, 8*s*. per number or 25*s*. pe annum). It contains, in 91 pages, articles by H. N Wilson and J. G. M. Bremner on "Disproportionation in Inorganic Compounds", by D. V. N. Hardy an N. J. L. Megson on "The Chemistry of Silicon Polymers", by L. J. Haynes on "Physiologically Active Unsaturated Lactones", and by A. D. Walsh on "Far Ultra-Violet Spectra, Ionisation Potentials and their Significance in Chemistry". The publication is intended to be of interest to chemists generally and not only to workers in the fields reviewed. A limited number of additional subscriptions for Vol. can be accepted.

Erratum. We regret that the illustration accompanying the communication entitled "Eye Movements During Monocular Fixation" by Drs. Mary P Lord and W. D. Wright (*Nature*, July 3, p. 25) ha been printed upside down.

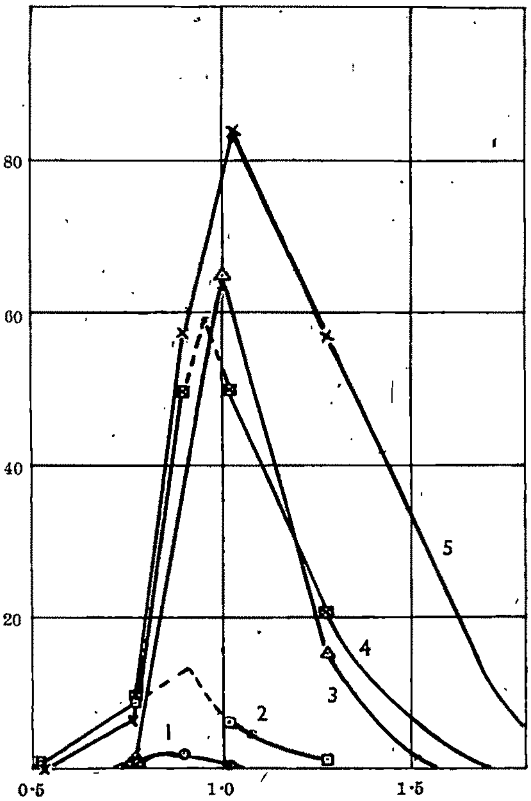
Role of the Hydroxyl Group in the Gelation of Aluminium Soaps in Hydrocarbons

IN most of the early investigations, aluminium soaps were prepared by aqueous metathesis between a soluble soap and an aluminium salt. As pointed out by McBain[1], the result of reaction between a weak acid and a weak base is not likely to produce a stable salt. The tendency of aqueous solutions of aluminium salts to precipitate aluminium hydroxide over a range of *p*H is well known, so some at least of soap prepared by aqueous metathesis is likely to consist of fatty acid adsorbed on to precipitated aluminium hydroxide. Analogous to the alumino silicates, alums, etc., one could associate a co-ordination number of four or six with aluminium, giving many different possibilities of co-ordination with fatty acid radical, undissociated fatty acid and water. When the effect of *p*H, heat and method of preparation on such a heterogeneous system[2] is considered, it is not surprising that results are difficult to duplicate.

At ordinary temperatures, soaps prepared by the above method have a negligible solubility in hydrocarbons, and tend to gel. On the other hand, a fatty acid and an aluminium alcoholate, when moisture is igorously excluded, react exothermically to give a product which is extremely soluble in benzene and does not gel. A study of benzene solutions of these aluminium 'soaps' prepared in the absence of water has given some interesting results. In each case the 'soap' is prepared *in situ*, and so the solution contains some free alcohol.

(1) The addition of very small amounts of water auses a marked gelling and increase in viscosity even at low concentrations of soap. A quantitative study of this is presented in the accompanying graph. n this case the equivalent of two molecules of fatty acid per molecule of aluminium alcoholate, $\mathrm{Al}(\mathrm{O}R)_3$, was allowed to react in a solution containing 2·66 per cent aluminium *sec.* butylate, and the viscosity was plotted against the number of molecules of water per atom of aluminium. The viscosity is anomalous and is therefore given as the time of fall of a 3/32-in. diameter steel ball through 5 cm. of the system. Within experimental error, it can be seen that in ach case the viscosity rises to a steep maximum at the equivalent of one molecule of water per atom of aluminium, and then falls sharply until at about he equivalent of 2 moles of water precipitation of soap begins. The position of the maximum viscosity is independent of the relative or total amounts of fatty acid and alcoholate allowed to react together; however, in the region of 1·0 mole of fatty acid per mole of alcoholate, precipitation and heterogeneity make results unreliable. The highest maximum is produced by 2 moles of fatty acid per mole of alcoholate.

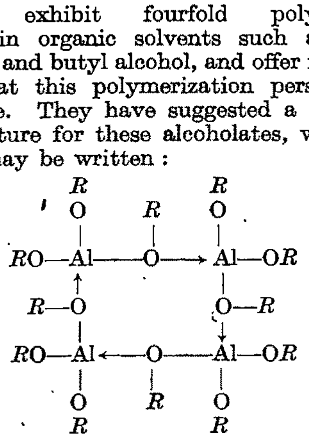
(2) It is possible to obtain reproducible, rather unstable solid monolayers by spreading on water a benzene solution of soap, prepared anhydrously as above. The compressed monolayers, which will tand pressures up to 50 dynes per cm. for a few minutes, show an area of 19 A.^{2} per molecule of fatty acid, provided the molecular ratio of fatty acid to alcoholate exceeds 1·5. Below this, a considerable decrease in area is observed, indicating that fatty acid has been removed from the surface.



CURVE 1, BUTYRATE ; 2, CAPROATE ; 3, DECANOATE ; 4, LAURATE ; 5, PALMITATE

Results further confirm the conclusions of other workers[1,3] that the aluminium tri-soap, empirically $\mathrm{Al}(\mathrm{O}F)_3$, does not exist, and that at most two fatty acid molecules react with one of alcoholate to give a di-soap mono-alcoholate $\mathrm{Al}(\mathrm{O}F)_2\mathrm{O}R$. The change in viscosity, on addition of water to the freely flowing solution of the anhydrously prepared soap, demonstrates the essential part played by the hydroxyl group in the gelation of aluminium soaps in hydrocarbons. The fact that the water reacts exothermically, releasing alcohol, and that the product of reaction is similar in all properties to the di-soap prepared by aqueous metathesis, leaves little doubt that a hydroxy compound is being formed.

Robinson and Peak[4] have shown that aluminium alcoholates exhibit fourfold polymerization, $[\mathrm{Al}(\mathrm{O}R)_3]_4$, in organic solvents such as benzene, naphthalene and butyl alcohol, and offer inconclusive evidence that this polymerization persists in the vapour state. They have suggested a stable octahedral structure for these alcoholates, which, when modified[3], may be written:



$$\begin{array}{ccccc} & R & & R & \\ & \mathrm{O} & R & \mathrm{O} & \\ & | & | & | & \\ R\mathrm{O}- & \mathrm{Al} & -\mathrm{O}\rightarrow & \mathrm{Al} & -\mathrm{O}R \\ & \uparrow & & | & \\ R- & \mathrm{O} & & \mathrm{O} & -R \\ & | & & \downarrow & \\ R\mathrm{O}- & \mathrm{Al} & \leftarrow\mathrm{O}- & \mathrm{Al} & -\mathrm{O}R \\ & | & | & | & \\ & \mathrm{O} & R & \mathrm{O} & \\ & R & & R & \end{array}$$

This structure would account satisfactorily for the stability, low melting points and boiling points and other properties of aluminium alcoholates. It indicates, too, that two alcoholate groups would react differently from a third; this partially steric effect could account for the difficulty of replacing three alcoholate groups by fatty acid.

On replacement of —OR by —OH, a more strongly electronegative group, the co-ordinate bond $\overset{R}{—\mathrm{O}}\rightarrow\mathrm{Al}$ is enormously weakened, allowing the possibility of disruption of the closed-ring polymer and the formation of long chains by hydroxyl bonding. Obviously this chain formation, and so gelling, is at a maximum when one —OH group is attached to each aluminium atom, and begins to fall off as other compounds such as water, amines, phenols, etc., which compete for hydroxyl bonds, are introduced. This agrees with practice. The lack of gelling power shown by aluminium mono-soaps can be explained by intra-molecular hydroxyl bonding.

An aluminium soap hydrocarbon gel can then be considered as made up of very large molecules loosely held together by (1) hydroxyl bonds, (2) Van der Waals attraction of long hydrocarbon chains. That a balance between these two types of bond exists is shown by the fact that equal concentrations (by weight) of soaps of varying chain-length show little variance in visco-elastic properties, as compared with the large differences shown by the equimolecular concentrations of the different long-chain soaps (see accompanying graph).

The influence of a third possible linkage, from the carboxyl group of the soap, C=O→Al, is being investigated. Details will be published elsewhere.

We are grateful to the chief scientist, Ministry of Supply, for permission to publish this communication.

Processing Thick Emulsions for Nuclear Research

In the application of the photographic method to research in cosmic-ray and nuclear physics, the need has always been felt for emulsions of thickness comparable with the range of the particles to be recorded. The use of thick emulsions has been greatly restricted, however, by the difficulties met in processing them. It has been possible to use plates with emulsions 200 μ thick but, using conventional methods, the degree of development is found to be much greater at the top than at the bottom of the emulsion. It follows that the grain density, in the tracks of particles of the same ionizing power, varies with the depth of the track; a result which leads to great difficulty in interpreting the experimental material even in experiments where it is possible to use short exposures so that complications due to fading are not present. We give here a brief outline of a method of processing which has enabled us to produce a nearly uniform development of emulsions 300 μ thick, so that the grain density in the tracks o particles in regions of equal ionization does not var by more than 10 per cent from the top to the bottom of the emulsion.

To secure uniform development, we must in principle make sure that the developer has time to permeate the emulsion before it acts. This might b achieved by soaking for a long time in a develope which acts very slowly (by reason, for example, o low concentration of alkali, high concentration o restrainer, or low temperature). Alternatively, w may attempt to separate the processes of permeatio and development. We have done this by cold soaking followed by rise of temperature, making use of th fact that the rate of permeation has a lower temperature coefficient than the rate of development.

The procedure is as follows: the plates are first soaked in water and then in cold developer. The temperature is next raised with the plates protected from a further increase in the concentration of th developing agent. After a suitable period of development, further action is checked in a cold stop bath, and the fixing is begun in a cold solution, the temperature of which is afterwards raised (see Fig. 1).

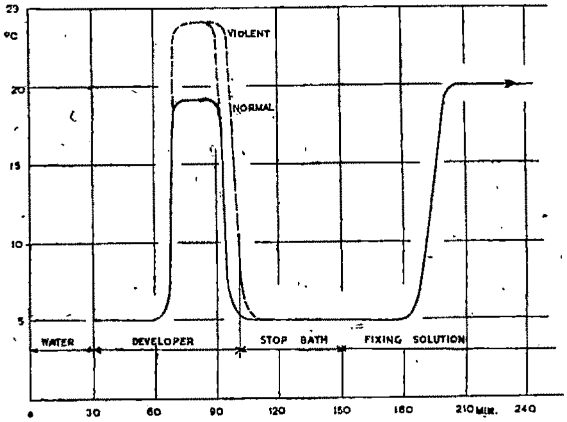

Fig. 1. Graph of typical operation for 300-micron plates

The accompanying photomicrographs (Fig. 2) show proton tracks at different depths in an emulsion 300 μ thick. The number of grains in the last 200 μ is 37 for the surface track and 361 for that which start at the glass.

This method, which we call 'temperature development' (T.D.), has a greater flexibility than that commonly employed. The conditions of development i the ordinary method are determined more by th time that must be allowed for the penetration of th solution into the emulsion than by any other factor. In temperature development, most of the development takes place when the temperature is high, afte the solution is nearly uniformly distributed throug the plate. This makes it possible to achieve differen degrees of 'discrimination' in the same type o emulsion, by varying the temperature and time o development and the composition of the develope

A stringent test of the advantages of the metho has been given by observations on β-ray tracks i the new Kodak X-ray emulsions[1]. Since the electro is highly scattered, it is difficult to find the complet track of a 100 keV. electron in an emulsion 50 thick. In the 100 μ and 200 μ emulsions, temperatur development made it possible to follow the β-ra tracks to greater lengths than in normally develope plates. Moreover, by 'violent' uniform developmen

Fig. 2. PROTON TRACKS IN A 300-MICRON PLATE. RECOIL PROTONS FROM NEUTRONS FROM A RADIUM–BERYLLIUM SOURCE. γ-RAY BACKGROUND

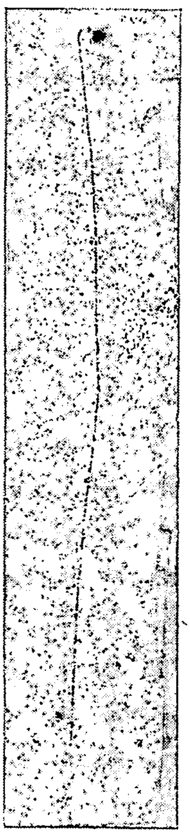

Fig. 3

Fig. 3. PROTON TRACK IN A 700-MICRON PLATE. AVERAGE DEPTH OF TRACK, 680 MICRONS. HEAVY γ-RAY BACKGROUND

it is possible to detect the last grains of electron tracks at every depth, even in the Ilford emulsions.

We cannot give here a standard development procedure, for in the experimental plates on which we have been working the optimum conditions vary from batch to batch of the same nominal type of emulsion, and must therefore be found by trial and error. The strength of the developer must be adjusted to achieve penetration with little development during the cold stage, and the temperature raised for a time between 10 and 40 min., to between 18° and 30° C., according to the degree of discrimination required and to the composition of the plate. Boron 'loaded' plates always show considerable unevenness in development. The presence of local concentrations of the 'loading' salt results in 'islands' in the tracks, regions of exceptionally high grain density, and blistering due to local swelling. These drawbacks tend to offset the advantages which have been claimed for the use of these plates in cosmic-ray work[2].

By diminishing the activity of the developer, and increasing the time of cold soaking, 700 μ plates were processed without great difficulty (Fig. 3).

At such depths, the optical conditions become critical. Inhomogeneities and impurities in the upper layers of the emulsion impair the image in the microscope and lead to apparent 'scattering' of the tracks below. If the number of 'events' in the emulsion is too high, 'deep' tracks may be completely obscured. Some of the impurities can be removed by thorough washing in distilled water. The translucency of the emulsion can also be improved by immersing it in a second strong fixing solution after it has been washed and dried in the normal way. When it is possible to look from the other side of the emulsion[3], which can be done with an ordinary microscope if either a stripped emulsion or one backed by thin celluloid is used, the maximum thickness which it is possible to observe can be doubled. It seems now that the limit to the use of very thick emulsion is set by optical, rather than processing, difficulties.

We wish to express our gratitude to Dr. C. F. Powell for helpful discussions during the work; to Mr. C. Waller of Ilford, Ltd., and to Dr. W. F. Berg, Dr. R. W. Berriman, Dr. R. H. Herz and Dr. G. W. W. Stevens of Kodak, Ltd., who prepared the special emulsions for us. We wish also to thank Mr. E. Samuel for his invaluable help with the photomicrographs.

Steric Hindrance in Vinyl-Mesitylene

A NUMBER of workers have observed various anomalous properties in nuclear-substituted derivatives of mesitylene, such anomalies usually being ascribed to restricted rotation about the bond connecting the substituent to the benzene ring caused by the two *ortho*-methyl - groups. In particular, Adams and Theobald[1] have resolved β-bromo-β-(3-bromo-2,4,6-trimethylphenyl)-acrylic acid and the corresponding β-chloro - compound into optically active forms, and have shown the half-life period of the latter to be much greater for the bromo- than for the chloro - compound (64 hr. and 200 min. respectively). Substitution of hydrogen for the halogen atom would clearly make resolution impossible. However, we have recently shown that restriction of rotation is still appreciable even with such a small 'blocking' group as hydrogen, by a study of the simplest possible compound of this class, namely, vinyl-mesitylene.

The abnormality of this hydrocarbon, as compared with similar compounds in which the vinyl group is not 'blocked' by two *ortho*-methyl - groups, is apparent in the values of most of its physical constants such as freezing point, boiling point, refractive index and specific dispersion. The ultra-violet absorption spectrum shows the typical reduced absorption observed by various workers for mesitylene compounds containing larger groups, such as aceto-[2], and nitro-[3], substituted in the benzene nucleus. The infra-red absorption spectrum shows differences from the spectra of styrene and *meta*- and *para*-methylstyrene in the regions characteristic of vibrations of the vinyl group, supporting the hypothesis that 'blocking' in the *ortho* - positions affects the electronic structure. These effects can best be explained in terms of restricted rotation about the C—C bond which attaches the vinyl - group to the nucleus, thus hindering the assumption of a coplanar configuration and hence the resonance of the external double bond with the nucleus.

The most remarkable manifestation of this effect is the greatly reduced tendency of this hydrocarbon to polymerize, which was first noticed by Klages[4]. It has been found to undergo no measurable change in two weeks at 100° C., whereas the polymerization of styrene and other nuclear-methylated homologues containing at least one unsubstituted position *ortho*- to the vinyl - group is about 90 per cent complete after two or three days at this temperature. Polymerization to an extremely brittle polymer of low molecular weight was effected by heating at 190° C. for several days, and also at room temperature in the presence of about 1 per cent of stannic chloride as catalyst.

Since 2,6-dichloro-styrene has been reported to polymerize readily[5], it is possible that some electronic interaction, such as the reversed field effect of the *ortho*-methyl - groups[6], is also of importance in causing the stability of vinyl-mesitylene.

There is a close analogy in steric terms between vinyl-mesitylene and α-methyl-styrene, for, in the former, the relevant rotation is hindered by the two *ortho*-methyl - groups, and in the latter the two *ortho*-hydrogen atoms interfere with the methyl - group on the rotating propenyl - group. This analogy extends to the physical properties and polymerization characteristics of the two compounds[7].

We are indebted to Dr. H. W. Thompson for the infra-red measurements, and to the directors of Trinidad Leaseholds, Ltd., for permission to publish this note; a full account of the work will be published elsewhere.

Electric Dipole Moments of Some Styrenes

THE electric dipole moments, in benzene solution at 25° C., of the following nuclear methylated styrenes have been measured:

(I)	*p*-methyl-styrene	0·38 ± 0·1 *D*
(II)	*m*-methyl-styrene	0·36 ± 0·1 *D*
(III)	2,4,5-trimethyl-styrene	0·45 ± 0·1 *D*
(IV)	2,4,6-trimethyl-styrene	0·42 ± 0·1 *D*

These values are approximately corrected for atom polarization. Otto and Wenzke[1] report a value of 0·63 *D* for (I). The others appear not to have been examined.

The moment of toluene is 0·35 *D* in the gas phase, corrected for atom polarization[2]; so the values found for (I), (II) and (III) are consistent with the moment of styrene being very small, and with there being very little induction of a moment in the vinyl- grouping by the *o*-methyl - group in (III). Direct measurements on styrene leave uncertainty about its moment; but this is probably not greater than 0·37 *D*[1,3,4,5].

The moment of (IV) is therefore larger than is consistent with the other values. The most obvious cause of this anomaly (see preceding communication; cf. Hampson and co-workers)[6] is that in (IV) the *o*-methyl - groups prevent the vinyl - group assuming a configuration co-planar with the benzene ring, as it would need to do to be in the best position for forming π-bonds therewith.

This explanation implies that the moment of the styrene molecule in which π-bonding is prevented may be as large as 0·4 *D*, though there is no evidence as yet to show which pole is nearer to the benzene ring.

If this be so, then whichever is the direction, the moment is different from that actually found for styrene, and this indicates that the π-bonding in the latter causes a moment which may be *c.* + 0·1 to + 0·4, or − 0·4 to − 0·7 *D*; that is, there is a permanent electron drift tending to cause either *ortho-*, *para-* or *meta* - direction in the ring. The latter seems to us unlikely, but until the direction of the moment of (IV) has been established, no certain answer can be given to this question.

A further implication is that in the 'inhibited' styrene either the σ-bond skeleton is polar, or the moment of the C—H bond is different in benzene and in ethylene, or both are true.

There appears also to be a difference between the moments of styrene and of triphenylethylene (0·6 *D* [3]), which may arise in the same way.

We are indebted to Mr. G. T. Kennedy for bringing this problem to our notice, and for supplying the compounds.

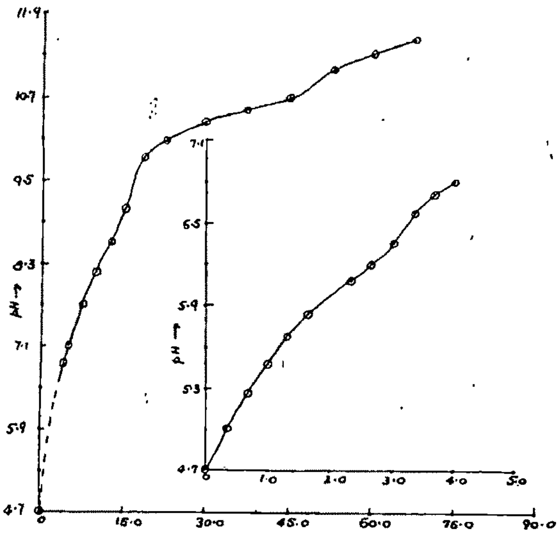
Titration Curves of Hydrogen Micas

THE titration curves of a number of micas have been studied as a part of a scheme of work on the electrochemistry of structurally well-known crystals in finely ground states. Some typical results obtained with muscovite are given below. Details will be published elsewhere.

The finely ground material having particles with 'equivalent spherical diameters' smaller than 2·0 microns was leached with dilute hydrochloric acid to obtain the hydrogen- or acid-mica by the replacement of the exposed potassiums by hydrogen ions. Potentiometric titration curves of hydrosols of this hydrogen mica with bases show three inflexions, the first of which is often very weak while the other two are quite prominent. The *p*H values at the inflexions as well as the form of the titration curve depend, to some extent, on the nature of the base used. Titration with sodium or potassium hydroxide gives the first inflexion at a *p*H between 6·15 and



m.e. KOH per 100 gm. hydrogen mica

7·3; the second and third inflexions occur near pH 9·0 and 10·5, respectively. A typical titration curve obtained on titrating a 1·0 per cent sol with potassium is shown in the accompanying graph. The initial (dotted) portion of the curve, drawn separately on a different scale to bring out the first (weak) inflexion clearly, resembles that of a weak acid. Pauling[1], on the other hand, had predicted a very strong acid character of hydrogen mica.

Practically all the buffer action of the sol, especially the buffering beyond the first inflexion, is observed at pH values much higher than the range of pH (approximately 4·14–5·0) within which aluminium hydroxide is precipitated[2]. No aluminium could be detected in the clear supernatant liquid of a mixture of the sol and potassium chloride in which the concentration of the salt was as high as 1·0 N. This supernatant liquid had a much lower pH than the pure sol, and it contained an amount of titratable acid which is approximately equal to—in some cases, it is appreciably less but never greater than—that obtained at the first inflexion of the titration curve of the pure sol with potassium hydroxide.

The acidity value calculated at the second inflexion of the titration curve of the sol in terms of milli-equivalents per 100 gm. of dry matter is, in all cases, equivalent to the quantity of potassium ions displaced from the ground muscovite in preparing the hydrogen system, and it indicates that this inflexion marks the completion of the neutralization of hydrogen ions acquired by the surface in exchange for the exposed potassium ions of the platelets. The acidity values calculated at the third and second inflexions are as 3 : 1, the actual values in the case of the specimen the titration curve of which is reproduced being, respectively, 16·0 and 47·5 milli-equiv. per 100 gm. This is just what would be expected if the two hydroxyl groups reckoned for each hydrogen ion of the above category in the hydrogen mica (to which the formula $H(Al_2)(Al\,Si_3)O_{10}(OH)_2$ can be given in the case of muscovite) reacted with the base at the third, or final, inflexion. Actually, for each such H ion, two structurally identical OH groups are available for interaction with the base through hexagonal rings of oxygens. The portion of the titration curve between the second and third inflexions, therefore, appears to indicate the neutralization of hydrogen ions dissociated from these hydroxyl groups.

The bearing of the above results on the question of the nature of heterogeneous acid systems and, in particular, on the buffer action and cation-binding power of clays and clay minerals which also have a micaceous structure, will be fully discussed elsewhere.

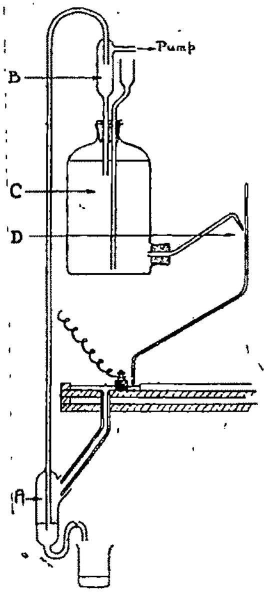
A Modified Ionophoresis Apparatus

Consden, Gordon and Martin[1] have described an apparatus for the electrophoretic separation of molecules of low molecular weight in a solid medium. They show that rapid perfusion of the electrodes of such an apparatus is essential, in order that, even after the potential has been applied for some considerable time, there may be no appreciable change in pH at the gel/liquid interface due to increased ionic concentration at this point. In the apparatus described in their paper, the perfusion buffer is lost, since, after bathing the electrodes, it passes into the cooling chamber beneath the gel trough, and so to waste. Two considerations led me to explore the possibilities of separating these two liquids.

First, it appeared desirable in certain cases to be able to obtain in solution amino-acids which had run the full length of the gel, by collecting fractions of the perfusate as the bands reached the electrode compartments. Secondly, since the time taken for the first band to traverse the length of the gel might be a period of many hours, and similar intervals might occur between successive bands, it appeared desirable to conserve the buffer solution during those periods when no amino-acids were passing across the gel/buffer interface. With this in view, various alterations and additions were made to the apparatus as described by Consden *et al.*



CIRCULATING DEVICE FOR CONTINUOUS ELECTRODE PERFUSION

A tube was inserted in the base of the electrode compartment in place of the aperture giving direct access to the cooling trough. Through this the buffer was able to flow directly into a sump (A) beneath the apparatus. The surface of the liquid in this sump was maintained at a constant level by means of an intermittent air-lift pump connecting the sump by means of a vertical tube having a diagonally ground tip, with a subsidiary reservoir (B) above the Marriotte bottle (C) containing the main store of buffer. The decreased pressure activating the air-lift device was provided by a water pump connected to the reservoir, from the base of which a tube led into the Marriotte bottle, terminating below the surface of the liquid. Provision was made for maintaining the volume of buffer in the system by combining a funnel with the vertical tube in the Marriotte bottle which governed the flow of liquid from the jet. This jet (*D*) was allowed to impinge on the surface of a glass rod which led the buffer into the electrode compartment. Such an arrangement permitted the rate of flow to be accurately controlled, since the difference in levels between the jet and the bottom of the funnel stem could be altered at will without affecting the rest of the apparatus. Variations in the water pressure to the pump were shown to cause the level of liquid in the sump to rise to such a height above the tip of the vertical tube that air was no longer able to enter at the bottom, with the resultant stoppage of circulation. This was obviated by the incorporation of a syphon in the sump to maintain the surface of the liquid at the level of the tip of the vertical tube. Two sets of apparatus, one for each electrode compartment, were attached to the same vacuum line, in order that the rate of flow to each electrode might be identical.

In runs of eight hours or more, using a neutral gel and phosphate buffers, the *p*H of the perfusates was not found to vary by more than 0·1 *p*H unit, except during those periods when acidic or basic amino-acids were leaving the gel. These fractions, and those of other amino-acids, were collected by interrupting the return of the buffer to the reservoir and substituting a receiver for the sump. The arrival of any band at the gel/buffer interface was calculated from the relative displacements of the bands as determined by the 'printing' method of the original authors. Two such prints were taken at intervals during the course of a run; this necessitated the use of a trough without a lid, but no trouble due to swelling or contraction of the gel was encountered. It was found that the ionic concentration in the gel remained sufficiently constant during any one run for the relationship between time and distance to be taken as linear.

Absorption of Ultrasonic Waves in Acetic Acid

THERE are broadly three possible causes of absorption of ultrasonic waves in liquids. The first two are viscosity[1] and conduction of heat[2]; these give rise to an absorption the coefficient α of which varies as the square of the frequency ν at all frequencies[3,4]. The third general cause is the perturbation by the wave of any equilibrium that may be set up in the liquid, if the new equilibrium state is attained exponentially, with a 'relaxation' time constant. The equilibrium may be chemical[5], or one involving the various degrees of freedom contributing to the specific heat[3], or between molecules arranged in an orderly structure and others arranged at random[6]. Whatever the mechanism responsible for the relaxation time, Kneser[7] has shown that it will contribute an additional absorption α, which is a function of the frequency ν. He has shown that for frequencies considerably below a relaxation frequency, α varies strictly as ν^2; considerably above this frequency it becomes constant; the quantity $\mu = \alpha\lambda = \alpha.c/\nu$ reaches a maximum value at the relaxation frequency.

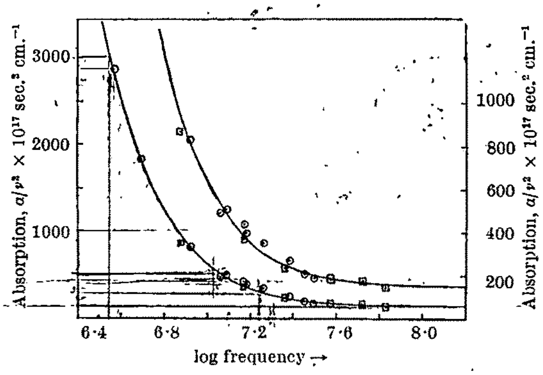

Fig. 1. ABSORPTION IN ACETIC ACID. POINTS IN CIRCLES, BAZULIN'S RESULTS; POINTS IN SQUARES, AUTHOR'S RESULTS. UPPER CURVE REPRESENTS PART OF THE LOWER CURVE ON A LARGER SCALE

If we find a case where α is not strictly proportional to ν^2, then it may be possible to distinguish between differing causes of absorption acting at the same time in the liquid. A good example is provided by acetic acid. A plot of α/ν^2 against log ν (Fig. 1) for this liquid shows that at high frequencies α/ν^2 tends to a constant value of about 155×10^{-17} sec.^{2} cm.$^{-1}$. At lower frequencies it rises greatly, suggesting a relaxation frequency at some lower frequency. The experimental results are due to Bazulin[8] and some recent measurements I have made, which are in good agreement with one another. The temperature was 16–17° C. for most of the observations.

If we postulate that the value of 155×10^{-17} represents the absorption due to viscosity, heat conduction and any relaxation process the relaxation frequency of which is well above 10^8 c.p.s., then it is permissible to subtract this amount from the values of α/ν^2 at all frequencies below 10^8 c.p.s. The remaining attenuation is then presumably due to a single relaxation process at around 2×10^6 c.p.s., and it is possible to make a quantitative test of Kneser's equation (14)[7]:

$$\alpha/\nu^2 = \frac{2\mu_m}{c\,.\,\nu_m\,(1 + (\nu/\nu_m)^2)}.$$

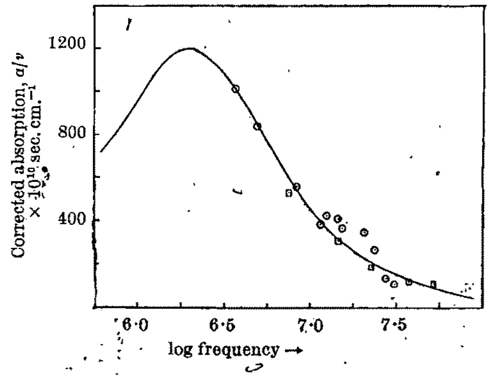

Fig. 2. RESIDUAL ABSORPTION α/ν, AFTER SUBTRACTION OF ABSORPTION CORRESPONDING TO $\alpha/\nu^2 = 155 \times 10^{-17}$. THEORETICAL VALUES ON CURVE. POINTS IN CIRCLES, BAZULIN'S RESULTS; POINTS IN SQUARES, AUTHOR'S RESULTS

At low frequencies $\alpha/\nu^2 \approx 2\mu_m/c.\nu_m = A$, say. Kneser's[7] equation can then be put in the form

$$1/\alpha = 1/A(1/\nu^2 + 1/\nu_m^2),$$

and may be tested by plotting $1/\alpha$ against $1/\nu^2$. This plot yields the best values of A and ν_m to fit the experimental points; from the plot we find $A = 12{,}000 \times 10^{-17}$ sec.^{2} cm.$^{-1}$ and $\nu_m = 2{\cdot}0 \times 10^6$ c.p.s. These constants can be used to calculate the theoretical variation of α/ν, which is proportional to μ. In Fig. 2 the expected variation of α/ν as a function of log ν is represented by the solid line, and the points are observed values of α/ν, after subtraction of the absorption corresponding to $\alpha/\nu^2 = 155 \times 10^{-17}$ sec.^{2} cm.$^{-1}$. The agreement with theory is good and suggests that the extra absorption is correctly ascribed to some phenomenon with a relaxation time of 5×10^{-7} sec.

The process responsible for the absorption in this case is very probably the chemical equilibrium between the dimer and the monomer of acetic acid. The rate of this reaction, and consequently ν_m, should increase rapidly with temperature. Experiments to find the temperature dependence of ν_m are in progress.

Kneser's relation (11) also enables an estimate to be made of the total change in velocity to be expected corresponding to the fall in α/ν^2. For

$$\frac{\Delta c}{c} \approx \frac{\mu_m}{\pi} = \frac{\alpha c \nu_m}{\pi \nu_m^2} = A \cdot \frac{c \nu_m}{2\pi}.$$

Using the values of A and ν_m quoted above, and putting $c \approx 1 \times 10^5$ cm. sec.$^{-1}$, we find

$$\frac{\Delta c}{c} \approx 4 \times 10^{-3}.$$

It seems likely that such a small change in velocity will be hard to find, due to the heavy absorption in the frequency-range concerned. The 1 per cent dispersion reported by Spakowski[9] between 0·2 and 3 Mc./s. appears to be roughly confirmed.

Crystal Structure of *B*-Starch from X-Ray Fibre Diagrams

IN recent papers[1], Kreger has published fibre data rom the *B*(tuber)-modification of starch. Though his technique is new and interesting, Kreger's results mainly confirm data which were published some years ago[2]. Apparently the earlier fibre diagrams were more highly orientated than Kreger's, since the ibre spacing (10·6 ± 0·1 kX.) could be obtained unambiguously from these diagrams. More recently, both *B* and *A* (cereal-type) fibres have been prepared by new techniques with truly extraordinary orientations[3]. The fibre spacing of the *A*-modification (10·5 kX.) is substantially equal to that of the *B*-modification, a result not unexpected, since Bear and French established a very close relationship between these modifications of starch[4].

From the fibre diagrams a unit cell and rough structure for the *B*-modification of starch have been proposed[2]. The orthorhombic unit, $a = 16{\cdot}0$, b (fibre) $= 10{\cdot}6$, $c = 9{\cdot}1$ kX., is essentially the same as suggested in Kreger's first paper. More recently, Kreger has criticized this unit on the grounds that it leads to an X-ray density (1·60) no greater than the observed density of starch under water (1·60–1·63)[1]. The X-ray density was calculated assuming that the hydration of *B*-starch amounts to one water molecule per glucose residue.

The degree of hydration assumed by Kreger is apparently about right for the *A* modification of starch; but there is considerable reason for believing that the ideal hydration of the *B*-modification is higher. Thus, air-dried corn starch and the cereal starches contain about 10 per cent moisture, while tapioca, potato and other tuber starches normally contain about 15–20 per cent (between 1½–2 water molecules per glucose residue[5]). Moreover, it has been noted that the tuber starches especially yield much sharper X-ray diagrams when thoroughly wet with water[4], indicating that a very high degree of hydration is ideal for the crystalline portions of *B*-starch. It seems not unreasonable that at the ideal composition of the *B*-modification there are as many as two water molecules per glucose residue. In this case, the X-ray density would be 1·67, certainly high enough for a carbohydrate and in very satisfactory agreement with observed densities of starch under water (1·60–1·63)[1].

The difficulty in understanding the fibre spacing of starch, noted by Kreger[1], has been discussed before[2]. However, the lower fibre spacing found from space models is sensitive to angles in the glucose ring and in the glucosidic bond, and the proposed structure cannot be eliminated by considerations of only those models which have tetrahedral or other idealized angles.

In considering the possibility of an error in the suggested unit cell for *B*-starch, it seems well to point out that the difficulties in interpretation of fibre diagrams usually arise from screw axes or centring which eliminate the first-order spacings of the non-fibre axes. The *B*-modification of starch, in the present interpretation, has a screw axis only along the fibre axis, the spacing of which is not in doubt. The *a*-axis of the proposed unit cell is just the Bragg spacing of the lowest-order reflexion on the equator of the fibre diagram. This leaves no further room for manipulation of lattice parameters from fibre data for an orthorhombic unit, and makes it nearly certain that no simpler unit for the *B*-modification can be found.

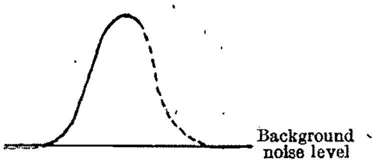
Shape of Pulses of Radio-frequency Radiation from the Sun

DURING some 400 hours observations of solar radiation on 75 Mc./s., the variation of the second detector anode current was recorded with a portable vibration galvanometer tuned to resonance at about 45 c./s. and damped less than critically, but so that the spot became stationary after sudden deflexions in less than 0·25 sec. Records were taken on 35-mm. film moving 12·1 mm./min. The gain was adjusted so that the current due to noise generated in the receiver was about 15 per cent of the maximum allowable, to avoid distortion in all but exceptional cases.

Ninety-nine single pulses of radiation lasting a few seconds each were observed sufficiently clear of overlapping pulses to give reason to believe that their shape on the film was a faithful record (by the linear detector) of the variation of radiated power from the source of the solar noise.

The 'tail' of such a pulse may indicate the manner of decrease in radiation by the source when it is no longer subject to the influence of an exciting agency, or, if the decay of the source under such conditions is very rapid, the curve will simply reflect the decrease in influence of the exciting agency. An analysis of the shape of the 'tails' of 78 such pulses was made after projecting the record, with magnification about 30 ×, and tracing the centre line of the photographic trace of the galvanometer spot. Twenty-one were not analysed, for the reason that the height of the pulse peak above background was less than 25 per cent of the background value, and too short a length of falling slope was available to enable significant measurements to be made. Fifty-eight were found to be very probably exponential in shape, eleven less probably so, four probably not so and five definitely not.

Between three-quarters and nine-tenths of the portion of the broken-line curve in the accompanying figure was analysed, and the deviation from average of the factor x in $\exp(-xt)$ was less than ± 15 per cent for those assumed to have exponential form.



TYPICAL PULSE SHAPE. PORTION OF CURVE EXAMINED, - - - -

The times taken for radiated power to decrease to half in the pulses of exponential shape are tabulated below :

Half-life (sec.)	0·4–0·6	0·6–0·8	0·8–1·0	1·0–1·2	1·2–1·4	1·4–1·6	1·6–1·8	1·8–2·0	2·0–2·2	Over 2·2
No. of pulses	5	8	12	13	8	7	3	0	2	nil

Included in the table above are thirty pulses occurring either consecutively, or within a short interval. These follow :

Date	Time interval	Half-value times (sec.)
27.5.47	30 sec. (con.)	0·75, 0·65
4.6.47	30 sec. (con.)	1·4, 0·9
22.7.47	30 sec. (con.)	0·9, 0·9
23.7.47	1 min. (con.)	1·2, 0·85
25.7.47	30 sec. (con.)	1·1, 1·1
7.8.47	30 sec. (con.)	0·7, 0·8
7.8.47	30 sec. (con.)	0·8, 1·3
12.8.47	40 sec.	1·2, 1·75, 1·35
30.9.47	5 min.	1·0, 0·85, 0·9, 1·0, 0·5, 1·1
30.9.47	1 min.	0·9, 1·05, 1·0
30.9.47	30 sec. (con.)	1·7, 1·1
30.9.47	30 sec.	0·9, 1·8

Although it might be assumed that pulses clos connected in time come from the same region a should therefore show similar half-value times, t results given above do not offer firm support f such a hypothesis.

No success was obtained from attempts to interp the rising portion of the pulse curve in terms exponential functions.

Spectrum of Iodine Oxide (IO) in Flames

BANDS attributed to iodine oxide (IO) w observed by Vaidya[1] in a flame of methyl iodide, a analysed into two systems, A and B. More recent Blake and Iredale[2] have published a revised analy for system A ; when this formula was used to arran the bands, an obviously unsatisfactory intensity d tribution was obtained. We have re-measured t bands, and extended the system to longer wa lengths. It is now found that all the bands can arranged into one system instead of two, this syst being an extension of the B system, with modifi values of v''. The bands are listed in the accompan ing table ; intensities are visual estimates maki some allowance for variations of plate sensitivi with wave-length.

BAND HEADS OF IO

λ	Int.	ν	v',v''	λ	Int.	ν	v',v
4189·0	5 v.d.	23865	5,0	5208·8	5	19193	2,5

5131·0	9	19484	0,3				

d = diffuse. v.d. = very diffuse.

The following are the molecular constants :

$$\nu_e = 21{,}565 \text{ cm.}^{-1} \quad \omega_e'' = 687 \text{ cm.}^{-1} \quad x_e''\omega_e'' = 5 \text{ cm}$$
$$\omega_e' = 512 \text{ cm.}^{-1} \quad x_e'\omega' = 5 \text{ cm}$$

A graphical Birge – Sponer extrapolation gives dissociation energy for the ground-state, $D_0 = 1{\cdot}9$ 0·2 eV. or 44 k.cal. Bands with $v' = 4$ are diffu and the 5,0 band is very diffuse; this is probab due to pre-dissociation. The band system for is now closely analogous to the systems recent reported[3,4] for ClO and BrO. This analysis gives normal vibrational intensity distribution as shown Fig. 2. The IO bands have been obtained wh iodine is added to an oxyhydrogen flame, thus su porting the assignment to IO and eliminating CI.

When iodine is added to a methyl alcohol/air fla a strong band, or region of continuum, with a sha ad at 4045 A., degraded to shorter wave-lengths, obtained. A similar but weaker band, at about 70 A., is obtained when bromine is introduced into methyl alcohol flame. The emitters of the bands e not known.

Hydride and Deuteride Bands of Aluminium, Copper, Silver and Gold

AN investigation of the spectra mentioned above has been undertaken with a water-cooled hollow cathode of Schüler type with helium filling. The break-off in the CuH-band λ 4280 found by Schüler and Gollnow is unique, and does not appear in any of the spectra of the above-mentioned metals. The experimental results show that the interpretation given by Herzberg and Mundie is correct.

On long exposure at the lowest possible pressure (0·03 mm.), the AlH-band λ 4240 shows a very sharp break-off with $P(19)$ as the last line in the P branch.

A detailed account of these experiments is to be published elsewhere.

Relation Between the Brunauer–Emmett–Teller and Harkins–Jura Isotherms

H. K. LIVINGSTON[1] has recently attempted to relate the Brunauer – Emmett – Teller and Harkins – Jura equations by means of the Gibbs adsorption isotherm for solid surfaces. However, he has only applied his method to one of the limiting conditions of the Brunauer – Emmett – Teller equation. We have extended this method to include the complete form of the equation, in order to direct attention to the great importance of the value of constant n in these relations.

The Harkins – Jura equation

$$\log p = B - A/v^2 \qquad (1)$$

(v is the volume of gas adsorbed at pressure p, A and B are constants) was obtained by substitution in the equation of state for condensed films:

$$\pi = b - a\sigma \qquad (2)$$

(where π is surface pressure, σ is area per molecule of adsorbate, and a and b are constants).

The Brunauer – Emmett – Teller equation may be expressed in the complete form:

$$v = \frac{v_m c.p}{p_0 - p} \cdot \frac{p_0{}^{n+1} - p_0.p^n(n+1) + n.p^{n+1}}{p_0{}^{n+1} + p.p_0{}^n(c-1) - c.p^{n+1}} \qquad (3)$$

or in two limiting forms:

$$n = 1;\ v = \frac{v_m c.p}{p_0 + c.p};$$

$$n = \infty;\ v = \frac{v_m c.p.p_0}{(p_0 - p)(p_0 - p + c.p)}. \qquad (4) \text{ and } (5)$$

Livingston obtained the relations

$$k_1\pi = \log\left(\frac{p_0 - p + c.p}{p_0 - p}\right) \text{ and}$$

$$k_2\sigma = \frac{(p_0 - p)(p_0 - p + c.p)}{c.p.p_0} \qquad (6) \text{ and } (7)$$

(where $k_1 = V\Sigma/RTv_m$, $k_2 = Nv_m/V\Sigma$, V is the molar gas volume, and Σ is the specific surface of the adsorbent). He then calculated the conditions under which the values of $k_1\pi$ and $k_2\sigma$, for any given value of c, could be expressed as a linear relation equivalent to equation (2):

$$k_1\pi = b' - mk_2\sigma. \qquad (8)$$

It follows from his reasoning that if the $k_1\pi - k_2\sigma$ relation is linear, then the pressure–volume adsorption isotherm may be expressed accurately by either the Brunauer – Emmett – Teller or Harkins – Jura equations.

Equations (6) and (7) are only valid for the limiting condition when $n = \infty$, being based on equation (5). In practice, it has been found that when $n > 5$, equation (5) represents the data fairly closely. However, with highly porous solids n is frequently less than 3, and equation (5) is no longer applicable. We have found, in adsorption experiments on highly porous amorphous carbons, that when $n < 3$, the Harkins – Jura plots of log p against $1/v^2$ are invariably curved. Similar results have been obtained by Joyner, Weinberger, and Montgomery[2]. The treatment of Livingston has, therefore, been extended to include equations (3) and (4).

From equation (3) we obtain:

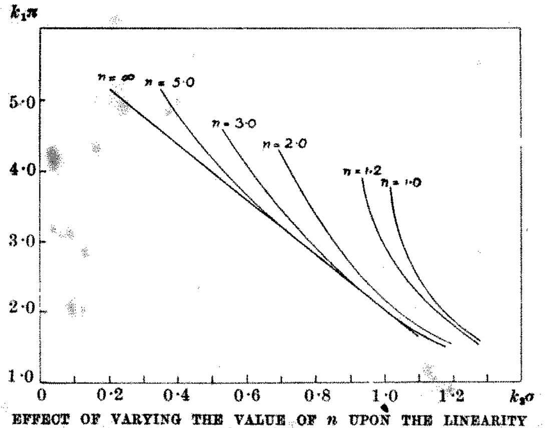
$$k_1\pi = \int_0^p \frac{c}{p_0 - p} \cdot \frac{p_0^{n+1} - p_0 . p^n (n+1) + np^{n+1}}{p_0^{n+1} + p . p_0^n (c-1) - cp^{n+1}} \, dp, \qquad (9)$$

$$k_2\sigma = \frac{p_0 - p}{cp} \cdot \frac{p_0^{n+1} + p_0^n . p . (c-1) - cp^{n+1}}{p_0^{n+1} - p_0 . p^n (n+1) + np^{n+1}}; \qquad (10)$$

From equation (4):

$$n = 1;\ k_1\pi = \log\left(\frac{p_0 + cp}{p_0}\right);\ k_2\sigma = \frac{p_0 + cp}{cp}. \qquad (11) \text{ and } (12)$$

The most general conditions are represented by equations (9) and (10). In order to discover the effect of low values of n, these equations were used to calculate the values of $k_1\pi$ and $k_2\sigma$ when $c = 50$, $p_0 = 800$, and $n = 1$, $1 \cdot 2$, 2, 3 and 5. Equation (9) was solved by graphic integration. The value of 50 was chosen for c, as Livingston showed that a longer linear portion on the $k_1\pi - k_2\sigma$ plot is obtained for this value of c than for any other value, when $n = \infty$. The results are shown in the accompanying graph. When $n < 5$, the $k_1\pi - k_2\sigma$ relation is no longer linear. The tendency to curve away from the $k_1\pi - k_2\sigma$ linear relation (when $n = \infty$) progressively increases as the value of n decreases. It appears that if $n < 5$, the conditions represented by equation (2) are no longer satisfied, and we should expect the plot of $\log p$ against $1/v^2$ to be curved. This is precisely what occurs.



EFFECT OF VARYING THE VALUE OF n UPON THE LINEARITY OF THE $k_1\pi - k_2\sigma$ RELATION

The physical significance of n is not known, but has been taken to depend mainly on the sizes of the pores. If this interpretation is correct, the above preliminary calculations indicate that when the average diameter of the pores becomes less than a certain critical value, the Harkins – Jura equation cannot be applied to the adsorption data.

A Suggested Explanation of Sangster's Rotations and Schmidt's "Wandering Vortices" in Geomagnetism

A CURIOUS and hitherto unexplained phenomenc was discovered many years ago by Sangster[1] froı a study of Greenwich magnetograms for periods magnetic disturbance. He showed that the horizont component of the disturbance vector at Greenwic rotates for considerable periods in the same directio so that its end describes a sequence of loops, whic vary greatly in size and shape but are all describe in the same sense, when viewed, say, from abov From 10h. to 24h. almost all the rotations are ant clockwise, while from 0h. to 10h. they are mostl clockwise.

The results of some calculations, made by Mr. Ashour and myself, of the currents induced in *non-uniform* ionospheric shell by a varying extern magnetic field, suggest a simple explanation of tl above phenomenon.

We find that the induced currents form vorte systems the centres of which tend to move co tinually towards the point of highest conductivit which we take to be the sub-solar point, B say. F example, a sudden increase in an inducing fie parallel to the earth's axis produces a system currents initially along circles of latitude, so that tl corresponding vortex centres are initially at the nor and south poles; these vortex centres do not rema stationary, but move rapidly along the noon meridia towards B. A *fluctuating* field leads to a sequence vortices of alternate polarities all moving towards two vortices of opposite polarities corresponding each complete alternation of the field. In tl actual ionosphere, the resulting system of curre vortices will doubtless be much more complex ar irregular than that found from our calculation but there will be the same tendency for the vortices to move away from the point of lowe conductivity and towards the point of highe conductivity.

It is this tendency which seems to me to expla Sangster's clockwise and anti-clockwise rotatio For, during the afternoon and up to midnight, tl point of highest conductivity of the ionosphe would lie in the south-west of Greenwich, and th of lowest conductivity to the south-east. Now it easily seen that a current vortex in the ionosphe moving southwards approximately along a meridia to the west of Greenwich would cause the disturban vector at Greenwich to rotate in an anti-clockwi direction through one half-revolution. If this vort were succeeded by another of opposite polarity, tl vector would rotate in the same direction throug the remaining half-revolution. Hence a successi of such vortices of alternate polarities would accou for the continued rotation of the disturbance vect in the anti-clockwise direction, which is found Greenwich from 10h. to 24h. At midnight, the conditions would be reversed, and the vector wou afterwards rotate in the clockwise direction observed. The theory indicates a change back to tl anti-clockwise direction at noon; Sangster's analys of the observations makes this change occur at 10 It is tempting to suggest that this earlier epoch ma be due to earth-currents induced in the great stret of sea to the west of Greenwich, but it is, of cours desirable to investigate the Sangster rotations other stations before attempting to develop tl theory further.

The actual existence of moving current vortices, milar to those assumed in the above explanation, as deduced by Schmidt[2] from an examination of the isturbing force at ten European stations during a eriod of disturbance at about 18h. on February 28, 396. The figure given by him (and reproduced in Geomagnetism", p. 313) shows a current vortex oving southwards along a line to the west of the ations, *followed by another of opposite polarity.* It ow appears that these "wandering vortices", as hmidt called them, may be due merely to self-duction in a *non-uniform* ionosphere. It is perhaps orth emphasizing that, in order to explain the otion of these vortices, it is unnecessary to assume ther (1) that there is any mass-motion of the conucting material, or (2) that the currents are prouced by some moving primary source of electrootive force. Once the currents are produced (by ectromagnetic induction or otherwise) the nonniform distribution of conductivity in the ionosphere ill necessarily cause the current vortices to move in e manner described above.

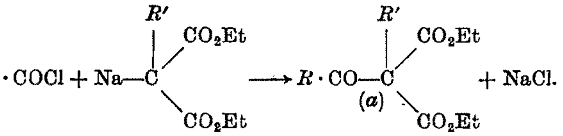
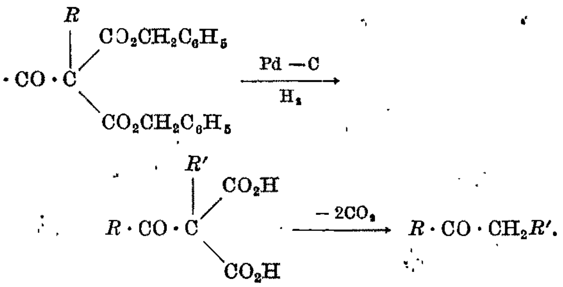
A New Ketone Synthesis

THE reaction between substituted malonic esters d acid chlorides has been investigated on a number occasions in the past[1], and has been found to give e corresponding acylmalonic esters in high yield cording to the following reaction :



Previous workers[2] have realized the potentialities such a reaction for the synthesis of ketones of the eneral formula $R.CO.CH_2R'$, but have failed, except the case where $R' = H$[3,4], to effect the ketonic drolysis of this type of keto-ester without simtaneous rupture of the bond (*a*).

It has now been found that the benzyl esters of ylmalonic acids readily undergo hydrogenolysis at om temperature in the presence of palladized charal with the formation of the parent keto-acids. ese acids on gentle warming (50–70° C.) lose two olecules of carbon dioxide and furnish the correonding ketones in excellent yield.



The method is applicable, for example, by suitably modifying the functional groups, to the synthesis of a wide variety of ketones, diketones, keto-acids and other carbonyl compounds. Typical cases in which it has so far been applied are the preparation of heptadecan-8-one (91 per cent yield from *n*-octoyl chloride and dibenzyl *n*-octyl-malonate), 2-methylpentadecan-5-one (80 per cent yield from undecoyl chloride and dibenzyl *iso*butyl-malonate), octacosane-10 : 19-dione (78 per cent yield from sebacyl chloride (1 mol.) and dibenzyl *n*-octyl-malonate (2 mol.)), tridecan-3-one-1-carboxylic acid (more than 66 per cent yield from undecoyl chloride and tribenzyl ethane-1 : 1 : 2-tricarboxylate) and heptadecan-9-one-1-carboxylic acid (81 per cent yield from 8-carbethoxy-*n*-octane-1-carbonyl chloride and dibenzyl *n*-heptyl-malonate, prepared by Mr. R. G. Mason).

The many possibilities opened up by this reaction will be the subject of further investigations, the results of which will be published elsewhere in due course.

Extinction of Petrol Fires by Methyl Iodide

IN a recent communication on this subject[1], O. C. de C. Ellis makes a number of statements which should not go unchallenged. First, it is stated that carbon tetrachloride will not extinguish petrol fires. For many years carbon tetrachloride has had world-wide use for the extinction of petrol fires, particularly those associated with internal combustion engines, and its reputation rests to a large extent on its success for this very purpose. Secondly, it does not decompose stoichiometrically to yield twice its vapour volume of chlorine ; the amount of chlorine evolved in a fire is, in most cases, negligible[2].

More serious, however, is that several important factors should have been overlooked in the tests and interpretation of results. Carbon tetrachloride and similar materials can extinguish flame only by achieving a sufficiently high concentration in the atmosphere ; clearly, then, volatility is of considerable importance. Methyl iodide (b.pt. 42·3°) will vaporize more readily than carbon tetrachloride (b.pt. 76·7°) ; consequently, there can be apparent differences in the properties of these two substances when they are applied to fires, although modification of technique will achieve the desired result in each case, namely, extinction of the fire. In using carbon tetrachloride it is necessary to provide sufficient heat transfer and, among other ways, this can be simply done by directing the liquid on to a warm surface, when sufficient vaporization takes place to put the fire out. To apply carbon tetrachloride directly into the middle of an inflammable liquid burning in an open tank may, quite likely, not extinguish the fire due to the fact that the carbon tetrachloride penetrates to the cold region underlying the burning surface and so does not vaporize. In any event, large fires of this type should be dealt with by carbon dioxide when the vapours are reasonably confined (as, for example, in a paint tank), or foam when they cannot be so confined.

It is not true that carbon tetrachloride is only one-fifth as effective as methyl iodide; this claim is explained by the fact that the importance of vaporization was ignored and the carbon tetrachloride was used incorrectly. Work carried out some time ago in the laboratories of this Company, to determine the minimum concentration of various substances required to extinguish a standard heptane flame, indicated, indeed, that the descending order of merit is, in general, bromide, iodide, chloride; but the following results show that there is no disproportionate superiority of methyl iodide over carbon tetrachloride.

Compound	Minimum extinguishing concentration (gm. compound/litre of air at N.T.P.)
Methyl bromide	0·19
Methyl iodide	0·28
Carbon tetrachloride	0·33
Methylene iodide	too involatile

The suggestion that pump type extinguishers should be filled with methyl iodide is impracticable. The mechanical problems presented by the use of a volatile liquid like carbon tetrachloride in equipment of this kind have been considerable in the past. If methyl iodide were used these problems would be greatly magnified and, indeed, would be insuperable unless the extinguisher were always kept at a cool and constant temperature. The alternative, therefore, would be the use of a pressurized bottle. Such extinguishers already exist for applications where they are particularly suited, and are filled with carbon tetrachloride or methyl bromide or a mixture of these two.

Judged, therefore, on its usefulness as a fire extinguishing agent, methyl iodide falls between two stools. It is too volatile to be used in a pump type of extinguisher and it would be pointless to consider its use in pressurized bottles on the grounds of improved combustion inhibition, since such appliances already use methyl bromide which is superior in this respect. In fairness it should be said, however, that methyl iodide may have one advantage over methyl bromide in that it may be less toxic.

Concerning the toxicity of methyl iodide, little published information can be found. Garland and Camps[3] report a fatal case of poisoning by methyl iodide in which the symptoms were similar to those of methyl chloride and methyl bromide. Henderson and Haggard[4] say that its toxicity is greater than that of methyl chloride, but less than that of methyl bromide. The same authors rate the toxicities of the latter two substances, relative to carbon tetrachloride, under acute conditions of exposure, as follows: methyl chloride 0·29, carbon tetrachloride 1·00, methyl bromide 2·20. Methyl iodide, therefore, would appear to be of the same order of toxicity as carbon tetrachloride, and it would be rash to assume that it is safer in use without sufficient confirmatory evidence.

Influence of Some Anti-Shrink Treatmen on the Friction between Wool Fibres

A NEW apparatus has been built for the measur ment of the friction between two fibres. The princip is that two fibres are twisted a few turns, and t four fibre ends loaded with equal forces, P_1. T load at one of the ends is increased until slippi occurs. If the necessary force is P_2 and the (sma angle between the fibre ends, β, the coefficient friction is given by the formula

$$\mu = \frac{\ln P_2/P_1}{\beta\pi n},$$

where n is the number of turns. The apparatus w be described in detail elsewhere[1].

Some measurements were carried out on fibr treated with sodium hypochlorite at pH 1, and fibres treated with alcoholic potassium hydroxi The measurements were made on the treated fibr in distilled water, after washing with water or neutralizing agent. The apparatus is built symmetri ally, so that it allows measurements of both wit scale and anti-scale friction on the same fibres. I consecutive measurements the variation in fricti with the number of slippings, due to abrasion, cou be determined. The same pair of fibres has been us for several series of measurements after differe times of treatment. For each series fresh parts of t fibres were introduced in the twist, thus avoidi abraded areas. For untreated fibres, up to 2,5 slippings can be made under the same conditions the apparatus without any noticeable change in t friction.

Figs. 1 and 2 give the values of the frictional c efficients at different times of treatment and differe numbers of slippings. The smaller dots indica values obtained at consecutive slippings after t given time of treatment.

There is a marked difference in the effects of t two treatments, which are both used for obtaini non-felting wool. Both cause an increase of t frictional coefficients. The chlorination diminis the difference between the anti-scale and the wi scale friction; but this difference is maintained af the alcoholic potash treatment. A very remarka difference is the behaviour of the friction after t treatments. The friction of the chlorinated wool

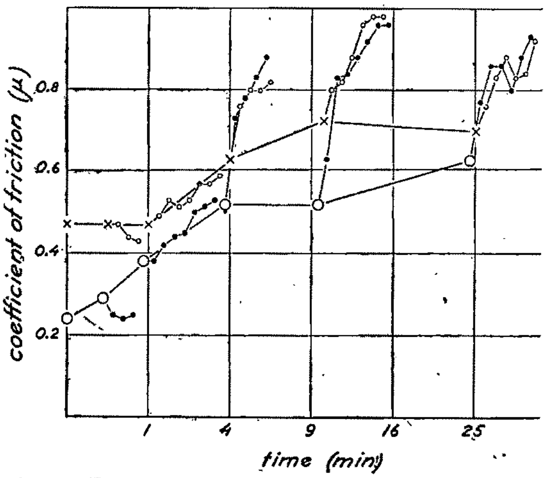

Fig. 1. FRICTIONAL COEFFICIENTS OF WOOL (○, WITH-SCALE ×, ANTI-SCALE) AFTER TREATMENT WITH HYPOCHLORITE (0·0 PER CENT AVAILABLE CHLORINE) IN 0·1 N SULPHURIC ACID

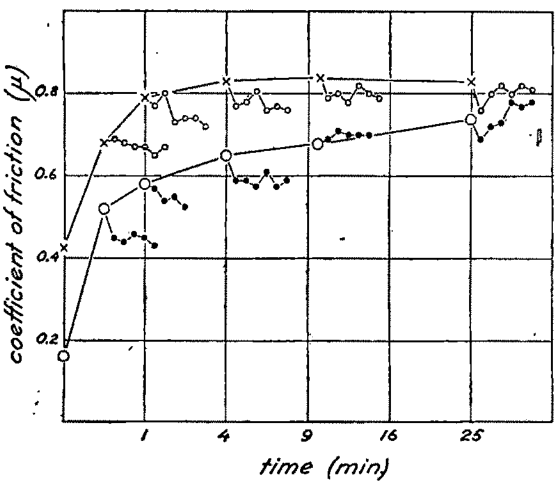

Fig. 2. FRICTIONAL COEFFICIENTS OF WOOL (○, WITH-SCALE; ×, ANTI-SCALE) AFTER TREATMENT WITH 2 PER CENT POTASSIUM HYDROXIDE IN 95 PER CENT ALCOHOL

onsiderably increased by only a few slippings in the pparatus, and the rubbings of the fibres during measurement eliminate the difference between the nti-scale and the with-scale friction. There is no orresponding effect for the potash-treated wool, where rubbings of the fibres do not noticeably hange the friction. All the measurements recorded in the graphs were made in distilled water. Measurements on chlorine-treated wool in soap solutions show a considerable decrease in the frictional coefficients μ about 0·15); but there is still no difference between anti-scale and with-scale friction. For the potash-reated fibres, the friction in soap solutions is somewhat lower than in distilled water, but there is still difference between the two coefficients.

It is assumed that the non-felting is caused by he elimination of the difference between anti-scale nd with-scale friction. An increase of both coefficients, as with potassium hydroxide treatment, auses a decrease in felting, but not complete elimination[2].

We hope to get more information about the chemical reaction between wool and various non-felting eagents by further studies of the frictional properties.

Pharmacology of Some *bis*-Trimethyl Ammonium Compounds

THE curare-like action of a series of *bis*-quaternary mmonium polymethylenes has recently been described by Barlow and Ing[1] and by Paton and Zaimis[1], and we can confirm that the C_3 compound curarizes, but is relatively inactive compared with *d*-tubourarine chloride on the rat diaphragm (1 per cent). ts action was completely reversed by prostigmine. Tetramethyl ammonium chloride showed about ·5 per cent of the activity of *d*-tubocurarine chloride on the rat diaphragm.) The C_5 compound had no action on the rat diaphragm. The C_3 compound has marked cholinergic action—salivation, lachrymation, bradycardia in decerebrated guinea pig—together with relaxation of decerebrate rigidity at a dose of 1·0 mgm. per kgm. It produced a response of the rabbit's ileum similar to that of acetyl choline (potency about 0·1 per cent that of acetyl choline). It has slight activity as an anticholinesterase (rat brain). It has no action on pseudo-cholinesterase (horse serum). Its cholinergic activity, apart from its low curarizing activity, would clearly render it unsuitable as a clinical substitute for *d*-tubocurarine. The C_5 compound has about the same anticholinesterase activity as the C_3.

The overlapping of 'muscarine', 'nicotine', and anticholinesterase activities is a very striking phenomenon which constantly recurs in complex quaternary ammonium compounds. If the chain includes phenyl groups the effect of increasing the distance between the $\overset{+}{N}$ atoms is not to increase the curarizing activity, but to develop anticholinesterase activity. $\overset{+}{N}(CH_3)_3.C_6H_4.CH_2.C_6H_4.\overset{+}{N}(CH_3)_3.2I$, in which the distance between the quaternary nitrogens is a little less than that of the C_7 *bis*alkyl ammonium, is about 6 per cent of the activity of *d*-tubocurarine on the rat diaphragm, and shows 'muscarine' effects but is not an anticholinesterase. If four more CH_2 groups are inserted into the chain, the curarizing activity drops to 2 per cent, but the compound is a very active anticholinesterase—of the same order of activity as eserine. Clearly the nature of the chain, as well as the distance apart of the $\overset{+}{N}$ atoms, affects considerably the activity of the compound.

We have attempted to determine the distance between the nitrogen atoms in Fisher – Hirschfelder models of the tubocurarine ion. Unfortunately, at least seven possible configurations can be constructed, any one of which might represent *d*- or *l*-tubocurarine, or *d*- or *l*-curine, and no one of which is convertible into another without breaking one bond or another. The distance apart of the nitrogen atoms varies for different models from that corresponding to C_3 to that corresponding to C_8 straight chains.

With regard to the species variation, remarked on by Barlow and Ing, and Paton and Zaimis, we showed in July 1947, at the Pharmacological Society, some results with two closely related compounds—*d*-tubocurarine and its dimethyl ether.

The ratio of the potency of the dimethyl ether to *d*-tubocurarine is:

	Intact animal	Diaphragm
Rabbit	9	3
Rat	3	3
Guinea pig	2	1
Albino mouse	0·5	0·4

Not only does the ratio vary between different species, but also especially in the rabbit the discrepancy may be larger in the intact animal.

Incidence of Malaria in Tropical Africa

THE conventional 'parasite-rate' (percentage proportion of children aged 3–10 years in whose blood malaria parasites are detected by a single examination) may be a misleading standard of qualitative measurement giving a distorted idea of the amount of malaria in a locality. But in practice a reduction from 70 to 40 per cent is often claimed to be evidence of effective malaria control, and we are led to believe that a figure of 5 per cent is a splendid achievement indicating a very low malaria incidence.

It has been pointed out that the rate at which infants acquire their first infection offers an exact and quantitative alternative method of measurement. If we can find the number of *infective mosquito bites* received by people in a given time, we have in a single figure not only the malaria-transmitting ability of the mosquitoes but also the actual incidence of the disease itself[1].

Working in Freetown, West Africa, we investigated the blood of infants at monthly intervals, and the examinations of fifty individuals made sequentially for eighteen months showed that twelve infections were received during that time. We could say that mosquitoes were infecting one in six infants each year.

Now if we visualize a situation in which one in every six persons in a city in the British Isles were to be infected with malaria each year, the problem of dealing with some 13,000 cases among a population of 80,000 such as existed in Freetown would indeed be a formidable one! (We are not, however, necessarily inferring that the African may react to infection as severely as the European.) Yet when we came to express the number of examinations of infants in whom malaria parasites were detectable as a percentage of the total examinations made, a parasite-rate of 5 per cent was obtained. On the face of it, that is a very small figure and could have easily misled us into a false assumption that the malaria incidence was very low.

Now while the infants were being investigated, mosquitoes were collected from houses in Freetown by standard methods, and the proportion carrying salivary gland infections was measured. From this data it was possible to calculate the 'parasite-rate' of the infants. The accuracy of these estimates encouraged us to calculate theoretical 'parasite-rates' produced by a wide range of numbers of 'infective mosquito bites' received by the average child in a year (see table). These values were in close agreement with observed data.

Number of infective mosquito bites per child per year	0·01	0·1	0·2	0·4	1·0	2·0	5	10	50
Calculated parasite-rate % in children	0·26	2·6	5·0	10	23	40	73	92·5	99·9

A reduction of the parasite-rate to 40 from 70 per cent then merely represents the difference between the average child receiving two infections of malaria each year and five. A parasite-rate of 2·5 per cent is revealed as the result of infection of one in ten children each year, which is certainly still too high.

Yet after four years of the most intensive mosquito control in Freetown, it appears that the parasite-rate of school children could not be reduced below a figure of 10 per cent (we can stop mosquitoes breedin but not people moving into and out of our contro area). While that is a very low rate for tropica Africa, our investigation suggests that infections ar still received by no less than half the children eac year.

We feel that were it possible to achieve a situatio where one in a thousand persons contract the diseas per year, then we might be entitled to say tha control of malaria could be effected. But over nearl all tropical Africa the average African seems norm ally to receive not less than five and frequently man more than fifty infective mosquito bites each yea

Above a figure of 75 per cent the parasite-rate ha no practical significance, since the average person i receiving superfluous infections. At satisfactor numbers of infective mosquito bites per year, th parasite-rate is less than 1·0 per cent. Consequentl changes in intervening values have also little practic meaning.

If this be the case, most efforts at malaria contr may merely reduce the frequency of receiving in fection at the cost of partial loss of immunity withou necessarily leading to any appreciable reduction the disease.

It all depends upon whether we are concerned i protecting small groups of completely non-immun Europeans, or attempting to protect the otherwis immune or partially immune indigenous populatio If the latter, it may well be that we shall hav to revise our conventional methods of assessin the incidence of malaria, and attempt to discov just how often the *average* African is, in fact, infecte and what exactly are the effects of malaria upon h health and efficiency.

Inhibition of Aerobic Sporing Bacilli by Hæmatin

CERTAIN bacilli will not grow on nutrient ag containing hæmatin at a concentration of 1/20,00 Other bacilli do not appear to be affected b hæmatin. The organisms tested are shown in t following table, the figures in brackets being t number of strains of each species tested.

INHIBITED BY HÆMATIN	NOT INHIBITED BY HÆMATIN
Bacillus brevis (5)	*Bacillus anthracis* (2)
,, *licheniformis* (11)	,, *carotarum* (2)
,, *megatherium* (10)	,, *cereus* (11)
,, *subtilis* (45)	,, *circulans* (7)
	,, *firmus* (11)
	,, *fusiformis* (5)
	,, *laterosporus* (1)
,, *alvei* (1)	,, *alvei* (2)
,, *coagulans* (1)	,, *coagulans* (2)

With the exceptions of *B. alvei* and *B. coagulan* all the tested strains of a given species reacte uniformly towards hæmatin. The growth of *subtilis* was completely inhibited by hæmatin at concentration of 1/125,000, and was partial inhibited by hæmatin at a concentration of 1/500,00

The effect of hæmatin on a wide range of other species of bacteria was tested; but in no case was inhibition observed, with the possible exception of some *Corynebacteria*. At a concentration of 1/16,000 hæmatin appeared partially to inhibit the growth of a few strains of *Corynebacterium diphtheriæ mitis* and *gravis*, *C. hofmanni*, *C. xerosis* and a gelatin-liquefying diphtheroid. On the other hand, it strongly stimulated the growth of two strains of starch-fermenting, gelatin-liquefying *Corynebacteria*.

Hæmatoporphyrin and coproporphyrin III at concentrations of 1/20,000 did not appear to inhibit the growth of *B. anthracis*, *B. brevis*, *B. cereus*, *B. licheniformis*, *B. megatherium* or *B. subtilis*. Mesoporphyrin, 1/20,000, did not inhibit the growth of *B. anthracis*, *B. cereus* or *B. subtilis*, but it appeared partially to inhibit the growth of *B. brevis*, *B. licheniformis* and *B. megatherium*.

None of the organisms referred to above was inhibited by whole or laked red blood cells, with the exception of six of the forty-five strains of *B. subtilis* tested. These six particular strains grew quite readily on nutrient blood agar, but the cultures autolysed within seventeen hours of inoculation; they did not autolyse for at least three days when blood was omitted from the same nutrient agar. With the exception of *B. megatherium*, all the strains of organisms which were inhibited by hæmatin were also inhibited by laked red blood cells plus trypsin; they were not inhibited by whole red blood cells plus trypsin, even when they were able to hæmolyse the red cells.

Prof. C. Rimington (who kindly supplied me with the porphyrin derivatives I have tested) has reminded me that Kämmerer[1] claimed more than thirty years ago that hæmatin (1/2,000) did not inhibit any of the organisms he had tested, including (what was then called) *B. subtilis*, but that mesohæmatin inhibited the growth of a large number of Gram-positive organisms, including *B. anthracis*.

I am indebted to Miss Kathleen Gilliver of this laboratory for supplying cultures of the bacilli which I used, and for advice concerning them.

This work is being continued.

Effects of Aeration on Bracken and Heather Grown in Nutrient Solution

It has frequently been noted by ecologists, and is readily observed in the field, that the bracken fern (*Pteridium aquilinum*, Kuhn.) is halted in its advance on encountering water-logged soil. Also, irrigation of a *Pteridietum* rapidly decreases the density and height of the plant. Apparently no experimental investigation of aeration as a factor in the growth of bracken has hitherto been made. Watt has suggested that aeration may be an important factor in the outcome of the struggle between bracken and heather (*Calluna vulgaris*, Salisb.), and therefore the latter has been the subject of similar experiments.

Solitary bracken sporelings bearing a few small fronds and roots were placed in jars containing a variant of Knop's solution. One series of eight jars was aerated continuously for two months. A second series was left unaerated, and nitrogen from a cylinder bubbled through a further eight cultures.

Calluna seedlings were grown under similar conditions except that each series consisted of twelve jars and the medium used was half-strength Crone's solution, periodically adjusted by addition of dilute sulphuric acid to maintain the *p*H of the solution below 6.

Estimations of dissolved oxygen were made by the Winkler method adapted for small samples in a syringe pipette.

The results of these experiments are summarized in the accompanying table.

The roots of the bracken plants in aerated cultures were long with many branches, of a golden-yellow colour, and the tips of the main roots and laterals were noticeably swollen.

In the unaerated series, the roots were short and bunched, and in no case did the roots penetrate more than a centimetre or so beneath the surface of the solution. The roots were dark-brown in colour. No lateral branching occurred and swollen root tips were not found.

The plants treated with nitrogen were older than the others. One might have thought that their greater size would have rendered them more vulnerable to the effects of low oxygen supply. Nevertheless, even after two months of almost continuous passage of nitrogen, the health of the plants was but slightly impaired, as indicated by a wilting of some fronds to a small extent. The mean root-length was somewhat lower than in the unaerated series. The rhizomes of most plants in the series bore many short adventitious roots along their length and, in certain cases, these were developed to such an extent as to produce a network in the damp cotton wool and on the surface of the cork. This may be interpreted as a response whereby the young plants were able to absorb oxygen from the air when grown in solution containing little oxygen.

At harvesting, the aerated heather plants, while apparently healthy, were of smaller stature than the unaerated ones. The root systems tended to be bunched, and, although much branching occurred, the laterals were very short in most cases. Microscopical examination of the aerated roots showed that the mycorrhizal fungus had very few external hyphæ. In the cortical cells, the mycelium was never so dense as to fill the cells completely.

In unaerated solutions, both root- and shoot-growths of heather were luxuriant. Mycorrhizal development was little different from that in the aerated plants.

	Pteridium aquilinum			*Calluna vulgaris*		
	Aerated	Unaerated	Nitrogen	Aerated	Unaerated	Nitrogen
Mean temp. of sol. (deg. C.)	11·3	—	—	15·7	17·4	17·9
Mean dissolved oxygen (c.c./litre at N.T.P.)	7·71	6·293	1·191	7·053	5·153	2·616
Mean lengths of roots (cm.)	22·6	6·7	6·2	8·1	15·3	8·2
Mean dry weight of roots (gm.)	0·0815	0·0595	0·0922	0·0894	0·0960	0·0717
Mean dry weight of fronds (gm.)	0·1475	0·0648	0·1573	0·2586	0·3561	0·2412
Ratio of roots to fronds (mean dry weight)	1 : 1·8	1 : 1·1	1 : 1·7	1 : 3	1 : 3·7	1 : 3·4

With almost continuous treatment with nitrogen, root- and shoot-growths were approximately the same as with air. External hyphæ were more frequent and the mycelium in the root cells was often in an advanced stage of digestion.

Work on the respiration-rates of the roots in relation to oxygen supply, and on the precise oxygen concentrations in various bracken and heather soils, is being carried out.

Etiology of Grass Disease

In view of the letter in *Nature* of May 22 in which W. S. Ferguson recorded a paralysing action of grass juice on the isolated rabbit intestine, it may be of interest to note that we have succeeded, by ligature of the ileum in experimental ponies, in reproducing the main clinical, biochemical and post-mortem findings of acute grass disease. Although in this disease there is no obvious obstruction to the onward passage of fluid from the greatly distended small intestine to the dehydrated contents of the colon, the close similarity between experimental ileal obstruction and the naturally occurring condition suggests that in the latter there may be some functional upset in this region. As the large majority of cases occur in horses at grass, and as the peak incidence occurs during the active-growth stage of the herbage, it is tempting to suggest that the disturbance may be due to some chemical substance either existing preformed in the grass or produced in the process of digestion. Ferguson's observations would seem to be well worth following up with this possibility in mind.

Apus and a Rare Cladoceran in Britain

The primitive crustacean known as apus, or *Triops cancriformis* (Bosc), which is of particular interest to zoologists, has only been recorded five times in Britain. It was found in 1738 in Kent[1], at the beginning of last century near Christchurch in Hampshire[2], a little later at Bristol[3], in 1907 in Kirkcudbrightshire[4], and in 1934 near Fordingbridge in Hampshire[5]. Last summer, at the suggestion of Prof. J. Omer-Cooper, one of the discoverers of apus near Fordingbridge, I sought it and got it again from the same pool in which it occurred in 1934[6]. It seems, then, as if apus were a permanent inhabitant of Britain and not merely introduced from time to time through its drought-resistant eggs being carried in mud on birds' feet. I am submitting a full account of my find for publication in the *Proceedings of the Zoological Society*. Apus may not be quite so rare in Britain as the recorded finds suggest, for Ray Lankester, in letters to Dr. W. T. Calman and Dr. R. Gurney, related that he found it on Blackheath and in Worcestershire. I should welcome news of other finds. The habitat in Hampshire is a shallow grass-bottomed pool which is waterless in dry weather.

In 1946, Mr. D. J. Scourfield described a new species of *Daphnia* from Kew Gardens, *D. ambigua*[7]. From the locality in which he found it, Mr. Scourfield suggested that it had been introduced with aquatic plants from abroad. Last summer, and again this summer, I have found *D. ambigua* Scourfield to be abundant in Regent's Park lake. This need not invalidate the hypothesis of a foreign origin, since *D. ambigua* may have been introduced into the lake, in the form of ephippia by birds, from the old Botanic Gardens near by. It was there that the first freshwater medusa was discovered in 1880, in a tank with the water lily *Victoria regia*, coming, therefore, perhaps from South America. Again, I should like to hear of other finds of *D. ambigua*.

Re-discovery of *Apus cancriformis*

In September 1907 I discovered two shallow grassy pools on the Preston sea merse, near Southwick, Kirkcudbrightshire, in which *Apus* was present. In one of these it was so abundant that when I raised my eleven-inch ring net out of the water it was half full of specimens, mostly full-grown. I searched many other pools in the same area but without finding it and, returning to the same pools a few days later, I found the edges covered with the shells and very few specimens left in the water. The gulls had discovered this mass of food and had destroyed most of the *Apus*. I have visited the area many times during the last forty years but not until this month, working the merse near the mouth of the Southwick burn, have I again seen *Apus*. My son found three specimens in a pool which then yielded us about thirty or more, and several other pools near the first produced small numbers, mostly immature.

Geoffrey Smith[1] remarked upon the erratic way in which the Phyllopods are scattered through the regions they inhabit, and how they may appear in a pond for several seasons and then vanish. While *Apus* occurred in different parts of Britain on each of the few occasions of which we have records, the accepted explanation of its appearance seems to have been that it was brought each time on the feet of geese and other aquatic birds; but when it turns up after forty years within a mile or two of where it was originally found, it is perhaps reasonable to ask, has it been present in the hundreds of pools in the sea merse which extends, with gaps, from Southwick via Ruthwell, Powfoot, etc., and into Cumberland?

ENGINEERING RESEARCH AT CAMBRIDGE

THE report of the head of the Department of Engineering, University of Cambridge, on the work of his Department for the year 1946–47, was published in the *University Reporter* of April 27.

The report is divided into three sections under the headings teaching, research and workshops. The first section is of interest because it deals with the transition period when some men were reading for he old undivided Mechanical Sciences Tripos, held for the last time in 1947, and others for the new wo-part Tripos which was held for the first time in hat year. The new Part 2 course, in spite of starting under difficult conditions due to heavy numbers and shortage of staff, ran surprisingly smoothly. In all, 765 candidates sat for Tripos examinations in 1947. The report points out that while the number of undergraduates in the Department (658) was 117 less than the average in 1920–21, the corresponding year after the First World War, no less than 574 of hem were reading for honours as compared with 447 in 1920–21. The difference in research activity is even more marked; during 1946–47, in addition to the members of the teaching staff, 23 postgraduate students were engaged in research work as compared with 3 in 1920–21.

In its second section the report deals briefly with ome thirty-five projects being carried out in nine laboratories of the Department. In aeronautics the study has been begun of the behaviour of air as it flows past a solid porous surface through which some of the air is sucked, and theoretical work was coninued on the prediction of aerodynamic reactions on wings when account is taken of the boundary layers which form on their surfaces. Other investigations involving fluid motion, carried out in the Hydraulics Laboratory, included the protection of a pumping main by admitting air through a valve as n alternative to the air-bottle method, the actions of whirlpools, a theoretical investigation giving an pproximate method of dealing with the equations governing the oscillations in a surge tank fitted to a ipe line, and the instability of a fluid surface when accelerated in a direction normal to its plane.

The main effort in the Electrical Laboratory was centred on re-equipment and on setting up a Magnetic Laboratory, but five main projects in electronics were undertaken, namely, the construction of an automatic plotter for trajectories in an axially symmetric electrostatic system, the construction of a new type of mass spectrograph, the investigation of he modulation of an electron beam, and also of hot noise in thermionic valves, and the construction of an experimental electrostatic electron microscope.

In the Heat Engines Laboratory, new methods have been used to examine the scavenging process in two-stroke engine. An investigation, supported by he Motor Industries Research Association, was also mbarked upon to record the movement of a piston ring relative to its groove in an engine running under s own power. Other projects, supported by the Ministry of Supply, concerned gas turbine problems, ncluding the investigation of the flow through ascades of axial-flow compressor blades, and a study of the turbulent boundary layer break-away of air rom the flat boundary surface of diffusers and from he curved surfaces of blades. Work was also begun n the heat-flow characteristics of liquid metals and on the development of a magnetic pump for pumping a liquid metal.

Considerable work was in hand in the Materials Laboratory. Since 1943 a team of workers, supported by the Admiralty, has been investigating the causes of fracture in welded ships. It has been shown that while residual stresses and reaction forces can be high, neither is the chief cause of fractures in welded ships; the trouble can, however, be attributed to a property of mild steel known as 'notch brittleness'. Two other investigations aimed at determining the effects of high rates of strain on mild steel and the effects of low rates on aluminium and other materials. A third was concerned with distribution of stress and strain in real materials having non-Hookean properties.

In the Mechanics Laboratory, the solution has been obtained to the problem of the stresses caused by a suddenly applied load on a beam supported in various ways; a number of direct verifications of the theoretical predictions of stress have been obtained experimentally. An investigation, supported by the London, Midland and Scottish Railway Company, of the motion of a single railway axle and a pair of wheels was completed. A special photo-elastic bench equipped with stroboscopic light sources has been constructed, with the help of a grant from the Institution of Mechanical Engineers, for the determination of the dynamic stresses in gear teeth. An attempt, assisted by the British Iron and Steel Research Association, is being made to determine theoretically and experimentally the relative distribution of useful and frictional work in the wire-drawing process.

A number of problems relating to pressure vessels have been investigated. Methods were devised for the solution of the differential equation governing the stresses and deflexions in drumheads of any rotationally symmetrical form with the aid of a mechanical analogue apparatus; help with this project has been given by the Research Department of Messrs. Babcock and Wilcox. Tests, supported by the British Welding Research Association, have been made on the pipe-bend portions of welded pipe lines, and it has been shown that the greatest surface strain occurring in the cross-section is the transverse strain inside.

With the support of the Nuffield Foundation, a start was made on the problem of tillage by measuring the component soil forces on a simple implement in motion.

In addition to the work on brittle fracture, the Department has been collaborating in other investigations on ships. Full-scale trials were conducted by the Admiralty during the years 1945–47, and the work being carried out in the Department is the reduction of the experimental data to a form suitable for interpretation into practical design recommendations. Work similar in aim though very different in scale has been undertaken on a 14-ft. sailing boat.

Much research into the behaviour of other structures was carried out. An investigation, supported by the British Welding Research Association and the Department of Scientific and Industrial Research, to find the true load-carrying capacity of rigidly jointed steel frame structures was continued. The behaviour up to collapse of a length of continuous stanchion bent in double curvature was investigated experimentally and a theoretical analysis of the same problem was completed. A successful start in developing a method of design taking account of plastic deformations was made by dealing with single-bay rectangular portal frames; the lateral instability of steel beams bent until they had partially yielded was studied, and a considerable programme of tests on battened struts was carried out.

In addition to these investigations under static loading conditions, attention has been given to the fatigue strength of structures. Equipment was developed successfully for carrying out fatigue tests on full-scale structures and structural components by the resonance vibration method.

A comprehensive investigation into the behaviour of light alloy struts was made, and an experimental and theoretical study of the lateral instability of light alloy beams is also being undertaken with the help of the Aluminium Development Association.

RABELAIS ON SYPHILIS

IN a thesis for a doctorate in medicine at the University of Paris, Dr. Mottron has chosen to extract from the books of Gargantua and Pantagruel all the references to syphilis ("Rabelais et la Verole". By J. Mottron. Pp. 127. Tours: Arrault et Cie., 1947). The texts are quoted *in extenso* and the commentary thereon gives a study of syphilis as it was understood in the first half of the sixteenth century.

Rabelais was a contemporary of Fracastorius, but he did not use the term syphilis, which only became popular much later. In the prologue to Gargantua, Rabelais dedicates his writings to "Buveurs tres-illustres, et vous verolez tresprecieux". His references to the disease are all in terms that could be understood by his lay readers.

The epidemic of syphilis in Europe began in 1493, and when Rabelais was writing there was already a good descriptive knowledge of the disease. The chancre was recognized as the primary focus of infection and its characteristic induration had been described. Also known were the short latent period before the start of the secondary stage with its *croustelevés*, or rupial lesions, and all the other manifestations of secondary syphilis on the skin and in the nervous system.

It was fortunate that mercury, the only useful remedy of the times, was used almost at once, and by accident, in the treatment of the new disease and that its good effects were recognized. Mercury was first used by inunction, and there is an allusion to this method of treatment in Rabelais' prologue to the books of Pantagruel. The toxic effects of mercury are also mentioned. When mercury was shown to affect syphilis the dosage was increased to toxic levels, and the ill-effects were confused with the manifestations of the disease itself. This confusion resulted in the change to guaiacum which, for a short period, superseded mercury.

Although mercury was used orally as early as 1533, inunction long continued as the chief mode of application. Sweating baths were often associated with mercury inunctions. Gasparo Torrella (1497) recommends the "best way to treat syphilis is to sweat the patient for fifteen days, fasting, in a steam bath or oven". Jean Fernel (1557) writes of steam baths at high temperature for twenty days or more. Sarsaparilla, a sudorific agent used in conjunction with baths, is also mentioned by Rabelais. The vogue for sweating has continued ever since. Baths in mercury vapour were used by Langston Parker i 1850 and to-day we use more elaborate methods i the hypertherms. Rabelais seems to have intende his works to be read by the suffering *verolez* whil they were sweating. It is doubtful whether eve Rabelais could mitigate the sufferings of the moder sweating cabinet; but it is an idea which ought t be tried.

Dr. Mottron seems to favour the theory tha syphilis existed in Europe in the pre-Columbian er and that the disease was unrecognized before 1493 or confused with leprosy, scabies, etc. He cite Broca's (1876) observation of the discovery o syphilitic lesions in bones from an ancient leprosorium and quotes the monk Theodoric (thirteenth century) Gaddesden (fourteenth century) and Bernard Gordo (1305), on the transmission of 'leprosy' by sexua intercourse.

The evidence of contemporary observers such a Torrella and Ulrich von Hütten is, however, of a new, hitherto unknown disease which alarmed th doctors to the point where they fled from the presenc of the sick. Public health measures were quickl enacted all over Europe. In Paris, in 1497, foreigner with the great pox were warned to leave the cit under pain of the halter for disobedience, and citizen so affected had to stay always indoors. The nex year, 1498, the penalty for the unfortunate syphiliti discovered at large in Paris was to be thrown into th river. In the city of Aberdeen, at the same time, t combat the French disease, it was ordained "that al licht weman be chargit and ordanit to decist fr their vicis and syne of venerie, and all their bothi and housais skalit". All these evidences sugges something absolutely new and terrifying.

In favour of the American origin for syphilis ar many points unspecified by Dr. Mottron. He doe not mention, for example, Ruy Diaz de Isla' "Tractado Contra el Mal Serpentina", in which i described the treatment, at Barcelona, of some o Columbus's men on their return from Haiti. No does he allude to more recent investigations on ancien bones which seem to show that syphilitic osteitis di not occur in Europe or Egypt before the sixteent century. This controversy is, however, interminabl and can be closed for the present with the observatio that Rabelais talks of a case of the *verole* in 1420.

The entity of syphilis is recognized by Rabelais He mentions gonorrhœa only rarely, but it is quit clear that he knew it as a separate disease. Syphili was also distinguished from leprosy in Rabelais day. Vibert speaks of lepers fearing contaminatio from syphilitics. Rabelais knew syphilis to be contagious and venereal disease; but he does no seek, like some of his contemporaries, for causes i planetary disturbances, poisoned water, cannibalism etc.

Dr. Mottron ascribes to Rabelais the trac "Triomphe de Très Haute et Puissante Dam Vérole". In this is cited, perhaps for the first tim a cause for venereal disease which is still occasionall suggested by patients:

> "Et notre fiffre a uriné
> Contre un mur dont mal lui en print".

Dr. Mottron is to be congratulated on his scholar development of a very interesting theme. My onl criticism is of his rather one-sided treatment of t theory of the American origin of syphilis; but Rabelais is on his side I shall say no more.

JAMES MARSHALL

STRESS ANALYSIS AND THE DESIGNER

A DISCUSSION on "Stress Analysis and the Designer" was opened by Sir Donald Bailey the Birmingham Conference on April 13 of the Stress nalysis Group of the Institute of Physics. Sir onald outlined his attitude to stress analysis as engineering designer. He needed answers to articular problems which could not be obtained by athematical methods either because of the comexity of the mathematical solutions or because of sign assumptions, unknown boundary conditions other practical uncertainties. He specified his quirements as the need to measure stresses up to –85 tons per sq. in. in steel or 25–30 tons per sq. in. light alloys, occurring at frequencies from 0 to 25 cles per second in structural work and up to cycles per second in mechanical work. This quired recording apparatus that would respond to least 1,000 cycles per second. The stresses obtained ould be correct to within 2½–5 per cent for all resses from 4 tons per sq. in. upwards.

Sir Donald outlined the field conditions under hich he required his apparatus to operate. On ructural work he found that he had very often to rry out tests in bad weather and on remote sites void of a power supply. The structures under vestigation were often large and the readings had be available at a central recording station several undred feet away from the structure. Experts on rain gauge methods were not usually available, and e equipment used had therefore to be sufficiently liable to be operated by the practising engineer, ho was not generally competent to carry out pairs to electronic equipment if this went t of commission at the crucial moment during a st.

The shortcomings of a number of methods of expermental stress analysis were then discussed. Mechanical d optical strain gauges are generally unsuitable for e in the field because they are incapable of recording alized and dynamic stresses and cannot be adapted central recording of the readings from a large mber of gauges. Sir Donald has found acoustic uges to be unsatisfactory and too large and heavy his purposes. Brittle lacquer techniques and oto-elastic methods were mentioned in passing, t neither of these are field methods. The rigid mperature control required for the brittle lacquer thods rules these out for use in the field; photostic methods are extremely useful, but necessarily ited to laboratory investigations on small-scale dels.

The electric resistance strain gauge is the most dely used method, but Sir Donald Bailey felt that ch more development work is needed here; the cking of the gauges to the structure needs much ill and experience in order to give consistent results. e waterproofing of gauges in the open air has been nd difficult. Temperature control and the correct cing of large numbers of gauges have been found kward and time-consuming, and the equipment ed in the recording of dynamic stresses has not, in neral, been found very reliable.

During the discussion which followed, the use of e acoustic strain gauges, particularly those of the ihak type, was defended; and a number of akers felt that by virtue of their robustness and edom from troubles due to changes of temperature, these gauges were eminently suitable for use in static tests of large structures.

A number of speakers felt that the difficulties of mounting electric resistance strain gauges have been exaggerated, but there was general agreement that the waterproofing of gauges in exposed positions is of paramount importance. The general feeling of the meeting was that there is no alternative to soldering the leads to electric resistance strain gauges; plugs and sockets invariably lead to erratic results. Where immediate results are required in the field, the use of pen-and-ink recorders was advocated; a representative of Messrs. Kodak pointed out that immediate results are obtainable from ordinary film and that processing in special solutions in a mobile unit need only take 40 seconds.

There was very general support for Sir Donald Bailey's contention that the manufacturers of electronic devices might pay more attention to the reliability of their products. The point was made that the engineer engaged on stress analysis work should be able to feel the same confidence in his oscillographs, amplifiers and other electrical recording equipment as the average householder has in his domestic wireless set. The view was put forward very strongly that the manufacturers tend to think of their customers too often as experts in electronics, who use the equipment in laboratories where minor repairs can easily be carried out, and do not cater for the engineer who wants to use his electronic gear merely as a tool and who knows no more about the construction of the instruments than is necessary for their efficient use. One industrial research unit was quoted as an example of the waste of effort involved in the present position; in this unit no less than nine members of the staff out of a total of thirty are engaged in the instrument section dealing mostly with breakdowns and troubles caused by insufficient screening of electrical recording instruments. It was made very clear by the discussion that the manufacturers have a long way to go before they achieve a standard of reliability and robustness in their products which will satisfy their customers in the growing field of experimental stress analysis.

E. K. Frankl

INTERNATIONAL INSTITUTE OF WELDING

WELDING has just achieved organisation on an international scale by the formation of the International Institute of Welding, at a meeting in Brussels during June 8–11, attended by the representatives of fourteen countries.

At the meeting of the Governing Council on June 11, M. P. Goldschmidt, administrative director of the Belgian Institute of Welding, was elected the first president of the International Institute, and the Council elected as vice-presidents Prof. H. E. Jaeger, lecturer in naval architecture at the University of Delft, and Prof. A. Portevin, president of the French Institute of Welding. One other vice-president is to be nominated by the American Welding Society. Mr. Walter Edström, vice-president of the Swedish Welding Committee, was elected treasurer. A special responsibility has fallen to the British welding community through the election as the first secretary-general of the international body of Mr. G. Parsloe, secretary of the British Institute of Welding.

The primary business of the meeting was to establish the International Institute and to set up a number of special commissions on various technical subjects. The following subjects have been included, the names of the respective chairmen being given in brackets: gas welding (M. C. G. Keel, director of the Swiss Acetylene Society); electric arc welding (Prof. H. E. Jaeger); resistance welding (chairman to be nominated by the U.S. National Resistance Welding Association); documentation (M. A. Leroy, director of the French Institute of Welding); testing and measurement (M. P. Goldschmidt); preparation of a welding dictionary (chairman to be nominated by the Belgian Institute of Welding); hygiene and safety (Mr. A. Härlin, secretary of the Swedish Welding Committee); weldability (Prof. Jaeger); residual stresses (Dr. F. A. Fox, assistant director of the British Welding Research Association); mechanical stress relieving (Prof. W. Soete, technical adviser to the Belgian Institute of Welding and lecturer at the University of Ghent); brittle fracture (Mr. Scheil, of the A. O. Smith Corporation, Milwaukee)

On June 8 and 9, two sessions were devoted to the reading of technical papers, and works visits were arranged on the following day.

It is intended to hold a similar expanded meeting of the Governing Council annually, and an invitation from the Netherlands to meet there in 1949 has been accepted. An invitation from the British delegation to hold the first World Welding Congress in Great Britain in the British Festival year, 1951, was also accepted.

TOXICITY OF D.D.T.

THE insecticide most in the public mind to-day is that known as D.D.T., concerning the efficacy of which rather extravagant claims have been put forward. Nevertheless, its discovery has already proved an event of major importance in view of its cheapness, adaptability and wide range of application. There remain, however, many aspects needing detailed study. One of these is the toxicity of D.D.T. to man and animals, both in the tropics and in temperate regions.

This subject has been investigated by Surgeon-Lieut. F. M. G. Stammers and Lieut.-Commander F. G. Sarel Whitfield, senior entomologist to the Medical Director General of the Navy. A brief summary of the investigations appeared in *Nature*, 157, 658 (1946); the full account has been published in the *Bulletin of Entomological Research* (38, 1; 1947). In the course of the investigations fifteen men, attached to the Royal Naval School of Tropical Hygiene in Colombo, were adopted as subjects for inquiry. They had been exposed for many months to heavy and continuous daily contact with a 5 per cent solution of D.D.T. in kerosene. Their work consisted of spraying ships and shore establishments against infestation by various insects. Of the men employed, one was a Tamil and the remainder Cinghalese. The results of a detailed medical investigation of these men, together with their general demeanour and labour output, indicated that they had received no ill-effects. In England the toxicity of a continuous-phase aerosol of D.D.T. to man and animals was investigated by means of trials at the Royal Naval Hospital, Plymouth, and at the Chemical Defence Experimental Station, Porton.

In so far as human beings were concerned th results were entirely negative. Also, there were n symptoms of D.D.T. poisoning in rats and rabbi as the result of 28-days exposure to continuou D.D.T. aerosol. Messrs. Stammers and Whitfiel devote most of their paper to a critical review the literature on the subject under investigation. A the result of this study and of their own investig tions, it seems that D.D.T. is harmless to man ar animals when used as an insecticide. It is, neverth less, possible by unskilled formulation, by the use unsuitable solvents and by misapplication to inc risk of life. The chance of cumulative effects fro the storage of D.D.T. in the milk and tissues sheep and cattle needs further investigation.

INSTITUTE OF PHYSICS

ANNUAL REPORT

AT the annual general meeting of the Institute Physics held on May 20, the following we elected to take office on October 1: *President,* D F. C. Toy; *Vice-President,* Dr. E. T. Allibon *Honorary Treasurer,* Mr. E. R. Davies; *Honora Secretary,* Dr. B. P. Dudding; *New Ordinary Me bers of the Board,* Mr. J. H. Awbery and Mr. E. W. Selwyn. Dr. G. B. B. M. Sutherland has be appointed by the Faraday Society as its new re resentative on the Board.

The twenty-eighth annual report of the Boa covering the work of 1947 was presented to the mee ing. The report shows that the membership, no at about 3,250, continues to grow at the rate of little more than ten per cent per annum. The Ins tute has seven branches, five in Britain and o each in Australia and India, and six subject grou comprising electronics, industrial radiology, X-r analysis, industrial spectroscopy, electron micr scopy, and stress analysis. The last was formed March 1947. All the branches and groups have ea held several meetings during the year, and the repo lists these in detail. In July, the Institute co-operat with the H. H. Wills Physical Laboratory of t University of Bristol in conducting a summer scho at which the attendance was 133, on "Cohesi Forces in Metals and the Mechanical Properties Solids"; and, in September, with the Physical Socie and in collaboration with the Institution of Electri Engineers, it organised celebrations, including special exhibition at the Science Museum, to ma the jubilee of the discovery of the electron.

The report shows that the Board has been acti in matters concerning the education and traini of physicists. The preparation of a report on develo ments in technological education has been undertak (and has since been published); and to help in pu licizing the newly established National Certifica in Applied Physics, the Institute has produced illustrated booklet entitled "Experimental Science A Career for the Practical Boy or Girl". T Australian branch, also, has in preparation a rep on "Physics in Australia" and a booklet on "Phys as a Career". In addition to individual inquir from members concerning professional matters, t Institute has, either through the Joint Council Professional Scientists and other bodies on which t Institute is represented, or directly, dealt with di culties in connexion with the re-organisation of t Scientific Civil Service, the collection of up-to-d ata on salaries paid to physicists and on available cientific man-power.

In April 1946, the statement that "the Board was n full agreement with the views expressed by the resident of the Royal Society regarding atomic nergy and secrecy" was circulated to members of he Institute. The Board has since seen fit to amplify his statement, and has declared that it "strongly elieves that atomic energy should only be used for eaceful and not warlike purposes". This, in its pinion, requires international agreement, and thus olitical action, which the Board feels is a matter est left to individual men of science. The Board grees to promote the free exchange of scientific nformation between scientific workers of all countries; ut it also realizes that it has been the practice for ome to accept a measure of secrecy as a condition f their employment or service. In this connexion he Board is prepared to give advice to individual members.

The report mentions that during the year a scheme as discussed with the Physical Society for the stablishment of an applied physics journal. It was ecided, however, that it was not practicable, at resent, to launch such a journal, and an alternative uggestion of the Council of the Physical Society that he Institute's publication, the *Journal of Scientific nstruments*, should be enlarged and a special section, f about forty per cent of its space, be devoted to non-instrument' articles, was adopted. Since anuary 1948 the *Journal* has appeared in this modified form under the new title of *Journal of cientific Instruments and of Physics in Industry.* A second edition of the "Handbook of Industrial Radiology" was called for during the year, and among he new publications the Institute has in hand are book of "Laboratory and Workshop Notes" selected rom the Institute's *Journal*, and, in book form, the apers read at the 1946 Manchester Conference on he measurement of stress and strain.

Repairs and improvements to the Institute's House t 47 Belgrave Square, London, are proceeding teadily but very slowly, the report states, but already onsiderable benefit has been derived from the increased accommodation and facilities, which include members' reading room, and a lecture room with a apacity of a hundred. It is anticipated that the ssential work will be completed within two years.

COUNCIL FOR THE PRESERVATION OF RURAL ENGLAND

AN indication of the nation's indebtedness to the Council for the Preservation of Rural England nay be obtained from a perusal of the Society's annual report for 1947–48, obtainable from 4 Hobart Place, London, S.W.1. Foremost among the issues ith which it has had to deal has been the vast roblem of the post-war use of land for training the armed forces. The Council has been charged by the Ministry of Town and Country Planning with the duty f presenting evidence in writing, and if necessary erbally, on amenity and scientific grounds, in all ases where it is considered desirable that such vidence should be presented. On his afforestation olicy the Minister of Agriculture has been advised on landscape planting and types of trees, while the ouncil's officers have also played their part in causing the cost-limit for the building of new houses to be raised in order that local stone might be used for facing in those districts where stone-built houses are traditional.

In conjunction with the Caravan Club and the Town and Country Planning Association, the Council for the Preservation of Rural England has set up regional sub-committees to eliminate (in the words of the Scott Report on Land Utilization in Rural Areas) "the nameless messes, the assemblage of caravans and converted buses and encampments which have littered and spoilt many a once charming stretch of coastline, lakeside and riverside, and a hundred other attractive scenes".

The submission of the Scott Committee that the introduction of carefully regulated suitable industries into the countryside would be beneficial has been endorsed by the Council and particular cases have been investigated, while the Council has also advised the Minister of Town and Country Planning on the location and design of wireless installations for the police and the B.B.C. Representations to the Postmaster General on the colour of telephone call boxes has enabled substantial agreement to be reached for those districts where objection is raised to the standard red of the 'Jubilee Kiosk'.

Opencast coal working has caused the Council much concern, and clear recommendations have been made to the Minister of Fuel on methods of regaining soil fertility and the restoration of land drainage after settlement as well as the general amenities. The reports of the Committee on National Parks were warmly supported by the Council; but dissatisfaction was registered with the Government's tardiness in implementing the main recommendations.

Other subjects dealt with by the Council during a year of considerable activity were the control of outdoor advertisements, the distribution and design of electricity installations, the siting and landscape treatment of road works and the preservation of buildings of historic and architectural interest.

CROPS OF THE CARIBBEAN

THE Governments of the United States and the United Kingdom (1942), and later of France and the Netherlands (1945), united to establish a Caribbean Commission to encourage and strengthen social and economic co-operation between their various possessions and bases in the area known geographically and politically as the Caribbean. In order to survey needs, to determine what research has been done, to facilitate research on a co-operative basis, and to arrange for the prompt dissemination of the results of research, the Caribbean Research Council was set up in 1943. One of its research committees, dealing with agriculture, nutrition, fisheries and forestry, has instituted a series of crop inquiries in all territories, and the results of two such investigations have recently been published (Crop Inquiry Series No. 4, "Root Crops and Legumes", 1947, and No. 5, "Vegetables". Caribbean Commission, 1736 Vermont Ave., N.W. Washington, D.C., or Kent House, Port of Spain, Trinidad, B.W.I. 0.50 dollar per copy).

Agriculture in the Caribbean has traditionally emphasized production for export, on the theory that it is more advantageous to produce locally a high-priced crop (sugar) and buy low-priced foods in the world market. This has resulted in neglect of home-produced foodstuffs, and as the conclusions are similar for both publications under review, it is convenient to treat them together. Production of root crops, legumes and vegetables is unorganised, being mainly in the hands of peasants who cultivate small kitchen gardens about one-eighth of an acre in extent, as an adjunct to small-scale agriculture. Seed is generally imported, and is often of low viability owing to lack of cool storage. Pests and diseases are common, and there are only limited facilities for preservation of the produce. Yields are low; but it would appear that very considerable expansion of vegetable production is possible without disturbing the acreage devoted to sugar, which is the main crop. Two encouraging trends are a pre-war export of vegetables on a small scale from some of the territories, and some attempt at co-operative harvesting and marketing.

Details of all aspects of vegetable culture in each territory are set forth in the bulletins, which have been edited by Dr. H. W. Marston, with assistance (for Bulletin No. 5) from Dr. Gustave Burmeister, both of the United States Department of Agriculture.

FORTHCOMING EVENTS

*(Meetings marked with an asterisk * are open to the public)*

Monday, July 19—Friday, July 23

CONGRESS OF UNIVERSITIES OF THE COMMONWEALTH (in the Examination Schools, High Street, Oxford).

Tuesday, July 20

At 10 a.m.—Discussion: "Relations of the State and the Universities".

Wednesday, July 21

At 10 a.m.—Discussion: "Inter-University Relations".

Thursday, July 22

At 10 a.m.—Discussion: "A critical review, from the points of view of an historian, a philosopher and a sociologist, of the structural and moral changes produced in modern society by scientific and technological advance".

Friday, July 23

At 10 a.m.—Discussions: "General Plans for Colonial Higher Education" and "The Extension of the University Secondment Scheme".

INSTITUTION OF CIVIL ENGINEERS (at Great George Street, London, S.W.1).—Conference on "Civil Engineering Problems in the Colonies".

Wednesday, July 21

BRITISH STANDARDS INSTITUTION (at the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London, W.C.2), at 3 p.m.—Annual General Meeting.

Thursday, July 22—Friday, July 30

COMMONWEALTH INSTITUTE OF ENTOMOLOGY (in the Large Chemical Lecture Theatre, Chemistry Department, Royal College of Science, Imperial Institute Road, London, S.W.7).—Fifth Commonwealth Entomological Conference.

Friday, July 23

At 10.30 a.m. and 2.30 p.m.—Discussions on Insecticides.*

Monday, July 26

At 2.30 p.m.—Discussions: "Biological Control" and "Estimation of Insect Populations in the Field".*

Tuesday, July 27

At 10.30 a.m.—Discussions: "Recent Developments in the Control of Stored Products Insects" and "Tsetse Research and Control".*

At 2.30 p.m.—Discussion: "The Need for Plant Quarantine on a Continental Basis, with Special Reference to Africa".*

Thursday, July 29

At 2.30 p.m.—Discussion: "Locusts and Grasshoppers".*

Friday, July 23—Saturday, July 24

BIOCHEMICAL SOCIETY (in the Biochemistry Department, The University, Glasgow, W.2), at 11.15 a.m.—Scientific Papers.

APPOINTMENTS VACANT

APPLICATIONS are invited for the following appointments on or before the dates mentioned:

ASSISTANT KEEPER to be responsible for the Zoological Collections in the Manchester Museum—The Registrar, The University, Manchester 13 (July 24).

EXPERIMENTAL OFFICERS AT THE MICROBIOLOGICAL RESEARC DEPARTMENT, Ministry of Supply, Porton, Wilts, for work in connexio with a pilot plant producing antibiotics—The Secretary, Civil Servic Commission, Scientific Branch, 27 Grosvenor Square, London, W. quoting No. 2198 (July 24).

LECTURER (Grade II) IN THE DEPARTMENT OF PHYSICS—Th Registrar, The University, Liverpool (July 24).

SENIOR ASSISTANT ENGINEER and a GENERAL ASSISTANT ENGINEE for Power Engineering Section, and a GENERAL ASSISTANT ENGINEE for Light-current Engineering Section, in the Authority's Laborato at Leatherhead—The Director of Establishments, British Electricit Authority, British Electricity House, Great Portland Street, Londo W.1 (July 26).

ASSISTANT LECTURER IN CHEMISTRY—The Registrar, The Univers ity, Reading (July 30).

GLASS DELEGACY RESEARCH FELLOWSHIP in the Department o Glass Technology—The Registrar, The University, Sheffield 10 (July 31

LECTURER IN PHARMACOLOGY—The Secretary, Welsh Nationa School of Medicine, 10 The Parade, Cardiff (July 31).

OFFICER-IN-CHARGE OF SOIL MICROBIOLOGY SECTION, an OFFICER IN-CHARGE OF SOIL ECOLOGY SECTION, and an OFFICER-IN-CHARG OF BIOLOGICAL ASSAY SECTION, for the Soil Biotics Division, a ORGANIC CHEMIST for Soil Chemistry Division and SOIL PHYSICIST (2) for Soil Physics Division, in the Soil Bureau of the Departmen of Scientific and Industrial Research, Wellington—Office of the Hig Commissioner for New Zealand, 415 Strand, London, W.C.2 (July 31

PHYSICISTS (2) FOR RADIO SECTION, a SENIOR PHYSICIST (Office in-Charge) FOR RADAR SECTION, a SENIOR PHYSICIST or ENGINEE (Officer-in-Charge) FOR ELECTRONICS AND ACOUSTICS LABORATORY and PHYSICISTS (3) FOR THE GENERAL PHYSICS LABORATORY, at th Department of Scientific and Industrial Research, New Zealand-Office of the High Commissioner for New Zealand, 415 Strand London, W.C.2 (July 31).

SENIOR LECTURER IN PLANT BIOCHEMISTRY at the University o Melbourne—The Secretary, Universities Bureau of the British Empir 8 Park Street, London, W.1 (July 31).

LECTURER IN MATHEMATICS (Pure Mathematics)—The Principa Royal Holloway College, Englefield Green, Surrey (July 31).

DEPUTY CHIEF SCIENTIFIC OFFICER in the Directorate of Engin Research and Development, Ministry of Supply, London—The Secre tary, Civil Service Commission, Scientific Branch, 27 Grosvenc Square, London, W.1, quoting No. 2191 (August 5).

HISTOLOGIST (Senior Research Officer or Research Officer) FOR TH DIVISION OF FOOD PRESERVATION AND TRANSPORT of the Counc for Scientific and Industrial Research, Brisbane—The Chief Scientifi Liaison Officer, Australian Scientific Research Liaison Office, Afric House, Kingsway, London, W.C.2, quoting No. 1772 (August 7).

RESEARCH OFFICER FOR THE DIVISION OF INDUSTRIAL CHEMISTR of the Council for Scientific and Industrial Research, Melbourne-The Chief Scientific Liaison Officer, Australian Scientific Researc Liaison Office, Africa House, Kingsway, London, W.C.2, quotin No. 1538 (August 7).

SENIOR PRINCIPAL SCIENTIFIC OFFICER IN THE INFESTATION CONTRC DIVISION of the Ministry of Agriculture and Fisheries—The Secretar Civil Service Commission, Scientific Branch, 27 Grosvenor Squar London, W.1, quoting No. 2193 (August 9).

DIRECTOR FOR THE CENTRAL GLASS AND CERAMIC RESEARC INSTITUTE, Calcutta—The Secretary, Council of Scientific ar Industrial Research, 'P' Block, Raisina Road, New Delhi, Ind (August 10).

TEMPORARY SENIOR LECTURESHIP IN MATHEMATICS at Aucklan University College, Auckland, New Zealand—The Secretary, Univer ities Bureau of the British Empire, 8 Park Street, London, W (August 15).

PHYSICISTS or ENGINEERS FOR METROLOGY AND ACOUSTICS LA ORATORIES in the National Research Laboratories, Ottawa—Tl Scientific Liaison Officer, Canada House, Trafalgar Square, Londo S.W.1 (August 16).

PROFESSORSHIP OF ECONOMIC AND MINING GEOLOGY at the Univer ity of Adelaide—The Secretary, Universities Bureau of the Briti Empire, 8 Park Street, London, W.1 (August 31).

ENTOMOLOGIST FOR THE RESEARCH DIVISION of the Departme of Agriculture and Forests, Sudan—Sudan Agent in London, Wellin ton House, Buckingham Gate, London, S.W.1, marking envelo 'Entomologist, Agriculture'.

GOVERNMENT CHEMIST in the Medical Department of the Go Coast—The Director of Recruitment, Colonial Office, 15 Victor Street, London, S.W.1.

LECTURER IN CIVIL ENGINEERING, a LECTURER IN MECHANICA ENGINEERING, and a LECTURER IN MATHEMATICS—The Clerk to tl Governing Body, Battersea Polytechnic, London, S.W.11.

LECTURER IN VETERINARY SCIENCE, a LECTURER IN GENETICS, LECTURER IN HORTICULTURE, a LECTURER IN STATISTICS AND EXPER MENTAL METHOD, a LECTURER IN POULTRY HUSBANDRY and LECTURER IN ENTOMOLOGY, for the Canterbury Agricultural Colleg Lincoln, New Zealand—The Secretary, Universities Bureau of t British Empire, 8 Park Street, London, W.1.

READERSHIP IN BIOCHEMISTRY tenable at the Royal Cancer Hospit —The Academic Registrar, University of London, Senate Hous London, W.C.1.

RESEARCH WORKER IN CHEMOTHERAPY AND TROPICAL MEDICI at the National Institute for Medical Research, London, N.W.3-The Secretary, Medical Research Council, 38 Old Queen Stree London, S.W.1.

SENIOR SCIENTIFIC OFFICER to take charge of Biology and Che istry Section (G.224/48A), a SENIOR SCIENTIFIC OFFICER to ta charge of Physics and Electronics Section (A.185/48A), a SCIENTIF OFFICER for investigation of deterioration of materials and equipme exposed under tropical conditions (F.429/48A), a SENIOR EXPER MENTAL OFFICER to lead a team working on Electronics (A.186/48A and EXPERIMENTAL OFFICERS and ASSISTANT EXPERIMENTA OFFICERS for work in Chemistry (F.430/48A), Biology (G.225/48A Physics and Electronics (A.187/48A), General Engineering (C.415/48A for Ministry of Supply Tropical Testing Establishment, Port Harcou Nigeria—Technical and Scientific Register (K), York House, King way, London, W.C.2, quoting relevant reference number.

EXAMINATIONS AND SELECTION BOARDS

THE remarks which Sir Percival Waterfield, the First Commissioner of the Civil Service, made at Oxford in March regarding the low standard in personality and intelligence shown by applicants for entry into the Civil Service have aroused a considerable discussion and formed the subject of a debate on the Civil Service initiated by Viscount Mersey in the House of Lords on May 26. Sir Percival's statement that, of three thousand graduates interviewed, 40 per cent of those who wanted to go into the administrative service and 50 per cent of applicants for the foreign service scored marks for personality and intelligence which represented complete failure, is one of which industry and the universities as well as the Civil Service are bound to take careful note. His further statement that about five per cent of applicants for the administrative service and eight per cent for the foreign service were below even the lowest category may well be discounted, as was suggested in the debate, by war-time conditions and the absence of the screening which was practised by the universities with candidates for the written examinations; but the feature that, among those who failed, 60 per cent had university or college scholarships and 20 per cent were those who had State scholarships, should cause at least as much disquiet to the educationist and industrialist as to the Civil Service Commissioners.

The three fundamental questions which arise here were well indicated by Viscount Mersey in opening the debate: the training or education which the candidates have received; the tests or examinations to be applied to them when they desire to enter the Civil Service; and the qualities which are judged necessary for the Civil Service. This part of Lord Mersey's speech suggests that he was aware of the discussion on selection for management at the British Association meeting in Dundee last year. Neither he nor any other participant in the House of Lords debate, however, recognized that in selecting men for the Civil Service, or for any other walk in life, the chief requirement is, as Mr. A. Rodger pointed out at Dundee, a reasonably clear notion of what we are trying to assess. The first question to be answered is: "What are we looking for in our candidates?" Unless we can give a reasonably clear answer to that question, neither the written examination nor the selection board is likely to give us the men or women we require.

It might well be argued, therefore, that some of the criticisms of the selection—and rejection—of candidates for the Civil Service are due to the simple fact that, with the growth of the Civil Service and the increasing range and complexity of its duties, we have become less sure of the qualities we desire in our Civil servants, and less able to formulate precisely the relative weight we attach to initiative, integrity and other aspects of personal character for which no method of assessment yet exists, if, indeed, it could be found. We cannot expect to devise the appropriate methods of selecting and testing candidates while we are uncertain in our own minds about the precise requirements those methods are to meet. Even if that uncertainty and indecision were removed, we have still a long time to wait before we can be satisfied of the validity of the new methods, as was, indeed, repeatedly asserted in the debate by the strongest supporters of the new tests.

There are, in fact, sound reasons why we should not discard the intellectual tests, however imperfectly such written examinations may disclose the boldness, quickness, clarity and candour which, with self-discipline, marked the habit of Greek thought in its greatest days, as Prof. F. A. Adcock noted in his presidential address to the Classical Association earlier this year. Indeed, Lord Lindsay very pertinently remarked that people who showed themselves capable of passing searching written examinations with distinction could not be altogether devoid of ability. He himself thought that while the interview by the Civil Service Selection Board was much better in many ways than the half-hour interview, the right course was to restore the solid evidence of achievement in the written examination and supplement the examination with the interview.

Whatever the ultimate decision, it seems clear that, as Lord Moran suggested, we are only at the very beginning of a method of assessing accurately the suitability of men and women for the Civil Service or for any other sphere. The task should be approached in humility, and it is of the first importance that we should arrange for the records of candidates to be followed up to see whether they meet the criteria of success for the various branches of the Civil Service. These criteria are not really known with any certainty; but the time and expense of validation should not be allowed to constitute obstacles in a matter of such general importance.

Lord Simon of Wythenshawe as well as Lord Piercy were confident that the new methods had proved their worth by helping the Final Selection Board to make fewer mistakes and a better selection. Nevertheless, we are only at the beginning, and it may be possible to devise an entirely fresh system. Lord Elton, for example, in urging once more that since character as well as intelligence is indispensable to all high achievement, character as well as intelligence should be the concern of the scholarship examination, directed attention to the Rhodes Scholarship system, which for forty years has been trying to do exactly what the Civil Service Selection Board is now attempting by the new methods. Lord Elton believes that the traditional tests were over-narrow in that they confined themselves to selecting persons likely to absorb readily and reproduce lucidly the ideas of other people. He emphasized that the Rhodes selection committees have been able to rely greatly on the school and academic record of the applicant, and that on none of these sixty or seventy selection committees was there a psychologist.

Lord Pakenham, who concluded the debate for the Government, had little difficulty in showing that Lord Elton had gone too far in implying that the Civil Service Selection Board should likewise dispense with the services of the psychologist. He indicated that particular importance is attached to studying the previous records of the candidates, and he promised that some sort of White Paper on the subject would be prepared. His speech itself gave an admirable account of the working of the methods at present used; and he submitted that the Government is taking the wisest course in trying out both systems and seeking to judge which system appears to select Civil servants who will maintain and enhance the great traditions of the public service of Great Britain.

Lord Pakenham's speech dealt mainly with this question of selection boards; but he made several specific statements of considerable interest. First, he said that the Departments of State were emphatic that they were getting very good material; but that the standard for the Home Service, and to a lesser extent for the Foreign Service, appeared to have been pitched too high. Accordingly, in the Home Service it had been decided to lower the pass mark slightly. The Foreign Service authorities, who had decided to rely on the selection board method for their recruits during the next few years, had not yet decided how to fill their much smaller gap. Lord Pakenham agreed with Lord Lindsay that in the post-war period many people had entered for the examination who would not have entered before the War; but he also said that a later and larger sample of candidates than that cited by Sir Percival Waterfield gave figures of 26·6 per cent and 30·7 per cent, respectively, of candidates for the Home and Foreign Services who passed the original qualifying test but who were finally graded as out of the running.

Nevertheless, although this is a slightly more encouraging picture than that given by Sir Percival Waterfield, the Government is proposing to review the national State scholarship system, and the Minister of Education has appointed a 'working party' to consider, in consultation with local education authorities and others, the various problems concerned with university awards. It is to be hoped that the 'working party' will grapple with the question of character which Lord Lindsay emphasized in this connexion for it grows more important as the proportion increases of candidates coming from schools where there are fewer opportunities for the training of character than in the public schools, where it is traditional Something must be done, as Lord Lindsay suggested, to secure that the State scholarships do not go to those who take no part in the ordinary activities of the school. Nor is the problem solely one for tackling at the secondary school level; Mr J. W. C. Adams, warden of Crewe Hall, Sheffield points out in the *Universities Quarterly* of May, tha many of the universities could do more to encourag participation in the corporate life of the university both by making halls of residence a more prominen feature of the civic universities and in other ways.

The debate in the House of Lords accordingly confirmed the value of the experiments in selection now proceeding; but it also underlined their experimental character and emphasized that the experiments must be so conducted as to permit judgment after a year or two of their reliability. Equally, it vindicated the very high standard of the universit man at the present day: there was no evidence that he universities are selecting the wrong people or raining them wrongly, and the whole trend of the debate was against premature or excessive specialization, in science, the arts or any other field. Lord Cherwell in particular commended Sir Percival Waterfield's suggestion that no arts student should be without some knowledge of science, and no science student without some knowledge of the humane tudies.

The increasing demands of the Civil Service on the trained man-power and woman-power of Britain raise the same problems of education and training. ust as the validity of the selection board's methods or the Civil Service is a matter of deep concern to ndustry, so the educational quality and attainments f the graduates from which both industry and the Civil Service are recruiting men and women are of much concern to them both. Nor indeed could the niversities themselves be indifferent to the views of either industry or the State service in this matter, r attempt any considerable changes without having egard to both points of view.

The situation is already serious. It is clearly ndesirable that an excessive proportion of the outstanding ability to be found each year among those eaving the universities of Britain should be drawn nto any one section of life. It has already been uggested that the Civil Service is obtaining more than its fair share of the first-rate ability at present vailable. The nation is best served by a reasonable istribution over all those spheres of life which call or such gifts. Statements by Sir Lawrence Bragg nd others have indicated some reluctance on the part of the ablest science students to enter industry. If such a tendency became too marked, the effect on ndustry would be serious. It would be equally nfortunate if industry itself attracted too large a proportion of our most gifted investigators and left the universities depleted in this respect.

Before the schemes of university expansion proceed o far, we should therefore reconsider the whole uestion of the aims and content of university ducation. Something more should be done along he lines that Dr. Percy Dunsheath attempts in his ecent book "The Graduate in Industry"*. The raduate needs to be informed about the openings that exist in industry and the real conditions of work hich obtain there; equally the industrialist does not always appreciate the contribution which the ained mind, when matured by experience, can make to industrial efficiency. Dr. Dunsheath has ndicated many ways in which the university appointments boards could make invaluable contributions to he more effective use of trained man-power. From hem, too, may well be expected some of the quantitive data by which we should revise our estimates r the rate and direction of university expansion, rticularly if, as seems likely, difficulties arise in meeting the requirements for graduates in applied cience suggested in the recommendations of the arlow Committee on scientific man-power in 1946. eyond this there is a wide field for research into the demands which various occupations make upon, and the scope they afford to, the various attributes of human personality.

The House of Lords debate is to be welcomed for putting the whole problem in its true perspective. It is not simply a question of the methods by which industry and the State can best select their recruits. Nor is it solely a question of the conditions which will enable the universities, industry and the State to attract to their service a fitting proportion of the ablest minds available from those graduating each year, or even of the way in which those men and women are to be trained and nurtured before they enter the universities, during their residence there, and in their subsequent careers. What stands out above all is that an unparalleled opportunity for experiment is in front of us, of which selection methods are only one facet. The problem of the development and wise use of the trained man-power and woman-power of Britain calls for the closest co-operation between industry, the State and the universities, as well as those institutions like the British Institute of Management and the National Staff Administrative College which are seeking to explore new methods and raise the whole standard of administration. Further, it should be remembered that, both in industry and in the Civil Service, the wise and full use of our ability involves increasing attention to its use and training after recruitment, so as to ensure that the keenness of young and able minds selected with so much care is not blunted by failure to use their talents to advantage, and in ways that afford satisfaction to their ideals as well as to their intellect and personality.

WHAT IS PHYSICAL CHEMISTRY?

(1) Rational Approach to Chemical Principles

By Dr. John A. Cranston. Pp. xii+211. (London, Glasgow and Bombay: Blackie and Son, Ltd., 1947.) 8*s.* 6*d.* net.

(2) The Elements of Physical Chemistry

By Prof. Samuel Glasstone. Third printing. Pp. vii+695. (New York: D. Van Nostrand Co., Inc.; London: Macmillan and Co., Ltd., 1947.) 25*s.* net.

(3) Physical Chemistry

By A. J. Mee. Third edition. Pp. xix+782. (London: William Heinemann, Ltd., 1947.) 20*s.*

(4) Physical Chemistry

By Dr. E. D. Eastman and Prof. G. K. Rollefson. (International Chemical Series.) Pp. viii+504. (New York and London: McGraw-Hill Book Co., Inc., 1947.) 22*s.* 6*d.*

PHYSICAL chemistry emerged as a separate subject at a time when physics and chemistry were separated by a fairly wide *terra incognita*, and the application of physical and mathematical methods to chemical reactions and equilibria offered an attractive field which was catered for by neither of the parent sciences. It soon developed a homogeneous subject-matter of its own, which has remained the backbone of physical chemistry courses ever since. It is natural that most of the new methods and fundamental conceptions of the behaviour of matter, which have contributed to the fuller understanding of chemical reactions and modes of combination, should have come from the experimental and mathematical branches of physics, and the role of the physical chemist has been to ensure the immediate and effective application of these methods and conceptions to chemical studies.

Now that the frontier between physics and chemistry has disappeared, the task of the physical chemist is by no means so clear. On one hand, the mathematical description of chemical combination has become a highly specialized branch of higher mathematics; on the other, the physicists have provided an armoury of weapons, such as X-rays, spectroscopes, mass spectrographs, electron microscopes, isotope techniques, etc., which are so demanding that their users tend to remain experts in their particular fields. In these circumstances, what should be taught to students as physical chemistry? Should it be those parts of physics which are most useful to the chemists? Or should it be the borderline region which concerns itself with the nature of chemical combination and the mechanism of chemical reaction —perhaps leaving the more mathematical aspects to the chemical physicist?

Faced with this vast and confusing extension, it is not surprising that teachers of physical chemistry have been much concerned with what to put into their courses and what they can safely leave out. That the times seem to many teachers to call for a re-orientation of physico-chemical studies is shown by the large number of recent text-books in which new interpretations have been offered of the subject.

The four books under review all reflect this tendency. Dr. Cranston's little book offers a new approach to physical chemistry in the school. He states his objective as follows: "It appears to the author that no more promising step . . . could be taken than ruthlessly cutting out the historical approach to the subject. The study then becomes a rational one. The physicist's atom is taken as the starting point and a reasonably detailed picture of its structure is drawn. The fundamental laws of chemistry . . . then tumble out of the picture in a perfectly rational way." The reviewer thinks that Dr. Cranston has justified his claim except in one respect. The introduction of the atom first has led him to describe the quantum numbers of the atoms in the periodic scheme on p. 21, while it is not until p. 80 that we are introduced to the conservation of energy or even the units of energy. Surely it is asking a little too much of the intuition of even "the average school boy, who, in an age of wireless, is already familiar with many aspects of electricity", to expect him to make any sense of the distinction between magnetic and spin quantum numbers, at the very beginning of his studies. A very simple picture of the atom would be adequate for everything which follows.

How to deal with atomic structure, in fact, presents a difficulty to all these authors. It obviously comes within the category of "those parts of physics which are most useful to the chemist", forming, as it does, the whole basis of his conception of matter; but it does not fit in very well with the more usual curriculum of physical chemistry which follows. Both Glasstone and Mee tackle this question at or near the beginning, but Eastman and Rollefson, for some reason, interpolate it between the liquid state and solutions. The reviewer would suggest leaving it out of text-books of physical chemistry entirely, an letting it be studied, empirically treated as it is under *inorganic* chemistry. Those students who wan to delve deeper should be encouraged to get help an inspiration from their physics departments.

Prof. Glasstone's book, a new addition to his serie of text-books, is in a style familiar to his man readers, and provides, at a more elementary leve than his "Text-book of Physical Chemistry", a clea and straightforward account of the subject. It references for further reading are entirely to article in the *Journal of Chemical Education*—a fact which makes it less suitable as a text in Great Britain tha across the Atlantic. A further feature is the larg number of revision questions, which enable the studen to test his knowledge and perhaps anticipate hi examiner's choice.

Mr. A. J. Mee's is a new edition of a well-know book, which will require no recommendation to user of the previous editions. The text of Profs. E. D Eastman and G. K. Rollefson is perhaps the mos comprehensive of the four books under review, a may be judged from such entries as the radial dis tribution of atoms in silica glass, infra-red frequencie of chemical bonds, and tracer studies with radioactiv atoms. Readers can decide for themselves whethe the book covers adequately the seven objectives o physical chemistry which are listed in the firs chapter. Space does not permit quoting these in full but how widely the authors interpret the subjec can be judged from their seventh objective: to describe, interpret or predict . . . "the molecular atomic and subatomic structure of the constituen particles"!

The last three books might well have given mor space to the rapidly expanding applications o physical chemistry in the biological field. Out o about 700 pages, Glasstone devotes 24 to the colloida state and Mee about 29, while Eastman and Rollefson do not mention it (they have a brief chapter on sur face phenomena). This is inadequate at a time whe chemistry is becoming increasingly concerned with larger molecules, both of living and of non-livin origin.

The most striking feature of these and of othe recent text-books of physical chemistry is the fac that they adhere so closely to the traditional curriculum. Writers of introductory texts are naturally concerned mainly with the past, and are wise not to concentrate too much on ephemeral 'recent advances' Perhaps it is asking too much to expect them t distinguish the trend of the present day and s anticipate the future needs of the present generatio of students.

J. A. V. BUTLER

APPLIED ELECTRONICS

Electronic Circuits and Tubes

By the Electronics Training Staff of the Cruft Laboratory, Harvard University. Pp. xxiv + 94 (New York and London: McGraw-Hill Book Co Inc., 1947.) 45*s*.

THIS book sets down, in nearly 1,000 pages, th greater part of the war-time course given t U.S. officers at the Cruft Laboratory, Harvar University. The range of material included i necessarily very great and, as Prof. Chaffee ha frankly stated in his foreword, ". . . the scope an the method of presentation of the material in this olume are not on a graduate level. . . .” Indeed, this could not possibly be so in a single volume which ncludes: A.C. vector theory; bridge and other measurements; transient analysis; network theory; wave-filters; thermionic emission; electron dynamics; transmitter and receiver circuits; gas-ischarge tubes; modulation theory; timing, ectification and control circuits. The treatment is ssentially technological and, in many places, merely escriptive.

The recent flood of books on the more technological spects of electrical communications makes one earch any new publication for positive contributions o the art; in this respect, this book is saved by ertain novel treatments. In particular, attention may be directed to the use of surface models in onnexion with coupled circuits, and to the simple pproach to the problem of transients and signal istortion.

Against these favourable points must be weighed the very condensed and sketchy treatment of certain opics. Thus, magnetrons are dealt with in one page, hile klystron and other micro-wave tubes are mitted (in spite of the title). Transmission line theory has been included in a companion volume ealing also with wave-guides and antennæ, and this as necessitated treating wave-filters from the eginning as finite structures, which, though the more practical condition, results in an unwieldy resentation likely to be confusing to the beginner.

To two appendixes are relegated the elements of he relevant mathematics, electricity and magnetism: ppendix (*a*) opens with the definition of powers of a umber and meaning of logarithms, and Appendix) with the inverse square law. If it be assumed that the reader needs to start at such elementary levels, it s unlikely that he will learn much from such intense ramming. It would have been preferable to have sed this space for expanding the main text, giving eferences to good elementary text-books which might supply the foundations.

The urgency of the War required the rapid training of great numbers of people, with varying backgrounds, n the application of electronic techniques. But the alue of such a course is doubtful now. Nevertheless, here must be many scientific people, possessing suitable grounding in mathematics, electricity and magnetism, who may be interested in applying such echniques to their particular branch of science. or them, this volume may serve as a reference book nd as a guide to the literature. There are a few, but elect, references and a clear index; the diagrams re good, and the style is consistent in spite of the oint authorship.

E. C. CHERRY

METABOLISM OF DRUGS

Detoxication Mechanisms

The Metabolism of Drugs and Allied Organic Com-ounds. By Dr. R. Tecwyn Williams. Pp. viii + 288. (London: Chapman and Hall, Ltd., 1947.) 25*s*. net.

THIS is the first monograph to be published in English describing the chemical changes which rugs or other substances foreign to the body undergo hen administered to animals. It is undoubtedly a seful compendium of the work which has been arried out in this field. Dr. R. T. Williams excuses his title on the grounds that the subject has been treated under such a heading in text-books of biochemistry. The title is, however, too narrow for the subject. Many of the reactions considered are certainly not detoxication processes. Thus the conversion of the azo dye prontosil into sulphanilamide appears to be an activation, and the metabolism of some substances such as picric acid and trinitrotoluene leads to more toxic products. The functions of the biochemical changes are unknown in most cases. “Detoxication Mechanisms” is rather a teleological expression, and the reviewer would like to suggest that another title or even the present sub-title be used for future editions. Even if it has become customary to use this term, there is no need to continue using a term which Dr. Williams admits if “Taken in its literal sense . . . becomes in many cases a misnomer”.

The metabolic processes which are described include oxidation and reduction and synthetic reactions such as the formation of thiocyanate from cyanide of acetyl and methyl derivatives of amines, and conjugation with glucuronic acid, sulphate, glycine, acetyl cysteine, ornithine and glutamine. The changes are considered particularly in reference to different groups of compounds, according to whether they are aliphatic or aromatic and the nature of their substituent groups.

The changes which most normal body constituents undergo, such as phosphorylation or oxidation, are often the same in all species, from bacteria to the higher mammals. The changes undergone by drugs and purines, however, show remarkable differences. Thus phenylacetic acid is conjugated with glycine by most mammals but with glutamine by men and chimpanzees and with ornithine by fowls. Aromatic amines are acetylated by most animals and birds, but not by dogs. The metabolism of β-naphthylamine shows interesting differences. When given to dogs, in which species it induces cancer of the bladder, it is excreted as 1-hydroxy, 2-amino derivatives; but in rats, rabbits and monkeys, in which bladder cancer has never been induced with this compound, 6-hydroxy, 2-acetylamino-naphthalene is produced.

The biochemical changes which synthetic substances undergo in the body give an indication of capabilities which would otherwise pass unrecognized. Thus the acetylation of amines is most easily demonstrated with foreign substances such as the sulphonamides. The study of the metabolism of phenyl-substituted fatty acids gives indications of the metabolism of fatty acids in the body. In this case the phenyl group acts as a tracer. Dr. Williams considers that there is no satisfactory unitary theory for the processes considered. Substances foreign to the body are probably changed chemically because they resemble natural body constituents sufficiently closely for them to become substrates of existing enzymes. A fresh drug may stimulate the body to produce a fresh enzyme by adaptation, but in many cases animals metabolize foreign compounds as soon as they are administered.

Dr. Williams has produced a useful compendium of the facts of the subject which will be of value to many biologists with interests in pharmacology and chemotherapy. When more facts are known, it might be possible to generalize and introduce satisfactory hypotheses for the innumerable chemical processes which the animal body can carry out.

E. BOYLAND

Modern Rubber Chemistry

By Dr. Harry Barron. Second edition. Pp. viii + 502. (London: Hutchinson's Scientific and Technical Publications, 1947.) 36*s*. net.

The Water-Soluble Gums

By Dr. C. L. Mantell. Pp. v + 279. (New York: Reinhold Publishing Corporation; London: Chapman and Hall, Ltd., 1947.) 36*s*. net.

IN "Modern Rubber Chemistry" Dr. Barron covers an immense field, stretching his title to include such topics as fabric construction, mould design and physical testing. The author's intention of being understood will be largely achieved, but there are some repetitions and examples of careless writing. A more selective account of early work would permit a clearer treatment of the scientific principles underlying, for example, the structure of rubber and the theory of vulcanization. The work of Farmer and his co-workers on this latter topic is surprisingly omitted. The useful analogy of likening the process of polymerization to the joining of hands is weakened by an unnecessary reference to chain formation through secondary valencies. The work as a whole can, however, be recommended as a valuable text-book on the technology of rubber.

Accompanying an increased insight into the structure and properties of synthetic polymers, our knowledge of many naturally occurring substances has been greatly enriched in recent years; indeed, many significant advances in high polymer science have resulted from studies on cellulose and natural rubber. It is of interest to note that while Dr. Barron turns to current high polymer theory to clarify some of the obscurities of rubber behaviour, this approach is not evident in Dr. Mantell's work.

"The Water-Soluble Gums" is a comprehensive account of the sources, collection, manufacturing processes and applications of a class of substances obtained mainly from plants. Gums are here described loosely as hydrophilic colloids, and it seems possible that the scope of the subject might be better defined by the phrase "Water-Soluble High Polymers". This definition would necessarily include polyvinyl alcohol, which is rapidly assuming importance, particularly in the United States, as a 'synthetic gum'. In general, the treatment of the subject is somewhat uncritical, and recent work on chemical constitution is not adequately described.

Volumetric Analysis

By Prof. I. M. Kolthoff and V. A. Stenger. Second revised edition. Vol. 2: Titration Methods; Acid-Base, Precipitation, and Complex-Formation Reactions. Pp. xiii + 374. (New York and London: Interscience Publishers, Inc., 1947.) 36*s*.

THE issue of the second revised edition of this standard work on volumetric analysis will be welcomed by a wide circle of analytical chemists. The book under review, the second of a set of three volumes, confirms the favourable reception accorded to the first edition.

This volume is divided broadly into three parts: (*a*) apparatus and general principles describing equipment and technique needed to achieve the best results with volumetric methods; (*b*) acid-base reactions, which include standard titrations and reactions involving displacement, hydrolytic precipitation and complex formation; and (*c*) quantitative precipitation and complex formation reactions in which titrations with silver nitrate, potassium ferr cyanide and many other reagents are described.

Within the scope of this book, which does n include oxidation-reduction methods, the treatment very comprehensive and contains a wealth of practic detail and shrewd comment. Many references a notes are included, but, as the authors point out, t lack of information during the war years has pr vented a full description of work published outsi the United States since 1940.

This book is recommended with confidence not on to analytical chemists but also to workers in oth branches of chemistry.

Chemistry in the Service of Man

By Prof. Alexander Findlay. Seventh editio Pp. xx + 390. (London, New York and Toront Longmans, Green and Co., Ltd., 1947.) 12*s*. 6*d*. ne

THE appearance of a seventh edition of th widely read book is timely and welcome. It h long been recognized as a valuable general accou of the way in which the science of chemistry helps meet the needs of mankind. Advances, both scienti and technical, have been so rapid of late that it essential for the subject to be reviewed at freque intervals, all the more so because of the effect of w

Prof. Findlay has carried out such a review adm ably in this latest edition. He handles his vast the with authority and skill. A wise selection of mater has been made, and the subject-matter has been ke up to date without a loss in the general balance.

As in previous editions, sound scientific treatme is happily married with a most agreeable ease style.

Honey and Your Health

A Nutrimental, Medicinal and Historical Comme tary. By Dr. B. F. Beck and Dorée Smedley. P 231 + 21 plates. (London: Museum Press, Lt 1947.) 12*s*. 6*d*. net.

THIS book is really a companion volume to the la Dr. Beck's earlier work "Bee Venom Therapy Although it is difficult to accept some of the autho views with regard to the nutritional advantages honey over other mixtures of sugars, it is alm impossible not to become infected by his enthusia and to enjoy reading the folk-lore about honey whi he has collected together from so many parts of t world. His history of the uses to which honey w put in bygone times makes fascinating reading a will, I feel sure, give pleasure to many people besi those who keep bees. Incidentally, this book conta some excellent recipes in which honey plays a ma part.

COLIN G. BUTLER

Sociology of Religion

By Joachim Wach. (International Library of So ology and Social Reconstruction.) Pp. xii + 4 (London: Kegan Paul and Co., Ltd., 1947.) 30*s*. n

THE author summarizes and reviews the literatu dealing with the forms, social expressions a general social relations of religion in all its vari manifestations. It is a work of immense erudit The index occupies 29 pages and the number footnote references is (roughly estimated) 5,000. a work of reference it is undoubtedly useful and w worth publishing. It is very doubtful, thoug whether anyone will have a better understanding religion after reading the book than he had before, even a better understanding of sociology.

A. D. R.

THE INDIAN FOREST SERVICE

By PROF. E. P. STEBBING
University of Edinburgh

THE passing of the British forest officer from India, where a succession of young men possessing that British intuitive love of an open-air life, with a ouch of the adventurous in it, has built up a magnificent forestry property for India, merits a record. t has been a work which has had a minimum of publicity, due perhaps to the failure of the forest officer (until comparatively recently) to write for the public.

The history and work of the British forest officer in the teak forests of Burma was reviewed in *Nature* of December 13, 1947 (160, 818). Earlier, in *Nature* of September 8, 1945 (156, 286), an article on "Post-War Forest Policy in India" was published. When the memorandum discussed in the latter article was written by the Inspector of Forests to the Government of India, the decision as to the future political division and status of the country had not been settled, and it was considered likely, in fact probable, that many British forest officers in the different rovinces would continue to serve out their time under whatever Indian government or governments were set up. This, in the event, has not proved generally to be the case.

The history of the forests of India from the practical point of view commences with the introduction of British administration into the country after the defeat of the French; as distinct from the earlier days of the East India Company, which only maintained trading posts at Bombay, Madras and Bengal. It was after the defeat of Tippoo Sahib in 1799 at Seringapatan in the south that British administration spread throughout a large part of Madras, and was ccelerated in portions of Bombay and lower Bengal. he administration extended almost in spite of ourselves, the forward progress being necessitated if the areas already under British rule were to be safeuarded; it was not premeditated.

The gradual extension of British rule soon began to have its effect on accessible forests. The partition of the provinces into divisions and districts necessitated the erection of headquarters buildings in each, the construction calling for large amounts of timber. he military authorities required timber for many purposes, while the Admiralty at home and the smaller dockyards around the coast of Britain and at Bombay ere soon taking increasing amounts of teak timber om the forests in the south, Malabar, Travancore and southern parts of the Central Provinces and Hyderabad, etc. The population of India, now living under settled conditions, rapidly increased in numbers, and in their old-time demands on the forest for fuel, grazing and small timber. In the south, teak was the only timber in use. It was the difficulties in meeting the requirements of the Naval dockyard in Bombay that resulted in the appointment of Dr. Gibson as *ad interim* conservator of forests in Bombay in 1844, with an assistant conservator and small office establishment; these were the first appointments of the nd in India. Gibson was confirmed conservator of forests in 1847. In Madras it was not only the overnment's and Army's annual teak supplies which were causing the gravest concern, but also the scarcity of firewood for Madras city and the hill station at Ootacamund which eventually led to the appointment of Dr. Cleghorn as conservator of forests in 1856. He was given three assistants. Shifting cultivation was rife in both presidencies when the British took them over. It was due to their efforts that this wasteful utilization and destruction of the forests had been, to a great extent, eliminated by Government order by 1860.

In the northern half of the country on the eastern section, sal (*Shorea robusta*) was the only timber in common use, and Government departments, in the absence of teak, would only take this type, while in the north, Punjab, etc., the chief timber in common use was the deodar (*Cedrus deodara*) brought down from the outer Himalaya. The partial disappearance of the accessible teak forests in Malabar, on the west coast of Madras, was the first intimation that forests were not inexhaustible, and from the middle thirties of last century, the recognition that some form of control would be necessary was gradually forced upon the Government of India, not only in connexion with the large annual Government requirements in the three timbers mentioned (the deodar after the capture of the Punjab in 1850), but also to safeguard the requirements of the population itself throughout much of the country.

Many attempted panaceas in short-term measures, to tide over sudden emergencies, were made before the position was faced squarely by the Secretary of State for India at home and the Governor General in India. The Indian Mutiny had come and gone; with, as a main first step, the commencement of the building of the Indian railways, for which large amounts of timber would be required, threatening, if left in the hands of timber contractors, to result in the extinction of large areas of timber forest. Correspondence between the Governor General and the Secretary of State, Sir Charles Wood, in 1862–63, resulted in the formation of the Indian Forest Service, and the appointment of Sir Dietrich Brandis as the first inspector general of forests. But it was one thing to create a forest service on paper and another to fill its ranks and to lay down the powers and duties of the new Service in connexion with the districts in which forests were situated, hithertofore entirely under the charge of the Civil district officer. From the first it was laid down that a conservator of forests should be appointed to each province (save where already in existence), his duties to be administrative and advisory to the lieutenant governor in charge of the province; and that the provinces should be divided up into a number of forest divisions, each under the executive control of an assistant conservator of forests. In the first instance, the new Service was filled by young men volunteering from the Army, the newly disbanded Indian Navy, and other sources. Many of those so appointed had some experience of the forests gained on private shooting expeditions. This served as a start; but Brandis soon realized that the fully trained forest officer would be required to introduce and maintain an effective organisation in the country. In the late sixties, with the consent of the Secretary of State for India, he commenced choosing yearly a few young men with sufficient acquaintance with scientific subjects—botany, zoology and so forth—who received their forestry training in France or Germany. In 1885 home training was started at the Royal Indian Engineering College, Coopers Hill, where it remained until 1905, after which probationers were trained at the University of Oxford, and eventually also at Cambridge and

Edinburgh. This training of British probationers for the Indian Forest Service persisted until about 1933; some Indian probationers were also trained in Britain, and eventually entered the Service up to 1939. Up to the outbreak of the First World War, the India Office advertised the number of probationers required annually, and the annual quota was selected before the specialized training commenced. It was this consistent policy, maintained throughout so long a period, that produced a fine body of men who have, through the years, built up and brought to its present position the magnificent forest estate in existence. For now it can be readily recognized that it was the action of the Secretary of State and the Governor General in the early sixties of last century which saved the forests of India from extinction in all accessible (to the timber market) regions, while the smaller areas in the vicinity of villages and small towns would quickly have disappeared.

Perhaps the four most important steps taken in the pre-Forest Service period were the formation of the very successful Nilumbur teak plantations, initiated by Conolly, Collector of Malabar in 1843; the public recognition by Cleghorn, a few years after his appointment as conservator, that sylviculture must be introduced into the management of the Indian forest; and the recognition of the damage done to the forests by the shifting cultivator, and the virtual suppression of the practice throughout the greater part of Madras and Bombay. Lastly, the growing realization and conviction of the Government of India between about 1840 and 1860 that the forests of India at the time accessible to exploitation of all types, including the provision of fuel and grazing required by the rapidly rising population, which was primarily agricultural, were not inexhaustible.

After its inauguration, the Indian Forest Service made considerable headway during its first decade. Apart from the constant support and driving force of successive Secretaries of State for India at home, there can be little doubt that the rapidity with which it got fairly settled in the saddle was due to the policy of railway construction adopted at the period. Buildings were required and wood fuel for the engines; also the sleepers for the tracks had at this time to come from the forests in the regions concerned, teak, sal and deodar. The unchecked exploitation of the forest by the timber merchant had been stopped. The brunt of the organisation for this enormous quantity of timber required fell on the young Department, and its energetic chief, Brandis. It is an Odyssey in itself, both the work and the names of the men mainly associated with it.

Some of the work during the first thirty years has already been dealt with in the article in *Nature* on "Post-War Forest Policy in India" referred to above. The main work of the Department, apart from exploitation and providing for the requirements of the people, lay in selecting and, after sanction, demarcating the forest reserves and protected forests in different parts of the country (including Burma), in laying down and cutting a network of fire traces for their protection, and in the division of the forest blocks by lines or rides into the unit of working and supervision termed the 'compartment'. This was a gigantic task which in the main was completed by the end of the century. To enable forest reservation to be legal, a special Indian Forest Act VII of 1865—amended by Act VII of 1878—was enacted. Separate Acts were passed for Madras, Bombay and Burma. The fire protection policy, the first attempted in a tropical country, was based on a first successful attempt to protect the Bor teak forests in the Central Provinces from fire durin the hot weather season. At the period, fires ra unchecked across the countryside in India during th hot weather, and the consensus of opinion held tha it would be impossible to protect the forests fron their customary baptism of fire. Forest officers o those decades can tell of the hardships of fire-fightin during the hot weather months. But great result were achieved.

During the latter part of this period in the mor advanced forests of the country it was possible to giv up departmental exploitation and introduce th method of marking standing trees in the forest fo sale, their felling and removal being undertaken b the purchaser, thus enabling the forest officer to tur to a study of the sylviculture of his forests, and othe professional duties. It was in this way that a beginning in the preparation of working plans took plac in India. From the appointment of Brandis in 186 as inspector general of forests, to the end of th century, three men occupied the post, himself an two other Germans, W. Schlich, and B. Ribbentro who had been recruited as fully trained young Germa forest assistants, and sent out to India in Januar 1870. Schlich held the post only for a couple of year 1883–85, when he accepted the appointment a professor of forestry at the newly organised forestr school at the Royal Indian Engineering College a Coopers Hill. Ribbentrop held the post with distin tion up to 1900.

The next great departure, and one which o considering the history and order of the progre would have been misplaced had it occurred earlie that is, before the reservation of the bulk of the fores contemplated had been achieved, was the formatio of the Imperial Forest Research Institute by Lor Curzon in 1906. By now the officers in charge of th forest divisions throughout the country had muc more time to give to purely forestry problems, an moreover, in the more advanced forestry areas the had the advantage of ranger executive officers wh had been trained at the (N.C.O.) ranger's class at th Dehra Dun Ranger's College, instituted in 188 Many of the divisional forest officers had problen which urgently needed study by the research office Sir Sainthill Eardley Wilmot was the inspector gener of forests at the time, and to him and the Vicero belongs the credit of taking a step which was to hav widespread ramifications, although it is impossible t go into the matter in detail. When Curzon asked th Inspector General where he was going to get h research officers from he replied, to the Viceroy expressed amazement, "from the Forest Department' The Agricultural Research Institute for India ha been inaugurated a few years before, also under th ægis of Curzon; but its officers had all to be recruite from home. One outcome was the new researc building, built at Dehra Dun and opened in 191 which quickly made its value apparent during th First World War—so much so that at the close that war a new building on a far larger scale, outsi Dehra town itself, was projected and sanctioned b the Government of India at a cost of one millio pounds. This has been functioning for many yea and once again, during the Second World War, w its value to India and the fighting forces fully show The introduction of research as a part of the work the Forest Department necessitated some form publications of the investigations achieved. The are now well known. During the previous centu ere were no official publications of the Department. he *Indian Forester*, a monthly magazine, started in 885 and still issued, was a private departmental ublication.

As research work progressed, it gradually became bvious that some decentralization would be neces-ary ; for example, one or more provinces might have major sylvicultural problem requiring study by the ylvicultural research officer. Even with the assis-ance provided at the Institute, it was not possible to nswer all calls. The selection and appointment of cal research officers in the provinces which required em was sanctioned, and thus came into being the cal research, sylvicultural, forest entomologist, and tilization officers, and, as important as any, the rovincial conservator of working plans. These fficers kept in close touch with Dehra Dun.

Reference was made in the article in *Nature* on the ak forests of Burma to the great progress made in orking the forests under carefully prepared working lans. In India, by the opening of the Second World Var, a network of plans for the forest reserves was in rce, and many of these had been revised more than nce. Since their early and tentative introduction, reat advances had been made in the scope and ntensity of management of many of these plans. he one *sine qua non* of the working plan, if properly repared, is that all over-felling is permanently hecked. Briefly, only the annual yield, that is, the nnual increment put on the trees, is cut. In the emorandum on "Post-War Policy in India, 1944", ne Inspector General of Forests was able to write on he subject of excess war fellings in the Government eserve forests in India : "Little is required to restore ne departure from normal, that is the excess War ellings ; a 40–50 per cent reduction in pre-War ields for a period of five to ten years, may in some ases be necessary. The true position can be determ-ned by the revision of the Working Plans which ust, therefore, be accelerated after the War." This forestry management brought to a high standard f efficiency.

Lastly, since the financial aspect of this great ndertaking by Government forms one of its aspects, e following figures speak for themselves :

evenue in 1868–69 = Rs. 40,38,800 and Surplus Rs. 12,65,467.
evenue in 1936–37 = Rs. 4,38,07,019 and Surplus
ast year before Rs. 1,53,58,194.
eparation of Burma)

In addition, forest produce to the value of s. 84,14,946 was given away free or at reduced rates uring 1936–37.

This article has no concern with political questions. t is merely a parting—a farewell to the Indian Forest ervice. But in the light of the long experience I have een fortunate to have had in following the progress f the management of the forests of India, and in the tudy I have been able to make of the history of those rests, it may not be out of place to put out a word f warning. In the case of forests in which the manage-ent has been brought along the road to efficiency in orking, as understood by the forester using these ords, there can be no standing still, no relaxation of upervision, either by the gazetted officer in charge r his chief ranger executive officer, and no delegation f important sylvicultural operations—the constant nspection, for example, of young crops of regeneration ntil they have passed out of the danger period, the arking of thinnings upon which the whole future of the timber crop depends, and so forth—and equally and all-important, no over-felling, even in an emergency, without a full recognition by the higher authority of its necessity. These are fundamentals. That they have not only been introduced but also maintained in the Government forest estate in India, the Second World War has effectually proved.

I would say this to India and Pakhistan. The British forest officer has built up not only a great legacy which he now makes over to the owner, but he has also brought it to a pitch not, I believe, existent in any comparable area of forest in the world. If it is a proud legacy to leave behind, it is an equally proud one to take over. In the hands of the India and Pakhistan forest officers, the world will watch with interest the further great progress to be achieved, a progress which will afford lessons in tropical forest management for both the executive forester and the research officer, wherever he may be working.

THE WORK OF THE NATIONAL PHYSICAL LABORATORY

THIS year, 'open days' at the National Physical Laboratory were held on June 21 and 22. On the first day representatives of industry, including many from organisations having no previous contact with the Laboratory, took this opportunity of seeing the large variety of research and investigational work that is undertaken. On June 22, the occasion of the annual inspection by the Laboratory's General Board, of which the president of the Royal Society is chairman, the visitors included members of the scientific staffs of universities and Government departments.

During the last twelve months the work of the Laboratory has been concentrated so far as possible on those short-term projects of the greatest immediate benefit to industry, although much has also been done during the year on the maintenance of the various national standards and on programmes of fundamental research. No outstanding new developments were on show, but the two hundred and seventy-two scientific exhibits well illustrated the work of the Laboratory's ten divisions, and mention will be made of a few of the more interesting items.

The aerodynamical work on the design of the proposed Severn Suspension Bridge, one of the most interesting exhibits in 1947, has now been transferred to an outstation where scale models are undergoing test in a large wind tunnel. The work of the Aerodynamics Division is largely concerned with problems of high-speed flight, and exhibits in the various tunnels demonstrated the work being done to improve flying performance by the use of specially designed low-drag wings and boundary-layer control by suction or blowing. Researches into problems of stability, control and flutter, increasingly important at high speeds of flight, are being carried on and a model 'xylonite' elastic wing, incorporating the major structural characteristics of a typical aeroplane wing, is used in the study of the twist of a wing caused by a change in distribution of the air loads and its effect on the response of the aeroplane to movement of the ailerons.

The Metrology Division has just completed for the first time since 1932 a comparison of the national copies of the Imperial Standard Yard and the International Metre with their respective principal copies.

Using specially devised equipment, a new high standard of precision has been attained. Interesting experiments carried out in the United States have established that when gold is irradiated with neutrons in an atomic pile, an isotope of mercury is produced which yields almost ideal monochromatic radiations when electrically excited. It will be possible in due course to propose replacement of the existing material standards of length by definitions in terms of the wave-length of this particular radiation.

Among the new machines made and designed by this Division was shown a floating-micrometer for measuring the diameter and rate of taper of tapered plug screw gauges.

An interesting new development in the Engineering Division is the setting up of a photo-elastic laboratory. The equipment on show included a photo-electric photometer for accurate measurements of the photo-elastic patterns. Work on heat transfer in pipes using mercury as the working fluid, started in 1938 but dropped during the war period, has recently been resumed, using an all-steel double-flow heat exchanger.

A strain-operated electronic trigger device designed in the Division was in operation on one of the special machines installed in the Lubrication Laboratory. This device will stop the machine should an increase in frictional force above a critical level indicate that seizure of the bearing under test is imminent. Small variations in strain of a weighbar are converted to voltage changes by an electrical resistance strain-gauge circuit, and when the strain exceeds a certain predetermined magnitude an electronic trigger is tripped which stops the machine before serious damage occurs. The principles underlying the operation of this device are thought to be applicable to a wide range of machines where the imminence of an unsafe condition may be accompanied by increase of linear strain in one element of the machine.

In the Physics Division the work of the radiology section on the protection of operatives against ionizing radiations and on the measurement of radioactivity is growing in importance with the increased availability of radioactive substances, and a comprehensive range of measuring and standardizing equipment was on show.

During the past year, further progress has been made with the extension of the section dealing with the fundamental work on acoustical standards of measurement. Among other developments which were on view was a room which has been provided for the standardization of microphones and other acoustical instruments. The walls of this room are lined with wedge-shaped absorbent constructions of the type now recognized to be exceptionally effective in suppressing reflected sound, thereby permitting field measurements of the highest accuracy.

A new quartz spectrograph has been installed in the Metallurgy Division, and together with a microphotometer and a precision comparator forms the main equipment of the Spectroscopic Laboratory. One of the interesting activities of this Division is the preparation of new materials and the study of their properties, and attention is now being given to the preparation of the metals vanadium and titanium in a state of high purity. Little is known, so far, of their physical properties and metallurgical behaviour, and this investigation will yield useful fundamental data.

Another notable exhibit was a projection microscope adapted to phase-contrast illumination. In this form high parts of the structure under examination
are revealed as bright areas; the low parts da
Light reflected by the specimen is split into
parts, one being advanced in phase a quarter o
wave-length relative to the other by means o
'phase-ring' in the objective lens. The two be
are re-combined and the interference between th
produces the typical phase-contrast effect. The sa
factory working of the method calls for the repl
ment of the ordinary disk aperture by one of
ring type. The images are similar to those given
the electron microscope and so help towards appr
ating the difference between electron microscope
normal optical microscope images. The phase-contr
microscope is capable of being sensitive to steps
surface-level of about 50 A.

The Electricity Division had on show equipm
for extending the range of quartz-controlled os
lations to centimetric wave-lengths. A number
stages of frequency multiplication, mixing
amplification are used to obtain sources of oscillat
of a power of about 3 watts having frequenc
controlled by the primary standard, of the follow
values: 33·6–36·8 Mc./s. in steps of 0·4 Mc.
67·2–73·6 Mc./s. in steps of 0·8 Mc./s. and 201
220·8 Mc./s. in steps of 2·4 Mc./s. By using th
oscillations and their harmonics up to the order
controlled frequencies are obtained throughout
range 350–8,000 Mc./s. at intervals of 1 per cent.
variable frequency oscillator, monitored by
standard, enables values between the control
frequencies to be obtained without appreciable l
in accuracy. Two further stages to be added
extend the range to 50,000 Mc./s.

The most obvious application of the equipmen
the rapid and precise calibration of wavemeters,
the sources at their fundamental frequencies will
serve for the testing of cables and dielectrics.
application of more fundamental importance may
the study of the radio-frequency spectra of at
and molecules. The spectra of a number of ga
have been examined both in Great Britain and
United States during the last three years, and t
of the ammonia molecule, for example, has lines
the neighbourhood of 23,000 Mc./s. the frequen
of which have been measured to a precision of 1 p
in 10^6. Such lines can be used as standards of
quency, and the possibility of obtaining molec
standards of this kind is exciting consider
scientific interest.

In the High Voltage Laboratory, measurement
the time variation of the light from sparks are b
made by means of a photo-multiplier, amplifier
cathode ray oscillograph. The immediate purpos
to provide a spark suitable for shadow photogra
in the Aerodynamics Division. The effects of electr
material and spark current are being studied
observations are being made on a gas disch
tube suitable for light pulses of 1 micro-sec
duration.

The Radio Division has developed a cathode
direction finder for the location of thunderstorm
long ranges. The apparatus exhibited is simila
that used by the Meteorological Office and is of g
value in problems such as the routing of aircraft
the Atlantic. A symmetrical arrangement of ort
gonal loop aerials is connected to a twin-cha
superheterodyne receiver which is tunable over
frequency range 10–30 kc./s., the normal operat
frequency being 12·5 kc./s. At this frequenc
minimum field-strength of 100 μV./m. (approximat
is required to give a full-scale trace on the cath

tube ; but for normal operation on atmospherics Britain, the balanced attenuators incorporated in equipment are adjusted so that a full-scale trace given by a field-strength of about 5 mV./m. Visual servation of the bearing on the cathode ray tube generally employed, but the equipment can easily adapted for photographic recording.

The Mathematics Division exhibited the compre- nsive range of machinery that it has available for nputational work ; one room was devoted to an position of relaxation methods, which have a ler application than is generally supposed. The vision is also able to offer advice on the application statistical methods to various research problems.

The work of the Ship Division continues to be ected mainly to satisfying the immediate require- nts of the shipbuilding industry for the large ume of new construction both for British and eign owners. Vibration of ships' hulls is a subject which much full-scale research has been con- ued, especially on vessels with long superstructures h as passenger liners, and a vibrograph and elerometer were shown, together with typical ords taken at sea.

Research on the design of ships' propellers is ried on principally in the Lithgow water tunnel, ich can be operated at reduced pressures to enable itation phenomena to be studied. The tunnel is o equipped with apparatus for the measurement the thrust delivered by the propeller and the shaft rse-power absorbed.

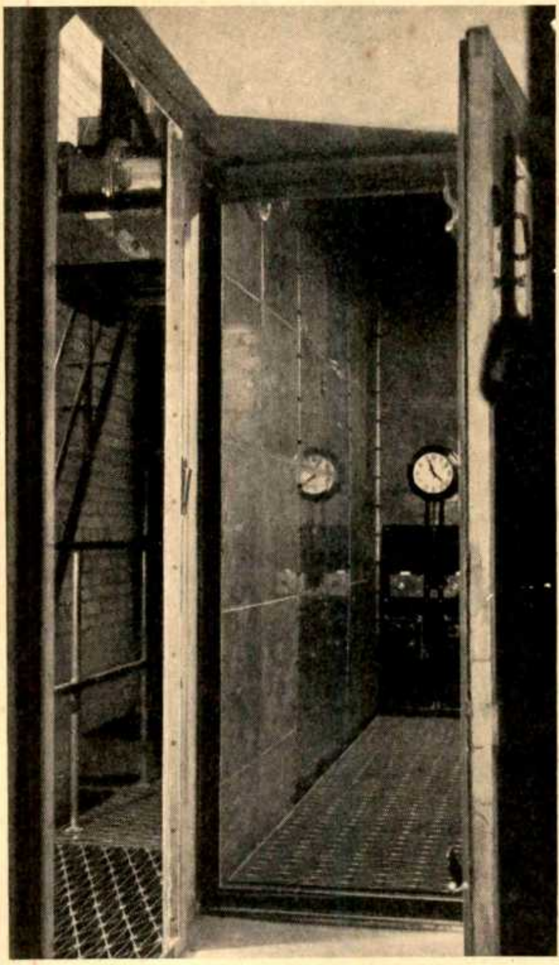
The Light Division displayed an interferometer able of comparing the flatness of two surfaces up 12 in. in diameter. The surfaces need not be in ual contact, although their separation should ferably be small. The observer is able to view, at rmal incidence, the interference fringes formed ween the surfaces, and means are also provided recording the fringe system photographically. amination of the record enables departures from tness of the order of 0·01 microns to be measured.

Among the exhibits in the Photometry Section of s Division was apparatus for studying the spectral ponse curves of the various mechanisms in the man retina. The principle is to measure the allest perceptible intensity of a monochromatic t stimulus applied at a particular point of the ina when the latter is brought into various states adaptation by exposure to a coloured light-field, ich may or may not be of the same wave-length the test spot.

CALORIMETER BUILDING FOR OMESTIC HEATING RESEARCH AT THE FUEL RESEARCH STATION, GREENWICH

By DR. A. C. MONKHOUSE

ONSIDERABLE attention has been paid in recent years to the more efficient use of fuel for nestic purposes, and to the development of better pliances for space heating, cooking and water ting. The amount of coal used directly for nestic purposes is about one-quarter of the total l consumption in Great Britain. If the indirect as gas, coke and electricity be included, the ount is one-third, or about 60 million tons a year. Improvements in the domestic use of fuel are of vital importance, therefore, in the economic and social life of the community.



ENTRANCE TO ONE OF THE CALORIMETER ROOMS

The Fuel Research Station of the Department of Scientific and Industrial Research has in the post-war years, in conjunction with other Government departments, research associations and industry, devised and undertaken tests to determine the performance of the various types of domestic appliances, particularly those using solid fuels. These tests involve the measurement of fuel consumption, the amount of heat emitted as radiation and convection, the heat imparted to the water, the loss of potential and sensible heat in the products of combustion, and the quantity of smoke produced. Some measurements, such as those of convection, are with many appliances difficult to determine directly and are usually assessed by a difference figure in the heat balance. To obtain more accurate data of the distribution of heat from an appliance, a special laboratory building has recently been erected at the Fuel Research Station at Greenwich ; it was opened for inspection by Sir Edward Appleton on June 30.

The building is a four-story structure occupying a ground area of about 3,000 sq. ft. On the first floor are four rooms or cabinets, 12 ft. square and 9 ft. high, each mounted centrally in a constant temperature chamber 20 ft. square and 26 ft. 6 in. high. In these rooms, which are, in effect, calorimeters, the appliances to be tested are installed. The rooms are made of ¼-in. plywood, birch or gaboon, covered on the inside and outside with copper sheets 2 ft. by 1 ft. 6 in. Plywood has been chosen because of its low heat capacity, consistent with suitable thermal conductivity and mechanical strength. Each copper sheet is electrically insulated from its neighbour. Differential thermocouples are embedded at the mid-points of the copper sheets directly opposite each other on the inside and outside of the plywood, so that the difference between the internal and external temperature of the walls can be recorded. By suitable wiring the temperature difference can be measured through any individual panel, or the average through a group of panels such as a complete wall, floor or ceiling, and the heat-flow calculated. In practice, the calorimeter rooms are calibrated by a series of measurements when known amounts of heat are supplied from an electric heater operated at constant voltage.

An appliance to be investigated is mounted on a grating floor in the room, and the flue outlet connected through an opening in the ceiling to the chimney. The rooms are designed to be air-tight; but the pressures inside and outside are automatically balanced by control of the flow of the inlet air, so that risk of leakage is reduced to a minimum. Air enters the room by a duct and its flow is measured by an orifice plate and is automatically recorded. The arrangement is novel as the appliance can be operated under natural draught conditions, while by use of the balanced pressure system the air flow can be accurately recorded. In addition, an auxiliary fan with a flow meter is mounted above the cabinet and can be used to extract ventilating air if required. The temperatures of the air entering and the products of combustion leaving the room are recorded, and, where required, measurements of the water heated by the appliance. Radiation from the appliance is measured in the room by thermopiles arranged on a travelling arc covering the hemisphere in which the appliance is placed centrally.

Constant-temperature conditions on the outside of the testing cabinets are obtained by controlled air circulation, and a refrigeration plant is also provided to give cool air, when atmospheric temperatures are high or when appliances with a high output of heat are being examined.

The flues taking the products of combustion from the room are lined with stainless steel to enable the soot deposited to be removed without contamination for weighing and analysis. The flues terminate below the roof of the building, and constant conditions are maintained at the exit by a cowl and an injector fan. The smoke content of the gases is measured by projecting a beam of light across the flue on to a photoelectric cell. Two separate light paths are used, one directly across the flue for dense smoke, and the other with an oblique path for the lighter smokes. Electrical supplies to the light projectors and the photo-cell amplifiers are specially stabilized so that the record is unaffected by variation of mains voltage or frequency. The double windows through which the beams of light pass are electrically heated to avoid deposition from the products of combustion. The photo-cell equipment is calibrated by direct determination of the concentration of smoke in the chimney gases.

The control room for the four testing rooms is on the first floor and is 52 ft. long by 10 ft. wide; it is connected by air locks to each of the four rooms. All instrument readings are automatically recorded i the control room, each calorimeter room having it separate panel. The instruments include six-lin recording potentiometers and controllers for the constant temperature chamber. Air-flow recorders ar mounted underneath the inlet ducts in the contr room. Equipment is also provided for the accurat control and measurement of the water supply fo measuring the boiler output of appliances.

Laboratory and office accommodation, and fu storage, are arranged in the building, which forms complete unit.

The construction and design comprise many nov features, and the calorimeter building should provid more detailed and accurate information of the hea output of domestic appliances and thus point th way to improvements in methods of heating.

OBITUARIES

Prof. Jacques de Lapparent

PROF. JACQUES DE LAPPARENT, the eminent Frenc lithologist, *Correspondant* of the Paris Academy Sciences, died on May 18 at the age of sixty-five.

Jacques de Lapparent was educated in Paris. Th enthusiastic interest which he displayed for minera during his youth grew with time. The man thoroughl realized the vocation of the boy and, moreover, became a true scientific creator, a scholar backed b an artist.

As a university professor, J. de Lapparent wa appointed to Lille in 1913, to Strasbourg in 1919, t Paris (Sorbonne) at the beginning of 1947. Sinc 1942, he also gave a regular course of geology an mineralogy at the École Centrale des Arts et Manufactures of Paris. His lectures were none the less i the classical style, and his original views and styl brought together a select group of advance students, chiefly in his later years.

Though he was a keen mineralogist and geologis de Lapparent devoted the greatest part of his care to petrography and lithology. As a naturalist h gathered a great deal of information by travellin through many countries: Great Britain, Finlan Yugoslavia, Greece, French North Africa, Frenc West Africa, and, of course, throughout France.

J. de Lapparent published about a hundred an twenty studies, including his authoritative an inimitable "Leçons de Petrographie", which established his world-wide reputation. Part of his reputation was due to some thirty published studies concerning bauxites and clays. He endeavoured to clea up the mineralogical composition and conditions deposit of these rocks and earths. He was the firs to show that three types of bauxite exist, each them characteristic of geological phenomena at th age of formation: gibbsite bauxites formed abov water-level, boehmite bauxites at water-level, an diaspore bauxites below water-level. Studying clay in a similar broad manner, he showed at the outs that fuller's earths are either kaolinite–halloysi earths, or attapulgite earths, or montmorilloni earths. These two last constituents, both aluminou and magnesian, are of different architectural type Prof. de Lapparent endeavoured to elaborate an unequivocal classification with the aid of X-ray studie which specify 7 A., 10 A., 14 A. as the structur spacings for phyllites. At the same time, wit his usual well-balanced scientific sense of researc he explained the geological origin of some montmorillonite clays.

Indeed, Prof. de Lapparent was able to combine the keenest observation of the naturalist, either in the field or in the laboratory, by eye or with the aid of a microscope, with the ability to call upon modern physico-chemical techniques, to contribute to lithological problems. In this respect, it must be emphasized that, though he considered himself a naturalist, he was fully conversant with many physico-chemical methods, procedures and tests, X-ray crystallography being among the most helpful. He was able to grasp very easily the structural work coming from Sir Lawrence Bragg and his school and from Prof. L. Pauling. His aptitude for understanding in quite a short time the geometrical and physical aspects of atomic structures was really amazing. His efforts to introduce into petrography the results of structural X-ray crystallography, made with a pioneer's confidence, began to receive full appreciation in recent years.

J. de Lapparent wrote with a modern style—rather unusual, at least in French scientific papers—which sometimes gave a wrong impression to the reader more accustomed to a bald style supposed to be more fitted to scientific truth. The epigraph introducing one of his books was the famous quotation: "To everyone his own truth"; one of his works bears for title: "Defense de l'attapulgite".

Actually, J. de Lapparent strived to report with a vivid style changes in the earth's crust, because he was himself a living representation of these phenomena. Further, the reader cannot but be impressed by the longing for truth which inspires J. de Lapparent's works and to appreciate the essential synthesis which appears in them in various guises. Up to the end of his life, Jacques de Lapparent maintained his high standards and his enthusiasm. His loyalty to friends, his charming attitude to all his acquaintances without reference to their position, made him a most attractive personality.

R. J. Hocart

WE regret to announce the following deaths:

Mr. T. R. D. Bell, C.I.E., chief conservator of forests, Bombay Presidency, during 1909–20, on June 24, aged eighty-five.

Mr. Harry Brearley, Bessemer medallist of the Iron and Steel Institute in 1920, known for his work on stainless steel, on July 14, aged seventy-seven.

NEWS and VIEWS

Zoology at Belfast: Prof. T. T. Flynn, M.B.E.

PROF. T. T. FLYNN is to retire at the end of the present session from the chair of zoology at the Queen's University, Belfast, which he has held since 1931. Born in Australia in 1883 and trained at Sydney under W. A. Haswell and J. P. Hill, he developed a natural interest in the anatomy and embryology and reproductive phenomena in marsupials. He maintained this interest throughout his university career, making valuable additions to knowledge in this subject. So recently as 1941, in collaboration with J. P. Hill, fundamental agreement in the mode of formation of the primary germ layers in monotremes and marsupials was demonstrated, while in 1947 strong support was given for the view of a similar mode of formation in birds and an incentive predicated for the re-examination of germ-layer formation in reptiles in the light of the work portrayed. Along with his interest in marsupials and their nearer allies, Flynn contributed work on the Pycnogonida of South Africa, describing ten new species; on corals of the Barrier Reef; on the invertebrate fauna of Tasmania; on rare and fossil Cetacea; and he demonstrated his interest in marine biology as leader of the Australian Antarctic Summer Expedition 1912, and as sole Royal Commissioner for the Tasmanian Fisheries in 1915. In his retirement to Jamaica he hopes to utilize this latter experience in taking a serious interest in the marine biology and fisheries of the Caribbean area, as well as in meeting the demands of the British Museum for local biological material.

On graduating at the University of Sydney, Prof. Flynn was awarded the University Medal and John Coutts Research Scholarship; and later he received the University Medal for his D.Sc. thesis. He was Macleay Fellow of the Linnean Society of New South Wales in 1911, and Rockefeller Fellow during 1930–31; he was elected a member of the Royal Irish Academy in 1934. In the Second World War he was Chief Casualty Officer (Civil Defence), Belfast, and received the M.B.E. for his services. His many friends wish him a happy and fruitful retirement.

Baron Roland von Eötvös (1848–1919)

ON July 27 the centenary occurs of the birth of the distinguished Hungarian physicist Baron Roland von Eötvös, who in 1891 founded the Hungarian Mathematical and Physical Society and was long the president of the Hungarian Academy of Science. Both his grandfather and great-grandfather had held high office under the Austrian crown, and his father Baron Josef von Eötvös (1813–71) was at one time Minister of Public Instruction. Born at Budapest, the younger Eötvös was educated at the University there, but studied later under Kirchhoff, Helmholtz and Bunsen at Heidelberg, and under Franz Neumann at Königsberg. He became a *Dozent* in physics at Budapest, and in 1872, at the age of twenty-four, was appointed to the chair of theoretical physics, and later was transferred to the chair of experimental physics. Known widely for his invention of the torsion balance for the investigation of gravitational anomalies, he was recently referred to by Prof. A. O. Rankine as "the father of geophysical prospecting for oil, even if a hesitant one". He died at Budapest on April 8, 1919, at the age of seventy.

European Meteorological Telecommunications Panel

AN international conference was held in London during July 5–10 to consider the problems which confront European meteorologists in the exchange of weather information. The meeting took place under the auspices of the International Meteorological Organisation, which recently decided to establish a meteorological telecommunications panel under each of its six regional commissions. This was the first meeting of the panel for the European region, and it was attended by meteorologists and telecommunications experts from Belgium, Eire, France, Great

Britain, Italy, Netherlands, Norway (also representing Sweden), Poland and the Occupied Zones of Germany. Observers from the United States Weather Bureau and the International Civil Aviation Organisation were also present. Unhappily, the Danish delegate and his secretary were killed in an air collision over Northolt on the day before the conference opened.

In an address of welcome to the delegates the Secretary of State for Air referred to the growing importance of meteorology to economic problems, and he directed attention to the accuracy of modern weather forecasts—a fact which is frequently forgotten by the public, who tend to stress the occasional failures. Rapid dissemination of weather reports is vital to forecasting. Hitherto the international exchange of reports has been made primarily by wireless telegraphy, but in recent years high-speed teleprinters have been introduced to link several of the countries in western Europe. The conference discussed measures for increasing the efficiency of this international meteorological teleprinter network and for extending it to the countries of central and eastern Europe. For exchanging weather information between Europe and North America, high-speed radio teleprinters are to be used, although it will be necessary to retain a trans-Atlantic cable link as a standby for use when radio fade-outs render the radio-teleprinter channel inoperative. The conference recommended that Great Britain should provide the European terminal for these trans-Atlantic exchanges and should also be responsible for disseminating the American reports throughout Europe by wireless telegraphy and by the European land-line teleprinter network. Great Britain already transmits in high-power broadcasts from Rugby a 'European collective' message, which gives a selection of European weather reports and can be heard throughout the northern hemisphere.

Evolution of the Gene

PROF. A. H. STURTEVANT discusses one of the most pressing problems of biology in a recent issue of the *American Scientist* (**34**, 225; 1948). It has been a mystery how new heritable material for the production of new characters originates. When Harland, as the result of his work on cotton, concluded that homology of parts in related species is not correlated with the homology of genes which produce them, another reason was given for disbelief in the value of homology for biological analysis. Sturtevant challenges this view and points out that the polyploid nature of cotton permits the differentiation of two sets of genes in the amphidiploids after their creation. Hence, in one species, one set of genes may control some characters, leaving the other free for differentiation. In a different species the reverse takes place. Sturtevant compares the characters in different species of *Drosophila* and suggests that two organs are homologous if they are conditioned by homologous genes. This implies degrees of homology, since genes may vary from being identical (being allelomorphic mutants), partly homologous to non-homologous. Homology therefore becomes relational and amenable to mathematical treatment rather than absolute.

Sturtevant points out that in a diploid organism all the genes are functional in that the characters they affect are subject to selection. An alteration in any one of them will give rise to a new phenotype. Therefore these genes cannot be spared for other purposes. If, on the other hand, some genes are carried on duplications, these will be surplus to the requirement of the organism and could vary to wide limits without an immediate effect on the individual or even its progeny. He therefore sees a source for new hereditary material in the duplications which constantly occur in most, if not all, living organisms.

Hæmophilia in Dogs

F. B. Hutt, C. G. Rickard and R. A. Field (*J. Hered.*, **39**, 3; 1948) describe the discovery of a sex-linked hæmophilia in dogs. This shows as a lameness and by swellings in various parts of the body when the puppy is six weeks old. Examination showed that the lameness was due to hæmorrhage at the joints. Of seventeen puppies which have been recognized as hæmophilics, not one has been raised to maturity. Several tests for hæmophilia in man were applied to these dogs and were found to give positive results. The breeding histories of the parents of the puppies were known; as a result, it was easily seen that the condition was due to a sex-linked recessive gene called *h*. The importance of the discovery lies in the fact that the comparative physiology of dog and man is well known, and the condition will be of value in research. It is noteworthy that this case in dogs is one of the few sex-linked genes in mammals other than man where seven or eight sex-linked characters are known. The pig has an inherited hæmophilia; but this is controlled by a recessive gene on an autosome. It is probable that paralytic or lame puppies which were destroyed in the past were in reality sometimes hæmophilic. It would be desirable to discover whether any hæmophilic puppies survive to maturity; on the different genetic backgrounds of different breeds, the recessive gene may not always have a lethal effect.

Uganda Forestry Department Report

THE report for the year ended December 31, 1946, of the Uganda Forestry Department has recently been issued (Govt. Printer, Entebbe. 1*s.* 6*d.*). The following quotation from a report on forestry in Uganda, by the late Prof. R. S. Troup in 1922, is given in an opening paragraph. "The percentage of timber forest in Uganda is very small compared with that of most timber-producing countries. . . . There does not, however, appear to be any real cause for alarm, provided the existing forest area is strictly maintained, and all accessible forests are brought under systematic management. . . . The preparation of forest Working Plans should be pushed on in all forests which are accessible to regular working. . . . Without Working Plans systematized work is impossible, and there is a strong risk of the forests being overworked and eventually rendered valueless." Uganda is one of the few departments in the Colonial Forest Services which has printed, published and circulated outside the Protectorate a working plan, with several others in hand. This plan is for the Budongo Forest and it undoubtedly saved that forest during the War. It has now been accurately revised for the second period of ten years, 1945–54. The Buganda Forests were exploited heavily during the War in the absence of a working plan, as in so many other parts of the British Empire and elsewhere in the world. The yield is now carefully controlled. The forest policy for Uganda is also being implemented by the systematic reservation of all main watersheds. This annual report shows that forestry and its requirements are thoroughly understood in Uganda.

Sugar Industry of the Caribbean

SUGAR still occupies the first place in Caribbean economy, despite the severe and growing competition in other parts of the world. The factors concerned with this economy are considered at length in "The Sugar Industry of the Caribbean", compiled by the Caribbean Research Council (Washington, D.C., 1947. Crop Inquiry Series No. 6). Some Caribbean territories have been unable to withstand competition and have given up sugar cultivation, whereas in others there has been an ncrease; but increase is most noted in production, not acreage. This has been greatly helped by research work on new varieties more resistant to disease, and he study of pests. Cane breeding is now active in Barbadoes, British Guiana and Puerto Rico. Experimental work with various fertilizers has had useful results, and there has been a great increase in the import of fertilizers. Sulphate of ammonia is the hief fertilizer. The estates without manure now form a minority. Another change in the industry of cane-growing is the increase in mechanization, especially in United States territories. Weeding and harvesting are still done largely by hand. Generally peaking, there is great scope for the use of more machinery as well as for the centralization of production.

Development of British Somaliland

THE report on the General Survey of British Somaliland, 1946, conducted under Approved Scheme 484, Economic Survey and Reconnaissance, under the Colonial Development and Welfare Act, records that the 1946 rainfall was higher than average and well distributed (British Military Administration, Burao, Somaliland. Pp. 20+12 pl. 6*s*.). Tribes ended to move more to south-west than south-east nd not so far afield from the Protectorate as in the revious two years. This was due to better rainfall in and near the Protectorate, and resulted also in a drawing in of Somali tribes towards British Somaliland. Rainfall and tribal migration maps are appended to the report. Development of water upplies and some minerals should be possible in 1947–48, and if the survey is continued until the end of 1950, a more balanced report, based on the records of a seven-year cycle, should be possible and facilitate the making of definite proposals for developing the ountry.

Medical Progress in Chile

THE Medical Faculty of Valparaiso, formed after a meeting of Chilean medical men convened in March 912, by Dr. Frederico Engelbach, has, since its ormation, planned the publication of an official cientific journal; but for various reasons this has ot been possible until this year. Now the first number of this vigorous Faculty's journal, *Revista Medica de Valparaiso*, has appeared. Well printed and tastefully produced, it will appear in February, ay, August and November each year and will publish only scientific papers. As the Faculty's president, r. R. Gajardo Tobar, says in his editorial, its pages re dedicated to those who have studied phenomena with objective criticism and express their results with the greatest possible precision. The new journal will ecord the more important themes presented to the aculty, summaries of the Faculty's meetings and rticles by individuals invited to contribute. This st number contains articles on hypertension of ephritic origin, streptomycin and tuberculous meningitis, the therapeutic action of urethane in leukæmia, and varicose veins and their treatment. Medical men in both the Old and the New Worlds will welcome this new record of the work being done in Chile.

British Agricultural Bulletin

British Agricultural Bulletin is a new, illustrated quarterly journal published by the British Council. It is intended for overseas circulation, particularly with a view to the needs of agricultural administrators, university and agricultural college teachers, research workers and large-scale farmers, none of whom have time to digest the vast specialist literature of to-day. In the words of Prof. J. A. Scott Watson's editorial note, its aim is "to put British knowledge and experience at the disposal of the farmers and citizens of other countries" and thus to help them in their efforts to increase the world's food supply. The articles in the first number (Spring 1948) cover a wide field and are written by specialists on the subject in each case. General principles of animal improvement, war-time farming in Cheshire, the resting break in farming systems and new ideas in grain storage are discussed in some detail, while of more general interest is the account given of the aims and organisation of the National Agricultural Advisory Service set up in Britain in 1946. Reviews and advertisements of books form a prominent feature, and a special article in this number is devoted to modern English books on agriculture. In future issues, it is hoped to give some account of such new technical developments or scientific discoveries as seem ready for application to farm practice, and to discuss matters of agricultural finance, economics and education in terms intelligible to the layman. The price for four numbers will be 15*s*. (including postage), payable to the British Council, 3 Hanover Street, London, W.1.

Irish Chemical Association Summer School

A SUMMER School organised by the Irish Chemical Association and held in Dublin during July 5–9 attracted 130 participants, of whom some thirty came from universities, hospitals and industrial concerns in Great Britain. The courses covered recent advances in various branches of chemistry. Dr. V. C. Barry, research fellow of the Medical Research Council of Ireland, dealt with the subject of chemotherapy with particular reference to tuberculosis. During his lectures he discussed some of the results obtained by the active school in Dublin of which he is the head (see *Nature*, 160, 800; 1947). Lectures were given on recent advances in the technique of organic chemistry by Prof. W. Cocker, professor of chemistry, Trinity College, Dublin. The last lecture of this particular series was delivered by Mr. E. R. Stuart, Trinity College, Dublin, who surveyed the methods of application of infra-red and ultra-violet radiation to the determination of the structure of organic compounds. Prof. E. J. Conway, professor of biochemistry and pharmacology, University College, Dublin, who has recently returned from a lecture tour in the United States, discussed biological oxidation and reduction, the nature of the cell membrane and the chemical interpretation of the action of hormones and vitamins, and concluded his course with a lecture on the biochemical approach to carcinogenesis. Prof. T. S. Wheeler, professor of chemistry, University College, Dublin, in a course of five lectures, gave a simplified account of the mathematical background of wave mechanics and described the application of the wave theory to problems in inorganic and organic chemistry. The School was opened by Mr. Michael Tierney, president of University College, Dublin, who referred to the responsibility of the man of science for the uses, good and bad, made of his discoveries.

Physiology and Pathology of Animal Reproduction

At the final meeting on June 30 of the first International Congress of the Physiology and Pathology of Animal Reproduction and Artificial Insemination, which was held in Milan under the auspices of the University and of the Spallanzani Institute, a permanent-committee was set up to organise within three years from now another congress on the subject. This committee is constituted as follows: J. Anderson (Kenya), Prof. T. Bonadonna (Italy), Prof. E. Garcia Mata (Argentina), Prof. R. M. C. Gunn (Australia), Dr. J. Hammond (Great Britain), Prof. N. Lagerlof (Sweden), Prof. G. Lesbouyries (France), Prof. B. B. Morgan (United States), Prof. E. Sorensen (Denmark). Prof. N. Lagerlof has been elected president and Dr. Hammond and Prof. Sorensen vice-presidents. Prof. T. Bonadonna, of Milan, secretary general of the first Congress, has been appointed secretary of the committee.

Revue Générale du Caoutchouc

"Rubber Developments" reports that arrangements have been made whereby the old-established monthly journal, *Revue Générale du Caoutchouc*, can be more readily obtained in Great Britain. Recently, the journal has been improved in make-up, and a welcome feature now is the inclusion of summaries in English of the more important articles. Specimen copies of the journal, subscription forms and further information can be obtained from the Secretary, British Rubber Development Board, Market Buildings, Mark Lane, London, E.C.3.

Earthquakes during March and April, 1948

There were at least nineteen strong earthquakes in the world during March, and at least seven during April. The strongest shock during March was probably that of March 3 from an epicentre near lat. 18° N., long. 119° E. off the north-west coast of Luzon, Philippine Islands. It gave ground amplitudes of 160 μ at Kew. The second strongest was on March 1, from an epicentre near lat. 3° S., long. 130·5° E., off the west coast of New Guinea. This gave ground amplitudes of 80 μ at Kew. The deepest shock during March occurred on March 23 from an epicentre near lat. 51° N., long. 155° E., off the southern coast of Kamchatka. The depth of focus was between 200 and 250 km. The only great shock on land was on March 27, when a severe earthquake shook the city of Sucre in Bolivia, causing considerable damage to property, including the cathedral, plunging the city into darkness and cutting off communications with the rest of Bolivia; only three casualties have been reported. An earth tremor on March 16 was felt at Lourdes, Argeles and Bagnères; but no damage is reported. There were no great earthquakes on land during April. The greatest earthquake during April was that on April 21 from an epicentre near lat. 19° N., long. 69·5° W., off the north-east coast of the Dominican Republic, and the deepest (200 km.) was on April 12 from an epicentre near lat. 14° N., long. 90·5° W., off the coast of Guatemala. Reports for these months have been received from the International Bureau at Strasbourg, the Jesuit Seismological Association, the U.S. Coast and Geodeti Survey and the following individual observatories Cleveland (Ohio), Beograd, De Bilt, Durham, Kew Stuttgart, Toledo, Uccle, Zurich and the Swis stations.

Colonial Services: Appointments

The following appointments in the Colonial Ser vices have been announced: R. Wilcox, inspector o mines, Malaya; L. St. Clair Bartholomew, fisherie officer, Uganda; Miss E. B. Cheek, biochemist Institute of Medical Research, Malaya; D. H Constable, soil survey officer, Trinidad; J. Fleming inspector of plants and produce, Nigeria; Miss R. M Lowe, fisheries research officer, Uganda; L. J. S Littlejohn (botanist and plant pathologist, Cyprus) soil conservation officer, Cyprus; P. O. Wiehe (plan pathologist, Mauritius), plant pathologist, Nyasa land; J. A. N. Burra (assistant conservator o forests, Palestine), assistant conservator of forests St. Lucia, Windward Islands; A. B. Walton (senio assistant conservator of forests, Federation o Malaya), conservator of forests, Federation o Malaya; R. J. S. Waddington (inspector of mines Tanganyika), senior inspector of mines, Tanganyika J. W. Loxton (superintendent of surveys, Palestine) staff surveyor, Kenya; R. W. Crowther (veterinar officer, Nigeria), veterinary officer, Cyprus; C. M Anderson (livestock officer, Tanganyika), senio livestock officer, Tanganyika; C. J. Buckley (live stock officer, Tanganyika), senior livestock office Tanganyika; J. W. T. Holloway (livestock office Tanganyika), senior livestock officer, Tanganyika.

The appointment of J. I. Moggridge (*Nature*, Apr 24, p. 637) should read "director, Tsetse Contr Department, Uganda".

Announcements

The Lister Medal for 1948 has been awarded t Prof. Geoffrey Jefferson, professor of neuro-surger in the University of Manchester, in recognition his contributions to "knowledge of the functions an structure of the nervous system, made as a Phil sophical Biologist, practising Neuro-surgery". Pr Jefferson will deliver the Lister Memorial Lecture i London in June 1949, under the auspices of the Roy College of Surgeons of England. This is the nint occasion of the award, which is made by a committ representative of the Royal Society, the Royal Colle of Surgeons of England, the Royal College of Surgeon in Ireland, the University of Edinburgh and t University of Glasgow.

Dr. J. T. Edwards, who was invited in 1946 b the Egyptian Government to advise on veterina education in that country, has been awarded th Order of the Nile (Third Class). Not only was D Edwards able to give valuable service to the veterina schools, but also he devised measures for combati an outbreak of cattle plague which threatened become a national disaster.

Prof. W. Sierpinski, of the University of Warsa and Prof. F. Riesz, of the University of Szeged, ha been elected *Correspondants* for the Section Geometry of the Paris Academy of Sciences.

We have received from Messrs. Johnson, Matth and Co., 73–83 Hatton Garden, London, E.C.1, catalogue of chemical compounds of the precio and other metals. This contains the names of ma compounds of rare metals as well as those of com moner elements, and standard metals of high puri for spectrographic work.

LETTERS TO THE EDITORS

Unit Cell Measurements of Wet and Dry Crystalline Turnip Yellow Mosaic Virus

CRYSTALS of turnip yellow mosaic virus, kindly sent to us by Dr. Kenneth Smith and Dr. Roy Markham (see *Nature*, July 17, p. 88), were examined both optically and by X-ray diffraction in this Laboratory. The crystals were small, isotropic, less than 0·1 mm. in size and ill-formed, but just sufficiently developed to indicate that they were octahedral bipyramids. The smaller crystals, first observed by Smith and Markham under a 1/12 oil immersion lens[1], are better formed and display a better development of this form. Following Federov's law on the relation between lattice development and crystal form, these crystals should possess a face-centred lattice.

Powder photographs were taken of the wet crystals, in sealed thin-walled borosilicate tubes containing mother-liquor, with copper $K\alpha$ rays obtained by crystal reflexion from pentaerythritol. From photographs taken at specimen-film distances of 30, 35 and 40 cm., the following spacings were recorded : 407 A., 250 A., 211 A., 175 A., 147 A. and 83 A. The spacings observed fit a face-centred cubic lattice with side equal to 706 ± 11 A., and the following reflexions are accounted for : 111, 220, 311, 400, 422 and 660, with a notable absence of the 222 reflexion, suggesting, therefore, that the virus particles are arranged in a diamond type lattice. There must be eight molecules per cell in such a lattice, giving an interparticle distance of 306 A. or 30·6 mμ.

The powder photographs of virus, dried over phosphorus pentoxide and taken at 30-cm. specimen-film distance, have not yielded the same number of reflexions ; there being present a strong reflexion at 190 A. and indications of a weak one at about 310 A. In the case of the wet crystals the 220 is the strongest reflexion, and if we assume that this is the same for the dried crystal this gives us a face-centred lattice of side 528 A.

Markham[2] has also sent us crystals that are nucleic acid-free and non-infective, which were obtained from the top layers of centrifuged solutions of the virus. The crystals in this case were smaller in size, but showed the same morphological development and optical properties. A noticeable feature here was the longer exposure time needed (144 hours as compared with 96 hours for the virus crystals) to give even an indication that a low-angle diffraction pattern could be obtained. The low-angle diffraction pattern, although weak, was found to be nearly identical in the measurement of spacings with that of the virus crystals containing nucleic acid. The high proportion of nucleic acid in the virus crystals must contribute effectively to the observed reflexions for the virus crystals, and so it is open to question at this stage whether the intensities of the corresponding reflexions in the two types of wet crystals are the same. This can only be settled with examination of bigger crystal specimens. The measurements, however, from the observed spacings for the wet and dry nucleic acid-free crystals gave cell sides of 725 ± 25 A. and 550 A. respectively. The reliability of these measurements is not as high as that for the virus crystals; but as they stand, the measurements would seem to indicate a slightly larger nucleic acid-free molecule than that containing nucleic acid. For practical purposes, however, one might at this stage assume the same size of hydrated molecule in both the infective and non-infective crystals.

This naturally raises the question of the location of the nucleic acid in the infective crystals. The X-ray evidence by itself at this stage is far too meagre to make any statement about it. It may be situated within the molecule or possibly on those surfaces of the molecule not exerting attractions between the tetrahedrally distributed neighbours. If the differences in cell-size measurement are significant, it might be possible that the nucleic acid in some manner holds the molecule in a tighter mass with the same attractive surfaces remaining unaffected. These questions can only be answered when it becomes possible to compare the wide-angle diffraction patterns of the two types of crystal.

It is most probable that in both types of macroscopic crystal the diamond-type lattice is retained on drying. On observation under the microscope, the virus crystals (those containing nucleic acid) have been observed to shrink homogeneously by about 15 per cent ; the earlier part of this shrinkage being reversible. If the diamond lattice is retained, the interparticle distance would be 228 A. (or 22·8 mμ) for the dried virus crystals, and 238 A. (or 23·8 mμ) for the dried nucleic acid-free crystals. Cosslett and Markham, in studying both types of virus aggregated on the electron microscope, support an open packing corresponding to the projection of a diamond lattice on the (110) planes with an interparticle distance of 19·3 mμ for the virus crystals[4].

On the basis of this evidence, it would appear that the interparticle distance of both types of protein can alter on drying by as much as 76–78 A. The nucleic acid apparently has no effect on the forces holding the particles together in either the wet or the dry crystals. A shrinkage of this extent has been found already in the case of tobacco mosaic virus, where at the isoelectric point the interparticle distances change[3] on drying from 175 to 152 A. There is, however, a fundamental difference between these two cases : the tobacco mosaic virus is one of close-packed long rods, whereas in the turnip yellow it must consist of iso-dimensional molecules. Now the change between the wet and dry state of the tobacco mosaic virus is not accompanied by any noticeable alteration of the internal structure of the virus particle. If we make the same assumption for the turnip yellow virus—and this would also be in accord with all recent work on protein structure, particularly that of Perutz—this would imply that in the crystal in its wet state the molecules are separated by a distance of 78 A. of water. The indication is that the individual molecule has a markedly differentiated surface of tetrahedral symmetry, having four faces with a greater affinity for similar faces in other molecules than has the rest of the surface.

Perutz[4] believes that, in the case of hæmoglobin there is a layer of 'bound' water attached to the surface of the molecule. Let us make the assumption for simplicity that the virus particle is spherical in shape and that in the wet crystal it is surrounded by a layer of water. Markham has observed that the partial specific volume of the particle is 0·685 and the density of the wet crystal is 1·33 (in sodium thiosulphate)[5]. A simple calculation from these figures, using the X-ray data as well, shows that the unhydrated particle must have a diameter of 206 A.; meaning, therefore, that there is a layer of water some 11 A. thick surrounding the particle in the wet crystal. This thickness compares rather favourably with the difference in interparticle distances as measured directly by X-rays and by the electron microscope: 228 A. by X-rays, 193 A. electron microscope[6]. The volume of the cell not occupied by the hydrated molecules in the wet crystal is therefore about 86 per cent, which is somewhat greater than the 76 per cent found by Markham for crystals in ammonium sulphate solution; but as we do not know the exact shape of the virus particles the discrepancy between these figures would imply that the particles are not likely to be spherical in shape. A tetrahedrally desegmented sphere, for example, with the same interparticle distance would give a larger volume.

Similar calculations have been carried out for the nucleic acid-free particles. Here Markham has found that the partial specific volume is 0·75 and the density of the wet crystal is 1·305 (in sodium thiosulphate)[5]. If we assume for the moment that the interparticle distance as measured from the dry crystal is the same as that for the dried virus crystals, then the calculations show this time that the nucleic acid-free particle is surrounded by a layer of water some 3 A. thick. In other words, the unhydrated nucleic acid-free particle has a bigger volume than the unhydrated virus particle. We have been informed by Cosslett (unpublished data) that measurements on electron micrographs of the nucleic acid-free material indicate, within experimental error, a particle that is larger than that observed by them for the virus. This seems to be borne out also by the X-ray measurements on the dried nucleic acid-free crystals, but as mentioned previously, we cannot claim sufficient accuracy for this last measurement.

It would be rash at this stage to speculate too freely on the question as to the location of the nucleic acid in the virus molecule from the few observations that have been made to date; but the evidence, scanty as it is, seems to point to the fact that the nucleic acid-free particle has a larger volume than that containing the nucleic acid. This appears to be a paradox—that something containing additional material should occupy a lesser volume than the same thing without the material! The paradox might be resolved by the suggestion that the nucleic acid draws the protein material of the non-infective particles into a smaller volume. Such a suggestion would not be out of keeping with the findings of many workers that it is extremely difficult, in most cases, to separate completely the nucleic acid from the plant viruses, as, for example, in the case of tomato bushy stunt virus.

We still cannot say anything about the shape of these particles. Whatever their shape, however, the force of attraction holding them together must be acting over relatively large areas of the particle which must come into near contact when the crystal dries, and these surfaces can be separated by 78 A. thickness of water containing ions and yet give the structure considerable rigidity. Similar layers of water have been observed in protein crystals; but the largest recorded thickness is 11 A. in hæmoglobin[3]. The importance of these observations is that they demonstrate at the same time a definite external complexity of virus protein and the possibility of maintaining equilibria at long distances in aqueous solution for bodies other than a plate or rod-like shape where it has been previously observed.

An Optical Analogue of X-Ray and Electron Diffraction Patterns

The bubble model developed by Bragg and Nye[1] gives a pictorial representation corresponding, with a high degree of probability, to the arrangement of atomic sites within a crystalline material. In order, however, to make further progress with the help of this model, it is desirable to produce an experimental technique which will enable some correspondence between the bubble model and the actual degree of order in the crystal to be established.

Perhaps the most convenient method of exploring the regularity of a crystal lattice is by means of X-ray or electron diffraction. With this in mind, some preliminary experiments were performed with bubble rafts made with the help of the Physical Metallurgy Section of this laboratory.

The rafts were photographed on to 35 mm. film at such a reduction that individual bubble images were about 0·2 mm. in diameter. Illumination was by means of two 'Photoflood' lamps symmetrically arranged. The (negative) image of each bubble thus consisted of a thin dark ring enclosing an almost transparent disk which had two dark points (the direct images, by reflexion) of the lamps superimposed on it.

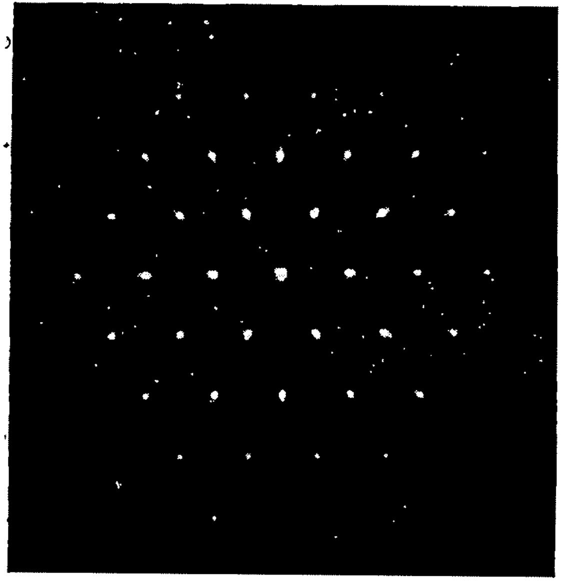

Fig. 1. DIFFRACTION PATTERN FROM PERFECT LATTICE

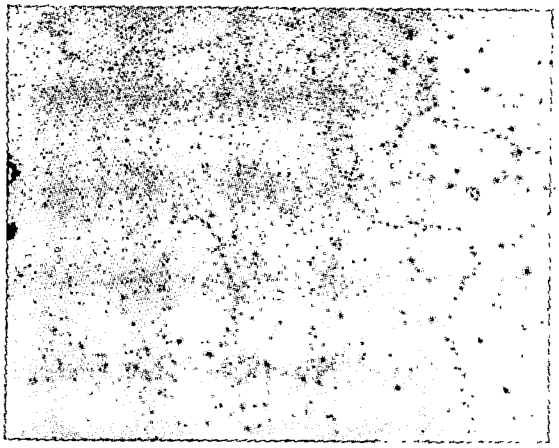

Fig. 2*a*. POLYCRYSTALLINE BUBBLE RAFT

The individual bubbles are not well shown, due to interference with the half-tone dots. Boundaries of crystal grains may be seen; also most of the dislocations may just be perceived as short dark lines

The developed film was then placed in an optical system which was, in effect, a spectroscope. Light from a pinhole approximately 0·10 mm. in diameter was rendered parallel by a collimating lens of about 35 cm. focal length; it then passed through the film and was observed in a telescope. The light source used was a B.T.H. 250-watt mercury vapour lamp with an Ilford 'Mercury Green' filter.

Each bubble image acts as a scattering centre and diffracts light with a polar diagram depending on its geometry and contrast. Interference between wavelets diffracted from the whole array of images gives a Fraunhofer diffraction pattern corresponding to that given by X-rays or electrons diffracted from a single sheet of atoms.

The pattern given by a perfect lattice is shown in Fig. 1. The photograph gives but a poor impression of the beauty of this pattern, which is especially great if the unfiltered light of the mercury lamp is used. In these circumstances each spot, save for the central one, becomes a short spectrum oriented in a radial direction.

Fig. 2*b* shows the pattern due to the polycrystalline raft shown in Fig. 2*a*. This raft was photographed immediately after growth, and consists of a few relatively large crystals with a certain amount of internal strains and dislocations. As might be expected, the pattern consists of 'spotty' rings, each spot being due to an area of almost perfect lattice. In addition, however, a certain amount of continuous background is evident. This is due in part to scattering from the photographic emulsion, but also in part to diffraction from the small amorphous portions around the grain boundaries.

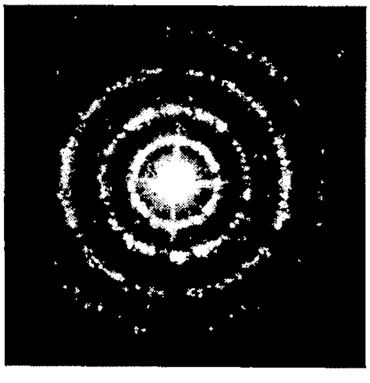

Fig. 2*b*. DIFFRACTION PATTERN FROM RAFT ILLUSTRATED IN FIG. 2*a*

The four white arms at right angles in the centre are due to diffraction from the edges of the rectangular aperture used in forming the diffraction pattern in this case

The patterns derived by this technique are more closely related to those obtained by electron diffraction than by X-rays, as in the former case diffraction is due only to a few atomic layers. Fig. 1 bears a close resemblance to the cross-grating pattern obtained by diffraction of electrons through a very thin sheet of mica.

Further work is being undertaken with the object of improving the resolution and illumination of the diffraction patterns.

Discrete Sources of Galactic Radio Frequency Noise

IN a recent communication[1] an outline was given of investigations of the variable galactic noise received from the constellation of Cygnus, first noticed by Hey, Parsons and Phillips[2]. The characteristics of the radiation were described, and evidence was given of its origin in a discrete source. A search has since been made over about one quarter of the celestial sphere for other such sources. The region investigated is roughly enclosed by the co-ordinates:

R.A. 8 hr., Dec. + 40°; R.A. 21 hr., Dec. + 40°;
R.A. 4 hr., Dec. − 40°; R.A. 17 hr., Dec. − 40°.

The frequency used was 100 Mc./s., with an overall sensitivity of 10^{-24} watts $m.^{-2}$ $(c./s.)^{-1}$, and the technique and equipment employed were as previously described[1,3].

So far, six new sources have been found. They are listed in the accompanying table together with the

SOURCES OF GALACTIC RADIO FREQUENCY NOISE KNOWN TO FEBRUARY 1, 1948

Temporary designation	Position		Intensity at 100 Mc./s. (watts $m.^{-2}$ $(c./s.)^{-1}$)	Angular width	Type
	R.A.	Dec.			
Cygnus *A* (1·46)	19h. 59m.	+41° 47′	6×10^{-23}	< 8′	Variable
Taurus *A* (2·47)	5h. 13m.	+28°	10^{-23}	< 30°	Probably long-period variable
Coma Berenices *A* (4·47)	12h. 04m.	+20° 30′	$1·5 \times 10^{-23}$	< 15′	Constant
Hercules *A* (7·48)	16h. 21m.	+15°	2×10^{-24}	< 1°	—
8·48	—	—	2×10^{-24}	—	Constant
5·47	—	—	3×10^{-24}	< 1°	Constant
Centaurus *A* (6·47)	—	—	10^{-23}	< 15′	Probably Cygnus-type variable

source in Cygnus. The positions of three of the sources of northern declination have been computed from the experimental time-elevation curves using the first 20° rise above the horizon. There is an uncertainty of about 1° in the positions given. The source 8·48 rises only shortly before Taurus *A*, and the lobe pattern is then obscured by the stronger source. Similar overlapping of the Centaurus and 5·47 sources has so far prevented their accurate location.

The majority of these sources appear to be in regions of relatively low noise-brightness and star-density. It may be, however, that regions of high noise-brightness are regions of high source-density, not suited to resolution with the present technique. As in the case of Cygnus, the new sources do not appear to be associated with outstanding stellar objects.

The discovery of these discrete sources raises the question of the origin of galactic noise. Henyey and Keenan[4] proposed a mechanism of free-free electron transitions in ionized interstellar matter, with a free space electron temperature of 10^4 ° K. Townes[5] has pointed out divergences between theoretical calculations on this basis and experimental results for the maximum apparent temperatures of the Milky Way, particularly above wave-lengths of two metres. Moxon[6] has shown that the minimum apparent temperature (that is, at the galactic poles) varies as λ^2, whereas the temperature along the Milky Way, after subtraction of the polar residual, depends on λ^3—suggesting a twofold origin. Recent research on solar radiation at metre wave-lengths indicates that radiation from the quiet sun corresponds to a temperature of 10^6 ° K. and is presumed due to thermal emission from the corona. During times of sunspot activity, however, there is evidence that the apparent temperature may exceed 10^{10} ° K. for long periods and be even higher for periods of about a minute.

It is therefore not unreasonable to expect a measurable aggregate of emissions from individual stars in regions of high star-density, despite the large dilution factor. Moreover, it is likely that the free-space electron temperature is greater than 10^4 ° K. in the neighbourhood of *B*- and *O*-class stars.

On the basis of the present observations, it is suggested that the factors contributing to the observed intensity and distribution of galactic noise are threefold.

(1) A 'base-level' due to free-free transitions as proposed by Henyey and Keenan.

(2) An aggregate of emissions from individual stars in regions of high star-density.

(3) A contribution from individual discrete sources, which may be distinct 'radio-types' and for which a place might have to be found in the sequence of stellar evolution. Purely electromagnetic disturbances as an origin of these have been discussed by several writers[2,9,10], and the following additional possibilities are envisaged: (*a*) A pre-main sequence model consisting of a large cool gas sphere, gravitational energy of contraction being radiated in the radio frequency spectrum. (*b*) A post-main sequence model—possibly a development of the planetary nebula consisting of an intensely hot central star, with its radiation in the far ultra-violet, surrounded by a shell of predominantly stripped atoms.

I wish to acknowledge the assistance of Messrs. G. J. Stanley and O. B. Slee in making observations involved in this work, which forms part of the research programme of the Division of Radiophysics, Council for Scientific and Industrial Research, Commonwealth of Australia.

Electric Conductivity of the Ionospheric *D*-Region

Recently, Cowling and Borger[1] have put forward theoretical reasons why the electric conductivity of the ionospheric *D*-region may be considerably less than that of the combined *E*–*F*-regions. On the further postulate that tidal motions increase with height in the ionosphere, they conclude that a recent deduction[2] concerning the origin of the solar and lunar magnetic variations is improbable.

There are two lines of reasoning, both mainly based on experimental evidence, which are difficult to reconcile with Cowling and Borger's conclusion. In the first place, it would appear very doubtful that tidal motions increase with height in the ionosphere. The height gradient of tidal motion depends profoundly on the temperature gradient in the ionosphere, and account must also be taken of the damping due to kinematic viscosity and to conductivity (both thermometric and electric). This damping alone must eventually cause a reduction of motion with increasing height. These considerations are supported by recent experimental evidence[3] that the solar tidal air motion is considerably greater in the *E*-region than in the *F*-region. (The much smaller solar tidal influence on *E*-region ionization is due to the much greater rate of ion production and recombination there.)

Again, recent experimental evidence[4] shows that the phase of the lunar tide in the *E*- and *F*-regions is substantially in opposition to that required to produce the lunar magnetic variations. This suggests strongly that these are produced mainly below the *E*–*F*-regions, and hence that the conductivity there is adequate.

Another argument against Cowling and Borger's conclusion is McNish's experimental evidence[5] that solar flares produce an enhancement, but little change in form, in the solar magnetic variations. It is known that such flares produce negligible changes in ionization in the *E*–*F*-regions, but notable changes in ionization below the *E*-region. Since it is most unlikely that a sporadic disturbance like a solar flare would cause an enhanced air motion identical in form with the regular solar tide, it seems very probable that the main part of the solar magnetic variations is produced below the *E*-region.

Nevertheless, while the weight of experimental evidence strongly suggests that the main part of the magnetic variations is produced below the E-region, it is important to reconcile this conclusion with Cowling and Borger's valuable discussion of the relatively small theoretical conductivity likely to be found there. In this connexion the results of an arlier investigation by Cowling[6] may be important. He showed that the conductivity of an ionized medium an become almost independent of the magnetic field if polarization is set up by the Hall current. n the earth's atmosphere the Hall current is produced by the differential motion of ions and electrons across the earth's magnetic field under the influence of the atmospheric tide. Calculation shows that if polarization adequate to equalize the velocities of ons and electrons is set up, then the effective conductivity of levels below the E-region will be increased by factors of the order 10^2–10^3.

This work is published by permission of the Radio Research Board of the Council for Scientific and ndustrial Research.

WE have recently begun to investigate theoretically how atmospheric tidal motions should vary with height above the E-layer. The work is still in the exploratory stage, and too great reliance cannot be placed on the tentative results which have so far been obtained. These results, however, suggest that tidal motions should increase with height for some considerable way above the E-layer. Considerable phase-changes may also occur above the E-layer. Such results are difficult to incorporate into a general theory of the magnetic variations, and we do not claim to be able to do so: but Dr. Martyn's interpretation of the facts need not be the only possible one.

Dr. Martyn's final suggestion will, unfortunately, not wholly resolve the difficulties to which we directed attention. Polarization counters the magnetic reduction in conductivity fully only if the Hall currents are completely prevented from flowing, and in this case the polarization field must considerably exceed the original field which makes it arise. If, say, the Hall currents in the ionosphere were vertical, the polarization produced by accumulations of charge above and below the conducting layer would be only slowly dissipated, and would be able to build up to a size sufficient to produce the desired effect. But normally the polarization electric field has a horizontal part, which makes the polarization charges leak away as fast as they collect. Hence, while polarization may partially restore the reduction in conductivity due to the magnetic field, it cannot do so more than partially.

Electromagnetic Level-Shift and Effect of Radiation Field

THE brilliant experiment of Lamb and Retherford[1] has conclusively demonstrated that in the hydrogen atom the $2S$-level is higher than the $2P_{1/2}$-level by about 10 megacycles, a result which reveals a breakdown of the Dirac equation of the electron when applied even to the simplest of the atoms. In a fundamental paper, Bethe[2] has given an explanation of the observed level-shift on the assumption that the transverse self-energy of the electron, in general, depends on the state in which the electron is.

The observed level-shift and Bethe's theory are likely to prove of considerable significance in astrophysics. It is to be observed that the shift in the Balmer lines arising on the above account is comparable to the Einstein solar red-shift. Again, because of the separation between the $2S$- and $2P_{1/2}$-levels the possibility, arising on account of the Stark perturbation, of the (forbidden) transition $2S \rightarrow 1S$, is severely restricted; that is, the $2S$-state would behave as a metastable state, a behaviour which would not have been possible if the levels $2S$ and $2P_{1/2}$ were coincident as demanded by the Dirac equation. The metastable $2S$-state would obviously have an influence on the hydrogen chromosphere. Further, in astrophysical applications, in determining level-shifts, account must be taken of the radiation field surrounding the atom.

It can readily be shown that the transverse self-energy of a free electron is affected by the radiation field, and in the case of temperature equilibrium the increase in the self-energy of the electron is given by

$$\frac{1}{137}\;\frac{\pi}{6}\;\frac{kT}{mc^2}\;kT,$$

where m is the electron rest-mass, k the Boltzmann constant and T the temperature. In the case of atomic levels, the effect of the radiation field becomes complicated (because of the infra-red catastrophe). The details of this investigation will be published elsewhere.

The Proof of Wien's Law

A VITAL step in the proof of Wien's Law, $E(\lambda,T) = T^5\psi(\lambda T)$, for complete radiation, is the adiabatic change in volume of a cavity filled with radiation. In Wien's first proof (1893)[1] and in the more analytical version of it given by O. W. Richardson[2], the cavity is cylindrical in shape and is provided with a movable piston. In order that the distribution in direction may remain random during the expansion, Wien stipulated that the cavity walls should be "perfectly white" (that is, diffuse rather than specular reflectors).

Larmor (1900)[3] pointed out that the proof is simplified if the shape of the cavity is taken to be spherical; the wave-lengths of all components are then altered in the same proportion. It is not, however, obvious that the distribution in direction is maintained during the expansion if the internal spherical surface is perfectly reflecting. Westphal

(1914)[4] makes the walls of his spherical cavity "white", possibly because of Wien's prescription of white walls for the cylindrical cavity.

Though Larmor's proof has been given in extended form in current texts, it appears not to have been demonstrated that, in the case of a spherical reflecting cavity, the change of angle with the normal which ensues on reflexion at the moving surface is compensated by the change of radius between reflexions. If i, θ are angles of incidence and reflexion respectively as the surface moves slowly outwards with speed dr/dt, $\theta - i = (2 \sin \theta /c)dr/dt$. The angle of incidence i' at the succeeding reflexion satisfies the equation $\sin \theta/\sin i' = 1 + dr/r$, where $dr = (2\, r \cos \theta /c)dr/dt$.

Thus $\sin i' - \sin \theta = -(2 \sin \theta \cos \theta /c)dr/dt$, and $i' - \theta = -(2 \sin \theta /c)dr/dt$, giving $i' = i$.

The angle of incidence remains the same at successive reflexions, and we may consider as a distinct group the radiation which is incident at angles between, say, θ and $\theta + d\theta$. If, at some temperature, $u_\theta d\theta$ is the energy density of the group in the immediate neighbourhood of the wall, and u represents the total energy density, it can be shown that $u_\theta = u \sin \theta$, while the pressure due to the group on the wall is $u_\theta \cos^2 \theta\, d\theta$ and the energy of the group in the whole sphere is $U_\theta d\theta = 4\pi r^3 u_\theta \cos^2 \theta\, d\theta$. The energy equation for the group in expansion is then:

$$dU_\theta + 4\pi r^2 u_\theta \cos^2 \theta \,.\, dr = 0,$$

whence

$$r du_\theta + 4u_\theta\, dr = 0.$$

Comparing this with the equation for the whole radiation

$$r du + 4u\, dr = 0,$$

it is seen that the energy of each group is altered in the same proportion during the expansion, and the distribution in direction is maintained.

Wien (1894)[5] showed that this was true for a group at nearly normal incidence ($\theta = 0$); but the general case appears not to have been discussed. Larmor inserted a material particle in his cavity in order to maintain normal distribution in wave-length; but it is not clear from his argument, which is couched in very general terms, that the calculation of the change of wave-length from the Doppler effect is valid when the particle is present. Planck[6] has shown that for a cavity of any shape, the distribution in wave-length remains normal whether the small material particle is present or not; his demonstration of this, like the proof given by Wien for a cylindrical cavity, is valid only if random distribution in direction is maintained. The spherical reflecting cavity, without a material particle, thus provides a satisfactory proof when supplemented by the demonstration above of the maintenance of random direction and by Planck's proof of the maintenance of the distribution in wave-length.

Photo-electric Star-following Telescopes

EXPERIMENTS have recently been conducted by the Telecommunications Research Establishment at the Royal Observatory, Greenwich, to investigate the automatic guiding of an astronomical telescope on a star. The work was done on the 13-in. astrographic refractor and the degree of success achieved was as follows.

In June 1947, using a very sluggish servo system, that is, one with a natural frequency of the order o 1/10 cycle per min., the steady state error in follow was less than 1″ (corresponding to an image movement of 0·001 in.).

The irregular refraction of the atmosphere causes the apparent direction of a star to vary at frequencies up to at least one cycle per second. Accordingly, a system with a more rapid response was built. In January 1948, using a servo system with a natura frequency of the order of ½ cycle per sec., there was a random steady state error of some few seconds of angle, owing to the larger band-width.

The servo system derives its 'knowledge' of misalignment from an error detection device comprising a graticule in the focal plane of the telescope, and in the form of a disk divided into equal sectors alternately opaque and transparent. The image of the star being followed is made to describe a circle over the face of the disk. Behind the disk is a photo-cell which collects the transmitted light in the form of pulses. When the telescope is aligned on the star, the circle of movement of star image is concentric with the disk and the pulses of transmitted light are of equal duration and separation; but when the circle of image movement is eccentric due to relative movement between star and telescope, the pulses then transmitted are effectively modulated in frequency The amplitude and phase of this modulation give a linear measure to a first order of the telescope misalignment in magnitude and direction. The misalignment signal controls the acceleration of a servo motor which drives the telescope.

Since the astrographic telescope at Greenwich has a fixed plate-holder, guiding is possible only in right ascension; hence only one rectangular component of the misalignment information is required and used

Consideration is now being given to the use of this or a similar system to guide automatically the 100-in. Isaac Newton telescope planned for erection at Herstmonceux.

Presence of Cobalt in the Anti-Pernicious Anæmia Factor

INDEPENDENT investigation here and in the United States led to the recent isolation of the anti-pernicious anæmia factor as red needle-shaped crystals[1–3]. Examination of its ash has now unexpectedly revealed the presence of cobalt.

In four separate batches of crystals we have detected cobalt by the characteristic cobalt blue borax bead and by the specific red colour reaction with nitroso *R* salt. Colorimetric estimations with α-nitroso-β-naphthol showed the presence of 4·0 per cent of cobalt in crystals dried *in vacuo* at 56° C. If each molecule contains one atom of cobalt, the molecular weight of the compound is about 1,500 ; allowance for 8 per cent loss on drying brings the value to 1,600, in excellent agreement with that of 1,550–1,750 for air-dried material which Dr. Dorothy Crowfoot (private communication) has found by X-ray crystallography. (The uncertainty s due to the amount of available material having been inadequate for accurate determination of density.) The value does not agree with about 3,000, which we found by the diffusion method. The discrepancy may be due to errors inherent in this method or to the use of impure material in the earlier experiments, but it is also possible that association occurs in solution.

So far as we are aware, the presence of cobalt in an isolated compound of natural origin has not been previously reported, although cobalt is recognized as an essential trace element. It has been shown to prevent or cure in ruminants a syndrome involving anæmia and arising from feeding on pastures deficient in cobalt[4].

In discussion with Dr. Randolph T. Major, of Merck and Co., Inc., we have been informed that the Merck workers have also discovered the presence of cobalt in their vitamin B_{12}. Their publication of this inding[5] refers to the presence of phosphorus. Our own analytical figures have already indicated that the molecule contains three atoms of phosphorus.

Interrelations of the Serum Protein in the Thymol Turbidity Test

THE mechanism of the thymol flocculation test developed by MacLagan in 1944[1] has in the past four years been the subject of study by several investigators[2–5]. In the course of a detailed study of the circulating proteins of a patient suffering from advanced liver disease, whose plasma was known to give a strongly positive thymol reaction (18 units), opportunity was taken to examine the observation hat normal human albumin would inhibit the thymol reaction[3].

The fraction used for the investigation consisted of the slower-moving components, separated from he descending limb, by the discontinuous electrophoretic technique of Tiselius. Fig. 1 shows the distribution of the components in this fraction. It will be seen that there were two major peaks having mobilities compatible with β- and γ-globulins respectively, and one intermediate peak the mobility of which corresponded to fibrinogen. This fraction was dialysed against 0·15 molar sodium chloride at pH 7·0, and after dialysis gave a well-marked thymol reaction using the technique originally laid down by MacLagan[1].

To the material so obtained varying concentrations were added of (*a*) crystalline normal human serum albumin in 0·15 molar sodium chloride, and (*b*) normal human serum 'albumin' obtained by precipitation of the globulins of normal serum with 26 per cent sodium sulphate at 37° C. and subsequent dialysis against 0·15 molar sodium chloride. Electrophoretic analysis of (*b*) showed that the fraction contained perceptible amounts of α_1-globulin (see Fig. 2).

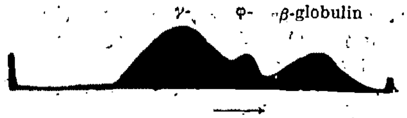

Fig. 1. PHOSPHATE BUFFER, MOLARITY 0·2 ; PROTEIN CONCENTRATION, 112 MGM. NITROGEN/100 ML.

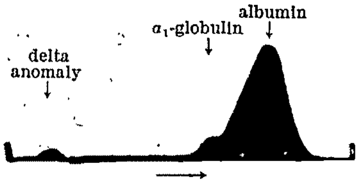

Fig. 2. PHOSPHATE BUFFER, MOLARITY 0·2 ; PROTEIN CONCENTRATION, 160 MGM. NITROGEN/100 ML.

In every instance the concentration of the globulin fraction in the final volume of saline was kept constant. The results are shown in the accompanying table.

(*a*) Crystalline human albumin Ratio of albumin nitrogen to globulin fraction nitrogen	Thymol test
0 to 1	++
0·81 to 1	++
1·62 to 1	++
3·24 to 1	+
4·77 to 1	±
9·55 to 1	–

(*b*) 'Albumin' obtained by precipitation of globulins from normal human serum with 26 per cent Na_2SO_4 at 37° C. Ratio of albumin nitrogen to globulin fraction nitrogen	Thymol test
0 to 1	++
0·28 to 1	–
0·56 to 1	–

The mean ratio of albumin to γ-globulin in eleven sera examined by electrophoretic analysis[6], all giving a well-marked thymol reaction, was 2·6 to 1 (σ = 0·705). This ratio of concentration is lower than that shown in the table as the minimal effective concentration to produce inhibition using normal albumin.

The inhibitory action of pure bovine albumin and of pure horse albumin was studied against the same globulin fraction, and both were found to be effective inhibitors in concentrations of the same order of magnitude as crystalline human albumin.

These results seem to suggest that the inhibitory effect of albumin as such is a function of its concentration in the system under test ; and further, that the interaction is not species specific.

The 'albumin' obtained by sodium sulphate precipitation was inhibitory in much lower concentrations than the crystalline albumins. This 'albumin' was demonstrated to be contaminated by α_1-globulin. This raises the possibility that inhibition may be a function of α_1-globulin closely associated with albumin, as well as albumin itself. An alternative rationalization of the observation is that in the process of crystallization, the specific reactive groupings on the albumin molecule have become modified so as to reduce its potential inhibitory effect when redissolved in normal saline.

I wish especially to express my thanks to Dr. Kekwick and to the Lister Institute for the facilities they placed at my disposal.

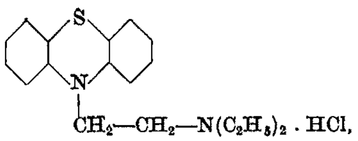
N-Diethylaminoethylphenothiazine: a Specific Inhibitor of Pseudocholinesterase

Mendel and Rudney[1] demonstrated that mammalian tissues may contain two distinct esterases, both capable of hydrolysing acetylcholine *in vitro*: a specific enzyme ('true' cholinesterase) and a non-specific enzyme ('pseudo'cholinesterase). The chemically dissimilar natures of the two enzymes were indicated by their selective behaviour towards particular choline esters[2] and by the selective toxic effects, on the pseudo esterase, of the dimethylcarbamate of (2-hydroxy : 5-phenylbenzyl)-trimethylammonium bromide[3] and of di*iso*propylfluorophosphate[4]. Both these substances exert powerful effects on pseudocholinesterase at concentrations which are relatively ineffective against true cholinesterase.

Experiments recently recorded in these laboratories indicate another organic compound which exerts a similar selective toxic action on pseudocholinesterase. The compound N-diethylaminoethylphenothiazine hydrochloride (also known as 2987 *R.P.*), of the following constitution:



$CH_2—CH_2—N(C_2H_5)_2 . HCl$,

was originally synthesized by Gilman and Shirley[5] and first examined pharmacologically by Bovet *et al.*[6] in connexion with its possible use in the symptomatic treatment of Parkinson's disease. It was tested for anticholinesterase activity, using the technique of Ammon[7]. The source of enzyme was either a rat brain extract, which is believed to contain only true cholinesterase[8], or blood plasma. The brain extract was prepared by grinding a whole rat brain with sand and normal saline, filtering through muslin, and diluting the filtrate with saline to a final volume of 8 ml. per gm. original tissue. Enzyme activities were measured at 37° C., using as substrates acetylcholine, acetyl-β-methylcholine (mecholyl) and benzoylcholine, in presence of various concentrations of 2987 *R.P.*, and measurements of carbon dioxide output in every case were made for a period of 1 hr. after equilibration. Controls without drug and without substrate were also set up. Typical results are shown in the table.

Source of enzyme	Concentration of substrate	Concentration of 2987 *R.P.*	% Inhibition of enzyme
0·5 ml. brain extract	0·007 *M* acetylcholine	$5·1 \times 10^{-4}$ *M*	0
0·5 ml. rat plasma	0·007 *M* mecholyl	$3·0 \times 10^{-4}$ *M*	9·2
0·5 ml. rat plasma	0·006 *M* benzoylcholine	$0·24 \times 10^{-4}$ *M*	74·0
0·3 ml. guinea pig plasma	0·006 *M* benzoylcholine	$0·075 \times 10^{-4}$ *M*	87·3

It will be seen that, while the activity of pseudocholinesterase, indicated by the action of plasma on benzoylcholine, is strongly inhibited by 2987 *R.P.* at concentrations of the order of $0·075 \times 10^{-4}$ *M* an $0·24 \times 10^{-4}$ *M*, the activity of the true cholinesteras indicated by the action of brain extract on acety choline and of plasma on mecholyl, is not affecte appreciably by the drug even at much greater concentrations, of the order of $5·1 \times 10^{-4}$ *M*.

The results are in harmony with the views expressed by Mendel *et al.*[1,2] regarding the chemicall distinct natures of the two types of cholinesteras

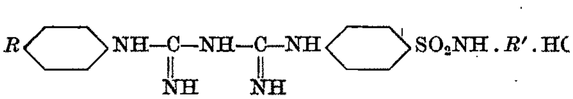
Metachloridine-substituted Aryl Biguanide as Possible Antimalarial Compounds

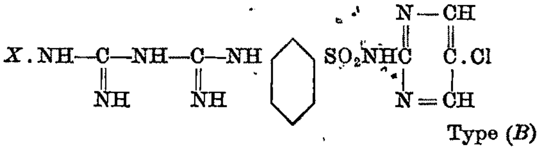
METANILAMIDES are reported to have no antibacterial action[1], and from the parallel nature of th antimalarial and antibacterial properties of sulph anilamides, discouraged research in the field c metanilamides as possible antimalarials. Recently English *et al.*[2] discovered enhanced antimalaria activity in 2-sulphanilamido-5-chloropyrimidine, an their work resulted in the discovery of metachloridine (*SN* 11437) (2-metanilamido-5-chloropyrimidine) which has been found to be effective both in avian and human malarias[4,5,6]. Metachloridine is 5-chloropyrimidine-substituted metanilamide, the action c which is not affected by the presence of *p*-aminobenzoic acid, and is supposed[3] to have a doubl mode of action due to the presence of 5-chloropyrimidine and metanilamide parts in the molecule.

Previously, sulpha-biguanides of type (*A*), som of which have shown encouraging antimalarial activity against avian malaria (*P. gallinaceum*), hav been reported by us[7,8]. The following compound of type (*B*) have also been prepared (see table), wher metachloridine forms the N^5-substituent of N^1-ary biguanides.



Type (*A*

R = H, Cl, Br, NO_2, CH_3, etc.
R' = H, 2-thiazolyl, 2-pyrimidyl, 4 : 6-dimethyl-2 pyrimidyl, 6-methyl-2-pyrimidyl.



Type (*B*)

X = substituted aryls.

N^1-Aryl-N^5-metachloridino-biguanides

X	M.p. of the hydrochloride (° C.)	M.p. of the free base (° C.)
1. Phenyl	232	234
2. *p*-Chlorophenyl	235	239
3. 2 : 4-Dichlorophenyl	256	234
4. *p*-Bromophenyl	227	243
5. *p*-Iodophenyl	208 (decomp.)	239
6. *p*-Methylphenyl	237	233
7. 3 : 4-Dimethylphenyl	246	232–234
8. *p*-Methoxyphenyl	202	236
9. *p*-Nitrophenyl	252	237

The hydrochlorides of these compounds have been prepared by the reaction of the appropriate aryl-cyanoguanidines with metachloridine hydrochloride in solvents like aqueous dioxan or 90 per cent ethanol. The free bases and the hydrochlorides are white crystalline powders.

During the preparation of the copper chelates of the substituted biguanides of types (*A*) and (*B*) by Andreasch's[9] method, the simple sulphanilamide-substituted aryl-biguanides (type *A*, R' = H) yielded the chelates readily, while those with heterocyclic sulphanilamides and metachloridine as substituents showed very feeble tendency towards chelation, perhaps due to the enhanced electro-negative nature of the sulphonamido group.

m-(5-Chloro-2-pyrimidyl)-sulphonamidophenyl-azo-cyanoguanidine did not lend itself to denitrogenation to give the corresponding cyanoguanidine compound. Details will be published elsewhere.

We thank the Indian Research Fund Association for the award of a fellowship to one of us (H. L. Bami).

Presence of a Parasitic Agent in Various Intracranial Tumours of Man

In a preliminary communication[1], one of us (C. J.) reported how, by following up indications that gliomas of the domestic fowl arise as foci of chronic inflammation and appear to be a response to the presence of some irritant influence, he was led to the demonstration of a parasitic agent associated with the lesions of glioma and encephalitis in this species. Bodies (*A*, *B*, *C* and *D*) were described and illustrated which were claimed to be phases of a pleomorphic parasite, while others (*E*) were strongly suspected, and still others considered possibly to represent further phases. In glioma and in chronic disseminated encephalitis, it was the *C* and *D* bodies that were especially demonstrated, while the *A* and *B* bodies tended to be more characteristic of purulent encephalitis.

These findings made it imperative to examine human gliomas for the possibility of the presence of some comparable agent; all tumours, whether gliomas or not, recently removed in the Neurosurgical Department of the Johannesburg Hospital have therefore been so examined.

The results are shown in the accompanying table.

PARASITIC BODIES IN TUMOURS FROM THE NEUROSURGICAL DEPARTMENT, JOHANNESBURG

Case No.	Diagnosis	Parasitic phases: *C* Bodies	Parasitic phases: *D* Bodies	Strongly suspected phases: *E* Bodies	Possible phases; *F*, *G*. *H*, etc.
1	Medulloblastoma	+	++*	+	
2	Medulloblastoma	+	+*	+	+
3	Medulloblastoma	+	+*	+	+
4	Spongioblastoma multiforme	+*		+	+
5	Spongioblastoma multiforme	+*	+	+	+
6	Spongioblastoma multiforme	+*	+	+	+
7	Spongioblastoma multiforme	+*		+	+
8	Meningioma Type III–IV	+*		+	
9	Meningioma Type III	+*	+	+	+
10	Meningioma Type III	+*		+	
11	Meningioma Type III	+*		+	+
12	Meningioma Type III	+*		?	
13	Meningioma, Spinal, Mixed	+*	+	?	+
14	Meningioma, Xanthomatous	+*	+	+	+
15	Pituitary adeno-carcinoma	+++*	+	+	+
16	Chromophobe adenoma	+*	+	+	+

+ Present. ++ Fairly frequent. +++ Very frequent. * More frequent or prominent than other phases. ? So rare that some doubt was felt.

In all of sixteen cases of glioma, meningioma or pituitary neoplasms, we have been able to demonstrate bodies indistinguishable from the *C* and *D* phases of the fowl parasite, while in most cases the suspicious *E* bodies and the other possible phases have also been seen.

All the varieties of *C* bodies (*C*, oval; C^1, double oval; C^2, piriform; C^3, bipolar; and C^4, ring- or horseshoe-shaped) encountered in the fowl have been identified in man.

It will appear from the table that *D* bodies tend to be more characteristic of medulloblastoma on one hand, and *C* bodies of meningiomas and pituitary tumours on the other. In the meningiomas no correlation could be found between the type of tumour and the variety of the *C* bodies which was predominant. But in the two pituitary neoplasms (one a β-cell adenocarcinoma, the other a chromophobe adenoma) the C^2 variety was predominant, and in these two cases there was a striking contrast in the frequency of the *C* bodies between the malignant and the benign tumour.

Properly differentiated Giemsa-stained paraffin sections of formol-fixed material and air-dried Giemsa-stained smears are both suitable for the demonstration of *C* bodies; but the *D* bodies are best demonstrated only in smears.

The bodies have been readily demonstrable only in a few cases, in other cases they were found after a short search; but in the majority of specimens, considerable and patient searching was necessary.

A full report of these findings will be published later.

We should point out that *D* bodies, considered alone, would probably not impress one as anything more definite than 'inclusion bodies'. On the other hand, *C* bodies might fairly be claimed on their own morphological merits as parasites. However, our opinion of the parasitic nature of the *C* and *D* bodies in human tumours is based chiefly on our ability in avian lesions to relate these bodies as phases of a life-cycle which includes the still more impressive schizont-like *A* body.

By analogy with avian pathology, we expect that a phase corresponding to the *A* body will prove to be demonstrable in man; but not necessarily in tumours, since in the fowl this body is more characteristic of the non-neoplastic lesions. Pending demonstration of the 'missing' phases in man, no opinion will be expressed regarding the identity of the human with the avian parasite.

The Stock of Whales

IN an article on the "Effect of Present-day Whaling on the Stock of Whales"[1], Dr. Hamilton points out that in spite of a 'rest' during the War, the Antarctic catch of blue whales in 1945–46 showed a scarcity of the largest animals, a reduced proportion of this species (30·7 per cent) in the total catch, and a reduced percentage of mature females which were pregnant; and he infers that the stock of blue whales is showing clear signs of reduction. Among other matters he points out that the limit of 16,000 'blue whale units' allows the killing of many more than 16,000 whales. Although in agreement with much of what Dr. Hamilton says, I think it should be noted that the figures for the subsequent season of 1946–47 show that blue whales were taken in relatively larger numbers, and formed about 38·5 per cent of the catch. Although this is still not very high, and gives no grounds for complacency, it is a distinct improvement on 1945–46.

It is doubtful whether the results of a single season are sufficient to indicate the condition of the stock, and since the better catches of blue whales in 1946–47 can scarcely be attributed to a sudden recovery in the stock, it is difficult to avoid the conclusion that 1945–46 was in some way an abnormal season in which the blue whales in the population were not adequately represented in the catch. The explanation may be in exceptional oceanographical conditions; but on this we have no adequate evidence. It appears that the weather at least was less favourable in 1945–46 than in 1946–47. Full details of the catches in 1947–48, and of sizes and percentage pregnant in 1946–47, have not yet, I believe, been published. It is not very clear, however, that the percentage of mature females pregnant is a wholly reliable indication of the condition of the stock.

Before the War, signs of depletion of the blue whale stock persisted over a succession of whaling seasons. If now a comparison of several seasons indicated that this stock is still declining, its position would be serious indeed. If, on the other hand, it is found to have recovered to some extent (and there is evidence, as yet unpublished, which suggests good recruitment of young blue whales), then it is important that it should not again be subjected to excessive, and in the long run uneconomic, hunting.

The international regulation of whaling is a complex subject; but briefly it can be said that the limit of 16,000 blue whale units (in preference to a specified number of whales) was adopted as the best practicable means of putting a 'ceiling' to the total Antarctic 'pelagic' catch. It represents approximately two thirds of the average annual catch before the War, and it can be reconsidered from time to time. Since 1 unit = 1 blue, 2 fin, 2½ humpback, or 6 sei whales, the larger the number of whales taken, the smaller will be the number of blue whales among them. This may not be a perfect method of limiting the catch, but it is probably the most effective of the international regulations.

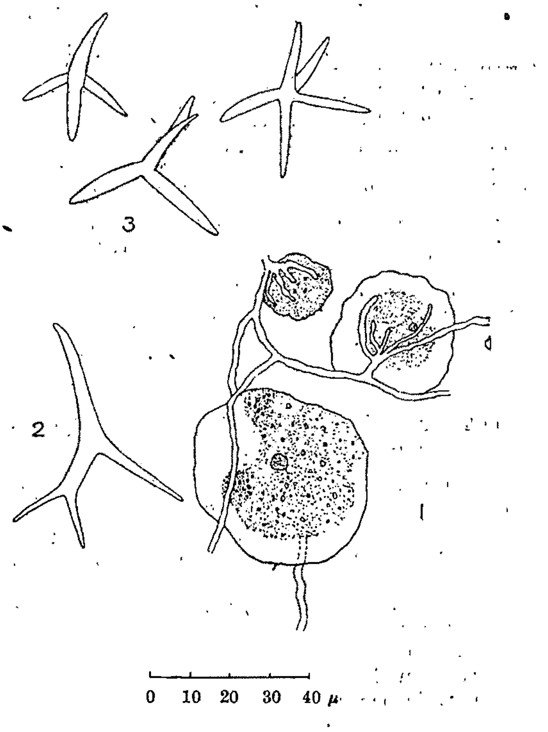
An Aquatic Predaceous Fungus, *Acaulopage dichotoma*, in Britain

IN the course of a general investigation into aquatic fungi, a predaceous Phycomycete, *Acaulopage dichotoma* Drechsler (1945)[1], has been identified for the first time in Great Britain.



The source of material was a small pond at Ken Vood, London, containing beech leaf and twig debris. n maize meal agar plates, a fungus was observed hich subsisted on aquatic amœbæ. The mycelium s extremely delicate and granular, with slight ranching, diameter varying between 1 and 2 μ ccording to age. Amœbæ, 30–45 μ in diameter, are aptured and a branched haustorium 10–30 μ in ngth is formed which persists until complete igestion is effected, when withdrawal of protoplasm ccurs (Fig. 1). When the mycelium is well stablished, conidia formation occurs, and exposure light seems to stimulate their formation. A short teral enlarges and two distal forks appear, frequently ne or both forking again (Fig. 2); less regular forking s of frequent occurrence (Fig. 3). At maturity, the istal portion of each fork appears devoid of protolasm and is termed the appendage. The conidia ave forks ranging from 15 to 40 μ in length.

This fungus agrees with the general description of *caulopage dichotoma* Drechsler, 1945, found in waterly leaf inoculum, and is named accordingly.

I found a greater variation in the degree of forking f conidia than is reported by Drechsler, and no race of the clear secretion which formed yellow eposits apparently produced by the fungus as an dhesive trap for amœbæ.

Osmoregulatory Capacity of Contractile Vacuoles

THE view that the contractile vacuoles of Protozoa n many cases perform an osmoregulatory function as been supported by much evidence[1] which need not e repeated here. Recent observations carried out n the freshwater peritrich ciliate *Carchesium aselli* ave demonstrated the remarkably close regulation f body volume which is achieved in spite of wide ariation in the osmotic stress imposed by the nvironment.

In some experiments, in order that the internal smotic pressure might be raised, the organisms were quilibrated with 0·05–0·5 molar solutions of ethylene lycol, which is known[2] to penetrate various cell nembranes at a significant but not too rapid rate. n return of the organisms to water free from thylene glycol, the contractile vacuole increased its ate of output immediately to from two to nine imes the rate before treatment; but it subsided in he course of ten to twenty minutes to its normal level f activity, no doubt owing to the escape of the thylene glycol from the organism. Greatly increased smotic stress was thus met by increased vacuolar utput, and the swelling which would be expected in he absence of osmoregulation was prevented or after the higher concentrations of ethylene glycol) onsiderably restricted. Similarly, in experiments in which the organisms were immersed in solutions of p to 0·03 molar sucrose, which for short periods nay be regarded as not penetrating in significant mount, the body volume remained unchanged within the limits of observation) while the rate of acuolar output was appropriately reduced.

The highly developed power of accurate osmoregulation which is therefore found in these ciliates may well be useful where the osmotic pressure of the medium is liable to fluctuate, as, for example, in estuaries. Apart from this, another important ecological aspect of this question may be suggested. It has been shown[3] for the egg of the sea urchin *Arbacia* that the rate of swelling on transfer to dilute sea water is considerably faster at higher temperatures, presumably because of increased permeability to water; and I have found this to be true also for the marine peritrich ciliate *Vorticella marina*. The Q_{10} for the permeability to water of the *Arbacia* egg has been estimated as ranging from 2·1 to 3·1 ('permeability' here including any changes which may occur either in the diffusibility of water or in the properties of the membrane); and that for *Vorticella marina* appears to be of the same order, although the precision of the results does not warrant a closer statement. But I have also found that the rate of vacuolar output of a freshwater peritrich increases with rise of temperature with a Q_{10} of 2½ to 3.

It seems reasonable to postulate that the contractile vacuole responds to small changes in the hydration of the protoplasm, whether these arise from a change in magnitude of the osmotic difference across the body surface or from a change in 'permeability' of that surface to water, so that the rate of vacuolar output is adjusted to maintain a practically constant body volume. In its natural habitat a freshwater peritrich might be exposed to seasonal extremes of 0–20° C., and in some circumstances the diurnal fluctuations might amount to several degrees. It seems that the organism would have to grade its osmoregulation to meet these changes. This may apply also to other freshwater animals, and so prove to have a general ecological importance.

Course of Untreated Infections of *Litomosoides carinii* in the Cotton Rat

THE efficacy of drugs in the treatment of human filariasis can be assessed by their effect on the microfilariæ in the peripheral circulation, and the effect on the adults merely inferred therefrom: in animals, however, the change induced in the adults can be assessed directly.

In recent years, *Litomosoides carinii*, the natural filarial parasite of the cotton rat, transmissible from rat to rat by the mite *Liponyssus bacoti*, has been studied in this laboratory and in others in Britain and America, with a view to its use for chemotherapeutic researches in filariasis. Much of the published work on the preliminary screening of drugs has been done with rats showing infections of unknown duration, naturally acquired in the field, and the results are interpreted as indicating that, while certain drugs kill the adult worms in the pleural cavity but do not affect the microfilariæ in the peripheral blood stream, the converse is true of other drugs, although, in some cases, only a transient reduction in the number of microfilariæ has been observed.[1] Our observations on untreated laboratory-infected cotton rats over the past two years lead us to conclude that there is need for considerable caution in the interpretation of such observations.

In a previous communication[1], the unsuitability of the white rat as a host for this purpose was suggested, for though the course of an infection in cotton rats and white rats follows the same pattern, in the white rat the microfilariæ do not persist in the circulation for the same length of time as in the cotton rat, and the death of the parent worms and their encapsulation occurs much earlier. Though the infection in the cotton rat has the same evolution, there is less disparity between its duration and the life span of the host. Nevertheless a cotton rat infected in its youth may outlive an infection which has undergone spontaneous cure. We have been able to follow, for a year or more, the general course of the blood infection in cotton rats exposed to infection once—usually for 24 hours—by small numbers of infective mites. Microfilariæ appear in the peripheral blood on the fifty-first day after exposure, and increase during the next month or more, after which the count tends to remain more or less constant, with wide variations about the mean. In one rat, still surviving, an infection intensity, varying between 140 and 240 microfilariæ/c.mm., has been maintained for the past twelve months. On the other hand, in another rat, the general level, varying between 80 and 190 microfilariæ/c.mm., persisted for some six months; but, during the following three or four months, the count dropped progressively until the microfilariæ finally disappeared three weeks before the animal's death, when only dead encapsulated worms were found.

In other cotton rats, infected on several occasions by mass exposure to mites, the infection has followed a similar course. Some, which showed counts of 1,500, 840, 675, 450 and 150 microfilariæ/c.mm. in the peripheral blood about the third or fourth month after infection, dropped after the seventh or eighth months to 530, 45, 30, 10 and 20 microfilariæ/c.mm. respectively, while in others, which died seven to twelve months after their last exposure, many of the adult worms were found to be dead and encapsulated.

The relationship between the death of the adult worms and the disappearance of the microfilariæ from the peripheral circulation cannot be defined in the absence of more precise knowledge of the migration-rate and the longevity of the microfilariæ. Though they are found most commonly in the peripheral circulation within one day of injection into the pleural or peritoneal cavities and the subcutaneous tissue, their persistence in the circulation in the absence of the adult varies from days to weeks and even months. Furthermore, in one such animal, a concomitant septic infection has been accompanied by a transient reappearance of the circulating microfilariæ after they had previously disappeared for a time, suggesting that redistribution may be an additional factor in their decline.

Our results cannot be taken to indicate the minimum time required before gross pathological changes are induced in the pleural sac by the adult worms, nor do they enable the duration of a particular blood infection to be estimated before the progressive and terminal fall occurs in the microfilarial count, nor can the disappearance of the microfilariæ and the death of the adult worm be correlated accurately at the moment. Nevertheless, they suggest that conclusions from treated infections should be made with due regard to the findings in untreated controls, and that results derived from wild, naturally infecte cotton rats should be interpreted with caution.

Density of the Blackfish Petrosal

The mammalian petrosal is generally recognize by anatomists as the most compact of bones. Th physical density of the various bones does not see to have attracted much attention. The only data i the literature available to me are those of th "Smithsonian Physical Tables", where the densit of bone is given as varying from 1·2 to 2·0 gm. pe cubic centimetre.

Mr. J. T. Sorenson included a petrosal from blackfish (*Globicephala melæna*) in the collectio which he made in his second stay at Campbell Islan in the New Zealand subantarctic group. The extr ordinary density of this specimen is striking an immediately apparent when the bone is handle Although the specimen measures only 40 mm. 28 mm. × 18 mm. in its major dimensions, the dr weight is 17·5 gm. After boiling in water to expel ai the volume measured by immersion is 5·0 c.c accordingly, the physical density is 3·5, considerabl exceeding the range given in the Smithsonia "Physical Tables".

In comparison, the petrosal of a dog weighe 1·34 gm. and had a volume, measured as before, 1·0 c.c. The density of this specimen, 1·34, falls we within the limits given in the tables, and confirm the initial impression of the remarkable density the blackfish petrosal.

A Method for Studying the Carbohydrate Metabolism of Micro-organisms

We wish to emphasize the usefulness of the metho of paper chromatography of sugar[1,2], especially whe applied on a quantitative basis[3], in the study bacterial metabolism. As an example we quote th following experiment on the utilization of sucrose b *Leuconostoc mesenteroides* (Lister Institute strain N 3351).

Most strains of this bacterium are found to produc copious yields of a dextran from this sugar and n other[4]. The strain used had those properties.

During the production of the gum, large quantiti of reducing sugars are formed, and it has been gene ally assumed that the glucose part of the sucrose polymerized to dextran with simultaneous liberatio of the fructose moiety[5]. Considerable interest centred on the bacterium due to Hehre and Sugg' enzymatic synthesis of the dextran.

A loopful of a 48-hr. culture of the organis (growing in Tarr and Hibbert's liquid medium[4] wit the addition of 2 per cent yeast extract) was inoc lated into 10 ml. of this medium, and the cultu flask incubated at 28° C.

It is possible by the paper chromatography metho to estimate at any desired interval during growth th

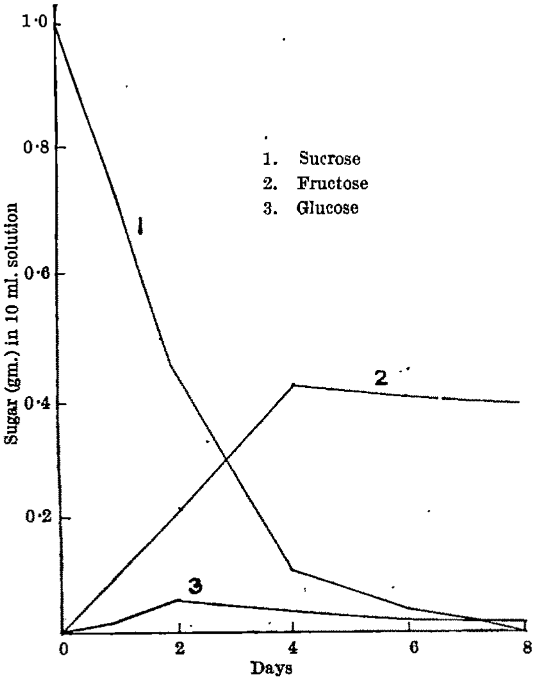

Fig. 1

glucose, fructose and sucrose present in the culture. Instead of using an internal standard[3] which might interfere with bacterial growth, an equal volume (15 µl.) measured by weighing was spotted from the culture on to a paper strip, using a flame-sterilized platinum loop for each spot. Sucrose can be detected on the paper with resorcinol[2] and estimated in the usual manner[3] after a preliminary hydrolysis with dilute oxalic acid. A check was made with known mixtures of the three sugars and nearly quantitative recovery was obtained. The results are plotted on the accompanying graph (Fig. 1) and a photograph is shown (Fig. 2) of a chromatogram obtained after two days growth. It is apparent that glucose as well as fructose is produced, although to a lesser degree. This experiment has been repeated several times with the same general result.

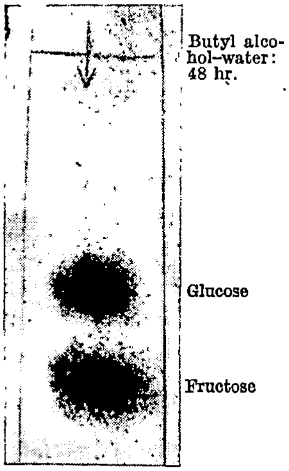

Fig. 2

We shall shortly be preparing a report of the method and further applications for publication in greater detail elsewhere.

Voltage Effects in Titanate Polycrystals

TITANATES of the perovskite type, such as the barium compound, possess ferro-electric properties at temperatures up to the Curie point, at which a λ-transition from a distorted to a cubic crystal structure takes place. Materials of this type possess high permittivities rising to a maximum in the temperature region of the transition. Beyond the Curie point, the relation between polarization and the applied field becomes linear; the ferro-electric influence, however, continues to make itself felt within a temperature region extending well above the Curie point.

In a previous communication[1], we described the variations in permittivity with time observed after the application of a unidirectional electric field to materials of this type. At temperatures below the Curie point, the permittivity was larger shortly after applying a strong D.C. field, and reverted at a decreasing rate to its initial value, within periods exceeding in some cases 30 min. Beyond the Curie point the permittivity had at first a reduced value and again reverted slowly to its original magnitude.

The permittivity of compounds of this type, measured with a small alternating field, is known to be decreased while a strong unidirectional tension is superimposed, at temperatures below as well as above the Curie point[2-4]. As no information appeared to be available on the variations of the permittivity during the application of a polarizing field, it was considered of interest to determine the curves relating the permittivity measured while a D.C. field (3,300 V./cm.) was superimposed to the time of application. At temperatures below the Curie point the permittivity was found to have an increased value on applying the field, and to fall at a decreasing rate to a steady value below that of the initial permittivity. Beyond the Curie point the permittivity decreased immediately and approached again slowly a final lower value.

It appears that the following mechanism may be responsible for the various effects observed. On the application of the field, oriented regions in the material grow at the expense of others, and owing to these changes anisotropic stresses[5] are produced on the crystallites, resulting in the displacement of the Curie point to a lower temperature. In the case of the tetragonal structure, for example, compressive forces in a direction parallel to the *c*-axis may predominate over those along the *a*-axis. At the same time, the maximum in the permittivity – temperature curve will be depressed progressively to lower values of the permittivity, owing to the increasing polarization in the material. On removal of the field, molecules added to the oriented regions revert again to their initial state, and the permittivity – temperature curve assumes its original position. Changes in the volume of the oriented regions, while rapid immediately on applying or removing the field, may continue to take place for comparatively long periods of time. The various effects observed can hence be explained by the depression of the permittivity – temperature curve, accompanied by the slight lowering of the Curie point, on the application of the field.

A similar explanation for the effects observed by us has been suggested by Szigeti[6]. According to this, the changes in the permittivity are due to a displacement of the permittivity – temperature curve by the external field, in a direction parallel to the temperature axis. It is suggested that the permittivity maximum is shifted to a lower temperature, retaining its original magnitude. This explanation, however, would be insufficient to account for the prolonged residual effects observed, if the depression in the permittivity – temperature curve is not taken into account, and without the assumption of a mechanism for the displacement of the Curie point, such as that suggested above.

It is interesting to note in this connexion that the permittivity maximum in this type of material has been reported to occur at lower temperatures in the case of strong A.C. measuring fields than at lower field strengths[7], and the explanation suggested for the residual effects is consistent also with this result.

We wish to thank the United Insulator Co., Ltd., Surbiton, for generously giving us facilities in its research laboratory during part of this investigation. We are greatly indebted also to Dr. B. Szigeti for helpful suggestions.

Chromatography of Dinitrophenyl Amino-acids and Peptides

SANGER[1] has described the use of 1 : 2 : 4-fluorodinitrobenzene to identify the free amino-groups of several proteins, employing the separation of the N-dinitrophenyl amino-acids on columns of silica gel. We have had only limited success applying this method, owing to variations in different batches of the silica gel, and the difficulty of preparing evenly packed columns, which led to diffuse bands, difficult to separate. Sanger stated that with these derivatives on paper chromatograms[2] long diffuse 'tails' formed, making the method quite inferior to the silica method. We are able to report some success with the two-dimensional method, however, without apparently using any special technique which might account for the improvement. Consden *et al.*[3] have also recently described the identification of α-δ-di-(dinitrophenyl)-ornithine running alone on a paper chromatogram, and Keston *et al.*[4] using the p-I^{131}-benzenesulphonyl derivatives of amino-acids have been able to estimate them after their partial separation on a one-dimensional paper strip.

We have tried a wide range of alcohols, phenols, amines, esters, ketones and hydrocarbons, all saturated with water, but with most of these 'tailing' was marked. Best results were obtained with n-butanol, phenol, collidine and n-butanol-acetic acid mixture, each saturated with water. The solution is applied in the usual manner to No. 1 or No. 4 Whatman paper and neutralized with ammonia vapour before the run. No solvent has so far been found which will satisfactorily resolve the group of dinitrophenyl amino-acids, containing large non-polar side-chains; for example, N-dinitrophenyl-leucine, N-dinitrophenyl-phenylalanine, αε-di-(dinitrophenyl)-lysine, etc., as the addition of the large dinitrophenyl-group still further diminishes the differences between these amino-acids. However, provided that only a few of this group are present, identification by running with the added authentic derivative is possible. 5 μgm. of a dinitrophenyl acid will give a good spot on a one-dimensional strip, but 20 μgm. may be required on a two-dimensional sheet, as the yellow colour becomes difficult to see after two traverses. Ultra-violet examination[5] shows the spots as pale yellow when weak, and as obscuring dark patches in larger quantities. There is no actual fluorescence.

Some months ago, Sanger (private communication) reported that he had separated some dinitrophenyl peptides on silica columns in a similar manner to his dinitrophenyl amino-acid separations. We find that if the hydrolysis of the dinitrophenyl peptide or protein is incomplete, extra yellow spots appear, which do not correspond to the position of the dinitrophenyl amino-acids. Further hydrolysis of such materials after elution has shown them to have been dinitrophenyl peptides, of size up to heptapeptides. This good spot formation with heavy materials extends to those of very large molecular weight. For example, the dinitrophenyl derivative of the 'protein' part of insulin of molecular weight 5,000 left after chymotryptic digestion[6] (before addition of dinitrophenyl groups) runs in phenol-water as a good spot with R_F 0·56. This material and also the mixture of relatively small peptides (average, pentapeptide) from the insulin digest, before treatment with fluorodinitrobenzene, either gave no bands on paper chromatograms in the case of the heavy insulin 'core', or a diffuse overlapping mixture of bands in the case of the peptide mixture.

Influence of Hydrogen Ions and Neutral Salts upon the Hydration of Interstitial Connective Tissue

WHEN a piece of interstitial connective tissue covering the thigh muscles of a rat was placed in water adjusted to pH 4·5, within a few hours it became opaque, white and shrunken. On the other hand, a piece treated at pH 11·0 became translucent, grey and swollen. These changes were mutually reversible and could be repeated several times. Observations with the dark-ground microscope showed that this swelling was not due to any change in the collagen fibrils but to a widening of the spaces between them; shrinkage was accompanied by an obliteration of such spaces and by a condensation and crimping of the collagen bundles.

Clearly, an explanation of these changes must involve a consideration of the nature of the substance which lies between the collagen fibrils. Flemming[2] described a substance in this situation which, on account of its property of contraction in weak acids, he referred to as the cementing substance. He considered the substance to be a mucin. Recently[1], I have shown that its chief characteristics are those of a protein. Following what has been said above, it should be added that this protein reacts strongly with water.

According to modern theory[3,4], the degree of hydration of a protein at different concentrations of hydrogen ions will depend upon the ionization of the NH_3^+ and COO^- radicals of the side-chains. Near the iso-electric point, a maximal number of the side-chains will be oppositely charged. The attraction of opposite charges will bring the side-chains together and result in a more compact structure with exclusion of water. On the alkaline side of the iso-electric point there will be suppression of charge on the cationic centres of the protein. A large proportion of side-chains will therefore come to possess the same negative charge and their mutual repulsion will open up the structure and lead to swelling. Theoretically, therefore, the properties of connective tissue described above are those of a protein having an iso-electric point in the region of *p*H 4·5.

Schade and Menschel[5] have shown that neutral salts may cause swelling of connective tissue. I have found that this effect is morphologically identical with that which occurs in conditions of reduced hydrogen ion concentration, and also that the reaction involved has the following features: (1) At neutrality the smallest concentrations of various salts necessary to cause swelling lie between $M/5$ and $M/20$. (2) While swelling, the tissue withdraws salt ions from the surrounding solution. (3) The capacity of a salt to cause swelling is greater with reduction of hydrogen ion concentration from the iso-electric point. (4) Although, in general, the actions of salts and hydrogen ions on the hydration of connective tissue are opposite and reversible, salts have no capacity to 'unlock' tissue which has become shrunken by prolonged treatment at a *p*H value near the iso-electric point.

It is clear that the hydration of connective tissue by the action of neutral salts is accompanied by some sort of union of salt with the protein. Probably the salt ions combine in some manner with protein side-chains. To do so, such side-chains must be available and not involved in electrovalent links with oppositely charged side-chains. Perhaps this is why salt has only a feeble 'unlocking' effect on tissue constricted by treatment near the iso-electric point of the interfibrillary protein, and also why, with decrease in hydrogen ion concentration away from this iso-electric point, the hydrating effect of the salt is so much greater.

It is apparent that salts exert a hydrating influence on connective tissue in physiological concentrations. This fact alone must be a matter of considerable importance not only to biological science but also to clinical medicine.

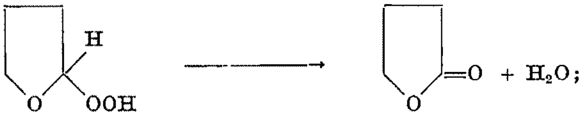
Tetrahydrofuran Hydroperoxide

A STUDY has recently been made in these laboratories of the liquid-phase oxidation of ethers. The products of oxidation may be satisfactorily accounted for by the formation of an intermediate hydroperoxide and its subsequent decomposition. As with the hydroperoxides of hydrocarbons, those of ethers are apparently often too unstable for isolation; but in the case of tetrahydrofuran the hydroperoxide has been isolated in the pure state.

The hydroperoxide obtained by the removal of unchanged tetrahydrofuran at low pressure from a sample which had undergone oxidation by prolonged exposure to air during storage was a liquid ($n_D^{20°}$ 1·6933) at room temperature. The product gave on analysis C 46·0, H 7·9 per cent (required, C 46·1, H 7·7 per cent) and liberated the theoretical quantity of iodine from acidified potassium iodide. The hydroperoxide was completely miscible with water and soluble in the common organic solvents (acetone, methanol, acetic acid), and strongly catalysed the polymerization of styrene and methyl methacrylate. The onset of thermal decomposition occurred in the range 70–80° C., and rapid heating to 100° C. did not cause detonation, though the decomposition became more violent at still higher temperatures. The normal reagents for the destruction of peroxides (ferrous sulphate, sodium hydroxide, etc.) were equally efficacious in the case of tetrahydrofuran hydroperoxide, the chief product of both the thermal and catalysed decompositions being γ-butyrolactone. The formation of γ-butyrolactone may be accounted for by loss of water:



though the fact that tetrahydrofuran hydroperoxide is a polymerization catalyst indicates that some homolytic decomposition also occurs, probably by fission of the O—O bond.

A complete account of this work will be published elsewhere.

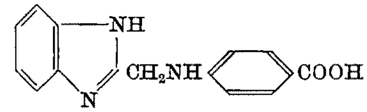
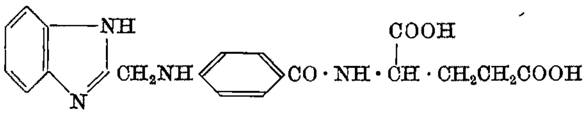
Benziminazole Analogues of Pteroic and Pteroylglutamic Acids

IN the course of experiments on the relationship of structure to biological activity in the folic acid series of growth factors, we have examined the benziminazole analogues of pteroic acid and of pteroylglutamic acid[1].

The compound (I), m.p. 281° (decomp.), in which the 2-amino-4-hydroxypteridyl residue (numbering according to the "Ring Index", Reinhold, New York, 1940) of pteroic acid is replaced by a benziminazole ring, was prepared from 2-chloromethylbenziminazole[2] and *p*-aminobenzoic acid in boiling alcohol, or *via* its ethyl ester, from ethyl *p*-aminobenzoate (found: C, 66·8; H, 4·7; $C_{15}H_{13}O_2N_3$ requires C, 67·4; H, 4·7 per cent). The benziminazole analogue of pteroylglutamic acid was obtained as a



I



II

diethyl ester (m.p. 125°) by the condensation under similar conditions of 2-chloromethylbenziminazole and ethyl *p*-aminobenzoyl-*L*-glutamate (III). Hydrolysis with cold aqueous alcoholic sodium hydroxide gave the required acid (II), isolated as a hydrochloride, m.p. 201° (found after drying at 100° in a vacuum: C, 55·6; H, 4·7; N, 12·6; Cl, 8·1; $C_{20}H_{20}O_5N_4$,HCl requires C, 55·5; H, 4·9; N, 12·9; Cl, 8·2 per cent).

The *p*-aminobenzoylglutamic ester (III) is conveniently prepared by refluxing a solution of *p*-nitrobenzoyl chloride in benzene with ethyl glutamate hydrochloride, followed by catalytic reduction of the product. The *p*-aminobenzoylglutamic acid obtained by hydrolysis of (III) has m.p. 167° and in *N* sodium hydroxide solution, $[\alpha]_D^{22°} = +29{\cdot}2°$, comparable with the recorded value for the *D*-isomer of $[\alpha]_D = -27{\cdot}4°$ [3]. Published accounts[4] of the preparation of *p*-nitrobenzoylglutamic acid from glutamic acid recommend the use of excess *p*-nitrobenzoyl chloride. We have found that by the simultaneous addition of the acid chloride (1 mol.) dissolved in dioxane and of an equivalent of 2*N* sodium hydroxide to a solution of glutamic acid (1 mol.) in its equivalent of *N* alkali, *p*-nitrobenzoylglutamic acid of m.p. 114–116° and $[\alpha]_D^{19°} = +16{\cdot}9°$ can be obtained in 70–80 per cent yield[5]. A full description of these experiments will be published in due course.

It has recently been found by Edwards, Starling, Mattocks and Skipper[6] that the benziminazole (II) replaces 'folic acid' as a growth factor for *Strep. fœcalis* R. (though at much higher concentrations), and also stimulates growth in presence of sub-optimal concentrations of folic acid. Similar experiments by us have, however, given different results. For *Strep. fœcalis* R., grown in the improved medium of Rabinowicz and Snell[7], modified by the omission of glycine and asparagine and by the inclusion of pyridoxin (100 μgm./l.), adenine and guanine (each 5 mgm./l.), the benziminazole (II) (10^{-9} to 10^{-3} *M*) did not replace pteroylglutamic acid. Growth was measured turbidimetrically after 20 hr. incubation at 37°. Nor was the organism stimulated in the presence of sub-optimal amounts of pteroylglutamic acid, but, on the contrary, under the latter conditions, growth was inhibited, although this inhibition was not observed when pteroylglutamic acid was added in amounts which afforded optimal growth in the absence of (II). Tests made with *Lactobacillus casei*, using the medium of Roberts and Snell[8] and estimating growth turbidimetrically after incubation for 22 hr. at 37° in an atmosphere of 95 per cent hydrogen, 5 per cent carbon dioxide, gave essentially the same results.

INHIBITION OF GROWTH OF *Strep. fœcalis* R. BY THE BENZIMINAZOLE (II) IN PRESENCE OF PTEROYLGLUTAMIC ACID

$1{\cdot}6 \times 10^{-8}$	0	1·57
,,	5×10^{-4}	1·50

* Averages of quadruplicate tubes after incubation for 20 hr.

It is possible that the discrepancy between our results and those of Edwards *et al.* may be due to variations in the respective media. It is noteworthy that the medium used by the American experimenters gave measurable growth for *Strep. fœcalis* R. in the absence of added folic acid. Unlike that described by Edwards *et al.*, which was acetate buffered and contained adenine, guanine, xanthine and uracil, the medium we have employed was buffered with citrate and contained neither xanthine nor uracil. In the light of recent work in this field[9], differences in the pyrimidine-purine content of the two media may well be significant.

The simple benziminazole (I) also, when tested with *Strep. fœcalis* R., was found to be inhibitory, though less so than compound (II), and was inactive as a substitute for pteroylglutamic acid.

The Sommelet Reaction

IN a communication under this heading in *Nature* of May 8, p. 723, Messrs. Anyal and Rassach refer to a paper by Graymore and Davies[1], in which it was shown that a mixture of benzylamine and formaldehyde gives benzaldehyde in good yield on heating in solution with hexamine. They say that, contrary to Graymore and Davies' findings, benzaldehyde can be obtained from benzylamine hydrochloride in the absence of hexamine. In a later paper by Graymore[2], it is shown that hexamine may be dispensed with, and benzaldehyde produced by heating methylene benzylamine (or, for that matter, a mixture of benzylamine and formaldehyde) with two-thirds of the quantity of hydrochloric acid, as required by the equation:

$$(C_6H_5CH_2.N{:}CH_2)_2 + 2HCl = 2C_6H_5.CH_2.N{:}CH_2,HCl.$$

It was hoped to obtain benzylidene methylamine from methylene benzylamine, but the attempt failed, the experiment resulting in the formation of benzaldehyde, methyl benzylamine and dimethyl benzylamine. Work is, however, still proceeding in this field.

JOHN GRAYMORE
Plymouth and Devonport Technical College.
June 29.

BIOGENESIS OF THE STRYCHNOS ALKALOIDS

By Prof. R. B. WOODWARD

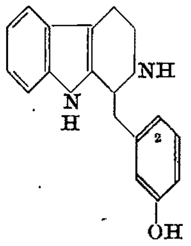
Converse Memorial Laboratory, Harvard University

ROBINSON[1] and Schöpf[2] have developed with conspicuous success the concept that a fundamental reaction of biogenesis involves the condensation between an amino (or imino) group, a carbonyl group and an anionoid centre:

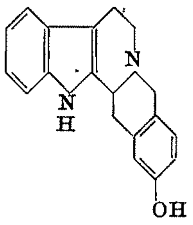
$$-\overset{|}{\underset{|}{C}}{}^{\ominus} + \overset{|}{\underset{|}{C}}=O + H\overset{|}{N}- \xrightarrow{H^+} -\overset{|}{\underset{|}{C}}-\overset{|}{\underset{|}{C}}-\overset{|}{N}- + H_2O$$

Type *A* reaction

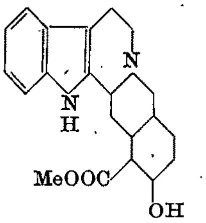
In a particular application of this idea, Hahn[3] has suggested that in the biogenesis of the alkaloids of the yohimbé group, tryptamine, from tryptophane, and 3-hydroxyphenylacetaldehyde (or an equivalent), from 3-hydroxyphenylalanine, condense by reaction (*A*) to give (I), and that from (I), by another reaction of type *A*, involving in this case formaldehyde (*or* an equivalent), N^b and the anionoid 2-position of the aromatic nucleus, (II) is produced. The latter contains the complete ring skeleton of yohimbine (III); the further changes necessary for the elaboration of (II) into (III) would not be unusual, and the various possibilities need not be discussed here.



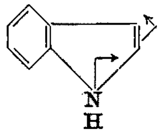
I



II

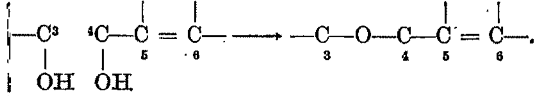


III

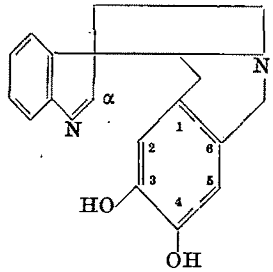


IV

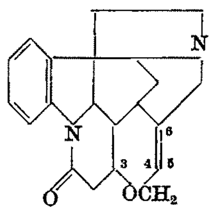
It is well known that the indole ring possesses anionoid reactivity at the β- as well as at the α-position, in consequence of the availability of electrons through the process shown in (IV, arrows). Consequently it is of interest to inquire as to the course of the reactions outlined above if condensation were to occur at the β- rather than the α-position. It is clear that, in this case, if 3,4-dihydroxyphenylalanine be considered the precursor, the product corresponding to (II) will be (V). It will be seen at once that the expression (V) contains striking similarities to many of the features of the strychnine molecule (VI). Moreover, the further elaboration of (V) in the direction of (VI) would involve for the most part relatively simple changes. Thus, since $-CH=N-$ is equivalent to $-CHO\ NH_2-$, the opportunity is present in (V) for a further reaction of type *A*, leading to the establishment of a new bond, as required, between the α-position of the indolenine nucleus and the anionoid 2-position of the carbocyclic ring. Steric considerations might bar this reaction in this simplest form, since the product, (VII), contains a double bond in an unusual position. On the other hand, it has been shown recently[4] that the *meta* positions of an aromatic nucleus can be bridged by a chain of five atoms, and, in any event, the reaction could lead to an unstrained tautomer of (VII), for example, (VIII); or alternatively, the condensation could occur at a later stage, since in the subsequent stages C_3 is likely still to bear the oxygenated substituent necessary for the conference of anionoid properties on C_2. Further, the (presumably, but not necessarily, oxidative) breaking of the carbocyclic ring (of V, VII *or* VIII) between the hydroxyl-bearing atoms C_3 and C_4 gives at once the system necessary for the formation of the seven-membered ether ring of (VI), namely,



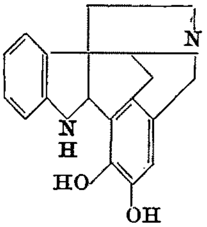
$$-\underset{OH}{\underset{|}{C^3}}\quad {}^4\underset{OH}{\underset{|}{\overset{|}{C}}}-\underset{5}{\overset{|}{C}}=\underset{6}{C}- \longrightarrow -\underset{3}{C}-O-\underset{4}{C}-\underset{5}{\overset{|}{C}}=\underset{6}{\overset{|}{C}}-.$$



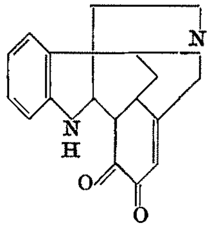
V



VI



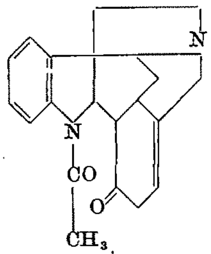
VII



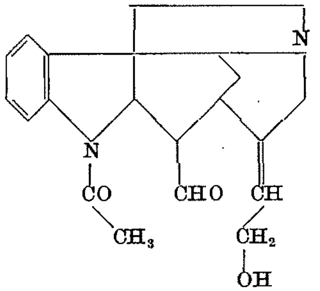
VIII

Apart from changes in the oxidation state of the molecule, the only further modification necessary for the construction of (VI) involves the interpolation of the two carbon atoms necessary for the completion of the lactam ring of (VI). It must be admitted that, at present, this part of the scheme appears to possess unusual features, and a detailed discussion of the various possibilities is scarcely justifiable. On the other hand, it may be noted that the acetylation of N^a (*cf.* aspidospermine, which may well contain a similarly situated N-acetyl group, and colchicine, as an example of the occurrence of acetylation in the biosynthesis of alkaloids), followed by condensation between an oxygenated cationoid function at C_3 and the reactive methyl group of $-\overset{|}{\underset{|}{N}}COCH_3$, would lead to a six-membered lactam ring.

Clearly the scheme as a whole is a flexible one, and many specific variants might be considered. If, for example, the intermediate (IX) were reached, through the initial participation of 3-hydroxyphenylalanine, as assumed by Hahn in the case of the yohimbé alkaloids, or through reductive processes from (VII)



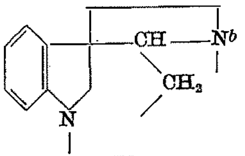
IX



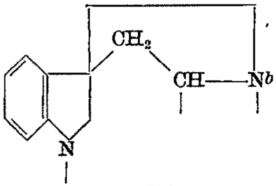
X

or (VIII), the opportunity exists for a variant of the well-known photolytic cleavage[5] of cyclic ketones, leading to (X); the conversion of (X) to strychnine itself (VI) would involve simply a single further reaction of type *A*, in which —OH replaces —NH_2. Further, it should be pointed out that the order of the stages indicated should not be considered fixed. Thus, the aldehyde component might enter the scheme after some modification of the carbocyclic ring has already occurred. For example, the condensation of tryptamine, a formaldehyde equivalent, and a *dihydro-derivative* of 3-hydroxyphenylacetaldehyde could lead directly, by the reactions indicated above, to (IX) (acetyl group missing). Finally, the possibility may be kept in mind that preliminary oxidation of the indole nucleus at the α-position might serve to force the initial condensation exclusively into the β-position.

On the whole, the possibility of building up so complicated a structure as (VI) by a series of simple reactions from plausible starting materials is so striking that it is difficult to believe that the scheme lacks significance. It is worthy of note that biogenetic considerations of this kind several years ago led us to consider that the environment of N^b in the strychnine molecule was that shown in the part structure (XI) rather than that (*cf.* XII) accepted at that time[6]. We felt, however, that in view of the relatively undeveloped state of knowledge in the field of biogenesis, the proposal of these considerations as a possible biogenetic scheme should follow rather than precede the definite chemical proof of the primary consequences of its acceptance. Since this proof has recently been brought to a successful conclusion in our Laboratory[7], our confidence in the scheme is sufficient to bring us to suggest that other alkaloids will be found which owe their genesis to less, or more, complicated variants of the same process, and investigations in this direction are already in progress.



XI



XII

SIR ROBERT ROBINSON writes:

When in New York in early 1947, I learned from Dr. Woodward that he had developed a scheme of biogenetic relations between strychnine and yohimbine. The details now available follow well-trodden paths in most respects; for example, the β-condensation would be included in any such hypothesis. The suggested fission of a benzene nucleus is, however, highly original. This daring speculation must be judged at this stage by 'the degree of coincidence' which called for it.

In the thirty years that have elapsed since my first paper on these topics, considerations of this kind have been constantly in mind and conclusions have been reviewed and modified when necessary. I therefore feel justified in stating that in my opinion Woodward's theory is probably correct in essentials. May I also venture to deprecate in advance a flood of further speculation on similar lines, unless it is supported by a comparable 'degree of coincidence'. It is obvious that by chopping up benzene rings and recombining the fragments, almost any kind of structure can be obtained.

INTERNATIONAL CONGRESS ON ANALYTICAL CHEMISTRY

AN International Congress on Analytical Chemistry, organised under the auspices of the Netherlands Chemical Society, was held at Utrecht during June 1–3. The president of the Congress was Prof. C. J. van Nieuwenburg, of Delft Technical University, and the general secretary, Dr. H. A. J. Pieters, of the Central Laboratory of the Netherlands State Mines. The Congress was divided into five sections dealing with: (I) general methods and standardization, (II) electrical methods, (III) emission spectrography, (IV) optical measurements and physical methods of separation, (V) microbiological methods and detection of traces. The proceedings consisted of thirteen formal lectures and the reading of forty-five original papers. Full-length pre-prints of the papers had been distributed before the Congress, so that after a short summary by each author most of the time was available for discussion. The proceedings were conducted in English, with French as the second language. The lectures and papers contributed to Sections I, II, IV, and V will be published in a special number of *Analytica Chimica Acta*, and those to Section III in *Spectrochimica Acta*.

The Congress was attended by about forty British analysts and by representatives from Belgium, Czechoslovakia, Denmark, France, Switzerland, and Sweden. Papers were also contributed from the United States. Holland was represented by more than two hundred and fifty chemists and physicists.

Visitors to the Congress could not be unimpressed by the great changes that analytical chemistry has undergone in recent years. Because of the demand for greater speed and accuracy and because of the need for handling much smaller quantities of material, the old classical methods based on gravimetric and volumetric procedures are being replaced by physico-chemical techniques. As a result of this development, the status of analytical chemistry is being raised to a much higher level, and analytical chemistry is becoming a science for the specialist.

Modern analysis, with its interests in optical, electrical and microbiological techniques, makes very great demands on the training of its practitioners, and it was emphasized by speakers from several countries that the training of analytical chemists lags a long way behind the requirements of modern industry.

Prof. van Nieuwenburg, in his opening address to the Congress, remarked that most of the developments in modern analytical chemistry had originated in the requirements of industry, and pointed out that this was borne out by the type of papers contributed to the Congress. He commented on the high cost of modern analytical equipment and said that much of it could only be purchased by the larger industrial laboratories; even these have to make a selection from the wide range of available instruments. An opportunity for the exchange of experiences gained in different laboratories with these modern techniques, such as was offered by the Congress, was most useful, and the dissemination of information in this way might lead to a saving of both time and money that might have been spent on inappropriate or useless equipment.

Most of the lectures and papers dealt with problems arising directly from the demands of industry. Dr. E. C. Wood, in his lecture on statistical aspects of chemical analysis to Section I, discussed the methods of sampling which enable the information sought by the analyst to be obtained as economically as possible. He stressed the need for proper randomization both in sampling and in performing analyses, and gave a short account of the use of 'quality control' charts in analytical work. He directed attention to the possibility of estimating the standard error from the range and described a method for extracting the maximum information from analytical investigations involving the estimation of a ratio. The advantages of the 'factorial' as opposed to the 'classical' type of experimental design was demonstrated and reference made to the value of carrying out an analysis of variance when examining the experimental data. Mr. W. J. Gooderham described and demonstrated his soap-film apparatus for the continuous analysis of coal gas.

Prof. E. Leclerc lectured to Section II on electrical methods of analysis. After reviewing the available methods and discussing their speed and accuracy, he described their applications in the Belgian metallurgical and petroleum industries. Prof. C. Duval spoke on automatic gravimetric analysis in inorganic chemistry and described some new polarographic procedures. Mr. E. Loeuille (Section III) discussed the possibilities and limitations of quantitative spectrographic analysis.

The lectures to Section IV were given by Prof. G. Duykaerts and by Dr. T. I. Williams on absorptiometric methods in chemical analysis and on chromatography respectively. Dr. Williams dealt with partition chromatography, the chromatography of inorganic substances, and the theory of chromatography. He described how the urgency of the Plutonium Project had stimulated work on the theory of chromatography. Dr. W. F. J. Cuthbertson lectured to Section V on recent developments in microbiological assay. He described the different techniques by which micro-organisms may be used for the assay of vitamins and amino-acids, and indicated possible future developments. Prof. A. G. Bertrand spoke on the determination of trace elements in plants and animals.

Dr. H. W. Thompson addressed the final session of the Congress on methods based upon infra-red and ultra-violet measurements. He reviewed the war-time achievements of infra-red analysis in the petroleum field and gave a critical survey of the available commercial instruments. Prof. P. E. Wenger summed up at the conclusion of the Congress.

A high scientific standard was maintained throughout the Congress, which was held in the pleasant rooms of the Esplanade, Utrecht's modern theatre. The Dutch organisers are to be heartily congratulated on the excellent way in which the Congress was arranged.

METABOLIC ASPECTS OF CONVALESCENCE*

THE fifteenth meeting of the Conference on Metabolic Aspects of Convalescence was once again one which devoted the greater part of its deliberations to one particular topic; on this occasion the subject was "Isotopes".

Put together in printed form, the discussions make an extremely useful review of the rapidly widening application of this comparatively new technique for the study of biological problems. Already we have been forced to revise many of our long-held beliefs regarding the nature of the metabolic processes of the body. Interpretations which provided plausible explanations of previously recorded data no longer suffice. As one member of the Conference put it, "The availability of these materials [isotopes] as tools for biological experimentation will have as profound and stimulating an effect on biological and medical science as did the discovery of the microscope". Work already completed suggests that this remark is no exaggeration.

As with all newly developed techniques, however, there are pitfalls for the unwary. In this instance, in addition to the usual initial difficulties of use and interpretation, there is the physical danger of radiation injury to the workers and assistants in the laboratories concerned. Since the hazard is an invisible one, the victim remains unaware of his injury until material damage has been done. With the present rapidity of spread in the use of radioactive materials it is inevitable that they should sometimes be handled by individuals unaware of the danger, and the part of the Conference report which deals with the diagnosis of early radiation injury and the precautions that should be taken to prevent tissue damage should be carefully studied. A statement from the National Cancer Institute is included which says, *inter alia*, "It must be emphasised that the absorption of radiation is always connected with damage, no matter how small the dose. It must also be emphasised that radiation effect may be cumulative." This places a heavy responsibility on the directors of laboratories in which work of this nature is in progress. There must be no repetition of the sufferings of the early radiologists.

In addition to the discussion of these practical issues, there are detailed considerations on the measurement of isotopes, on the synthesis of labelled compounds, and on their use in clinical investigations and in the treatment of disease.

---

* Conference on Metabolic Aspects of Convalescence. Transactions of the Fifteenth Meeting, New York, 31st March, 1947. Pp. 163. (Josiah Macy, Jr. Foundation, 565 Park Avenue, New York 21.) 2.25 dollars.

In all these the reader has the advantage—inherent in the form in which these transactions are published—of not only learning what an experimenter has to say about his work, but, in addition, seeing the comments it elicited from other keenly interested participants. The question and answer, and the pooling together of small observations which, in isolation, might seem unimportant or meaningless, encourage a clarification and building up of ideas. The contrasting styles of the different contributors also make the reading of these publications much more enjoyable than the reading of some technical journals in which the papers have been so zealously 'edited' that all trace of individual style of expression has disappeared.

The remaining topics discussed at this fifteenth meeting were mostly concerned with hormone studies, and several of the papers consisted in the presentation of further data from work which had already been reported at earlier meetings. The interdependence of the multifarious metabolic activities which take place in the human body and the consequent folly of trying to interpret any one in isolation become more and more evident as each set of these transactions is put together.

M. W. GRANT

MECHANICAL FOAM FOR FIGHTING PETROL FIRES

FOAM for dealing with petrol fires can be generated in two ways: by chemical reaction (chemical foam), or by mechanical agitation (mechanical or air foam). Mechanical foam is largely used in Great Britain and is produced by churning up air and water with a foam-stabilizing agent, such as saponin or soap. The foam-making branch pipe is the apparatus in general use by fire services.

The use of foam appears to have been originally suggested by Laurent in 1904. He successfully demonstrated at St. Petersburg the use of chemical foam against burning naphtha. In 1912, the first foam fighting apparatus for fire-brigade use was introduced into Britain. By 1939, one or two efficient foam compounds were available; but they were both expensive and made from imported materials. With the outbreak of hostilities there came the probability of a large increase in the incidence of petrol fires and also the danger of a shortage of raw materials. Consequently, at the request of the Ministry of Home Security, Research and Experiments Department, an investigation into the whole problem of suitable foaming agents for combating fires of inflammable liquids was undertaken at the Chemical Research Laboratory of the Department of Scientific and Industrial Research. The experimental team was under the leadership of Dr. N. O. Clark, who is the author of Chemical Research Report No. 6: "A Study of Mechanically Produced Foam for Combating Petrol Fires" (London: H.M. Stationery Office. 2*s*. 6*d*. net), in which full details of the problem, the course of the researches and the results obtained are given.

Large-scale methods were developed which permitted a quantitative estimation of the value of foam as a fire-fighting agent, and also a laboratory technique was devised for the investigation of the physical properties of foam. The nature and properties of suitable foaming agents, such as chemically broken down hoof and horn meal, or glue mixed with materials similar to soapless shampoos or chemically treated blood, were elucidated. The us of chemically treated blood—a waste material from abattoirs—as a foaming agent was discovered by the research team. This new compound had the additional advantage of a much lower viscosity than other types and so could be used without modification in R.A.F. crash tenders. It produces a high-efficiency foam for combating aircraft fires, and during the Wa production was devoted entirely to this particular type of foam.

On the purely scientific side, quantitative evidence was obtained in favour of Plateau's classical theory of foam stability. It would appear that the expansion property depends on the interfacial tension, air/liquid at the appropriate age of the surface, and the rate of diffusion of the active material into the surface, and is limited by the energy-level of the method of preparation. The hydrolysed proteins are, for example, slow in diffusing into the surface of their solutions. A close relation was shown to exist between the critical shearing stress of a foam prepared from a liquid with appreciable solidity in it surface to that of the corresponding liquid surface.

For the first time, a proper scientific background to the problem has been established, and the 'figure of merit' of foam on a petrol fire can be roughly estimated, but not accurately predicted, from laboratory measurements of the properties of foam, the mos important being heat resistance, expansion, and petrol resistance. There is still need for relating laboratory experimental data with those of large-scale tests.

S. WEINTROUB

LINEN INDUSTRY RESEARCH ASSOCIATION

THE report of the Council of the Linen Industr Research Association, Belfast, for the year ended September 30, 1947, states that the strengthening of the financial position of the Association, which now includes practically all the firms in the industry, has permitted the Council to proceed with the Director' plans for expansion, and the new buildings have been commenced. In addition to the large shed with a floor space of 9,800 sq. ft. for technological researche on line and tow preparing, dry spinning and weaving which forms the main extension, the new plans include the provision of more staff amenities and facilities, extension of the testing-room and furthe space and equipment for research in bleaching dyeing and finishing. Reference is made to th co-operation in research which has already flowe from the liaison service described in the last annua report. Comprehensive surveys of conditions o temperature, humidity and ventilation in wet spinning mills have brought to light many striking anomalies, and have led to suggestions by whic decided improvements can often be introduced ver economically into the working conditions by comparatively simple measures.

Studies in the retting of different types of straw b various methods in the large-scale retting tanks hav continued, and in view of the larger differences i yield caused by variations in weather conditions during field-drying of the retted flax, attention has een focused on treatments to prevent such microiological deterioration. Investigations are being ontinued to improve the efficiency of fibre extraction y turbine scutching machines. An investigation for e Ministry of Supply has shown that the strength f flax yarn depends on the fibre-breaking stress, the neness and the length of the fibre strands in the raw. . study has also been made of the levelness of rayon aple yarn spun on flax machinery, and one comenced on the suitability of flax machinery for pinning wool, alone and mixed with other fibres. he possibilities of automatic winding and weaving e being studied, while research on bleaching and yeing continues to have as its object the developent of existing methods and investigation of new nes to improve the quality of the product. In nishing research, the study of the application of rease-resistant finishes to linen fabrics has figured rominently and the possibility of fixing both nishes and protective agents by chemical combinaon with the cellulose has been examined.

Some six hundred testing reports have been made to embers, and much cloth testing, chiefly the measureent of tearing and tensile strength, has been underaken in connexion with the development of new ypes of flax canvas. Special attention has also been irected to the influence of the micro-structure of ax fibres on the behaviour of flax materials, both uring processing and in service.

EDUCATION IN AND FOR THE SERVICES

ALTHOUGH the education authorities of the three Services—Royal Navy, Army and Royal ir Force—frequently collaborate and meet to pool xperiences and thrash out problems common to all, was probably for the first time that all three met by vitation to present their case and reveal their main bjectives and the problems which they entail to an udience of nothing but civilian educationists on uly 14 at the Conference on "The Education of the oung Worker" organised by the Department of ducation of the University of Oxford and held at anchester College, Oxford, during July 12–17.

The case for the Royal Navy was presented by nstructor-Captain F. C. Sobey, director of studies, M.S. *Kestrel*, Winchester; that for the Army Royal Army Educational Corps) and the Army Cadet orce by Brigadier W. G. Pidsley, deputy director of rmy education, and Brigadier H. Kenyon, deputy irector cadets, respectively; and that for the Royal ir Force by Group-Captain I. B. Hart, deputy irector of education. The meeting was held under he chairmanship of a civilian, Mr. L. J. F. Brimble.

Mr. Brimble emphasized the exceptionally difficult roblems which arise in Service education—problems hich are often not appreciated by its critics. Now hat the Services, particularly the Army, have to eal with National Service entrants, their subjectaterial is not just a cross-section of the public; ndeed, it is almost the entire public at the age of 8–19 plus years. Service intakes at these age-levels nclude all grades of intelligence and all standards of ducational attainment from illiterates up to univerity graduate level. In most areas there are not nough men or women to warrant segregation into roups according to standard of intelligence or achieveent, so that frequently many different grades have to be taken together, though, of course, individual teaching and training are not overlooked. This is, perhaps, the greatest imaginable challenge to the ingenuity of the education officer or instructor. As an illustration, Mr. Brimble described a lecture-discussion which he recently led with Army men of Higher School Certificate standard and upwards, and compared this with a lecture he gave soon afterwards to a group of Army near-illiterates of ages 19–25 years in which only one had ever heard of Faraday and only two of Gladstone. In these two cases, he had his audiences segregated, which made matters much easier than they frequently are in the field.

Group-Captain Hart stated that in the Royal Air Force there are two main educational aims—education for the Service itself and education for the individual. Naturally one aim helps the other, so the distinction between the two is more imaginary than real, and both aims are integrated and correlated wherever possible. Education for the Service is compulsory, whereas that for the individual is mainly voluntary. By and large, the scheme works well in spite of two main difficulties: (1) the peripatetic nature of most Royal Air Force personnel which can frequently upset completely even the best-devised schemes, and (2) the lack of qualified instructors—a lack which is at present common to all educational projects, both Service and civilian.

Brigadier Pidsley gave a very lucid account of the recently planned scheme for the Army which, he emphasized, is still only of an interim nature since the Army itself has still to settle down to a peace-time footing. The Army absorbs the majority of National Service entrants (it is composed roughly of half regulars and half National Service men); but despite the movable nature of Army men and units and the shortage of trained instructors, the scheme, like that of the Royal Air Force, is getting well under way. Just as in the Royal Air Force, units are sent to many parts of the Commonwealth, etc.; but wherever they may be, the presence of the Royal Army Educational Corps is felt. Some units are isolated and there the ingenuity of the instructors is taxed to the limit; other units are near big towns where civilian educational facilities are available to Army men and women. The Army educational scheme is very flexible though it has three broad aims: (1) to make a man a soldier; (2) to train him in good citizenship; and (3) to enable him to develop along the best lines as an individual. Broadly speaking, Brigadier Pidsley claimed that the Army education scheme has got its horse to the water; now it is the job of the Royal Army Educational Corps to see that it drinks.

Speaking for the Army Cadet Corps, Brigadier Kenyon claimed that its educational and training scheme has a real moral purpose behind it and he described various means whereby this purpose is being achieved. The wide variety of interests, both cultural and vocational, inherent in such groups of boys is recognized and catered for so far as is possible. Though religion is recognized and encouraged, politics, and especially party politics, are not. Everything is dealt with on a voluntary basis; nothing is forced upon the boys.

As was clearly stated by Instructor-Captain Sobey in a stimulating yet amusing contribution, the case for the Royal Navy is somewhat different from those of the other two Services. The Navy has few problems arising as a result of the intake of National Service men because that intake is so small—at the rate of about two thousand a year. There is no ship, however, no matter how small or large, and no shore establishment, where there is not at least one well-qualified instructor, and in some ships such as large aircraft carriers and certain shore establishments there are several instructors. Training is, of course, mainly technical; but wider vocational and cultural interests are accepted and encouraged.

It was of interest to note that in all three Services current affairs and citizenship loom large and are compulsory. There are few subjects which appear in a civilian adult education programme which do not appear in the curricula of Service educational schemes. The ultimate aim of linking up and integrating Service education with the national civilian education should in due course be achieved with little or no difficulty.

FORTHCOMING EVENTS

Tuesday, July 27—Friday, July 30

SOCIETY FOR APPLIED BACTERIOLOGY (at Queen's University, Belfast).—Annual General Meeting and Summer Conference.

APPOINTMENTS VACANT

APPLICATIONS are invited for the following appointments on or before the dates mentioned:

ASSISTANT IN THE AGRICULTURAL BOTANY DEPARTMENT, a LECTURER (Grade III) IN DAIRY CHEMISTRY, and an ASSISTANT LECTURER IN AGRICULTURAL CHEMISTRY—The Secretary, North of Scotland College of Agriculture, 41½ Union Street, Aberdeen (July 31).

LECTURER IN PHYSICS—The Clerk to the Governors, Woolwich Polytechnic, Woolwich, London, S.E.18 (July 31).

H.M. INSPECTORS OF FACTORIES—The Secretary, Ministry of Labour and National Service (O.E.11), 80 Pall Mall, London, S.W.1 (July 31).

SENIOR LECTURER IN CHEMISTRY, and ASSISTANT LECTURERS (one primarily in Botany and one primarily in Zoology) IN THE DEPARTMENT OF BIOLOGY—The Clerk to the Governors, Chelsea Polytechnic, Manresa Road, London, S.W.3 (July 31).

LECTURERS IN (*a*) PHYSICS with subsidiary MATHEMATICS, (*b*) ELECTRICAL AND MECHANICAL ENGINEERING—The Chief Superintendent, Telecommunications Research Establishment, Great Malvern, Worcs. (July 31).

SECRETARY OF THE DEPARTMENT OF PHYSICS—The Cavendish Professor, Cavendish Laboratory, Cambridge (July 31).

RESPONSIBLE LECTURER IN ELECTRICAL ENGINEERING, a RESPONSIBLE LECTURER IN MECHANICAL ENGINEERING, and a RESPONSIBLE LECTURER IN CHEMISTRY—The Principal, Royal Aircraft Establishment Technical College, Farnborough, Hants (July 31).

ASSISTANT PHYSICIST—The Secretary, Royal Northern Hospital, Holloway, London, N.7 (July 31).

PSYCHOLOGIST—The Secretary, National Hospital for Nervous Diseases, Queen Square, London, W.C.1 (July 31).

ASSISTANT LECTURER IN THE DEPARTMENT OF GEOGRAPHY—The Registrar, The University, Leeds 2 (July 31).

ASSISTANT AGRICULTURAL ECONOMISTS (3, male)—The Secretary and Registrar, The University, Bristol (July 31).

FOULERTON RESEARCH FELLOWSHIP IN MEDICINE—The Assistant Secretary, Royal Society, Burlington House, Piccadilly, London, W.1 (August 1).

LECTURER IN PHARMACOLOGY—The Secretary and Registrar, The University, Bristol 8 (August 1).

PHYSICIST—The Secretary, British Jute Trade Research Association, Bellfield Street, Dundee (August 14).

POWER HOUSE SUPERINTENDENT in the Power House of the Fertilizer Factory, Sindri, Bihar—The High Commissioner for India, General Department, India House, Aldwych, London, W.C.2, quoting No. 333A. (August 14).

LECTURERS IN (*a*) ENTOMOLOGY, (*b*) GENETICS, and (*c*) INSECT PHYSIOLOGY, in the Department of Zoology and Applied Entomology—The Secretary, Imperial College of Science and Technology, South Kensington, London, S.W.7 (August 17).

SENIOR PRINCIPAL SCIENTIFIC OFFICER at the Royal Observatory, Greenwich—The Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2207 (August 20).

CHEMISTS (men and women) in the Grades of Scientific Officer Class and Experimental Officer Class, for analytical work in connexion with atomic energy development, under the Ministry of Supply—The Ministry of Labour and National Service, Technical and Scientific Register, K Section, York House, Kingsway, London, W.C.2, quoting F.78/48A/2 (August 24).

PRINCIPAL SCIENTIFIC OFFICER, and SENIOR SCIENTIFIC OFFICERS, in the Engineering Division of the Atomic Energy Research Establishment, Harwell, Berks—The Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2205 (August 26).

CHIEF TECHNICAL INSPECTOR in the Ministry of Pensions—The Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2218 (August 28).

ASSISTANT TO THE PROFESSOR OF BOTANY—The Registrar, Trini College, Dublin (August 30).

KEEPER OF ANTIQUITIES—The Director, Museum and Art Galler New Walk, Leicester (August 30).

DIRECTOR (Professor or Reader) OF THE UNIVERSITY OF MADR BIOCHEMISTRY LABORATORY—The High Commissioner for Ind General Department, India House, Aldwych, London, W.C.2 (Ind August 31).

SENIOR LIBRARY ASSISTANT (graduate, preferably in Science Economics)—The Registrar, University College, Southampton (Augu 31).

SCHOLARSHIP for training in INDUSTRIAL RESEARCH—The Direct Institute for Industrial Research and Standards, 45 St. Stephe Green, Dublin (September 1).

MAMMALOGIST (male), and an ORNITHOLOGIST (male)—The Direct Transvaal Museum, P.O. Box 413, Pretoria, South Africa (Septemb 30).

METEOROLOGISTS for the East African and West African Meteor logical Services—The Director of Recruitment (Colonial Servic 15 Victoria Street, London, S.W.1.

LABORATORY ASSISTANT/STEWARD FOR PHYSIOLOGY—The Head the Department of Biology, Chelsea Polytechnic, Manresa Roa London, S.W.3.

GRADUATE IN PHYSICS OR CHEMISTRY in the Intelligence Divisi for Literature Research—The Secretary, Research Association British Rubber Manufacturers, 105 Lansdowne Road, Croydon.

LABORATORY STEWARD (Grade II)—The Secretary, Northampt Polytechnic, St. John Street, London, E.C.1.

RESEARCH STAFF in the categories of PHYSICS, CHEMISTRY (main Physical), and ENGINEERING—The Director, Gas Research Boar 1 Grosvenor Place, London, S.W.1.

PHYSICISTS to work on problems connected with the measureme of motion and forces in winding and weaving machines, and to i vestigate problems of cloth structure and serviceability—The Direct Linen Research Institute, Lambeg, Lisburn, N. Ireland.

LABORATORY TECHNICIAN (Grade C) IN THE BIOLOGY DEPARTME —The Warden and Secretary, Royal Free Hospital School of Medicin 8 Hunter Street, London, W.C.1.

LECTURER IN THE PHYSICS DEPARTMENT—The Secretary, Nort ampton Polytechnic, St. John Street, London, E.C.1.

RESEARCH BIOCHEMIST IN THE DEPARTMENT OF PATHOLOGY—T Dir ctor of Pathology, Bernhard Baron Memorial Research Labor tories, Queen Charlotte's Maternity Hospital, Goldhawk Road, Londo W.6.

LABORATORY ASSISTANT (man) at Westminster Secondary Technic School, Ebury Bridge, London, S.W.1—The Education Officer (Esta 2), London County Council, The County Hall, London, S.E.1.

SPECIAL DEMONSTRATORSHIP IN THE DEPARTMENT OF BACTERIOLOG AND IMMUNOLOGY (to work principally at St. Albans)—The Dea London School of Hygiene and Tropical Medicine, Keppel Stree London, W.C.1.

RESEARCH STUDENTSHIPS IN THE DEPARTMENTS OF BOTANY, CHE ISTRY, PHYSICS and ECONOMICS—The Registrar, University Colle of the South-West, Exeter.

LECTURER or ASSISTANT LECTURER IN PURE MATHEMATICS, LECTURER or ASSISTANT LECTURER IN PHYSICS, and a LECTURER ZOOLOGY—The Registrar, University College of the South-Wes Exeter.

SCIENTIFIC METHOD IN THE CONSERVATION OF PICTURES

IN the Golden Age, Plato and Aristotle walked in the Academy and in the Lyceum, instructing and disputing. We, in our time, are in possession of much of their labours; we have entered into them, and they have become part of our inheritance. Other searchers after truth there were too in those days—artists and craftsmen—who fashioned things for delight as well as for use. But alas! less, much less, of their works have survived to the present day. In the case of paintings (originally a great number) next to nothing now remains. In due time, men of genius in applied science appeared, men who understood how to harness natural law to immediate needs. They had to combat the Platonic tendency to discourage investigations concerned with gross matter, and for centuries there had been the lag between discovery and application. But it may be that man was not then ready for such advances. Enough to recollect that when a giant appeared—in the person of Leonardo da Vinci—he combined consummate artist, engineer, technician and natural philosopher all in one. Perhaps sensing his own incapacity to generalize, he strove against heavy odds to study afresh the works of Archimedes, and thus, with not inconsiderable success, to effect a junction between studio and laboratory.

The centuries that have passed since then have taken heavy toll of man's cultural patrimony. No nation has escaped, though losses are probably less than some people imagine. But deterioration goes on without ceasing: here a little and there a little, until some irreplaceable masterpiece stands in real jeopardy. The duty of conservation is plain enough. How is it to be shouldered? On p. 166 of this issue of *Nature*, Dr. W. G. Constable discusses the findings of the Weaver Commission, appointed last summer to examine the methods and results of cleaning pictures at the National Gallery.

In outline, the report of the Weaver Commission goes far, perhaps as far as it is permissible to go, in the direction indicated by the terms of reference. But its significance lies much deeper. For it is a wider concept than what has happened or not happened to certain pictures that is involved. It is nothing less than the place of scientific method in the task of conservation; and it may be said at once that the report provides full vindication for its introduction. Clearly, every consideration and weight must be accorded to æsthetic principles (and at a certain stage of operations these may well be crucial); but when all is said and done, supreme paintings are physical objects and subject to all the limitations, stresses and strains to which such things are prone. Restoration connotes much more than 'cleaning'; a branch of knowledge now known fairly widely as 'picture-mechanics' is indicative of the temper of responsible people who strive to understand, and then to use, the advancement of laboratory techniques for the benefit of the national collections. They are not in the least inclined to wander into other people's gardens, where they may or may not be welcome: their sole function, as they see it, is to bring to bear every kind of scientific device and experience, and to use them impersonally and impartially in the service of conservation. Again, just as the ablest physician or surgeon will realize that his patient has a personality, and that recovery from illness and sound health thereafter are closely connected with it, so the man of science in the service of the arts appreciates that a great picture was made and exists for glory and for beauty, for the enjoyment of mankind. Manifestly, the responsibility of the authorities is to the future, as well as here and now.

Realizing this, the Weaver Commission stressed the need for air-conditioning as the most important single item among those calculated to preserve the pictures in the National Gallery in the interests of posterity. Shortly after the pictures were returned from their war-time exile in Wales, the Ministry of Works, in consultation with the Trustees and Gallery officials, started to prepare plans, and intensive study of the problem—by no means an easy one in the case of such a building as that in Trafalgar Square—has been going on continuously. It is understood that, in fact, a start has already been made with the erection of the room for the necessary equipment, and much of the machinery is already on the site. Naturally, every opportunity is being taken to learn from experience, by visits and so forth to installations, both in Great Britain and overseas. The project is of necessity being conducted in stages; and there can be little doubt that a most efficient scheme will emerge in the end. Advantage is being taken of the atmospheric pollution tests made in the Gallery during 1936–37 to guide the engineers in the filtration problem; for there is no reason for thinking that the data to-day are appreciably different from those of twelve years ago. Similarly, observations already exist relating to the moisture-content of panel paintings (that is, those executed on wood) both in the public galleries and elsewhere. These figures are of considerable importance in calculating the limit between which it is desirable for the relative humidity to be stabilized.

For some months past, preliminary plans have been maturing for the more exact registration of the dimensional change in wood and fabric supports as a function of relative humidity and temperature. The experiments have been designed to reproduce as nearly as possible the actual conditions obtaining in a picture and should yield valuable information relating to warping, cracking and flaking.

These activities are perhaps but a fraction of the scientific care of paintings. An indication of the problems involved is given by Mr. F. I. G. Rawlins, scientific adviser at the National Gallery, in an article, with illustrations from some of the 'cleaned' pictures, which is published in the July issue of *Endeavour*. It is quite clear that no single institution can hope to tackle all the problems presented by an attempt to look after great pictures adequately. Before the War—in fact, ever since the research laboratory of the National Gallery was established in 1935—the policy has been to work in close co-operation with the Department of Scientific and Industrial Research. Broadly, the task is twofold: the application of scientific processes (mostly physics) to the pictures themselves, and next the 'farming out' of questions relating more to the materials from which pictures are constructed and the control of the environment. The fusion of both lines of inquiry should lead (and indeed has led) to a much fuller understanding of the whole subject. In the main, the first type of work is undertaken in the National Gallery laboratory itself; whereas the second is carried on in such establishments of the Department of Scientific and Industrial Research, and sometimes of the research associations, as convenience may suggest. In all cases, the Gallery laboratory is in control of operations and co-ordinates them all. Further, the Gallery has the unique advantage of the services of an Advisory Scientific Committee. This is an honorary body of six distinguished men of science who meet quarterly in order to help in whatever way they can in the application of scientific methods, both in conservation and as an aid to historical research. It was set up by the Trustees fourteen years ago, with the scientific adviser of the National Gallery (who is also in charge of the research laboratory) as secretary, and it is noteworthy that, apart from work on conservation, these years have seen valuable studies of æsthetic as well as scientific aspects of the pictures in the Gallery.

The result of all this is difficult to assess, since it is still something of a novelty and in the formative stage. But two tendencies are beginning to take shape: one (the short-term aspect) the value of an exact scientific and technical approach and control applied to the National Gallery's problems as such; and the other (the long-term view) a definite bridging of the gap that has so long separated the arts and sciences from one another, to the detriment of both. It is no less through doing than through thinking that the scholar and craftsman, technician and artist, can come to appreciate each other in a common quest for the beautiful.

FIBIGER: PIONEER OF EXPERIMENTAL CANCER

The Danish Cancer Researcher, Johannes Fibiger
Professor in the University of Copenhagen
By Prof. Knud Secher. Pp. 206. (Copenhagen Arnold Busck; London: H. K. Lewis and Co., Ltd., 1947.) n.p.

THE first part of this book recounts Fibiger's ancestry back to 1667: some of his ancestors including his father, were medical men; but they seem to have made no striking contributions to scientific knowledge. Fibiger's youth was not altogether happy, since his father died when he was a child and his mother was put to some difficulty to educate the children and had little time for the affection that might have softened Fibiger's character His early history perhaps explains his rather moody nature, particularly in his early adult life, when, no doubt, he had to contend with the usual difficulties common to many medical men. But he seems to have been happy in his professional career, and writes enthusiastically of his early training with rof. Salomonsen, who gave him a comprehensive aining in bacteriology which stood him in good ead in his later work.

The second part of the book deals with his pro- ssional life up to the time that he made his dis- overies of the relationship between infestation with e *Gongylonema neoplasticum* and tumours in the omachs of rats. His first scientific period was ainly concerned with controversies about the athogenicity of bovine strains of tubercle bacillus. n this work Fibiger found himself in opposition to och, who belittled the importance of bovine in- ection as a source of human disease. Fibiger and ensen upheld, successfully, the importance of the ovine strain, and at numerous international con- resses he made his case so successfully that he apidly acquired an international reputation.

During this same period, Fibiger came to hold lead- g positions in the medical and scientific world in enmark, and in 1907 was elected to the Cancer ommittee, which was originally formed to investigate ancer of the uterus. His influence was soon felt on is Committee, of which he became vice-president 1908. He sponsored a questionnaire to all Danish hysicians, dealing with the incidence of cancer, d obtained replies from 99 per cent of them. In 09 he instituted a system of free microscopical agnosis for which he was largely personally re- onsible. In the next few years he obtained cancer nsuses from the Faroes, Iceland and Greenland, hich yielded the interesting result that the incidence the Faroes and Greenland resembled that in Europe, hereas in Iceland it was only about half as high. bout this time, a chance observation diverted his tention to experimental cancer investigation, which ade his name famous throughout the scientific orld, and won for him the Nobel Prize in 1928.

The third part of the book deals with the develop- ent of this research, and is not only a convenient llection of facts which are not readily available to nglish readers, but is also a defence of Fibiger's con- usions by Secher against the criticisms that have en made since his death. There are numerous ustrations of the nematodes, of the cockroaches hich are their intermediate hosts, and of the gross d microscopic pathological lesions observed by ibiger, both in wild rats and in those experimentally fested. One can well understand how he reached is conclusions, on the available evidence, and in e light of scientific knowledge at that time; but espite the enthusiasm with which Secher supports e work of his friend, it cannot be said that he does uch to strengthen the case as presented by Fibiger imself. It is unfortunate that fire destroyed the gar factory in which the wild rats infested with ematodes were found with tumours in their stom- chs. Even the most careful attempts by Passey d his collaborators to reproduce the conditions of ibiger's experiments may have failed in some portant but apparently trivial circumstance to produce exactly the conditions in Fibiger's lab- atory. Secher stresses the heavy infestation held Fibiger to be essential for the induction of umours, and not realized by others repeating the ork. The reviewer cannot escape the conclusion at some of the tumours seen by Fibiger were nuinely malignant; but only benign tumours d hyperplasia have been recorded by others who ve tried to repeat his experiments. There seems tle doubt that some, at least, of the alleged meta- ases in the lungs were probably instances of metaplasia in bronchiectatic cavities, as clearly demonstrated by Passey *et al.* Secher illustrates, on p. 133, such a lesion as a "pulmonary metastasis"; but on the same page is a low-power photomicrograph described as a "glandular metastasis", which looks like a keratinizing squamous carcinoma. The tumours that were maintained by transplantation in Fibiger's experiments seem to have qualified as malignant.

Secher succeeds in convincing the reader of Fibiger's integrity, and of the great thoroughness with which he pursued his investigation. He seems to have left nothing to chance, and to have been highly critical of his own results. If he failed to give a completely satisfactory explanation of them, that must be attributed to lack of knowledge of the influence of vitamins and other factors on hyperplastic lesions, in the period about the time of the First World War, when this work was done. It must be said, however, that there are many irritating features in this book. It is written in English, and yet it is filled with the most curious phrases and words, which make the meaning obscure. For example, the stomach is referred to as the 'ventricle' very frequently, and a number of strange words occur throughout the text. Fortunately their meaning is usually clear, as, for example, "irritaments", "cancerated", and so on. The spelling of foreign names varies from page to page, and even on the same page. It would have been of considerable advantage to the reader if the text had been edited by an Englishman before publication.

P. R. PEACOCK

CLOCKS AND WATCHES

Horology

The Science of Time Measurement and the Construction of Clocks, Watches and Chronometers. By J. Eric Haswell. With Supplement. Pp. xvi+288+19 plates. (London: Chapman and Hall, Ltd., 1947.) 16*s.* net.

IT is now about eight years since the previous edition of this book was sold out, and a measure of the esteem in which it was held by horologists is that second-hand copies were unobtainable. Its reappearance is therefore very welcome. The book commences with a clear exposition of the fundamentals of time and time measurement, which are treated at considerably greater length than is usual. The section on pendulums deals principally with those types used in precision clocks; it is unfortunate that the question of temperature compensation and temperature errors is not treated quantitatively, as this does not require difficult mathematics, such as the author has evidently taken much trouble to avoid. Also there is no mention of the magnitudes of circular and barometric errors. A point of terminology which seems doubtfully correct is the use of the term a 'free' pendulum, since all clocks described as having 'free' pendulums have their pendulums, in fact, coupled to constant-force escapements of one kind or another. The term, however, has a wide usage among horologists, and it is perhaps as well to retain it.

Clock and watch escapements are treated in Chapters 4 and 14; here, unfortunately, the author deals only with special cases of escapement lay-out and proportions. In the case of the lever and cylinder watch escapements, this is not very serious, as their designs are fairly stereotyped nowadays; but in cases such as the dead-beat and recoil clock escapements, which may, in fact, be constructed with widely varying proportions, the information available is not of much use. Also references to the impulse tangent circle are misleading, since impulse is, in fact, delivered at right-angles to these lines, and in most of the drawings of clock and lever watch pallets there are small but nevertheless important geometrical errors.

Gearing is dealt with in Chapter 5, and in the supplement, and an interesting section has been included on epicyclic trains for revolving-escapement watches. There is a very useful section on the balance and spring, covering both the questions of temperature and positional errors; the supplement includes a section on modern hairspring alloys.

A good description of striking and chiming mechanisms, general lay-outs of clocks and watches, and much interesting and useful information on complicated watches, such as chronographs, calendars and repeaters, with a good chapter on the marine chronometer, combine to make this book very useful and informative to those interested in horology from a descriptive point of view. R. A. Fell

LABORATORY ORGANIC CHEMISTRY

Newer Methods of Preparative Organic Chemistry

Translated and revised from the German. (Published and distributed in the Public Interest with the consent of the Alien Property Custodian.) Pp. xiii + 657. (New York and London: Interscience Publishers, Inc., 1948.) 8.50 dollars; 51*s*.

Semimicro Qualitative Organic Analysis

By Nicholas D. Cheronis and John B. Entrikin. Pp. xiv + 498. (New York: Thomas Y. Crowell Company; London: Constable and Co., Ltd., 1947.) 25*s*. net.

Reactions of Organic Compounds

By Dr. Wilfred John Hickinbottom. Second edition. Pp. x + 482. (London, New York and Toronto: Longmans, Green and Co., Ltd., 1948.) 25*s*. net.

THESE three books cater for the needs of the student and the worker in organic chemical research.

"Newer Methods of Preparative Organic Chemistry" comprises fourteen articles each written by a German expert, which have been translated and revised by American chemists. It thus presents the reader with authoritative accounts of the application in the laboratory of a number of the most useful of modern methods and special reagents. Oxidations using lead tetra-acetate or periodic acid and dehydrogenations with sulphur, selenium or platinum and palladium catalysts are described. Catalytic reductions with Raney nickel or copper chromite are reviewed in detail. Another chapter is devoted to oxidations and reductions in presence of aluminium alkoxides. An account of biochemical oxidations and reductions deals with the employment for preparative purposes not only of micro-organisms but also of higher animals.

Other sections of this book discuss various substitution reactions of aliphatic substances, the chemistry of organic fluorine compounds and the uses of boron fluoride and hydrofluoric acid in organic reactions. The fact that the chapters on diene syntheses a the uses of diazomethane were written by Alder a Eistert respectively is a guarantee of their excellenc and in conclusion an account is given of the uses organolithium compounds.

The volume is an excellent and timely producti which will be of great service to the research worke

"Semimicro Qualitative Organic Analysis" aims providing a general course in qualitative orga analysis for students, and a manual and referen book for workers in all types of laboratory, wheth academic, professional or industrial.

The rapid expansion of our knowledge of t chemistry of biological materials has been largely d to the use of microchemical methods, the advantag of which are generally recognized, and the resear worker in organic chemistry must sooner or lat acquire the necessary technique. The princip adopted by the authors of this book is that the stude should learn to work on the semimicro scale in t organic laboratory from his first year, and t advantages in economy of material and valuab training are obvious. All the necessary operatio and equipment are, therefore, described at the outse and the rest of the book gives a systematic procedu for the identification of a substance, special emphas being placed on observations of solubility. Suitab derivatives are listed for each class of compound a exact directions are given for their preparation a careful purification on the semimicro scale.

Numerous lists of selected references are include and the book concludes with a valuable collection tables of compounds arranged in classes in order melting or boiling point together with particulars various derivatives or figures for physical properti such as density, refractive index or rotatory pow to assist the identification. A final table includ many more complex bases, drugs, vitamins a hormones.

This volume will not only be useful to the studen but will also prove most valuable as a book reference.

A new and revised edition of Hickinbottom "Reactions of Organic Compounds" will be general welcomed. It reviews in detail the reactions of the main classes of compounds and gives in an appe dix a scheme for their identification. New materi has been added, particularly in the sections saturated and unsaturated hydrocarbons, on organ lithium compounds and on the uses of diazomethan The book is a valuable source of information wi many preparative details, and it is packed wi references to the literature.

APPLIED SURFACE CHEMISTRY

Surface Chemistry for Industrial Research

By J. J. Bikerman. Pp. ix + 464. (New Yor Academic Press, Inc.; London: H. K. Lewis a Co., Ltd., 1948.) 8 dollars.

THE author states in his preface that "Th volume is an exposition, adapted to Industri Research, of the fundamentals of Surface Science In fact, it is nothing of the sort; it is an assembla of data of surface phenomena with the fundamenta badly scamped. Too frequently also, the auth introduces a topic with a definite statement and the proceeds to cite reservations and evidence against without afterwards summing up. The reader is left confused.

The book is comprehensive ; it has the conventional subdivision into liquid–gas, liquid–liquid, solid–gas, solid–liquid–gas, solid–liquid–liquid, and a final hapter on electric surface phenomena. It is extremely well and thoroughly documented and the international cope of the references is most praiseworthy. Taking chapter at random, out of 284 references, 23 were to books, 71 to technical journals and, of the remainder o academic publications, 45 were German, 51 British, 23 Russian, 21 American and the remaining 0 assorted European. As usual, of course, this completeness of bibliography has led to lack of ritical assessment and to citing papers which will e found to add nothing to accepted statements. It has also led to a curious tendency to cite results obtained from rather exotic systems without enough data upon simple ones and common substances. To give examples, the section of four pages on unimolecular films contains a statement that "Since the ength" (of what, is not stated) "does not differ much rom the length of an 'oil' molecule, films of a similar r smaller thickness are termed unimolecular". his is all the introduction to this important branch f surface chemistry that the author gives to the ndustrial worker. No force/area curves are reproduced. Shortly afterwards, foams receive 14½ pages.

The section on emulsions is a good example of the econd chief fault of the book, namely, that of making an exact statement and following it by a collection of bservations, usually showing noticeable critical hought. The diagrams are unusually well designed and drawn, but the type used for numerals in the ext is bad and the '2' is a continuous offence to the eye.

This miscellany should be welcomed by those cturers who like to enliven their teaching with eferences to practical applications and perhaps by tudents wishing to heckle their lecturers. It cannot e recommended to anyone else, which is a pity, ecause the book does contain much acute and critical hought.

Compilations of this sort are nothing new ; they re a sort of crude operational research in technology hich has been practised for centuries. Another ecent book in this same field—"Emulsions and oams", by Berkman and Egloff—is an example of ork of this character in its extreme form, undulterated by critical discussion or theoretical oundation. Such authors can properly retort, specially in the case of emulsions, that there exists o such fundamental foundation and that their ooks are a criticism of, and a challenge to, academic orkers. Here the Irishman's definition of a net as lot of holes tied together with bits of string is apt. undamental theory and experiment is the string ; omewhere in the holes is the practical application ; me of the holes are very large ones, especially in a cience of such recent growth as surface chemistry. pplied science cannot alone fill them, and fundamental work must do more to bridge the gaps. Their o-operation, however, is not encouraged by publication of masses of facts and figures not correlated with any organised net-work of knowledge, and not apable of being so correlated because they are bserved without any intention of seeking such orrelation.

Books of this sort are an indictment of the failure academic workers to come down from their 'ivory towers' and help to clean up the mess ; but they also indict the applied worker in industry, often engaged as a research worker. There are far more of these in industry than there are in the universities ; they are able men ; they have more time and often better facilities for research. Why do they not play a more serious part in bridging the gap between pure and applied science ? Why is this serious wastage tolerated ? Perhaps because the 'practical' man is in charge and he says : "cut out the theoretical stuff and tell me how it works". Bikerman's book will appeal to such so-called practical men.

A. S. C. Lawrence

THE SCIENCE OF NUTRITION

Science and Nutrition

By A. L. Bacharach. Third edition. Pp. xii+142. (London : Watts and Co., Ltd., 1947.) 6*s.* net.

THE usefulness of this book, and its success, are sufficiently well attested by the fact that it has now run into its third edition. The scope is well indicated by Sir Jack Drummond, who in the preface to the first edition published in 1938 wrote that it should be read "not only by the intelligent 'man-in-the-street', whom for no very clear reason one assumes to be a layman, but also by the medical profession, until quite recently lamentably behindhand in recognizing the significance of experimental dietary studies, and perhaps even by the politicians who are at the moment very timorously testing the strength of 'nutrition' as a party plank".

A second edition, thoroughly revised and in many parts rewritten, was published in 1944, when the author wrote : "The last five years have shown a very marked change in the attitude of the public to the problems of nutrition. An enlightened Ministry of Food of which the effectiveness was no doubt in large measure due to its youth and its freedom from the trammels of precedent ; to a Minister who not only understood human nature, but also appreciated the value that science can have for the community ; to a scientific adviser—the writer of the Preface to this book—whose grasp of practical possibilities proved as shrewd as his knowledge of nutritional science was wide and flexible, and whose practical and scientific services have, since this book was first published, been fittingly rewarded by Knighthood and the Fellowship of the Royal Society ; last, but by no means least, to a Public Relations policy that has been as persistent and enthusiastic as it has, generally, been honest and intelligent : all these factors have helped to make tens of thousands of people realize for the first time that eating and drinking may be as important in their effects on our physical health as a few have always realized them to be on our spiritual well-being".

That is very true, and well said ; and what is equally important now is that the ground gained during the War should be extended further, and that public opinion should continue to be enlightened. In that aim, anyone seeking a balanced and interesting introduction to the science of nutrition can be recommended unhesitatingly to study this book. The new edition contains a number of minor changes and corrections and also a brief new allusion to folic acid, research on which has led to such remarkable developments since 1944.

CLEANING AND CARE OF THE NATIONAL GALLERY PICTURES

By W. G. CONSTABLE

Curator of Paintings, Museum of Fine Arts, Boston, Mass.

NOW that the dust of controversy over the cleaning of certain National Gallery pictures has to some extent settled, it is possible to judge some of its results. The ineptitude of much of the criticism should not blind us to its value. Apart from witnessing how greatly some of the owners of the pictures care about them, both the praise and blame meted out to the National Gallery authorities have revealed a fundamental confusion of thought over the cleaning of pictures—confusion between how a painting looks after treatment, and how its physical condition has been affected. Whether the spectator likes the appearance of a painting is a matter of taste, whereas its physical condition is a matter of fact; but only too often those who by habit or conviction like to see paintings as in a glass darkly make reckless charges of removal of original glazes, abrasion of surface and so on. That is not to say that criticism of appearance is unjustifiable. Pictures are meant to be looked at, and when all excrescences such as dirt, discoloured varnish and later repaints have been removed, a painting does not necessarily look as the artist meant it to look. Colours may have changed ; there may be breaks in the surface ; cracks may have developed ; the pigment layer may have become more transparent with time, revealing the painter's earlier intentions or, in the case of paintings on a dark ground, causing the tone of whole areas to be lowered and so obscuring detail. It therefore becomes a problem for those in charge of paintings to decide what should be done in such cases ; and the decision will range from merely 'in-painting' with a neutral colour the most obvious and disturbing breaks, to an elaborate tinting out of all blemishes and the use of a toned varnish, or retention of some of the old, to unify the whole. One thing is certain, however, we can never be quite sure how the painter intended his work to look ; and since succeeding generations will have their own opinions on the matter, anything added to or left on a painting in the interests of appearance should be incapable of doing harm, and should be easily and safely removable.

This particular problem, however, was only raised by implication during the controversy ; and both the National Gallery authorities and the Committee of Confidential Inquiry appointed by the Trustees have confined themselves to the question of the physical condition of the pictures, and how it has been affected by cleaning, both recently and in the past. The National Gallery presented its case in the form of the "Exhibition of Cleaned Pictures", which was reviewed in an article in *Nature* of October 18, 1947 ; and what follows is concerned only with the Report of the Committee. This consisted of Dr. P. Coremans, head of the Central Laboratory, Belgian National Museums ; Dr. G. L. Stout, former head of the Department of Conservation, Fogg Museum of Art, Harvard University, now director of the Worcester Art Museum, Massachusetts ; and Dr. J. R. H. Weaver, president of Trinity College, Oxford, who acted as chairman. It is difficult to imagine a committee technically better equipped, and more independent and judicially minded ; and the report should become a *locus classicus* on certain aspects of cleaning. Presumably for reasons of economy, the report has not bee published, but mimeographed copies may b consulted at the Victoria and Albert and the Britis Museums ; an article on the report by Dr. Weave appeared in *The Times* of May 8.

The report falls into two main parts. The firs gives the results of intensive examination of te recently cleaned pictures of diverse types, includin all those the cleaning of which has been most severel criticized, notably Rembrandt's "Woman Bathing" Rubens' "Chapeau de Paille", and Velazquez' "Philip IV when elderly". The second part summarizes the results of this examination, and make a series of recommendations on future practice an policy in cleaning, and on general measures for conservation. In the examination of the ten selecte pictures, not only were all available records of cleanin taken into account, but also the criticisms an comments which have been made in the Press The broad result cannot be more succinctly state than in the words of the report. "In the ten picture which were examined no damage was found to hav resulted from the recent cleaning either becaus of a partial solution of original paint or because o abrasion or rubbing of original paint at the tim when extraneous materials were removed from it.' As regards particular pictures, of the Rembrand it is said, "Adverse comments . . . centered o alleged damage, during recent cleaning, to th proper right wrist and hand. There is no evidenc to support the view that such damage has occurred" the conclusion concerning the Rubens' "Chapeau d Paille" is that "the procedure in the cleaning o 1946 seems to have been sound ; there is no evidenc of loss at that time or of any substantial deposit of extraneous material left on the original paint" while of the Velazquez it is said, "Losses in the pain are minor ones and all were present before th cleaning began in 1946. Part of the former surfac coating still remains. There is no evidence of an damage from recent treatment."

All this is interesting enough in itself and mos reassuring. But equally interesting are the metho by which the conclusions were reached. The Committee was presented with a new type of proble Analysis of a painting to ascertain its presen physical condition, by such means as X-ray, ultraviolet light, microscopic and chemical analyses, etc is nowadays standard procedure ; but to discove what, if anything, had been removed from a paintin at different periods in its history meant adaptin these methods of investigation to new uses, an inventing others. A procedure used in every cas was to test the solubility of the original paint laye with various solvents. This varied according t whether a resin had been mixed with the oil medium but in all cases the original paint layer resiste much stronger solvents than those recorded to hav been used in the recent cleaning. Close examinatio of the structure of the paint layer also prove valuable. In the "Chapeau de Paille", for exampl a greenish-blue paint visible in part of the sky wa alleged by a critic to have once covered the blu of the sky as it now appears ; but this greenish-blu is now proved to be below the blue, which wa applied in places to modify it. To estimate whether urface had been abraded, comparison with areas which could reasonably be regarded as in their riginal state was the standard test. X-ray photographs taken in the past were a means of judging whether paint that had been removed was original r a later re-paint, notably in the case of the Rembrandt; and ultra-violet light was extensively used to ascertain whether, in areas alleged to have een damaged, old varnish still remained. Occasionally, as confirmatory evidence, the material in swabs used in cleaning a painting was analysed. n one case, at least, zinc white was discovered—a pigment unknown at the date of the painting, nd so an indication that a later re-paint had been removed. Rightly, however, the report discounts the value of such evidence, owing to the difficulty—often impossibility—of distinguishing original pigment from that used later.

Though the report thus completely vindicates the National Gallery authorities on the main charges brought against them, it has also found occasion for ome mild criticism. One ground for this, which may prove disconcerting to those who have assailed recent cleaning, is that some pictures, notably the Rubens' "Brazen Serpent", "Autumn: The Château de Steen", and "Peace and War", have not been cleaned enough, either in the interests of safety or f appearance. Old varnish or re-paints left on a picture are potential agents in disrupting the original urface, and if softened by partial cleaning may penetrate deeper into the interstices of the original paint, and so increase the difficulty of their removal, nd their power to do harm; while their effect in throwing part of the painting out of tone may be considerable. In this connexion, the report brings ut the difficulty of removing an old varnish or a re-paint, if the medium used by the artist contains resin similar to that present in the extraneous elements, since the solvents used for removal may attack the original pigment layer. This danger was iagnosed by Faraday so long ago as 1853, and creates a difficulty in cleaning Constable's "Cornfield". In fact, in this picture and Rubens' Rape of the Sabines", while noting the presence f extraneous and therefore possibly deleterious elements, the Committee holds that "special problems encountered in the process of cleaning would be considered to warrant accepting the present state as the best that could practically be reached".

Considerations of this kind lead to the more eneral conclusion that "materials used for cleaning . . can be considered safe or unsafe only with respect to a particular piece of paint", and that it is not even certain that the same solvent . . . can e considered quite safe over the entire area of one icture. In any part of a picture, safety is relative o other factors, particularly to timing and manipulation." This emphasizes how important is full iagnosis before a painting is cleaned. X-ray, ltra-violet light, infra-red rays, the tintometer, analysis of pigment layer and varnish, experimental tests in unimportant areas, must all be made and their results checked against each other. No one man can be expected to apply all these means of investigation; and so the system of modern medical practice must be followed, of specialist reports eing put at the service of the man in charge, the cleaner. He, too, should be the centre of another set of specialist researches concerned with the materials he uses. Much has been discovered about olvents and protective coating materials; but much remains to be done in selecting and adapting them for use on paintings. In the last resort, however, it is the wisdom and skill of the cleaner which count. The scientific investigator can give him the facts, but he has to interpret them, estimate their significance and act upon them. In incompetent hands, any materials can do harm to a painting, especially if camouflaged by a little scientific knowledge; and the ideal cleaner adds, to wisdom and skill, sensibility and integrity. It is easy to produce a result which will fool for a time anyone save an expert, but which has either damaged the painting or sown the seeds of future trouble. The cleaner's responsibilities, moreover, do not end with cleaning. The report emphasizes the necessity of full and precise record, not only of diagnosis but also of treatment, as an indispensable guide to possible future action; and in preparing such a record the cleaner must play a leading part.

Another criticism suggested is the need for greater attention to the supports of paintings. It is not always sufficiently realized that an oil painting consists of several layers: the support, usually canvas or panel; the ground; the pigment held in a medium; and the protective covering. Each of these layers is liable to expand, contract or disintegrate on its own account, and thereby affect the appearance and condition of the painting; and imperfect bonding between the layers may intensify the trouble. Cleaning, in the ordinary sense of the term, is concerned with the protective coating and the pigment layer alone, in the interests of safety and of enabling the picture to be seen at what is thought to be its best. But properly considered, cleaning is only one part of the business of keeping every element of a painting in good health. Treatment of the supports of painting, however, requires more investigation and thought than it has hitherto received. It is not so long ago, for example, that glue was the universally accepted adhesive for attaching a new canvas on the back of an old one (the process known as 'lining'); while defective panels were always 'cradled', that is, secured on the back by a series of criss-cross slats. Both methods are now known to be at best unsatisfactory, and at worst dangerous; but though they are now falling into disrepute, no completely satisfactory substitutes have yet been found. It is to be hoped, therefore, that any campaign to put the supports of National Gallery paintings in order will be tentative, and based upon experiment and research.

One step, however, can be taken at once which can only have the most salutary results, that of controlling temperature and humidity conditions in the National Gallery. Experience in the quarry at Manod, where the paintings were stored during the War, proved how beneficial such control can be; while the disastrous effect of its absence is demonstrated by the cracking and warping of the panel on which Rubens' "Autumn: The Château de Steen" is painted, during the hard frost of January 1947. Let no one think, however, that air-conditioning is a complete answer to the problem of keeping pictures in good health. In a public gallery, the public themselves introduce variable elements of heat and humidity, which so far no system has been able to control. But it will not be the least of the services of the Committee of Inquiry to the public, if its recommendation that full air-conditioning be installed in the National Gallery is accepted and speedily implemented by those responsible.

OBSERVATIONS ON THE PRODUCTION OF MESONS BY COSMIC RADIATION

By Dr. G. P. S. OCCHIALINI
AND
Dr. C. F. POWELL
H. H. Wills Physical Laboratory, University of Bristol

In examining photographic plates exposed to cosmic radiation at a height of about 10,000 ft. on the Jungfraujoch and the Pic du Midi, and at about 18,000 ft. on Kilimanjaro and Chacaltaya, we have now observed twenty nuclear 'explosions' which are accompanied by the emission of slow mesons. In this communication we give a number of photomicrographs of the tracks of these 'ejected' mesons. An analysis of the observed secondary effects which they produce enables us to show that at least the majority of them interact with nuclei and are therefore negatively charged; and that on the average they produce more vigorous nuclear disintegrations than most of the negative mesons which stop in the emulsions after being generated outside it. The main features of our present knowledge of charged mesons, with masses in the interval from 100 m_e to 400 m_e, can be accounted for in terms of two types of particles of different mass[1,2], which can be either positively or negatively charged, the heavier being generated in processes associated with the explosive disintegration of nuclei, and decaying spontaneously to produce the lighter ones. The possibility is not excluded, however, that the phenomena are more complicated than has been visualized hitherto.

In discussing the new material, we employ the previous classification of the different types of mesons recorded by photographic plates, which is based on their observed behaviour at the end of their range in the emulsion[2]. Thus we use the term 'σ-meson' for any particle, with a mass intermediate between that of a proton and an electron, which leads to the disintegration of a nucleus with the emission of one or more heavy particles of which we distinguish the tracks. Similarly, a 'π-meson' is one which, at the end of its range, gives rise to a secondary meson, of range $\sim$ 610 μ in the emulsion, the secondary particle being referred to as a 'μ-meson'. In addition, it is convenient to distinguish, by the symbol 'ρ', those mesons which enter the emulsion at the surface or from the glass of the plate, and which give rise to no observed secondary particles. It is certain that the different categories of particles thus defined are not all homogeneous. The ρ-mesons, for example, must contain a large number of both positive and negative particles; and we may also include among them some π-mesons of which we fail to distinguish the track of the associated μ-meson. It is nevertheless desirable to retain this phenomenological classification at the present stage in the development of our knowledge.

There are two features, peculiar to the pho
graphic method of detecting nuclear particles, wh
are of importance for the present experiments.
particle, with a given initial energy, is brought
rest in a solid material in a time interval about t
thousand times shorter than the corresponding per
when it is moving in a gas. A meson, for examp
with an initial energy of 4 MeV., is stopped ir
photographic emulsion in about 10^{-12} sec., as co
pared with 5×10^{-8} sec. in normal air. It follo
that it is possible, in principle, to arrest particles
an emulsion, and to study any secondary effec
associated with the emission of heavy charged p
ticles, which they produce at the end of their ra
—even although their 'life-time' is so short that wh
moving in a gas or a vacuum they would, alm
certainly, decay 'in flight'.

In contrast with this extremely extended 'tin
scale', the powerful 'integrating' property of t
photographic method—its continuous sensitivity
sometimes gives rise to difficulties owing to the cha
juxtaposition of unrelated events. As an examp
Fig. 1 shows a mosaic of photomicrographs in wh
the 'stars' *A* and *B* are joined by a common track
At first sight it might have been concluded that t
two events are associated, but a closer inspecti
indicates that the two stars represent two separ
nuclear explosions; and that the particle τ, wh
originated in star *A*, passed by chance near the cen
of star *B*. This interpretation depends upon t
observation that the two portions of the trajecto
τ, on either side of star *B*, are precisely in lin
that there is no significant change in grain density
the two portions of the trajectory near star *B* a
on either side of it; and that the track does n
pass precisely through the centre of star *B*, but a
distance of about 2 μ from it. While events of t
type are very rare, they emphasize the need
caution in interpreting the observations made wi
photographic plates, and the importance of beari
in mind the possibilities of confusion due to t

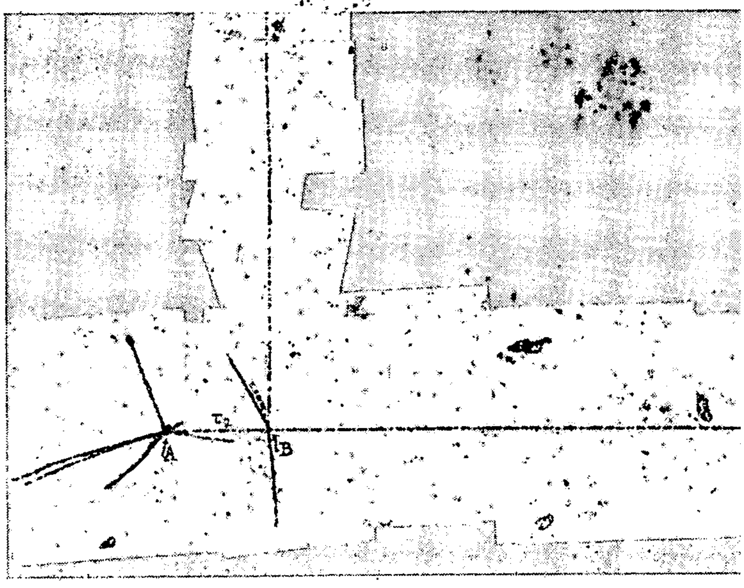

Fig. 1. Chance juxtaposition of unrelated events

The particle, τ, emitted from the star *A*, passes by chance within a distance of 2 μ of star *B*. The interpretation depends upon the observation that the two portions of track τ, on each side of *B*, are precisely in line; and that they show no signific difference in grain density

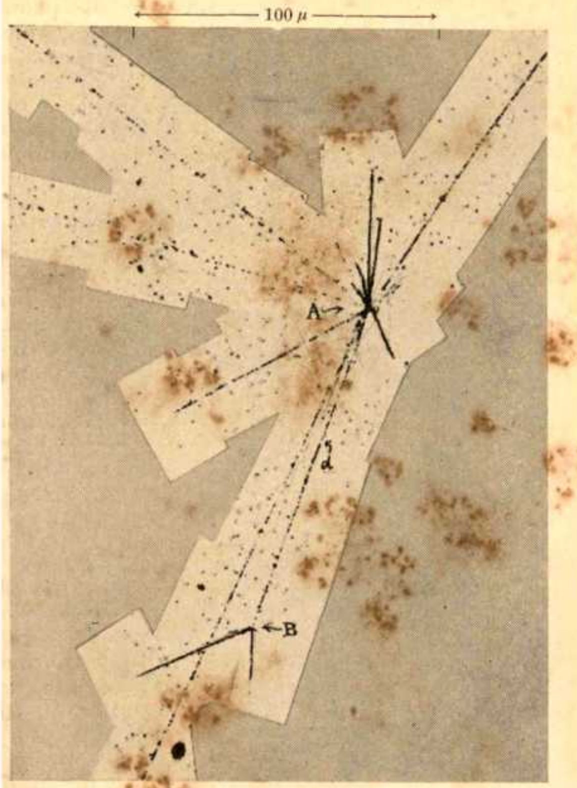

Fig. 2. Secondary disintegration produced by a particle emitted during the explosive disintegration of a nucleus. We assume that the particle producing the track d originated in star A, and collided with a nucleus at the point B. The track d is too short to allow us to establish its direction of motion by observations on the distribution of grains in the track. The secondary disintegration, B, can be explained in conventional terms if the emitted particle is a deuteron or a triton. We cannot assume that the particle d is emitted from B and leads to the disintegration A, unless d is a particle of charge $> 2e$ and with an energy greater than we have hitherto encountered

Observer: Miss P. Dyer Exposure: Chacaltaya

hance juxtaposition of the tracks of unrelated articles.

In addition to such fortuitous events, we have ow found many examples of secondary effects prouced by particles emitted during nuclear explosions. hese include the elastic collisions of protons, euterons and tritons with the nuclei of hydrogen nd other elements present in the emulsion. In other stances, of which Fig. 2 shows an example, we have bserved fast particles, emitted from 'stars', which roduce disintegrations by collisions with nuclei. he particle producing the track d in Fig. 2, which d to the secondary disintegration B, cannot have een a proton; for its velocity, as indicated by the rain-density' in the track, is too low. The distegration can, however, be explained in conventional terms, if the particle producing track d is ssumed to have been a deuteron, or one of greater ass.

In a previous paper, examples were given of distegrations produced at the end of their range by esons observed to be ejected during the explosive isintegration of nuclei. Two further events of this ype are shown in Figs. 3 and 4. In these photoraphs, the characteristics of the tracks of the articles producing the secondary disintegrations, S, ake it certain that they are produced by mesons. both cases, protons are emitted from one or other of the disintegrations which reach the end of their range in the emulsion. Their tracks can therefore be compared with those of the associated mesons, in conditions which are unaffected by 'fading'.

In conformity with our classification, we refer to such particles as 'ejected σ-mesons'. In other similar events, such as those represented in Figs. 5 and 6, the ejected particles producing the secondary disintegrations are of short range, but the tracks show changes in direction due to scattering, so that we can identify the corresponding particles as mesons with confidence.

While the ejected mesons are commonly observed to be created in processes which lead to the disintegration of the parent nucleus with the emission of several charged particles, the event represented in Fig. 7 has different characteristics. The meson originates in an interaction which leads to the emission of a single heavy charged fragment of short range. In no case have we observed the origin of the

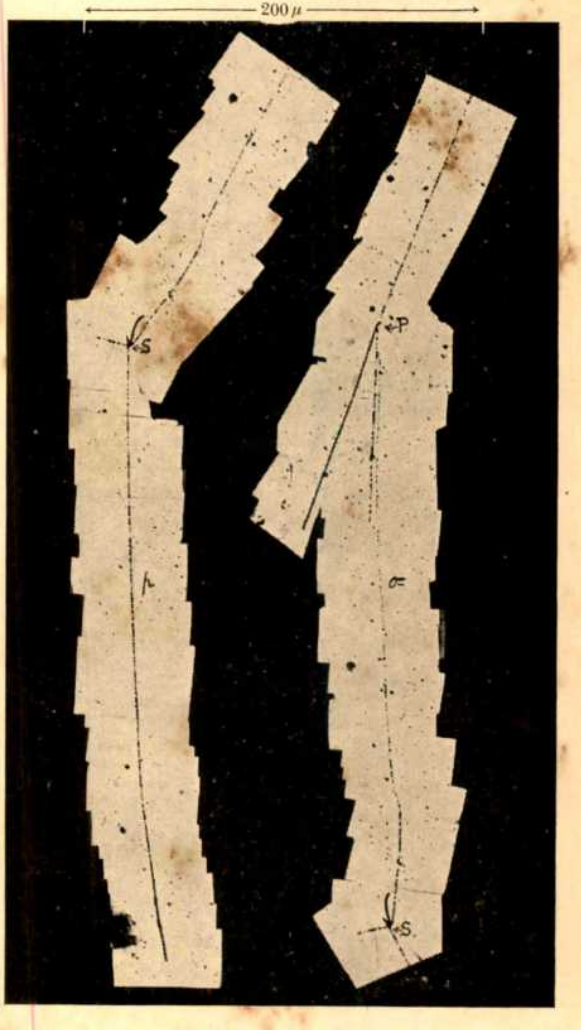

Fig. 3. Ejected σ-meson

A meson, σ, created during the explosive disintegration of a nucleus at the point P, reaches the end of its range and produces the secondary disintegration at S. Four particles are emitted during the secondary disintegration, one of which is a proton, p, of nearly the same range as the meson. The mosaic has been arranged to facilitate a comparison of the characteristics of the two tracks

Observer: Mrs. W. J. Van der Merwe Exposure: Jungfraujoch

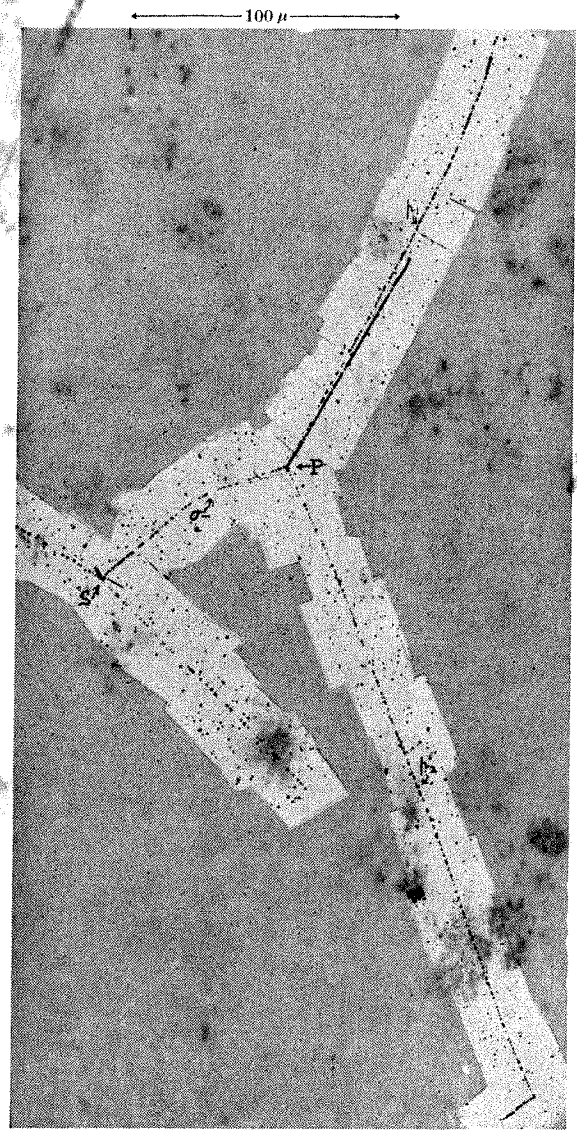

Fig. 4. Ejected σ-meson

Observation in a plate exposed at sea-level. The tracks are faded, and the event probably took place more than a month before the development of the plate. We interpret the event as due to the emission of a meson, σ, from the star P. The meson reaches the end of its range and produces a disintegration with the emission of three particles, of which we can distinguish the tracks. We attribute p_1 and p_2 to protons, which came to rest in the emulsion and of which the tracks can be compared with that of the meson
Observer: P. H. Fowler Exposure: Bristol (200 ft.)

track of a meson in the emulsion, unaccompanied by the emission of one or more heavy charged particles. In one or two cases where such an event is suggested by a casual inspection, closer observation shows that the meson has entered the emulsion at a large angle of 'dip', and has been scattered through a large angle, afterwards moving in a plane nearly parallel to the surface of the emulsion. As a result, the track becomes suddenly more clearly visible after the point of scattering.

Figs. 3–7 are characteristic of seventeen events which we attribute to the ejection of σ-mesons. In addition, we have found three examples of ejected mesons which stop in the emulsion without producing an observed nuclear disintegration. In determining the frequency of occurrence of these ejected ρ-meso we meet the following difficulty. We have n observed more than 10,000 'stars' each of which accompanied by the emission, on the average, several protons. Among such a large number, must expect to find some protons which su abnormally large deflexions in passing through emulsion, and which might therefore be wron identified as mesons. On the other hand, by ov emphasizing the frequency of occurrence of su abnormally scattered protons, we may reject tra which were, in fact, produced by mesons. T difficulty is serious only when the particles are short range, so that the additional evidence provi by observations on the change of grain-density al the track is meagre. Because of these difficulti we cannot be certain that, apart from statisti fluctuations, the relative numbers of ejected ρ- a σ-mesons are accurately represented by the pres observations. We can say with confidence, howev that the number of ejected σ-mesons greatly exce that of the corresponding ρ-mesons.

Disintegrations Produced by Ejected σ-Meson

We have now observed the tracks of more th 5,000 slow ρ-mesons and 600 σ-mesons, which or inate outside our emulsions. It is reasonable assume that approximately half the ρ-mesons ha a negative charge. Assuming that the true p portion is 40 per cent, a figure which is consiste with recent measurements of the charge and t mass of cosmic ray mesons by magnetic deflexi experiments[3], we can determine the relative f quency with which negative mesons of all typ

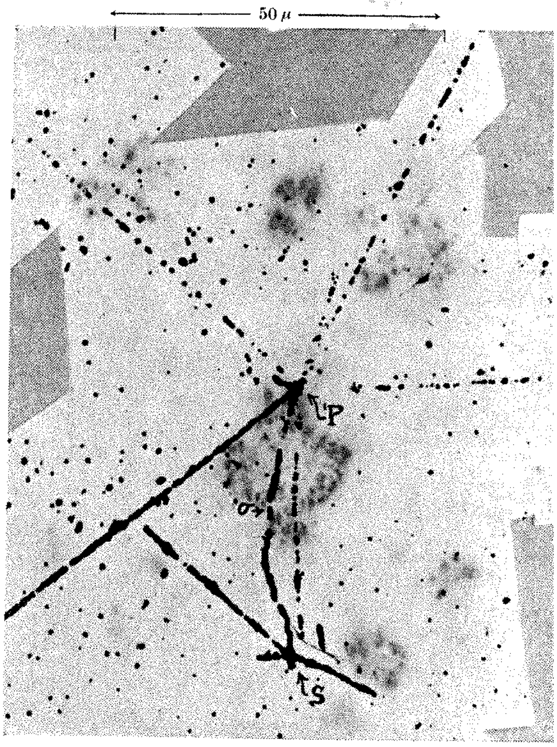

Fig. 5. Ejected σ-meson

The meson originates in the star P, and produces the disintegration S from which four charged particles are emitted. The track of the meson has a large angle of 'dip' in the emulsion, and the apparent 'grain-density' is increased through foreshortening
Observer: Mrs. G. Cohen Exposure: Kilimanjaro

at the end of their range in our emulsions, lead to he production of different numbers of heavy charged particles of which we distinguish the tracks. The result is shown in Fig. 8*a*.

We can also determine the corresponding distribution for those slow mesons which originate in nuclear explosions in the emulsion; see Fig. 8*b*. In spite of the uncertainty in the true numbers of ejected ρ-mesons—which lead to no secondary particles of which we distinguish the tracks—and the relatively small total number of ejected mesons observed hitherto, it is clear from Fig. 8 that there are substantial differences between the two distributions. In particular, a much greater proportion of the ejected mesons lead to disintegrations with the emission of heavy particles than is the case with negative mesons which come to the end of their range n the emulsions after being generated at points outside it. Thus, suppose the ejected mesons to be dentical in type with the ordinary negative mesons. From the distribution shown in Fig. 8*a*, it can be shown that for every negative meson which produces a disintegration with the emission of one or more heavy charged particles, there are four which give rise to no observed secondary particles. We should therefore expect the observed seventeen 'ejected' σ-mesons to be accompanied by about seventy cases in which an ejected meson produces no observed disintegration at the end of its range in the emulsion. This number is to be compared with the three actually found. We must conclude that the ejected mesons are of a different nature from the majority of the negative mesons which enter the emulsion from points outside it. A similar result follows if the fraction of the ρ-mesons which are assumed to be negatively charged is reduced to 20 per cent or lower.

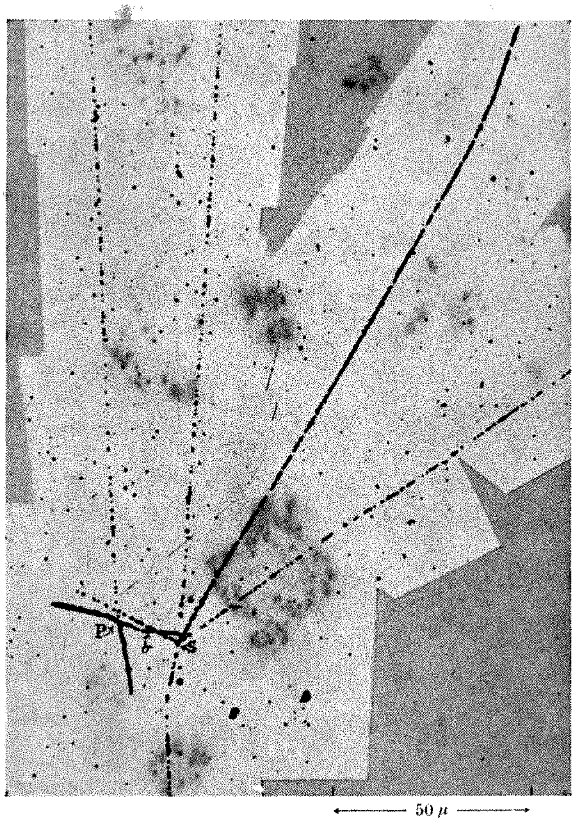

Fig. 6. Ejected σ-meson of short range
We interpret this event as due to the ejection of a σ-meson from the point *P*, the particle producing a secondary disintegration at the point *S*. The scattering of the particle producing the track is clearly marked, but its direction of motion is ambiguous. Our interpretation is based on the large deviation of the track near *S*, a feature commonly observed with mesons at the extreme end of their range
Observer: Mrs. W. J. Van der Merwe Exposure: Jungfraujoch

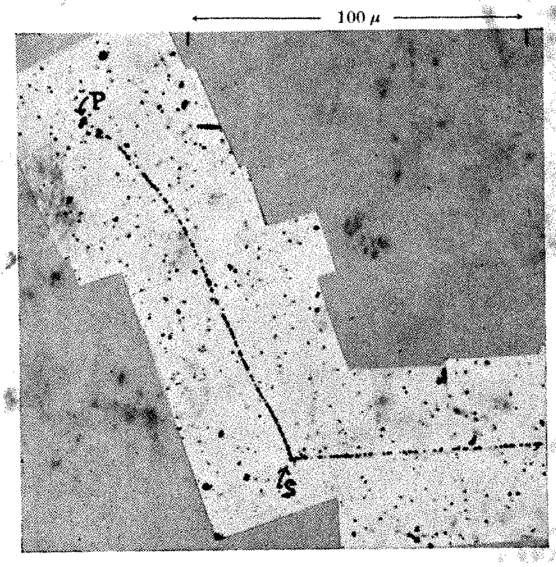

Fig. 7. In this event, a meson is produced at the point *P*, and at the end of its range it produces a disintegration at the point *S* from which a single proton is emitted. In contrast with the other events, the production of the meson appears to be accompanied by the emission of a single heavy particle of short range
Observer: Mrs. B. A. Moore Exposure: Jungfraujoch

The results also appear to have a bearing on the important question of the atomic capture of mesons by atoms. A large proportion of the ejected mesons observed in the present experiments must have been brought to rest in the gelatine, and have produced the disintegration of a light nucleus. In a subsequent paragraph we suggest that the ejected mesons are heavy particles ($300\,m_e$) with a short life-time, $\tau \sim 10^{-8}$ sec. If this is correct, the time which elapses before they are captured into a *K*-orbit must be less than this value. A similar result follows, presumably, for mesons of mass $\sim 200\,m_e$. The present results, therefore, give strong support for the view that the delayed coincidence experiments cannot be explained as due to the time taken by a negative meson to reach a *K*-orbit[4,5].

Absence of Ejected π-Mesons

A second striking feature of the observations is the absence of any ejected π-mesons, particles which recent experiments by Gardner and Lattes[6] prove to be positively charged. We cannot be certain that all the ejected mesons we have found are negatively charged, for some of the three ejected ρ-mesons might be assumed to be positive. We can be sure, however, that most of the ejected mesons, and it is reasonable to assume that all of them, are negative.

We can account for the failure to observe a positively charged ejected meson, in the conditions of our experiments, in terms of the repulsive forces exerted on such a particle during its escape from the parent nucleus; forces which will ensure that it will be emitted with an appreciable kinetic energy. Because of the rapid increase of range with energy, an increase in speed of emission of a particle will greatly decrease the probability of its coming to rest in the emulsion and being identified. It is therefore

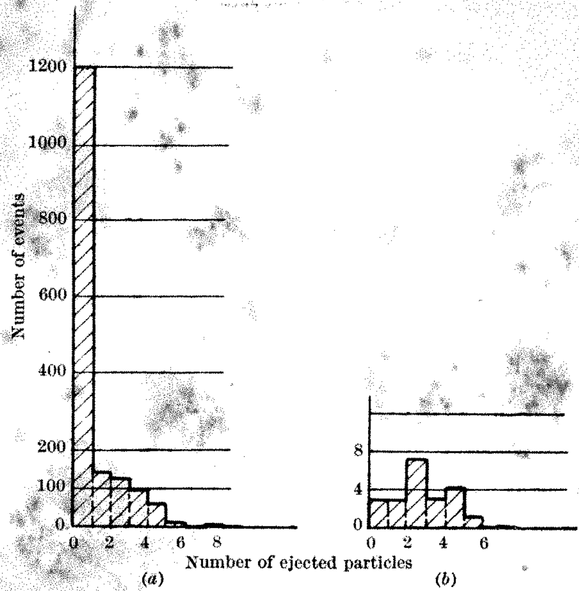

Fig. 8. Relative frequency of the disintegrations produced by negative mesons which lead to the emission of different numbers of heavy charged particles ; (a) mesons entering the emulsion ; (b) mesons created in the emulsion

reasonable to attribute the marked inequality between the observed numbers of ejected positive and negative mesons to the particular conditions of our experiments, and the effect of the nuclear charge.

Interpretation of the Results

In accord with previous assumptions, it is possible to give an account of the present observations in terms of two types of mesons, of mass $\sim 320\, m_e$ and $\sim 200\, m_e$, which can be charged either positively or negatively. We assume that the heavy particles have a strong interaction with nucleons, and that they are produced in processes which commonly lead to the explosive disintegration of nuclei. A heavy meson is regarded as having a short life-time, so that when it is produced in the atmosphere, it usually decays in flight to produce a light meson and a neutral particle. Further, from measurements of the masses[9], it is reasonable to assume tentatively that these light particles are identical with the mesons of the penetrating component of the cosmic rays. It then follows, from the delayed coincidence experiments[7], that the negative particles of this type which are brought to rest in the gelatine will decay with the emission of an electron, and will appear in the present experiments among the ρ-mesons. On the other hand, some of the light negative mesons which stop in a silver bromide grain may produce disintegrations with the emission of heavy particles, and so appear among our σ-mesons ; otherwise they will contribute to the ρ-mesons.

These assumptions allow us to explain the difference in the two distributions, shown in Fig. 8 ; for an ejected σ-meson is to be regarded as a heavy meson which, at the end of its range in solid materials, is captured by an atom, afterwards interacting with the nucleus, whatever its atomic number, and leading to its disintegration. On the other hand, the majority of the negative mesons entering the emulsion are regarded as light mesons, which, if captured by an atom of low atomic number, decay with the emission of an electron[7] ; and which, even if captured by one of high atomic number, may give rise to no observed secondary heavy particles.

It may be noticed that the observation that a fe of the ejected mesons do not produce disintegration with the emission of heavy charged particles is no inconsistent with the view that they are all of mas $\sim 320\, m_e$; for, in some cases, one or more neutron may alone be emitted in the disintegrations the produce. On the other hand, we cannot exclude th possibility that some of the ejected particles are ligh negative mesons. The evidence strongly suggests however, that the proportion of light particles of the type commonly found among the penetratin particles of the cosmic radiation, which are produce directly in the observed processes, is less than 20 pe cent.

The origin of the different types of mesons in th cosmic radiation, according to the present assumptions, is shown schematically in Fig. 9. It is assume that the 'primary radiation', possibly neutrons an protons, in collisions with nuclei, gives rise to th emission of both positive and negative particles o mass $\sim 300\, m_e$, π^+ and π^-. When formed in the hig atmosphere, these particles decay in flight to produc particles, μ^+ and μ^-, of mass $\sim 200\, m_e$, and a neutra particle ν^0. The indicated decay of this neutra particle into two photons is speculative. Those o the μ-particles formed by decay in flight can stop in th emulsion either in the gelatine ○, or in a silver bromide grain ▨. The positive particles, μ^+, are assume to decay with the emission of an electron and neutral particle, both of which are unobserved in th emulsion. It is further assumed that the μ^--particles when stopped in gelatine, also decay with the emission of a negative electron. These particles, μ^+ an μ^-, together constitute the majority of the ρ-mesons Some of the μ^--particles which stop in a silve bromide grain may possibly produce disintegration with the emission of heavy particles. In this cas they will appear in our experiments among th σ-mesons.

When the primary radiation interacts with th nuclei of matter in the immediate neighbourhoo of the plate, the π^+- and π^--particles, if ejecte with a suitable kinetic energy, can stop in th emulsion. The π^--particles then interact wit either light or heavy nuclei to produce nuclear disintegrations ; they thus contribute at least th majority of the σ-mesons. The π^+-particles come t the end of their range and suffer μ-decay ; they thu appear as our π-mesons. Finally, if the collision o the primary radiation with a nucleus occurs in th emulsion, we sometimes observe the ejection of π^--particle. In accord with the present assumptions we also postulate that π^+-particles are sometime emitted in such explosions, but that they commonly escape detection because of their higher energy o emission.

In accordance with the relationships suggested in this scheme, we should expect to observe approximately equal numbers of σ- and π-mesons. Recent experiments have enabled us to increase the accuracy of the determination of the relative frequency of occurrence of the two types, and we have obtained the value $N\sigma/N\pi = 1{\cdot}05 \pm 0{\cdot}25$.

In spite of the qualitative agreement between the new experimental results and the present assumptions, it is clear that the latter must be accepted, at present, with reserve. Prof. Klein[8] has raised the question, for example, as to whether the heavy negative mesons, which produce disintegrations and which are produced artificially, are, in fact, the negative counterparts of the positively charged

-mesons. While the approximate equality in the umbers of σ- and π-mesons observed in the cosmic adiation, and the determinations of their masses, ive strong support to the assumption that they are articles of the same type, it cannot be regarded as inally established. Secondly, the limits of error in he determination of the masses of the individual osmic-ray mesons are such that we cannot yet xclude the possibility that most of the ρ-mesons are mixture of different types, of different mass. Both hese points of uncertainty will presumably be larified when more accurate determinations of the nass of the different classes of particles have been nade.

In view of the above reservations, and of the ossibility that the ejected σ-mesons are composed f particles of different types, we may summarize he results of the present experiments in the following eneral terms. The mesons which we observe to be roduced also have a high probability, when reuced to low velocities, of producing nuclear disntegrations of both light and heavy elements, with the emission of heavy particles. Their behaviour is therefore consistent, in both respects, with the view that they have a strong interaction with nucleons.

We are indebted to Dr. Franzinetti and Dr. S. Rosenblum for some preliminary information on the sign of the charge of ρ-mesons obtained in magnetic deflexion experiments; to Dr. H. Fröhlich and Mr. P. H. Fowler for discussions on the relative numbers of ejected σ- and π-mesons; and to Mr. A. G. Meek for organising a safari for the ascents of Kilimanjaro to obtain the exposures at 16,000 ft.

NEWS and VIEWS

Hope Professorship of Zoology at Oxford:
Prof. G. D. Hale Carpenter, M.B.E.

THE best wishes of scientific men everywhere go to Prof. G. D. Hale Carpenter on the occasion of his retirement from the Hope professorship of zoology at Oxford. He has occupied this chair since 1933 when he succeeded the late Sir Edward Poulton. After taking his degree in the honours school of natural science at Oxford, Prof. Carpenter gained a scholarship at St. George's Hospital Medical School, London. There he completed the usual medical courses, and obtained the certificate with distinction of the London School of Tropical Medicine. Thus qualified, he joined the Colonial Medical Service in 1910 and was appointed in the same year to the Royal Society's Sleeping Sickness Commission in Uganda. In the First World War he served in the East African Campaign during the years 1914–18. Afterwards he was made specialist officer for the control of sleeping sickness in Uganda from 1920 until 1930 and, in the following year, he retired from the Colonial Service.

Settling in Oxford amid highly congenial surroundings, Prof. Carpenter identified himself with the aims of the Hope Department, and it must have been a source of gratification to him when he followed in the footsteps of the great protagonist of Darwinism only two years later. All through his African career he was an ardent field naturalist. His duties in connexion with tsetse-fly problems took him constantly into the field. Many of his experiences and observations are embodied in his two books "A Naturalist on Lake Victoria" (1920) and "A Naturalist in East Africa" (1925). While at Oxford he has established a teaching course in entomology and published in collaboration with E. B. Ford a handbook on "Mimicry" in Methuen's Biological Series. This latter book embodies much of Carpenter's original work and notably his field observations on mimetic Lepidoptera and their enemies. In this way he has replied to the many critics of the mimicry theory who, as often as not, had no such first-hand information with which to support their contentions. During his tenure of the Hope professorship, in addition to his writings on Lepidoptera, he has developed the scientific value of the associated collections along sound lines. In particular, predaceous insects and their prey and the evidence of bird attacks on Lepidoptera deserve special mention. Prof. Carpenter has served as president of the Royal Entomological Society of London (1945–46), and as a vice-president of the Linnean Society.

Dr. G. C. Varley

DR. G. C. VARLEY, who has been appointed to the Hope professorship of zoology at Oxford, was educated at Manchester Grammar School and went up to Cambridge with a major open scholarship in natural science at Sidney Sussex College in 1929. He obtained a first class in both parts of the Natural Sciences Tripos and was awarded the Frank Smart Prize for zoology in 1933. In the same year he was appointed to a research studentship at Sidney Sussex College and became superintendent of the Entomological Field Station. During 1935–38 he was a research fellow of his College and in the latter year he obtained the degree of Ph.D. for a thesis on "The Natural Control of the Knap-weed Gallfly". In 1938 he was appointed to a University demonstratorship and became curator of insects in the University Museum of Zoology at Cambridge. During the early part of the War, he was engaged in research on wire worm control, and in 1941 he joined the Army Operational Research Group of the Ministry o Supply. Here he did distinguished work on the application of radar to coast defence and was pro moted to the rank of senior experimental officer After the end of the War, in 1945, he was appointed to the readership in entomology in the Department of Zoology at King's College, Newcastle-on-Tyne Dr. Varley's main interests lie in the field of population studies with particular reference to insects, and he has a wide knowledge of the whole field of ecology He is a first-class naturalist and a man who has exceptional powers for interesting his students in al branches of his subject. His new appointment wil give him the opportunity of developing to the ful his chosen field of work at a university which has already made such important contributions to the study of animal ecology.

Paris Academy of Sciences:
Prof. Robert Courrier

THE Paris Academy of Sciences has two 'secrétaires perpétuels': Prince Louis de Broglie, and very recently, Prof. Robert Courrier, who was elected in May in succession to the late Prof. Alfred Lacroix Prof. Courrier, who was born in 1895, began his medical studies at Nancy, but they were interrupted by the First World War. On demobilization in 1919 he went to Strasbourg to work in the laboratory o the well-known endocrinologist, Prof. P. Bouin. He was appointed a professor in the Faculty of Medicine at Algiers in 1926, and went to Paris in 1938, where he has since held a chair in the Collège de France He was elected to the Academy of Medicine in 1941 and to the Academy of Sciences in 1944.

Prof. Courrier's work has been on the glands o internal secretion. One of his first investigations concerned the thyroid, when he showed that one can inhibit this gland by massive doses of the thyroid hormone. He produced important evidence in support of the theory of Prof. Bouin, on the elaboration of the male hormone by the interstitial tissue of the testicle. He played a large part in the early researches on the female sex hormones; he found in the human female the follicular hormone which Allen and Doisy had just discovered in the sow; he found this hormone outside the ovary, and in particular in the amniotic liquid, and he remarked that it could pass through the placenta and the mammary gland, and powerfully affect the fœtus and the newly born. He demonstrated the hormonal dualism of the ovary, at a time when leading workers held the view that only one hormone was secreted. With his pupils he has studied for a long time the functional relations connecting the two ovarian hormones, and he has made a detailed analysis of the endocrinology of gestation which he has described in a recently published book

Mathematics at University College, Bangor:
Mr. D. E. Littlewood

MR. D. E. LITTLEWOOD, whose appointment to the chair of mathematics at the University College o North Wales, Bangor, in succession to Prof. T. G Cowling, has recently been announced, is well known as an algebraist. His best-known work is concerned with the theory of group characters, a branch o algebra which has been extensively developed in the last fifty years and which has an unusually wide application to fields as diverse as the algebraic theory of invariants and modern quantum mechanics. Littlewood's work is in the direct line of tradition associated with the names of Frobenius, Alfred Young, and Schur; and his book, "The Theory of Group Characters" published in 1940, is a standard work on the subject. In recent papers, Littlewood has developed a calculus of a class of symmetric functions known as Schur functions which have recently been shown to have extensive applications in invariant theory.

Promethium, the New Name for Element 61

At a symposium held by the American Chemical Society at Syracuse University on June 30, J. A. Marinsky and L. E. Glendenin, who during the War had succeeded in separating element 61 from the other uranium fission products, proposed to christen this element 'promethium'. They explained their choice by a reference to Prometheus, "who stole fire from heaven for the use of mankind and for his audacity was chained to a mountain by the gods and set upon by vultures. This name not only symbolizes the dramatic way in which the element may be produced in quantity as a result of man's harnessing of the energy of nuclear fission, but also warns man of the impending danger of punishment by the vulture of war." In a review published some eighteen months ago (*Nature*, **159**, 8; 1947) the conclusion was reached that Prof. C. D. Coryell's group, to which Marinsky and Glendenin belong, had the strongest claim to the discovery of element 61 and was entitled to give it a name. Some may perhaps think the present proposal a little far-fetched, since there are more impressive effects of atomic energy known than the production of small quantities of a new rare earth, and classical students may take exception to the vultures—since Prometheus' quarrel was with Zeus, the bird sent by his antagonist to torture him was, naturally, an eagle; but the etymology of this new name will soon be of as little importance as that of dozens of other element names which are much less appropriate. There are still the rival claims for 'illinium' and, more recently, for 'cyclonium' (see *Chemical and Engineering News*, **25**, 2555; 1947), and it is, therefore, too early to say whether the chemists of Coryell's group will be generally recognized as the discoverers of element 61; but their brilliant work seems to merit this international recognition, and there is a great likelihood that promethium (symbol Pm) will take its permanent place in the table of the chemical elements.

Commonwealth Plant Breeders' Meeting

An informal meeting of Commonwealth plant breeders was held at the School of Agriculture, Cambridge, during June 24–25. Representatives from Australia, Canada, England, Malaya, New Zealand, Northern Ireland, Scotland, Sierra Leone, South Africa, Sudan, Tanganyika and Wales were present; Dr. P. S. Hudson, director of the Commonwealth Bureau of Plant Breeding and Genetics, acted as chairman. The proceedings of the meeting included a review by Dr. P. S. Hudson and Mr. R. H. Richens of the work of the Commonwealth Bureau of Plant Breeding and Genetics since the last similar meeting, short reports by the delegates of the principal lines along which plant breeding is developing in the various Commonwealth countries, and an account by Dr. P. S. Hudson of the results of the meeting held at Washington last April, between the Food and Agriculture Organisation, the Commonwealth Agricultural Bureaux, the U.S. Department of Agriculture and other bodies, on genetic stocks. Among the resolutions passed at the meeting, several deprecated any reduction in the number or length of the abstracts appearing in *Plant Breeding Abstracts*, the periodical published by the Commonwealth Bureau of Plant Breeding and Genetics; support was given to a proposal to institute a standing inquiry service whereby plant breeders should be sent details at regular intervals of all published articles bearing on their own field of research; and suggestions were made to provide for an efficient service for the maintenance of genetic stocks of crop plants. The proceedings of the meeting will be circulated to the delegates and to other interested bodies.

Olympic Torches

The Organising Committee of the XIVth Olympiad approached the Department of Scientific and Industrial Research in 1946 for assistance and advice on the design of a torch to be carried by relays of runners across Europe from the plain of Olympia to Wembley Stadium in London, and on the most suitable fuel. This problem was undertaken by the Fuel Research Station, and the actual investigation was carried out by Dr. L. R. B. Shackleton. After many trials, it was decided that the most suitable fuel was hexamine in the form of tablets. Hexamine gives a non-luminous flame, and to make the flame visible in all weathers 6 per cent of naphthalene was added. The fuel was manufactured by Promedico Products, Ltd., 22, Turle Road, London, N.4. Prototype torches made at the Fuel Research Station were tried out by runners, first from the South London Harriers and, after certain modifications in design, by officers from the Royal Naval College, Greenwich. In the final design of the torch, seven tablets are enclosed in a perforated metal cylinder with an inner sleeve concealing the lower three tablets. As the upper tablets burn away, the lower reserves are forced up into the burning zone by a spring. In order to facilitate lighting, the Wessex Aircraft Engineering Co., Ltd., Salisbury, provided a tablet of nitrate composition which was introduced on top of the fuel pack. A quick-match, provided for ignition, protruded through the perforated container. One or two final refinements were introduced at the concluding stages to safeguard the effectiveness of the torches during transport to the various countries through which the relay runners had to pass. The fuel tablets were totally enclosed in a nitro-cellulose cover provided by Cascelloid, Ltd., High Holborn, London. This cover burned immediately on ignition, leaving no carbon residue. The perforated metal fuel container was also capped and sealed with adhesive tape. Both of these precautions were considered necessary to preserve the fuel and to avoid any risks of accidental ignition.

Museum of the History of Science, Oxford

Since 1940 the Museum of the History of Science, Oxford, has been making inquiries as to the whereabouts of a number of valuable and irreplaceable objects which had been stored at the beginning of the War by the late curator of the Museum, Dr. R. T. Gunther. These included the oldest dated instrument in the world, an astrolabe dated A.D. 984, the astrolabes of Queen Elizabeth and Archbishop Laud, the sundial made by Nicolaus Kratzer for Cardinal Wolsey, and many other treasures. Dr. Gunther died without revealing the place where he had stored these valuables. They have now been found in the stone-vaulted basement of the Museum, packed in three cases which were labelled as containing various astronomical instruments of the late eighteenth century and mixed with a number of cases actually containing such instruments. By this means, it is conjectured, Dr. Gunther had intended not only to protect them from air attack but also from the searches of a possible invader. It is hoped that the Museum will open next October, when these treasures will be displayed once more to public view.

Use of Selenium for Pest Control

INVESTIGATIONS have shown that selenium salts, among other substances applied to the soil, are taken up by plants and will make the plants so treated poisonous to certain pests that attack them. Selenium compounds, such as sodium selenate, have lately been tried by a few growers for the control of chrysanthemum eelworm and some other pests of flower crops. This is dangerous because selenium compounds are poisons to man; moreover, they may persist for long periods in the soil, and if food crops are grown later in treated soil the plants may take up the poison in sufficient amount to make them injurious to health if eaten. For the present, neither sodium selenate nor any selenium compound should in any circumstances be used for pest control purposes. The Ministry of Agriculture and Fisheries understands that no proprietary insecticide containing selenium is manufactured in Great Britain.

Astronomical Instruments

SIR HOWARD GRUBB, PARSONS AND CO. have issued a catalogue of some of the astronomical equipment designed and manufactured by the Company. The photographs and illustrations are arranged in sections as follows: reflectors, refractors, domes, driving mechanism, breechpieces, transits, coelostats, objectives and mirrors, and also "In the Workshops". The illustrations do not represent in every detail the latest design practice because advances in engineering technique during the War are now applicable in some cases to the design of astronomical equipment. At the end of the book there is a list of the large telescopes—twelve altogether—manufactured by the Company between 1927 and 1947.

The Night Sky in August

NEW moon occurs on Aug. 5d. 04h. 13m., U.T., and full moon on Aug. 19d. 17h. 32m. The following conjunctions with the moon take place: Aug. 2d. 07h., Venus 9° S.; Aug. 9d. 05h., Mars 2° S.; Aug. 14d. 04h., Jupiter 4° N.; Aug. 31d. 03h., Venus 8° S. Mercury, which rises an hour before the sun on Aug. 1, is in superior conjunction on Aug. 11, and is badly placed for observation during the greater portion of the month. Venus rises at 1h. 40m., 1h. 20m. and 1h. 15m. at the beginning, middle and end of the month, respectively, and can be seen for some hours before sunrise. The stellar magnitude of the planet is about −4·2 throughout August, and the visible portion of the illuminated disk varies from 0·3 to 0·47. Mars sets at 21h. 38m., 20h. 55m. and 20h. 10m. at the beginning, middle and end of the month, respectively, and can be seen for a short time after sunset. Jupiter, in the constellation of Ophiuchus, can be seen low in the evening, setting at 0h. 25m. and 22h. 30m. on Aug. 1 and 31, respectively. The planet is stationary on Aug. 16. Saturn, in conjunction with the sun on Aug. 19, is not well placed for observation. On Aug. 31 the planet rises an hour before the sun but is practically unobservable. No occultations of stars brighter than mag. 6 occur during August. The Perseid meteors attain a maximum about Aug. 10–12, but moonlight will partly interfere with the observation of the shower at that time.

Announcements

WE regret to announce the death of Sir Clifford Paterson, O.B.E., F.R.S., director of the Research Laboratories of the General Electric Co., Ltd., which occurred on July 26.

PROF. RAOUL COMBES, professor of plant biology in the University of Paris, has been elected to the Section of Botany of the Paris Academy of Sciences in succession to the late Prof. P. A. Dangeard.

IN commemoration of the centenary of the birth o Baron Roland von Eötvös (see *Nature*, July 24 p. 135), a small collection illustrating his work has been arranged at the Science Museum, London. It will remain on view until September.

THE Managers of the Royal Institution have appointed Dr. D. P. Riley, University demonstrator in the Department of Mineralogy and Petrology Cambridge, to the Dewar Research Fellowship tenable in the Davy Faraday Laboratory of the Royal Institution. Dr. Riley will undertake a programme of research on the application of methods of X-ray diffraction analysis to the study of the structure of colloidal systems and biological materials

PART of the exhibition of photographs demonstrating the value of air photography to archæology recently held in London (*Nature*, July 17, p. 96) has been transferred to the Ashmolean Museum, Oxford for the period August 2–September 4.

A SYMPOSIUM on the "Chemistry, Metabolism and Biological Effects of Steroid Hormones" will be held in the University of Wisconsin, during September 6 8, under the auspices of the University of Wisconsin and the U.S. National Research Council Committee on Growth, acting for the American Cancer Society Among the topics to be discussed are: clinical use of steroids in gynæcology; growth and fattening of animals; metabolism and excretion of steroids relation of structure to function of steroids; lactation and reproduction in animals; clinical and experimental work on cancer; metabolism of convalescence; sex differentiation and steroids. The symposium will be open to the public. Further particular can be obtained from Dr. Edgar S. Gordon, chairman Symposium Committee, University of Wisconsin.

THE Science Co-operation Office in Cairo of th United Nations Educational, Scientific and Cultura Organisation has compiled a very useful list o scientific papers published in the Middle East and received by the Office up to March 1, 1948. Th papers are classified under mathematics, mechanic and physics, chemistry, geology and geophysics botany, zoology, medical sciences, engineering agriculture and psychology, and there are single entries under palæontology and biology. Most o the entries are under zoology, medical sciences, agriculture and psychology. A list of periodicals reviewed includes particulars of frequency, price an the name and address of the publisher, the periodicals being arranged by countries.

LETTERS TO THE EDITORS

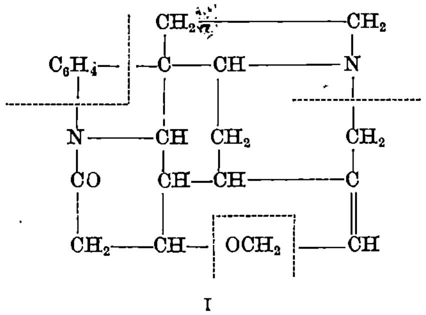
The Editors do not hold themselves responsible for opinions expressed by their correspondents. No notice is taken of anonymous communications

Synthesis of Vomipyrine

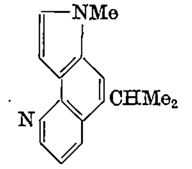
An outstanding result of Wieland's long series of investigations of vomicine was the degradation of the alkaloid to a base, $C_{15}H_{16}N_2$, termed vomipyrine[1]. This afforded yellow salts, and the spectrochemical behaviour clearly indicated its constitution as an alkylated pyrroquinoline, $C_{11}H_7N_2 . C_4H_9$, although the position of fusion of the rings and the position and distribution of the alkyl group or groups (2Et, Me, Pr, Bu, etc.) was unknown. Guesses based on the earlier strychnine formulæ were disproved by synthesis[2].

Even with the strychnine formula (I) now considered to be established beyond doubt[3] there remained some ambiguity. Our first idea was that vomipyrine should be 5-*iso*butyl-7 : 8-pyrroquinoline[4]; but a few months ago, Prof. H. Wieland kindly informed us that vomipyrine contained a methylimino-group. This modified our view and the base was then thought to be Ind-N-methyl-5-propyl-7 : 8-pyrroquinoline or Ind-N-methyl-5-*iso*propyl-7 : 8-pyrroquinoline (II). There was little evidence to enable a choice to be made between these, or, what is the same thing, to locate the carbon atom which is extruded from the skeleton.

However, a carbon atom had been lost once before, namely, in the distillation of the products of reduction of methylstrychninium salts. In this case the conclusion was reached that a carbon atom attached to oxygen had been eliminated[5]. Therefore, the constitution with an *iso*propyl group was favoured for vomipyrine.



I



II

The dotted lines in (I) indicate the fissions assumed to occur; the N-methyl group of (II) is not present in (I) but occurs in the related vomicine structure[6].

We therefore decided to synthesize a base of the constitution (II), and in the first place studied methods for the preparation of the hitherto unknown 7 : 8-pyrroquinoline itself. An application of the modified Skraup reaction[7] to 6-nitro-*o*-toluidine afforded 7-nitro-8-methylquinoline, m.p. 134–134·5°, and this, by reduction and formulation, was converted into 7-formamino-8-methylquinoline, m.p. 157°. Cyclo-dehydration to 7 : 8-pyrroquinoline, m.p. 216–217°, occurred on heating with potassium *t*-butoxide, although the yield was small. Treatment of this base with potassamide in liquid ammonia, followed by methyl iodide, yielded Ind-N-methyl-7 : 8-pyrroquinoline, m.p. 112°. The salts of the two tricyclic bases were yellow and the absorption spectra of the bases were like those of vomipyrine and other pyrroquinolines.

The way was thus open to an unambiguous synthesis of (II). *p*-Cymene was dinitrated[8] and reduced to 6-nitro-2-amino-*p*-cymene. The Bradford, Elliott and Rowe technique[7] was used in the preparation of 7-nitro-8-methyl-5-*iso*propylquinoline, m.p. 88°. This was reduced to the amine, m.p. 109°, which was formylated (m.p. 123°) and cyclo-dehydrated as above to 5-*iso*propyl-7 : 8-pyrroquinoline, m.p. 182–183° (hydrochloride, sinters at 222°, liquid at 226°; Wieland's base, $C_{14}H_{14}N_2$, obtained as a by-product in the formation of vomipyrine, was an oil; hydrochloride, sintered at 220°, m.p. 240°). The potassamide – liquid ammonia – methyl iodide method then gave the desired Ind-N-methyl-5-*iso*-propyl-7 : 8-pyrroquinoline (II), m.p. 108–108·5°. The base crystallized from light petroleum (b.p. 60–80°) in flat, rectangular, colourless plates, but two opposite angles were usually truncated, giving a six-sided outline. The ultra-violet absorption in methanol showed maxima at 2660 A. (log ε, 4·17) and 3380 A. (log ε, 3·75). There is a slight discrepancy here since Wieland and Horner[9] give for vomipyrine maxima at 2677 A. (log ε, 4·4) and 3347 A. (log ε, 3·8); the possible error indicated was, however, ± 20 A.

All doubt was dispelled when Prof. Wieland kindly furnished us with a small specimen of authentic vomipyrine. We are very grateful to him for this collaboration. This specimen crystallized from light petroleum in the characteristic six-sided plates and had m.p. 106·5–107·5° after drying at 50°/20 mm. Mixed with our synthetic base, the melting point was 108·5° after sintering at 107°.

Crystallographic, including X-ray, comparisons of the two specimens showed complete identity, and we are greatly obliged to Mrs. D. Hodgkin for kindly undertaking this work.

The bases fluoresced identically blue-violet in ethereal solution and gave identical (characteristic) Hopkins – Cole and pine-splinter reactions.

The importance of vomipyrine, always great, was enhanced by the recent demonstration of the relation of vomicine to strychnine[6]. It was then pointed out that vomicine chemistry had acquired a direct bearing on the strychnine problem. Although it is true that the constitution of strychnine is already established, the proof is a long one and, though rigid, it demands a close and critical study of a most complex branch of structural chemistry. The synthesis of vomipyrine facilitates a more direct approach. It confirms the constitution (I) in regard to those features that have been regarded by some authors as most open to criticism.

It is worthy of note that degradation products, which have been synthesized, cover the entire carbon and nitrogen skeleton and all the rings except that which includes the cyclic ether group. These products are dinitrostrychol, tryptamine, carbazole, vomipyrine and β-collidine. There is sufficient overlap to fix the positions of fusion of the rings.

Structure of Dunnione

THE investigation of dunnione and its transformation products by Price and Robinson[1] did not completely establish the structures of these compounds. The work was interrupted by the War; but Dr. Price has recently suggested that the further examination of these substances be included in a programme of research on quinones which is proceeding in this Laboratory. As closely related work is being done in the United States, it seems desirable to give a brief preliminary report of the scope of the present investigations, and of the results already obtained.

The structures previously assigned to dunnione and the *iso*-dunniones have been confirmed by the synthesis of *dl*-dunnione and β-*iso*-dunnione. Claisen rearrangement of 2-γγ-dimethylallyloxy-1 : 4-naphthaquinone gives rise to two products: the normal rearrangement product, 2-hydroxy-3-αα-dimethylallyl-1 : 4-naphthaquinone (m.p. 70–71°), and the abnormal product, 2-hydroxy-3-αβ-dimethylallyl-1 : 4-naphthaquinone. The latter compound proved to be identical with the *iso*-dunniol of Price and Robinson (*loc. cit.*), and by ring closure with sulphuric acid it is converted to αββ-trimethyldihydrofurano-1 : 2-naphthaquinone identical with the β-*iso*-dunnione derived from natural dunnione. Similarly, ring closure of the normal rearrangement product gives ααβ-trimethyldihydrofurano-1 : 2-naphthaquinone (m.p. 93–94°), which is evidently the racemic modification of dunnione. Its melting point is not depressed by mixing with the natural dextrorotatory pigment (m.p. 98–99°), and on treatment with cold alkali it is gradually converted to two products, which are evidently *dl*-α-dunnione (m.p. 110–111°) and *dl*-*allo*-dunnione (m.p. 141–142°). The first of these gives β-*iso*-dunnione on heating with sulphuric acid, and the second shows the characteristic absorption spectrum previously recorded[2] for the dextrorotatory *allo*-dunnione derived from natural dunnione.

It is noteworthy that the normal Claisen rearrangement of the γγ-disubstituted allyl ether was accomplished simply by boiling an alcoholic solution under reflux for a few hours. The yield was 93 per cent. When the ether was heated for a few minutes, without solvent, at a temperature slightly above its melting point, the main product was that resulting from abnormal rearrangement.

The structure of β-*iso*-dunnione has also been proved by an independent synthesis starting from 2-hydroxy-3-βγγ-trimethylallyl-1 : 4-naphthaquinone (m.p. 169–170°).

With the structures of these compounds thus established, it seems evident that the change from the dunnione to the *iso*-dunnione structure is simply a somewhat unusual example of the Wagner–Meerwein type of rearrangement.

Furthermore, it seems probable that the rearrangement of dunnione to *allo*-dunnione involves a reaction characteristic of 2-hydroxynaphthaquinones having a tertiary alkyl group in the quinone ring. This hypothesis is supported by the observation that 2-hydroxy-3-αα-dimethylallyl-1 : 4-naphthaquinone undergoes a similar reaction when heated with aqueous alkali, giving a product (m.p. 148–149°) which dissolves in aqueous sodium bicarbonate to give a *yellow* solution. An analogous product is obtained by the action of alkali on 2-hydroxy-3-ααβ-trimethylallyl-1 : 4-naphthaquinone (m.p. 81–82°).

Full details of this work will be published elsewhere.

R. G. COOKE

Organic Chemistry Laboratory,
University of Melbourne.

A Natural Precursor of the Folic Acid Complex

RECENTLY Elvehjem and his co-workers[1] have demonstrated the presence, in rat liver homogenates, of a natural precursor capable of conversion by enzymes also present in liver to material having folic acid activity. They base the use of the term 'folic acid' on the fact that there is no evidence that the material produced is identical with pteroylglutamic acid. The same considerations apply to its use in the present communication.

Following observations made some time ago[2] that similar activity can be produced chemically by the interaction of histidine with certain components of an acid hydrolysate of casein, I have indicated[3] that this amino-acid may also act as a biological precursor of some member of the folic acid complex, and it now appears that in all probability it is identical with the precursor described by Elvehjem.

An enzyme capable of converting histidine into material having growth-stimulatory activity for *Streptococcus fæcalis* R. has been shown to be widely distributed in Nature. It occurs in relatively high concentration in mouse skin tissue, mouse and cat liver, hog spleen and duodenum and in horse heart. Certain of these tissues contain preformed growth factor, as is shown by the fact that samples heated to destroy enzyme activity induce marked growth and acid production in cultures of *S. fæcalis* R. (cf. Table 1). Also apparently they contain appreciable amounts of the precursor postulated by Elvehjem, since incubation of fresh samples causes an increase in activity.

Table 1. The activity of cat liver extract in producing folic acid from histidine at *p*H 7·4, estimated in terms of ml. *N*/20 acid produced in 10 ml. cultures of *S. fæcalis* in 18 hr. after the addition of 1 ml. of the mixture

Mixture incubated for 18 hr.	Acid production (ml. *N*/20)
0·5 ml. liver + 5·5 ml. phosphate buffer	4·45
0·5 ml. liver (boiled) + 5·5 ml. phosphate buffer	4·10
0·5 ml. liver + 5·0 ml. phosphate buffer + 0·5 ml. 0·1 per cent histidine	5·45
0·5 ml. liver (boiled) + 5·0 ml. phosphate buffer (solution + 0·5 ml. 0·1 per cent histidine solution)	4·15

These preparations, in addition to the activity lready present, are capable of producing increased ctivity when incubated in the presence of histidine. 'able 2 shows the increased acid production in ultures of *S. fæcalis* induced by the addition of 1ouse skin extract after incubation with various uantities of histidine at *p*H 7·4 for 18 hr.

able 2. Activity of 0·2 ml. mouse skin extract incubated for 18 hr. at 37° C. with histidine

Addition of histidine (μgm./ml.)	Acid production (ml. *N*/20)
150	3·31
75	3·32
37·5	2·91
18·0	2·47
0	1·45

As a preliminary to a separation of the active omponent of the enzyme complex present in an xtract of cat liver, a preparation of vitamin B_c onjugase using this extract as source was made. Vhen tested for folic acid production, it was shown hat the fraction soluble in 50 per cent saturated mmonium sulphate solution which contained the onjugase was not adequate, but that the precipitate om this fractionation was also necessary for the eaction with histidine to take place.

The presence of relatively large amounts of folic cid in the liver preparations made separation and esting rather difficult, and the possibilities of horse eart were examined, since although it has only bout one quarter the activity per mgm. dry weight, he preformed folic acid content is about one half hat in the liver preparations. Partial purification as been effected by making use of the absorption f the protein on paper pulp in the presence of concentrations of ammonium sulphate which were insufficient to produce a precipitate. Treatment of his material with lower concentrations of ammonium ulphate elutes the activity quite effectively.

25 mgm. of dried horse heart (prepared at 40° C. by iobin, Ltd.) was extracted with 200 ml. of *M*/15 hosphate buffer at *p*H 7·4. After filtration through Seitz filter, the filtrate was diluted to 600 ml. with uffer one-third saturated with ammonium sulphate, nd 50 gm. of paper pulp added. It was shaken or two hours and filtered. The paper was resusended in 600 ml. of *p*H 7·4 buffer, 8·3 per cent aturated with ammonium sulphate, and reshaken. he paper after filtration was resuspended in 600 ml. vater and treated as before. Table 3 records the ctivity of the various stages in this fractionation, howing that the majority of the enzyme is eluted y the dilute sulphate solution.

Table 3. Activity of fractions of a horse heart extract

Mixture incubated	Acid production ml. 0·5 *N* acid	
	Actual	Increase due to histidine
·1 ml. Original extract	0·12	
·1 ml. Original extract + 500 μgm. histidine	0·46	0·34
·3 ml. Paper filtrate	0·01	
·3 ml. Paper filtrate + 500 μgm. histidine	0·08	0·07
·3 ml. Paper $(NH_4)_2$ SO_4 eluate	0·14	
·3 ml. Paper $(NH_4)_2$ SO_4 eluate + 500 μgm. histidine	0·50	0·36
·3 ml. Paper water eluate	0·04	
·3 ml. Paper water eluate + 500 μgm. histidine	0·08	0·04

In view of the fact that the enzyme system escribed above has been shown not to be identical vith vitamin B_c conjugase, and the fact that Elvehjem as shown his enzyme to have a different *p*H optimum om the conjugase, it would appear likely that the two may be identical. The partially purified enzyme, after elution from the paper, has an optimum activity at *p*H 7·8, as opposed to the *p*H 7 optimum observed by Elvehjem. Such a drift, however, often occurs on purification. Assuming that the enzyme systems are identical, it would follow that the substrates are also related, if not identical. It has been shown that arginine and, to a certain degree, glutamic acid can replace histidine as substrate for the folic acid producing enzyme. Edlbacher[4] and Walker[5] have postulated the production of unstable intermediates in the oxidation of histidine in the liver. These intermediates, formamidino glutaric acid and formyl glutamine, bear a considerable structural similarity to arginine; and glutamic acid is the end point of the degradation. It may therefore be that the true substrates for the enzyme producing folic acid may be the unstable hexone bases produced during the oxidative deamination of histidine.

The implications of these observations are far-reaching in their effect on firmly held theories regarding the mammalian metabolism of the folic acid complex. If tissues of such a large variety of animals are capable of synthesizing folic acid *in vivo* as well as *in vitro*, doubt must be cast on theories attributing sulphonamide-induced blood dyscrasias to intestinal sterilization. Also it may be expected that the presence of amino-acids in biological materials will tend to produce discrepancies in microbiological assays of the growth factor.

A fuller account of these investigations will be given elsewhere.

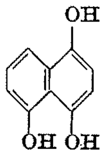
Hydrojuglone and Apparent Vitamin C in Walnuts

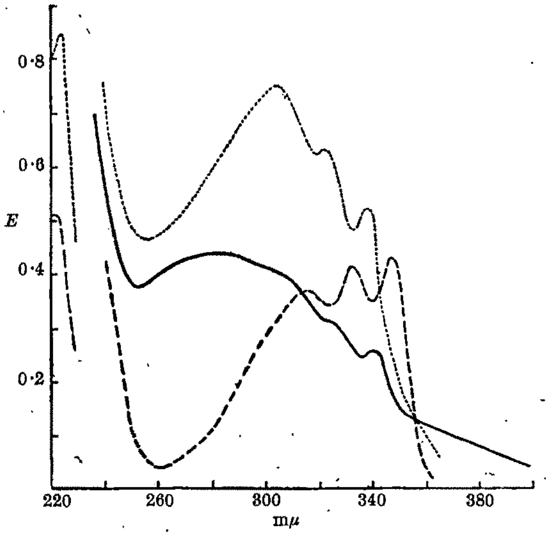
PREVIOUS communications from these laboratories[1-4] have shown that associated with the remarkably high concentrations of true vitamin C in different tissues of the walnut (*Juglans regia*) and allied species are considerable amounts of non-specific dye reductants provisionally termed[5] 'apparent vitamin C'. The proportion of apparent vitamin C in the total dye reductants varies from less than 5 per cent in the endocarp to more than 90 per cent in resting buds and catkins. We have now obtained evidence that this so-called apparent vitamin C in walnuts is mainly, if not entirely, a derivative of hydrojuglone or 1 : 4 : 5 trihydroxynaphthalene:



Extracts of resting buds and catkins from various walnut trees around London were made in ethanol containing 5 per cent v./v. hydrochloric acid AnalaR, which inhibited enzyme action and rendered the extracts stable for one to two weeks when stored in the refrigerator under nitrogen. The clear green extracts diluted with acid alcohol or alcohol and examined in a Beckman Model DU spectrophotometer gave absorption curves with the following maxima:

$$\sim 270,\ 283\text{–}285,\ \sim 305,\ 325,\ 342,\ \sim 360\ \text{m}\mu$$

(see graph). When these extracts were adjusted to pH 4·0 with N sodium hydroxide and chromatographed on alumina the following bands were obtained (reading from top): dark green, light greenish-yellow, lilac (turning green in acid alcohol). On development with 60–70 per cent alcohol the lilac band readily washed out of the column and was collected with the filtrate. Mineral acid was needed to remove the other two bands. The filtrate contained practically the whole of the dye reductants present in the original extract and showed maxima at 225, 305, 326 and 342 mμ in acid alcohol. The relative intensities of the peaks were unaffected by further adsorption on alumina, barium sulphate or lead acetate. Oxidation with N/100 iodine at pH 1 formed a yellow compound, soluble in ether, giving maxima at 249 and 425 mμ, corresponding with those for juglone.



Absorption curves of synthetic hydrojuglone — — —, of hydrojuglone derivative separated from male catkins of *J. regia* - - - -, and of the original acid alcoholic extract of the catkins ——. The maxima at 221–224 mμ for synthetic hydrojuglone and for the hydrojuglone derivative were obtained with dilutions of 1 in 4 and 1 in 5 respectively of the extracts used for obtaining the main parts of the curves

Hydrojuglone, which we prepared from juglone by reduction with zinc and hydrochloric acid, and by shaking out an ethereal solution of juglone with an aqueous solution of sodium hydrosulphite, gave the four maxima detected in the filtrate, but at slightly longer wave-lengths (namely, 225, 315, 334 and 348 mμ), these differences being probably due to ester formation in the natural product. The movement to shorter wave-lengths of the reduced form on esterification has been checked using juglone acetate. Such ester formation would also explain the much greater stability of the natural product as compared with synthetic hydrojuglone, which can lose most of its dye-reducing power and change back to a juglone within a few hours, especially on exposure to sunlight. Such change is accompanied by development of yello colour, which also occurs when walnut extracts containing apparent vitamin C are titrated with th indophenol dye, and the increase in yellow colour thu produced has been found to be roughly parallel t the content of apparent vitamin C in numerou extracts prepared from different walnut tissue during the last two or three years. The dye titratio value of synthetic hydrojuglone has been found t vary with the titration pH in the manner which on of us (F. W.)[6] has previously shown to be characteristic of apparent vitamin C in walnut extracts, thu clearly distinguishing it from reductone and othe possible constituents of apparent vitamin C.

The occurrence of hydrojuglone in different walnu tissues has been known for many years[7]. We hav not been able to find in the literature any referenc to naturally occurring compounds of hydrojuglone o to its possible relationship to vitamin C. Mor recently, Lugg and Weller[8] considered the possibilit of hydrojuglone being present among the non-specifi dye reductants in walnuts, but (owing probably t their attention being concentrated on fairly matur fruit) did not find any significant amount of it i their experimental materials. Our spectroscopic an dye titration results show that in resting buds an catkins there may be more than 3 per cent of hydrojuglone, calculated on the fresh material, an accounting for practically the whole of the dy titration. During growth and development this percentage gradually falls, concurrently with a stead increase in the concentration of ascorbic acid. Ou evidence indicates that in growth and developmen of walnut tissues hydrojuglone, in association wit ascorbic acid, may play a more important part tha has hitherto been suspected. We hope to publis more details later.

We are indebted to Dr. R. Melville, of the Roya Botanic Gardens, Kew, for samples of walnuts an botanical information, and to Miss Nora Baxter an Miss Elaine Finnegan for assistance in preparatio of numerous extracts.

This investigation forms part of the work for University of London Ph.D. thesis by one of u (C. D.).

Effect of Salt on Partition Chromatogram

THE adverse effect of salt on partition chromatograms on paper has been mentioned by Consde Gordon and Martin[1], and a method for removing sal from mixtures of amino-acids and peptides has bee recently described by these authors[2]. If such desalted solutions are then fractionated on pape chromatograms and the individual spots washed o the paper and hydrolysed with 6 N hydrochloric acid in capillary tubes, some salt is reintroduced, presumably from the glass. Electrodialytic desalting is now scarcely practicable owing to the number and very small volume of these solutions.

Fortunately, the amount of salt present is insufficient to prevent the final analysis of the hydrolysates on further paper chromatograms. Under these conditions, the effect of salt on the ninhydrin-treated chromatograms is usually seen as a yellow spot in the glycine – alanine region when phenol – coal gas – ammonia has been used as solvent. Sometimes there is also an opaque 'waterlogged' spot visible nearer the origin of the chromatogram while still wet with solvent. The salt effect is much smaller when 'Pyrex' instead of soda glass capillary tubing is used.

If the chromatogram, prior to treatment with ninhydrin, is extracted with toluene to remove traces of phenol and then sprayed, after drying, with thymol blue solution, a blue spot appears in exactly the same part of the chromatogram as would have been occupied by the yellow (ninhydrin) spot, thus indicating the presence of alkali in this area. Spraying with methyl red solution instead of thymol blue reveals a red (acid) spot nearer the origin corresponding to the position of the 'waterlogged' spot.

These effects were reproduced on chromatograms of amino-acids mixed with sodium chloride or sulphate (10–20 μgm. of each) and on chromatograms of these salts alone. The observations suggested that the alkalinity which often prevents the full development of the colours with ninhydrin of those amino-acids which occur in that region might be eliminated by the use of acidified ninhydrin solution. This proved to be the case when acetic acid (1 per cent v./v.) was added to the ninhydrin solution (0·1 per cent in *n*-butanol). With mixtures containing relatively high concentrations of salt, waterlogging becomes so important as seriously to distort the top part of the chromatogram, and the alkalinity may be sufficiently high to prevent entirely the development of the colours of glycine, threonine, alanine and tyrosine with unacidified ninhydrin. Nevertheless, even under these conditions, by the use of acidified ninhydrin, the colours of these amino-acids are revealed and show no distortion and no alteration of their R_F values. The separation of salts into cations and anions has also been observed with other solvent systems. With *s*-collidine, the effect is reversed, the acid spot being the faster and appearing in the valine – leucine region, and the alkali spot appearing near glycine.

It is hoped that these observations may be helpful to those investigators who are using chromatographic techniques.

P.S.—Since submitting this letter, we have seen the paper by Partridge and Westall[3], who also observe the separation of inorganic salts into ions, on paper chromatograms.

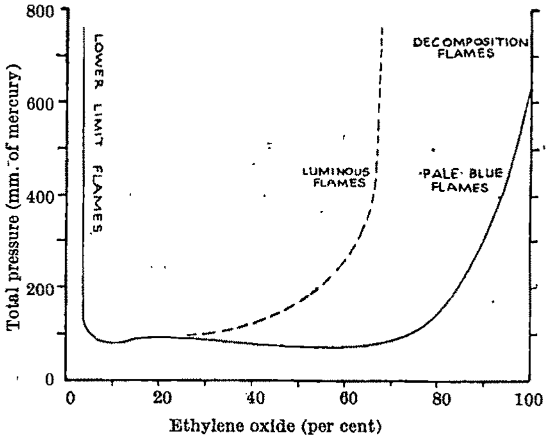
Ethylene Oxide Explosions

THE occasional occurrence of ethylene oxide explosions during the fumigation of dried fruit has led us to undertake a detailed study of the combustion characteristics of the vapour. An examination of the effect of pressure on the spontaneous ignition temperatures has yielded results somewhat like those for acetaldehyde[1,2]. Cool flames can be *initiated* in ethylene oxide – air mixtures in the neighbourhood of 330° C. at atmospheric pressure.

The effects of pressure on flame propagation in ethylene oxide – air mixtures have been observed in a closed glass tube, 5 cm. in diameter, using hot-wire ignition. With the tube vertical and ignition at the lower end, continuing flame propagation can occur at atmospheric pressure in all mixtures containing more than 3·6 per cent of ethylene oxide. With increasing proportions of the combustible above the lower limit, the flame changes from non-luminous to luminous in the usual way, and approaching about 68 per cent a normal upper limit flame is obtained. Beyond this point, however, the flame loses its luminosity and becomes pale blue; this continues while any air is present in the mixture. In the absence of air, ethylene oxide propagates an even less luminous blue decomposition flame, but at a higher speed and with greater pressure increase.

The effect of reduced pressure on these phenomena, under the conditions of experiment, is shown in the accompanying graph. The decomposition flame is propagated down to 630 mm. pressure; but below this an upper limit for ethylene oxide – air appears and the inflammable range is narrowed, being finally eliminated at about 70 mm.

Neither the blue flame with rich mixtures nor the decomposition flame is propagated vertically downwards, and under such conditions an upper limit is observed corresponding approximately to the boundary for luminous flames shown as a broken line in the graph.



The blue flame obtained with the rich mixtures no doubt corresponds with that observed under slightly different conditions by G. W. Jones and R. E. Kennedy[3], and by R. M. Jones[4] with mixtures containing up to 80 per cent of ethylene oxide. Coward and Jones[5] suggest that the flame is analogous to the cool flame of diethyl ether, but our investigations indicate that this is not so. The flame is, in fact, initiated at too high a temperature and too low a pressure for such to be the case, and we have tentatively formed the opinion that it is associated with the endothermic character of ethylene oxide. Very similar behaviour has been noted by Forsyth and Townend[6] using ethylene – air and ethylene – oxygen mixtures, and recently, Mr. G. Williams-Leir, working with one of us in this Department, has obtained further evidence of a range of non-luminous flames beyond the recognized upper limit of ethylene in air at atmospheric pressure[7].

We have also succeeded in establishing limiting conditions of temperature and pressure for the spontaneous explosive decomposition of ethylene oxide, and are studying the kinetics of the explosion limit in relation to the work of earlier investigators of the kinetics of the slow decomposition[8–10].

The investigation as a whole is being continued and detailed results will be published in due course.

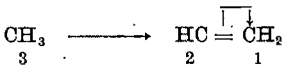
Radical Addition Reactions

VARIOUS theories have been advanced to explain the direction of addition of neutral unsymmetrical radical reagents to unsymmetrical unsaturated systems. Such addition is often 'abnormal' as compared with the 'normal' additions observed with ionic reagents. Thus Waters[1] states that "free radicals . . . react preferentially at points of high electron density", and Mayo and Walling[2] have suggested that the direction of addition is governed by the relative heats of formation of the two alternative intermediates in the addition. No disagreement with the views of the latter authors can be advanced because there is, in general, no method of accurately evaluating such constants. The statement by Waters, on the other hand, is not in agreement with the present experimental data, since his view would imply that neutral radicals are electrophilic in character.

Recorded observations on the addition of radicals to unsymmetrical unsaturated systems can be explained if it is presumed that radicals attack preferentially at points of high 'differential electron density' —differential, that is, with respect to the symmetrical *unsubstituted* systems. Examples will make this clear. With benzene, already substituted by either *o*-, *p*- or *m*-directing groups, the greatest differences in electron density with respect to unsubstituted benzene occur at the *o*- and *p*-positions; the *m*-position is relatively unaffected. Free radicals attack benzene derivatives principally at the *o*- and *p*-positions[3].

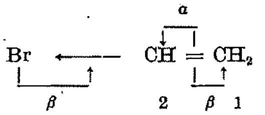
In propylene the inductive effect (+ *I*) of the methyl group is usually considered to initiate a mesomeric effect as in (I), which more than compensates for the drift of electrons from C_3 towards C_2.



I

C_1 is thus more negative than C_2 and also has the higher differential electron density with respect to unsubstituted ethylene; in agreement, atomic bromine, in abnormal addition, adds to C_1.

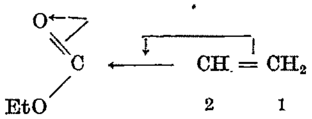
A similar argument applies to (say) vinyl bromide (II). Here the position is more complicated in



II

that the inductive effect (– *I*) of the bromine atom initiates the mesomeric effect (α), which in turn is partially compensated by the mesomeric effect (β). Although (β) is of dominant importance for ionic addition, where it becomes an electromeric effect in the transition state, the negative end of the dipole in vinyl bromide lies at the bromine atom, thus showing that (α) is more important in the unexcited compound. Following the argument given for propylene, the position of maximum differential electron density is at C_1 in agreement with the direction of 'abnormal' addition of bromine atoms.

In α : β-unsaturated esters, such as ethyl acrylate (III), both ionic and radical addition of unsymmetrical



III

addenda furnish the same products[3]. This is again in agreement with prediction. The $-CO_2Et$ group exerts an inductive effect (–*I*) on the ethylenic linkage and also the mesomeric effect (–*M*) illustrated. For electrophilic attack C_2 obviously has a greater electron density than C_1, as indeed is shown by the direction of electrophilic ionic addition, which is contrary to the Markownikoff rule. But radical reagents, like bromine atoms, do not attack C_2 but C_1, where the differential electron density is clearly greater than at C_2. This last example is one where it is possible to distinguish without ambiguity between the predictions of Waters' theory and the one propounded here.

It has recently been shown by Koelsch and Boekelheide[4] that aryl radicals add to the β-position in methyl crotonate (IV), but to the α-position in methyl cinnamate (V). Such reversal of addition is easily understood when it is remembered that the inductive effect (–*I*) of the carbomethoxyl group is greater than that due to phenyl, and that the change in electron density at the β-carbon atom in methyl cinnamate, due to the mesomeric effect (– *M*) imposed by the carbomethoxyl group, is compensated by the mesomeric effect (+ *M*) of the phenyl group.

oelsch, C. F., and Boekelheide, V., *J. Amer. Chem. Soc.*, **66**, 412 (1944).

DR. BARTON's term 'high differential electron ensity' is quite useful for explaining more precisely y early, and vague, statement that "free radicals tack molecules preferentially at points of high ectron density"[1]. Obviously *electron-availability* is n essential requisite for free radical reactions. Free eutral radicals, such as Br·, CH_3·, or C_6H_5·, are ectrophilic reagents in so far as they tend to comlete their electron octets, and this end they can hieve (*a*) by combining with another unpaired ectron, as in $CH_3\cdot + \cdot NO \rightarrow CH_3{-}NO$; (*b*) by mbining additively at one of the easily available electrons of an olefinic bond; or (*c*) by abstracting n outer atom *plus* one electron from another moleule, as in $Cl\cdot + HCH_3 \rightarrow Cl{-}H + \cdot CH_3$. The ease reaction is $a > b > c$, and this is the order of vailable electron densities at the atom which is ttacked.

Dr. Barton concerns himself with process (*b*), and ere it is the differential electron density at the two nds of the π-electron bond of the olefine which is nportant. It is to be judged, as he points out, by aking into account both inductive and mesomeric fects of substituents upon the static structure of e olefine, but not the inductomeric or electromeric rocesses which arise when an olefine molecule bemes polarized by an approaching heterolytic agent[1]. One should remember, however, that these dical reactions are all bimolecular, and hence the sential criterion of the reactive tendency is the nergy difference between the initial and the transition tates. Often, as in the cases of vinyl bromide, thyl crotonate and ethyl cinnamate, this energy ifference can be gauged most easily by writing down e structures of the alternative radical addition proucts; for example, $Br{-}\dot{C}H{-}CH_2{-}Ph$ and $Br{-}$ $H(PH){-}CH_2\cdot$, where mesomerism is obvious in the rmer, but not in the latter, case. This, of course, is e point of view of Mayo and Walling, and is much ore accurate than my original electron density icture, which was not intended to cover all mesomeric ystems.

In the case of aromatic systems, Dr. Barton's escription of the experimental facts, though unfortunately current, is somewhat misleading, since the substitutions of aromatic compounds by free radicals have not, on account of inherent practical difficulties, been studied quantitatively. It would be truer to say that whereas the *para*-substituted product can always be isolated, both the *ortho-* and the *meta*-isomeride are often formed in comparable amount. Forthcoming papers in the *Journal of the Chemical Society* by Prof. D. H. Hey and myself will deal with this question.

Nickel Plating by Chemical Reduction

Brenner and Riddell[1] have described a method for nickel and cobalt plating by chemical reduction of the metal salts with sodium hypophosphite under both acid and alkaline conditions. Aside from its utility, this reaction is one of considerable interest by virtue of its catalytic nature. Thus, in the concentrations they use, deposition occurs only if certain metals are immersed in the solution and, even in their presence, deposition is inhibited by the addition of such materials as potassium thiocyanate and lead in small amounts. It is suggested that some insight on both these effects and also on the unusual kinetics of the reaction is obtained by the mechanisms outlined below.

I. *Alkaline Solutions.* The initial reaction step is one of electron transfer involving nickel and hydroxyl ions at the catalytic metal surface, *M*.

$$\begin{aligned} Ni^{++} + M &= Ni^{+} + M^{+} && (1)\\ OH^{-} + M^{+} &= OH + M && (2)\\ 2Ni^{+} &= Ni + Ni^{++} && (3)\\ H_2PO_2^{-} + 2OH &= H_2PO_3^{-} + H_2O. && (4) \end{aligned}$$

The overall reaction is:

$$Ni^{++} + H_2PO_2^{-} + 2OH^{-} = Ni + H_2PO_3^{-} + H_2O.$$

The interchange of electrons between the nickel ion and the surface will, following Michaelis[2], take place in one-electron steps. The Ni^{+} ion first formed can then acquire another electron or disproportionate[3] to give the atom as in reaction (3).

This mechanism accounts for: (i) The necessity of a metal surface to act as an electron source and sink as in reactions (1) and (2). The generally unfavourable free energy change[4] of reactions as $OH^{-} + M_{aq.}^{++} = OH + M_{aq.}^{+}$, where $M_{aq.}^{++}$ is the ion in solution, shows this oxidation-reduction reaction not to involve dissolved ions of the catalytic metal but electrons present at various levels in the bulk metal as such. (ii) The non-catalytic nature of glass and plastic in their inability to take part in the electron transfer reactions (1) and (2). (iii) The action of inhibitors and the incidence of passivity in their effect on the electron availability at the surface. (iv) The independence of reaction-rate on the nickel concentration in the rapid nature of the electron transfer steps. (v) The dependence of the rate in linear fashion on the hypophosphite concentration in reaction (4), which involves an atom transfer step. This reaction is favourable thermodynamically, ΔG being approximately − 130 k.cal.[4].

II. *Acid Solutions.*

$$H_2PO_2^- + M = H_2PO_2 + M^- \qquad (5)$$

$$H_2PO_2 + H_2O = H_3PO_3 + OH. \qquad (6)$$

The reactions of the nickel ion remain as given above. The overall reaction is:

$$H_2PO_2^- + Ni^{++} + H_2O = H_2PO_3^- + Ni + 2H^+.$$

This mechanism differs from that in alkaline solution in the nature of the anion primarily involved in the electron transfer step at the metal surface—reaction (5). The unusual features of the deposition reaction in acid media accounted for include: (i) The independence of rate on both nickel and hypophosphite concentration, since both ions take part in electron transfer steps at the metal surface. The hypophosphite radical, first formed afterwards reacts with water to give the OH radical and hypophosphorous acid, which, as they are formed in juxtaposition, will rapidly interact to give the final products of oxidation. This reaction has a free energy change of – 130 k.cal.[2]. (ii) The increase in deposition-rate with agitation of the metal surface is due to impoverishment at the surface of the ion $H_2PO_2^-$.

A curious feature of unexplained origin is that, in mixed nickel–cobalt solutions, only the former is deposited, providing the process is worked under acid conditions.

I wish to thank Mr. D. A. Dowden for helpful discussions.

Deamination of Amino-Acids by X-Rays

Recently we have isolated products of hydroxylation from dilute aqueous solutions of benzene and benzoic acid irradiated with ionizing radiations (X-rays, γ-rays, neutrons)[1]. The formation of phenolic compounds in these experiments furnished experimental evidence in support of the theory put forward by one of us[2] in 1944, according to which the primary action of ionizing radiations results in the splitting of the water molecules according to

$$H_2O \rightarrow \ldots\ldots \rightarrow OH + H,$$

presumably through the ions H_2O^+ and H_2O^-. These reaction products are similar to those obtained from the same substances by the action of OH-radicals produced chemically (for example, by the hydrogen peroxide – ferrous salt system), or in the biological oxidation of these substances[3]. We have now found that irradiation by X-rays of dilute aqueous solutions of certain simple amino-acids results in an (oxidative) deamination yielding ammonia, and the corresponding aldehydes similar to those obtained from the same substances *in vitro* by the action of OH-radicals produced chemically[4].

The experimental conditions were similar to those reported previously[1]. For example, aqueous solutions of serine (100 ml. solution containing 400 mgm.) were irradiated with doses of the order of 10^6 r. uni
The ammonia formed in the irradiated solution w
determined by the method of Parnas[5]; the yie
being of the order of 0·3 millimoles. (The yields r

Influence of Low Temperatures on the Mec anism of the Austenite – Martensite Transformation

Systematic investigations have been carried o
on the influence of low temperatures on the latt
parameter of austenite and martensite and on t
axial ratio *c/a* in martensite.

Two plain carbon steels were chosen containi
0·89 per cent and 1·2 per cent of carbon respective
In order to obtain a martensite structure, the samp
were quenched from 930° in brine solution af
holding for 15 min. at this temperature in a carb
monoxide atmosphere. Rods of 0·5 mm. diame
were cut from the quenched specimens by cutti
very slowly with a carborundum wheel, applyi
efficient water-cooling. The rods were afterwa
etched in order to remove the surface layer.

X-ray photographs of the rods from these ste
were taken in 9-cm. and 19-cm. Debye – Scher
cameras using cobalt radiation and an iron filt
The rods were then immersed in liquid air for c
hour and liquid nitrogen for 30 min. and X-r
diffraction photographs again taken. In cert
cases, instead of using liquid air or nitrogen, some
the rods were immersed in a liquid helium bath
about 1·5° K. for approximately 6 hr. After liq
air or liquid nitrogen treatment and X-ray exami
tion, some of the rods were treated in liquid heli
and examined by X-ray diffraction methods aga

The photographs were photometred by means
the Hilger non-recording X-ray microphotomet
Readings were taken at intervals of 0·1 mm. a
sometimes in more interesting cases 0·01 mm. alo
the entire length of all films, and correction for n
linearity in the blackening intensity curve was ma
from calibration strips put on the film by means

a rotating stepped sector. This correction was necessary in only a few cases.

The lattice parameter was measured. A value for he axial ratio was obtained from M_4, using the designations adopted by Lipson and Parker[1], and his was used in calculating c and a from each of the lines M_6. The value a was also obtained from M_8 (220) and the true value was found by extrapolating linearly rom $\sin^2 \theta = 0$ to $\sin^2 \theta = 1$.

The lattice parameter c of the martensite decreases, while the parameter a shows very little change. The diminution of the parameter c in liquid helium is much more noticeable than in liquid air or nitrogen.

The axial ratio c/a in tetragonally distorted marten-ite[2] distinctly decreases after the specimen is immersed in liquid air or nitrogen. The ratio c/a decreases very strongly after cooling the specimen in liquid helium.

The lattice parameter of austenite decreases after he specimen is cooled in liquid air and nitrogen, and especially after cooling in liquid helium.

The immersion of the specimens in liquid air, nitrogen or helium has apparently the same effect as the shift in the position of the smaller carbon content in Honda and Nishiyama's[3] curves, which how that the c and a lattice parameters for marten-ite, their ratio c/a and the a lattice parameter for austenite vary linearly with the carbon content.

Investigations on the breadths of X-ray diffraction lines and grain size of martensite and austenite are in progress and a full report on the subject will be published elsewhere in the future. This work has been carried out in the Royal School of Mines, London, under the direction of Prof. C. W. Dannatt. Grateful acknowledgment is due to Prof. J. F. Allen for facilities in the Royal Society Mond Laboratory, Cambridge.

Photodisintegration of the Deuteron

THE photodisintegration of the deuteron into a proton and a neutron is a case of the two-body problem in nuclear physics; the effect was first discovered by Chadwick and Goldhaber[1]. Accurate measurement of the cross-section for this effect can give information about nuclear forces which is of nterest in view of the several theories which have been put forward recently[2-5]. These theories predict values between 13 and 17 × 10^{-28} cm.^{2}. The cross-section has been measured three times before[1,3,6]; but since these values are all considerably below those predicted by theory, and in view of the significance of this constant, it was thought worth while to make use of improvements in technique that have been made in the meantime.

The measurement was made by direct counting of the photoprotons in an ionization chamber filled with deuterium to a pressure of six atmospheres using a calibrated source of radiothorium, which gives 2·62-MeV. γ-rays. This method is independent of a neutron standard and also avoids counting the disintegrations caused by the 2·2-MeV. line emitted by such a source[6,7]. To ensure counting of all photoprotons, which have an energy of only 0·2 MeV., in the presence of the strong γ-radiation, electron collection is essential. To achieve this at six atmospheres pressure the hydrogen must be exceptionally pure (less than 1 part in 10^6 of oxygen). We were greatly encouraged in attempting to obtain electronic conduction in a metal ionization chamber by the work of Mr. G. H. Stafford[8], using extremely pure hydrogen in an all-glass ionization chamber. The counts were found to be reproducible from day to day within 2 per cent.

The source was placed at 1 metre from the chamber, at which distance (52·5 ± 1) counts per minute were observed. In order to obtain the cross-section from this observed rate of counting of photoprotons, the following facts must be known.

(1) The γ-ray flux. The radiothorium source was compared with a radium standard using an ionization chamber similar to that used in the Curie Institute in Paris, so that the absolute millicurie content could be calculated using a result of Ricoux[9]. It is well known that one 2·62-MeV. γ-ray is emitted for every disintegration of the thorium-C″ nucleus, with the exception of the few disintegrations (1 in 10^4) which give a long-range α-particle. The branching factor (0·35) is also well known[7]. A correction of 6 ± 0·5 per cent has to be made for the absorption of γ-rays in the brass walls of the ionization chamber.

(2) The sensitive volume of the ionization chamber. The chamber is a closed cylinder with a small hole for entry of the collector electrode. The cylinder is connected to a negative high voltage (5 kV.), which is ten times the saturation voltage to ensure complete collection. The sensitive volume is then assumed to be the geometrical volume (51·7 ± 0·2 c.c.), which was obtained by filling with distilled water and weighing. Corrections have to be made for those photoprotons which lose most of their energy in the walls (5 ± 1 per cent at this pressure) and for the region in the immediate vicinity of the central wire which is insensitive because of the effect of positive ions. Use of a cylindrical chamber with a small collector makes this correction small (2·2 ± 0·5 per cent).

(3) The pressure in the ionization chamber. This was obtained by expanding into a known volume and reading the pressure on a mercury manometer. This, when corrected to N.T.P., gives 6·01 ± 0·03 atmospheres.

(4) The purity of the gas in the chamber. This was afterwards checked with a mass spectrometer. The gas entered the mass spectrometer through a palladium leak giving an assumed enrichment for the lighter isotope of 1·33. Using this figure, the purity of gas was 95 ± 1 per cent deuterium.

The final result for the total cross-section (magnetic plus electric photo effect) is: $\sigma = (16{\cdot}2 \pm 1{\cdot}0) \times 10^{-28}$ cm.^{2}.

It is interesting to compare this result with the predictions of meson theory. The results of recent theoretical calculations of the total photo-nuclear cross-section have kindly been sent to us by Prof. Hulthén and are given below (see also L. Rosenfeld[4] and Pais[5]).

Type of meson theory	Assumed meson mass	$\sigma \times 10^{28}$
Møller–Rosenfeld	197	15·1
Neutral	197	16·8
Møller–Rosenfeld	296	13·3
Neutral	296	13·7

Our result therefore eliminates the substantial discrepancy with theory which previously existed, and favours a light meson mass. The precision of our measurements is insufficient to decide between the different types of theory.

We have to thank the Ministry of Supply for the loan of the radiothorium source, the Department of Scientific and Industrial Research for a maintenance grant, Dr. Reaf and Mr. Thoneman for the analysis of the deuterium, and Lord Cherwell for his continued interest in the work.

Note added in proof.—Dr. Gentner has kindly pointed out to us that the high value obtained for the cross-section could be due to a γ-ray line at 3·2 MeV. of uncertain intensity reported by Simons and Zuber (*Proc. Roy. Soc.*, **159**, 383; 1937). An examination of our proton energy spectrum shows that the line (if it exists) has an intensity too small to influence the result.

Nuclear Isomeric Transitions of Short Periods

The elements copper, molybdenum, silver, cadmium, indium and lead have been irradiated by a pulsed beam of X-rays, activity ascribable to metastable states being sought in the intervals between pulses. The electrons producing the X-ray pulses had energies up to 1·05 MeV., the pulse width was 5 μsec., repetition frequency 200 per sec. and mean current 15 μamp.; the mean current during the pulse was thus approximately 15 m.amp. The elements were irradiated within Geiger–Müller counters, counts between pulses being displayed on an oscillograph with time-base triggered by the pulses. No evidence of activity was obtained. Periods greater than 100 μsec. could have been detected. Some details are given below of the experimental arrangements whereby a particular spurious effect can be eliminated, since these may be of interest in similar studies where more energetic X-rays are available.

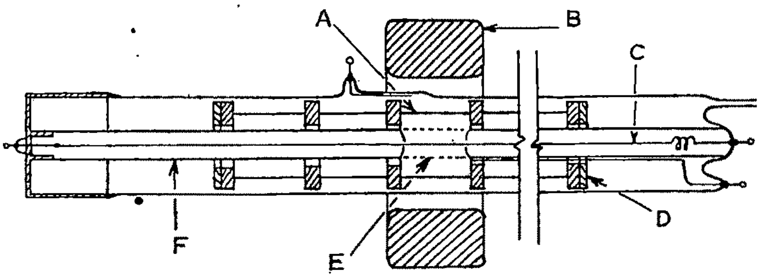
The electron beam was generated by a pulsed linear resonant-cavity accelerator, working at 1,200 Mc./s., constructed by the Radiophysics Division of the Council for Scientific and Industrial Research, Sydney; an earlier type of accelerator, using similar principles, has been described[1]. As a result of developments by Mr. B. Y. Mills, of the Radiophysics Laboratory, electron energies up to 1·25 MeV. have been obtained with a single cavity.

When counters with the metals under investigation as cathodes and filled with argon (pressure 15 cm.) and ether (pressure 15 mm.) were irradiated, a short-period ‘activ dying away in approximately 0·01 sec. was served; a high X-ray intensity increased counting-rate between pulses, in some cases an apparently continuous discharge. In the cop cathode counter the counting-rate was less inte than in those with other metals as cathodes. Th effects were shown to be extra-nuclear in origin follows.

The six metals were placed within the envel of a screen-wall counter; this type of counter[2] be used for magnetic measurements of energies particles produced by nuclear disintegration. design adopted for the present experiments is show the accompanying diagram. The envelope is of gl with one brass end; the cathode is a cylindri copper wire mesh, and the material to be irradia a cylinder placed outside the cathode. By slid each outer cylinder in turn into position facing cathode, differences due solely to the different me can be detected. A filling of argon–ether mixture to 4 cm. pressure was employed, so that scat ing effects could be neglected in the measurement energies of any particles emitted from metasta nuclei. It was found that the application to the ou cylinder of a potential more than 2 volts above t of the cathode in each case reduced the counti rate between pulses to a value not significan different from that occurring when there was outer cylinder facing the cathode mesh. Thus counts between pulses could not have been produ by electrons of energy more than 2 eV. Their act origin is being investigated.

The absence of any observed long-period activ with lead requires comment, as one might exp that the 1·6 min. isomer of threshold 0·65 M previously discovered by Waldman and Collins[3] wo have been produced by X-rays of maximum ene 1·05 MeV. However, an approximate calculation the assumption of the yield quoted by the ab experimenters shows that in the present experime an increase in counting-rate of more than 5 minute should not have been expected, and suc low rate would not have been regarded as significa All known isomers in the other metals require m energetic X-rays for their activation.

With regard to short periods, the presence in l of a metastable state with period of order 1 m.s if such existed with an activation cross-section the order 10^{-34} cm.^{2} or more, could have b detected; this estimate is based on the assumpt of an activation-level at 0·65 MeV. It seems lik that there are no suitable activation-levels bel 1·05 MeV. in the nuclei of silver[4], cadmium[4] indium[5]. It is interesting to note that no isom transitions of periods of the order of 10^{-3} sec. h yet been reported, although some activities w



Screen-wall counter. Envelope, 3 ft. × 3 in. diameter. *A*, outer cylinder; *B*, magnetic field coil; *C*, anode wire, 3½ mil. tungsten; *D*, outer support and shield; *E*, copper cathode mesh (80 per inch); *F*, glass support for cathode icro-second periods have been discovered which are roduced by radioactive decay into stable isotopes[6].

A study of the behaviour of nuclei immediately llowing nuclear reactions and inelastic collisions ay show evidence of short-lived isomers. In order examine such effects, it is proposed, using a method milar to that here described, to irradiate various aterials with neutrons produced by a pulsed ion eam in a (D + D) generator.

Grateful acknowledgments are due to Dr. E. G. owen, chief of the Radiophysics Laboratory, for aking available facilities for the experiments deribed, and to Dr. R. E. B. Makinson for suggesting is work. Financial assistance has been provided y a Commonwealth Science Research Grant.

A Gravitational Field with a Curious Geometrical Property

IT is well known[1] that there are fourteen indeendent absolute scalar differential invariants of the econd order associated with the gravitational metric,

$$ds^2 = g_{\mu\nu}\, dx^\mu\, dx^\nu. \qquad (1)$$

can be argued that the vanishing of all the inariants need not imply the vanishing of all the venty independent components of the curvature nsor R_{hijk}. On the other hand, it may be pointed it that, when the invariants vanish, there are urteen differential equations to be satisfied by the n $g_{\mu\nu}$ components; and it is not at all obvious at a gravitational field with a Riemannian metric cists for which the fourteen invariants vanish. We port here the existence of such a gravitational field escribed by the metric

$$\begin{gathered} dS^2 = -A(dx^2 + dy^2 + dz^2 - dt^2) \\ A = A(\xi),\ \xi = x - t, \end{gathered} \qquad (2)$$

r which the surviving components of the energyomentum tensor satisfy the relations,

$$T_1{}^1 = T_1{}^4 = -T_4{}^1 = -T_4{}^4, \qquad (3)$$

ch being equal to

$$\frac{1}{8\pi}\left[\frac{1}{A^2}\frac{d^2A}{d\xi^2} - \frac{3}{2}\frac{1}{A^3}\left(\frac{dA}{d\xi}\right)^2\right]. \qquad (4)$$

he above metric with the conditions (3) may be mpared to the gravitational field corresponding to directed flow of radiation as given by Tolman[2]. or (2), the conformal curvature tensor vanishes and $_{\mu}{}^{\nu}$ has the structure of the electromagnetic energyomentum tensor; these circumstances together eing responsible for the vanishing of the complete t of invariants.

Interpretation of Data from Electrical Resistivity Geophysical Surveys

MR. J. M. HOUGH has described in *Nature* of May 22 a graphical method of analysing results from the four-electrode method of determining electrical resistivity, when applied to a horizontally stratified earth. He cites particularly the case of a two-layer earth. In a paper published in the *Proceedings of the Physical Society*, **47**, 589 (1935), we described this graphical method and gave the universal curves for the case when the four electrodes are equally spaced. The analysis for the distribution of an alternating current with parallel flow in a two-layer earth was also given. Comparisons were made between results obtained with alternating currents and those obtained with the four-electrode method.

The graphical method just mentioned was used to some extent in the preparation of the electrical resistivity maps of Great Britain and southern Scotland issued by the Electrical Research Association in 1935.

S. WHITEHEAD

British Electrical and Allied Industries
Research Association,
Greenford, Middlesex.

W. G. RADLEY

General Post Office.

BEFORE I commenced an investigation of the interpretation of data from electrical resistivity surveys, unfortunately I failed to find any reference to the paper by Drs. Whitehead and Radley.

There are two points in the treatment of this method by Drs. Whitehead and Radley on which I should like to comment. They suggest that this method is not as accurate as that due to Tagg. For the ideal case of two perfectly homogeneous layers separated by a plane boundary parallel to a perfectly plane surface of the earth, this is probably true. In actual surveys, these conditions are never completely fulfilled, and deviations caused by irregularities in the boundary planes and inhomogeneities in the layers make any two-layer curve into only an approximation to the actual curve: under these conditions, I suggest that either method would be equally applicable.

In their paper, Drs. Whitehead and Radley only apply the method to a two-layer problem. I believe that the method is especially useful in the case of certain types of multi-layer earth. In my communication, I did not discuss this at length as the method is essentially the same as that proposed by Tagg, but, in my opinion, very much more convenient than that of Tagg. I have used the method on some results obtained by Prof. L. S. Palmer in Holderness for deposits which have three main layers, topsoil, low-resistance boulder clay (this layer is not usually homogeneous but contains thin strata of sand, etc.), and high-resistance chalk. In the eight cases examined, four showed a curve of three-layer type, and for these the specific resistance of the boulder clay ranged between 130 and 80 ohm ft., and that of the chalk between 240 and 570 ohm ft. The topsoil varied from 2½ ft. and 6 ft. in thickness, and in two cases where bore-hole data were available the chalk was within 10 per cent of that for the bore-hole.

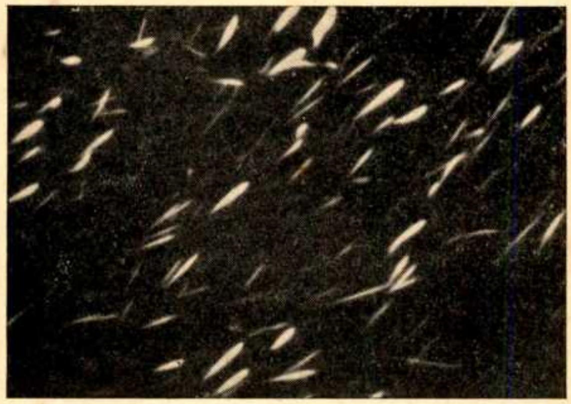
Open Hearth Furnace Models

A DESCRIPTION was given in a letter in *Nature* of March 27, p. 479, of the use of aluminium powder for flow visualization in a water model of an open hearth furnace. It has since been shown that part of the pattern was due to air bubbles, and that if these are eliminated the aluminium shows up as extremely short light streaks due to the rapidly changing orientation of the disk-shaped particles during the exposure period.



At the suggestion of Mr. F. H. Saniter, director of research, further tests were made in which a stream of gas (initially oxygen) was introduced into the water before the 'checkers', after all the original bubbles had been eliminated by suitable adjustment of the control valves. This technique resulted in an immediate improvement both in the ease of observation and photographic clarity. Not only were the individual bubble streaks far more clearly discernible, but also the falling off in light intensity of the flash from the discharge tube during the exposure results in a point on the tracks that enables their direction of movement to be easily recognized. This latter feature is proving a great asset in the study of such highly turbulent conditions.

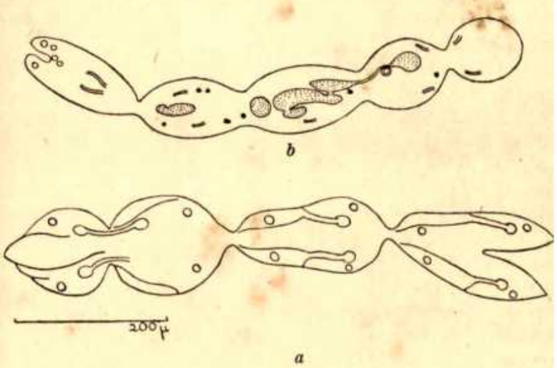
Induced and Spontaneous Abnormality in Ciliates

MOTTRAM[1,2], by means of various physical agents and by means of certain cyclic hydrocarbons—all factors, except one of the latter group, said to be carcinogenic—disorganised a ciliate and found some persistence of abnormality in the offspring of the disorganised cells. At first he named the ciliate *Paramecium aurelia*[1] and later *Paramecium* and *P. colpoda* Ehr., but finally adjusted the identification to "an amicronucleate race of *Colpidium*"[2]. It is important to realize that his ciliate, being without a micronucleus, was intrinsically abnormal. In the reaction he suggested an analogy to tumour formation and surmised that where such abnormals arise spontaneously in culture there has been unwittingly some exposure to a carcinogenic factor.

Such abnormalities, the origin of which is in
double cell, have been produced by merotomy[3,4], b
exposure to sodium bromide[5], hydrogen cyanide
benzene hexachloride ('Gammexane')[7], by transf
of a culture to hard chlorinated tap water[8]; also
a sequel to conjugation[9].

In the case of 'Gammexane' and *Parameciu*
caudatum, up to a 56 per cent conversion to a
abnormal form has been obtained. These doubl
cells become monstrous and multinucleate. The
give rise to both normal and abnormal cells, bu
usually there is no suggestion of persistence of al
normality, which disappears at the death of th
primary or secondary abnormal forms. One of ninet
such cases closely followed has behaved differentl
with constant difficulty in parting of the cells
division, and yielding frequent double cells, vario
distorted individuals and monsters for six mont
until the clone was abandoned. The greatest develo
ment of abnormals occurred eight to ten weeks aft
the exposure to 'Gammexane'.



Chain-forming spontaneous abnormal *Paramecium caudatum*. *a*, From life, showing doubling of mouths and contractile vacuoles and bifid tendency. *b*, Showing disorganisation of nuclei and intercalary division. Macronuclei are shown stippled, healthy micronuclei as black dots, degenerate ones as circles, gullets as slits

In spite of the fact that this experience was uniq
in the series, it would have been attributed to
residual effect of the 'Gammexane'; but, about th
same time, a double cell appeared in a stock cultu
which formed part of the control. This spontaneo
instance has maintained abnormality in its offspri
for more than a year, and the clone is still vigoro
though with a morbid tendency. The cells are e
tremely sticky in division, so that chains of up
nine cells are produced. There is a tendency
bilateral symmetry in organelles, but the nuclei
the chains are completely disorganised (see figur
It gives off normal cells, and normal side-lin
can be obtained by selection. In some respec
it resembles a case reported by Jennings[10] whi
also arose spontaneously but has better viability
the chains will live alone in culture, whereas his di
unless normal cells were included to aerate th
medium. He recorded no doubling of organelles a
did not report on nuclear conditions. The sto
cultures, maintained in 0·5 per cent linseed infusio
were exposed to no conceivable carcinogenic agen
and the origin of this abnormal clone was, witho
doubt, due to some intrinsic cause.

In the light of such observations, the basis
Mottram's hypothesis does not exist. Neverthele
having regard to the present wide use of benze
hexachloride as an insecticide, it was thought wi

test it for possible carcinogenicity (see following tter).

bsence of Carcinogenic Activity of Benzene Hexachloride ('Gammexane')

FOR reasons given in the preceding letter, benzene xachloride has been tested for carcinogenic pro- erties. A 0·5 per cent solution in acetone has been plied twice weekly for fifteen months to the inter- apular skin of a group of thirty mixed stock mice. further twenty mice were subcutaneously im- anted with pellets of paraffin wax containing 3 per nt of 'Gammexane', and have since been observed r ten months.

No tumours have been induced in either group. oreover, there have been none of the changes seen ith known carcinogens during the latent period, r example, epilation, local thickening and con- estion of the skin, epidermal hyperplasia, and brillary changes in the dermis of the first group[1]; the characteristic failure to form a firm collagenous psule round the pellet in the second group[2]. The rvival-rate has been satisfactory, twenty-one and elve out of the original thirty and twenty respect- ely being still alive at the time of writing. Of the ad mice, one showed leukæmia at autopsy and other was killed following the observation of a rcinoma of the breast; both these lesions occur ontaneously in the stock, and there is no reason to tribute them to the treatment.

It is perhaps worthy of mention that the general ndition of the mice in the first group has been finitely superior to that obtaining in an average periment; this we attribute to the reduction of rasitic cutaneous infestation. In certain types of olonged experiment, periodical treatment of the imals in this way might prove of general value.

Rhythmic Respiration in the Sea Urchin

I AM much interested in the note by Dr. Erik uthen on the presence of rhythmic respiration in a urchin eggs[1]. Fifteen years ago, while at Harvard, erformed a number of experiments on the fertilized gs of another species of the sea urchin, *Arbacia nctulata*, using the Warburg microrespirometer chnique. I found rhythmic variation in the rate of ygen consumption by these more or less uniformly eaving eggs. The phenomenon is quite pronounced 25°, but not so at 15°. The oxygen consumption time, or oxygen consumption *v.* cleavage curves are very much the same as those given by Dr. Zeuthen. I also discussed in detail the reasons for the failure of previous workers to find such variations. In Warburg's first experiments[2] the readings were taken at too long intervals, and Gray's[3] experiments were made at too low a temperature (11°) for the variations to be significant. Shearer's data actually showed such a variation if his data were replotted differentially as rate against time, rather than as an integral curve of amount of oxygen consumed against time, which was the way he plotted the results.

The results of my experiments, together with the discussion, were published, upon my return to China, in *Wuhan University Journal of Science*, **7**, 1 (1937). Unfortunately, war broke out soon after, and very few copies of the journal are in existence now. Even I myself have no copy. I am trying to locate this article, both in China and in libraries abroad.

Use of Rotifera for Testing Analgesics, Narcotics and Similar Drugs

THE assay of the analgesic power of therapeutic substances by means of rats cannot be carried out with any degree of precision. It has been found that the Rotifera can be employed for this purpose since they are extremely sensitive to killing agents unless they are previously narcotized[1].

Through the courtesy and active help of Mr. E. D. Hollowday, regular supplies of the rotifer, *Brachionis calyciflorus*, were obtained, and lots of 1·0 ml. of the water containing 10–15 of the Rotifera pipetted into small tubes. An equal volume of a solution of the drug under test at a known concentration was slowly added, the tube being gently rotated to ensure even mixing. After allowing to stand for 10 min. the Rotifera were examined under the microscope. After noting their condition, the animalcules were killed with formalin and the state of the cilia determined.

The various states were defined as follows:

(i) *Dead.* These had died from 'natural' causes and generally consisted of the lorica containing a more or less decomposed internal mass.

(ii) *Killed.* These had contracted on contact with the formalin or other drug without passing through a state of narcosis. This was indicated by contraction of the cilia, generally accompanied by contortion of the internal organs.

(iii) *Narcotized.* These showed no contraction or contortion, the Rotifera being free from movement but with the cilia outstretched. On the addition of formalin, no immediate obvious changes took place.

(iv) *Alive but not narcotized.* These were either static or else free-swimming with the normal movement of the cilia. On the addition of formalin, they contracted and contorted within the lorica.

The relative numbers in the three classes, killed, narcotized, and alive but not narcotized, were counted.

The effect of various drugs was examined throughout ranges of concentration depending on the activity of the particular substance under investigation. The first compound examined was acetylsalicylic acid, and as the *p*H value of the solution was *c*. 3·3, the other substances were used at approximately this degree of acidity, except in the cases of sodium salicylate, the calcium salt of aspirin, phenobarbitone and barbitone. The results obtained are shown in the accompanying table.

It is interesting to observe the peculiar effect of aspirin. When pure acetylsalicylic acid is added in requisite amount, the infusoria show perfect evidence of narcosis; but they appear to be killed at the same time, since on transferring to fresh water they show no signs of recovery. If the aspirin be converted into calcium acetylsalicylate and employed at *p*H 6·0, the narcotized Rotifera recover when transferred to fresh water. If the calcium salt be decomposed by the addition of acetic acid, so that the *p*H value is about 3·5, then no recovery takes place. Since salicylic acid appears to be fairly lethal and the Rotifera do not recover from treatment with a dilution of 1 : 1,500, it would seem that the peculiar effect of aspirin may be connected with the breakdown of the molecule into its component moieties. So far as is known, aspirin decomposes in aqueous solution of *p*H 3·3 at 20° C., at the rate of about 1 per cent per hour, a speed which is too slow to account for the rapidity of kill. It may be, however, that the acetylsalicylic acid is decomposed at a much greater rate when it is in the internal fluid of the Rotifera and where *in vivo* factors are operating.

Compound	Concentration of drug producing		Recovery from narcosis
	Kill	Narcosis	
(1) *Analgesics* :			
Hyoscine hydrobromide	1 : 200	1 : 1,500	+
Amidopyrine	1 : 1,000	1 : 40,000	+
Aspirin	1 : 1,000	1 : 2,000	–
Calcium aspirin (*p*H 3·5)	1 : 200	1 : 450	–
Calcium aspirin (*p*H 6·0)	1 : 40	1 : 70	+
Salicylic acid	1 : 1,000	1 : 1,500	–
Sodium salicylate (*p*H 6·4)	1 : 20	N.N.	–
Phenacetin	1 : 1,500	1 : 2,000	+
(2) *Local Anæsthetics* :			
Cocaine hydrochloride	N.K.	1 : 7,000	+
(3) *Anæsthetics* :			
Ethyl alcohol	1 : 10	1 : 10	
Chloroform	1 : 500	1 : 1,600	+
(4) *Hypnotics* :			
Morphine	1 : 400	1 : 500	
Codeine	1 : 30	N.N.	–
Barbitone (*p*H 9·2)	1 : 20	N.N.	–
Phenobarbitone (*p*H 9·0)	1 : 14	N.N.	–

N.K.: up to a concentration of 1 : 750, cocaine did not kill.

N.N.: narcosis could not be produced by sodium salicylate nor with the hypnotics codeine, barbitone or phenobarbitone. With morphine, some 60 per cent of the Rotifera showed evidence of narcosis, while with ethyl alcohol at a concentration of 1 : 10 less than 50 per cent were narcotized, the remainder being killed.

We have found that the larger animalcules, such as *Cyclops* and *Daphnia*, do not lend themselves to this type of experimentation. The experimental results suggest, however, that the Rotifera are excellent experimental animals for the assay of drugs which have analgesic and anæsthetic properties.

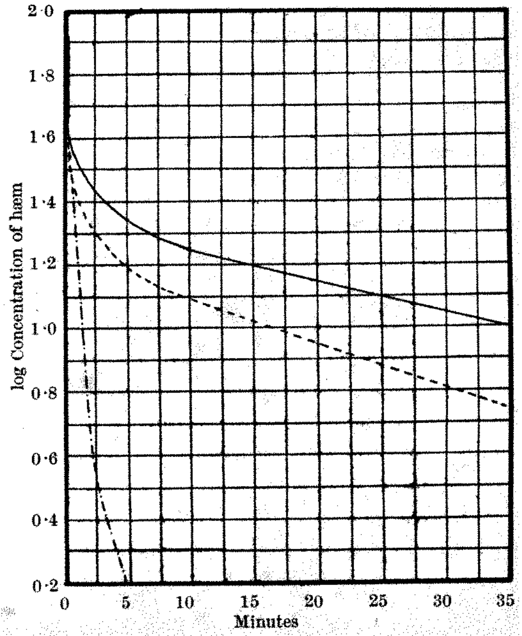
Fœtal Hæmoglobin and Erythroblastosis

In a recent communication, Jonxis[1] repo quantitative estimations of alkali-resistant and lab hæmoglobin in cases of hæmolytic disease of the ne born. He comes to the conclusion that after bir only hæmoglobin of the labile, adult type is forme and that in hæmolytic disease of the new-born the is a selective destruction of red blood corpusc containing fœtal hæmoglobin. We carried out the years 1939–42 a great number of similar estim tions; these have been briefly reported previous elsewhere[2,3].

Our results were at variance with those of Jonx The method applied was a modification of that Haurowitz[4], adapted to the use of Evelyn's phot electric step-photometer. The investigations we carried out before the *Rh* factor and its relationsh to the hæmolytic disease of the new-born was know and it is significant that the study of denaturati curves after blood transfusions revealed two typ one indicating a selective destruction of the bab cells and one showing indiscriminate destruction. the accompanying figure the abscissa represents t time in minutes after addition of *N*/4 sodi hydroxide, the ordinate the logarithms of the co centration of oxyhæmoglobin at each time. T concentration of the original solution, which w always approximately 0·1 gm. per 100 ml., was tak as 100. The percentage of alkali-resistant hæm globin was calculated by extrapolation of the secon gentle slope to time 0. The case was that of hæmolytic disease of the new-born and had a hi reticulocyte count indicating a rapid regeneration erythrocytes. The graph shows a complete repla ment of the fœtal hæmoglobin by the adult ty after blood transfusion, and yet 24 hours later the is already 16·5 per cent alkali-resistant hæmoglob Further curves illustrating selective and indiscri inate destruction of erythrocytes after blood tra fusions in cases of hæmolytic disease of the ne born are given in an earlier publication[3].

Where a few days after a blood transfusion t denaturation curve returns to the pre-transfusi type in the presence of a high destruction- a



egeneration-rate, it is obvious that fœtal hæmolobin has been formed in extra-uterine life. Cases ith an indiscriminate destruction of patient's and onor's cells show that there is no relationship whatver to the type of hæmoglobin present in the red lood corpuscles. In full agreement with these findngs are the results obtained by Mollison[5], who tudied the survival of transfused erythrocytes in æmolytic disease of the new-born by the method of ifferential agglutination. In almost all cases where *Rh*-positive red blood cells have been transfused hey were eliminated within ten days. The detruction of erythrocytes in hæmolytic disease of he new-born depends on their sensitization by *Rh* ntibodies and shows no relationship to the chemical onstitution of the globin component of their hromoprotein.

Carbonic Anhydrase in *Arenicola marina*

Several years ago, Brinkman and his collaborators eported that carbonic anhydrase is present in the lood of *Arenicola*[1]. This observation was confirmed y Florkin[2]. Recently, through the kindness of Prof. H. Munro Fox, I have had an opportunity of tudying the distribution of the enzyme in this nnelid in more detail than was done in these two apers, and some interesting points have come to ight.

The determinations of enzyme activity were made y the 'boat' method of Meldrum and Roughton[3], recautions being taken to ensure that diffusion did ot constitute a limiting factor. All the experiments ere carried out at 0° C., the Meldrum – Roughton nit of activity being calculated for that temperature. issues were cut into small pieces, washed with several hanges of sea water and then weighed. After being ound with a little sand, they were extracted for ne hour at room temperature with distilled water the proportion of 1 ml. to each 25 mgm. of tissue. he catalytic effect of the tissue extracts was always mpared with the activity of blood diluted to give he same final hæmoglobin concentration. Hence ny errors due to traces of blood remaining in the ssues were reduced to a minimum. Hæmoglobin as determined directly with a Hilger – Nutting pectrophotometer.

Table 1 gives the figures obtained for blood samples ken from five individuals, together with figures for uman blood (A. M. C.) to serve as a comparison. will be seen that the mean activity of *Arenicola* ood is about the same as that of human blood, though there is considerable individual variation.

Table 1

Enzyme (units per c.mm.)	Hæmoglobin (gm. %)	Activity : hæmoglobin
4·0	2·9	1·38
3·6	3·5	1·03
4·5	4·1	1·10
3·4	2·6	1·31
2·6	1·8	1·44
Mean : 3·6	Mean : 3·0	Mean : 1·25
3·7 (A. M. C.)	15·3	0·024

The ratio of enzyme activity to hæmoglobin concentration, calculated as units of enzyme per cubic millimetre of blood and grams of hæmoglobin per hundred c.c., is much higher in *Arenicola* than in human blood and tends to be fairly constant. The presence of such a large amount of carbonic anhydrase is of considerable importance, for *Arenicola* blood, like that of most annelids, contains very few corpuscles. Of four samples of blood centrifuged for thirty minutes at 3,200 r.p.m., only one showed any signs of a slight deposit of cellular material. Thus the enzyme must be free in solution, an exception to the generalization that carbonic anhydrase is never found outside cells[4].

The enzyme is also present in appreciable amounts in many of the tissues of *Arenicola* (Table 2) but is absent from the cœlomic fluid, as was noted by Florkin.

Table 2

Tissue	Units of enzyme per 50 mgm. wet weight
Œsophageal pouches	71–110
Chlorogenous tissue of stomach	15–38
Gills	5–15
Œsophagus	6–14
Nephridia	3–12
Intestine	1–4
Ep dermis	1–3
Muscles	Traces
Proboscis	Traces
Nerve cord	Nil
Cœlomic fluid	Nil

Of all the tissues examined, the œsophageal pouches showed the highest concentration of carbonic anhydrase. Although these diverticula have a very rich blood supply from several large sinuses situated beneath the inner epithelial lining, it seems rather improbable that they play an important part in the direct elimination of respiratory carbon dioxide from an animal so well equipped with external gills as *Arenicola*. On the other hand, it is difficult to see what other function they could have. The secretion is only slightly acid (pH about 6·4), so the glands can scarcely be similar to the gastric glands of vertebrates. It might be worth while considering whether the pouches represent a primitive respiratory organ which was of importance in annelids lacking external gills. In this connexion it is interesting to recall the work of Eisig[5] on some of the smaller polychætes. He made a careful study of the œsophageal diverticula in syllids and hesionids and concluded that they act as reservoirs of water and air, from which oxygen can be obtained when the supply from the external medium is insufficient to meet the organism's requirements. Eisig compared the pouches with the swim bladder of a fish. It would be interesting to examine the catalytic activity of the tissues of *Arenicola assimilis*, a form which possesses several pairs of œsophageal pouches.

This investigation is being carried out during the tenure of an 1851 Exhibition Science Research Scholarship. My thanks are due to Prof. D. Keilin for suggesting the problem and for his interest in its progress.

LOCALIZATION OF ALKALINE PHOSPHATASE IN YEAST

By Dr. WALTER J. NICKERSON
(Guggenheim Memorial Fellow)

EDITH J. KRUGELIS
(Donner Foundation Fellow)

AND

NILS ANDRESEN
Carlsberg Laboratorium, Copenhagen

THE Gomori technique[1] for alkaline phosphatase localization has been extensively employed with animal and plant material; but it does not appear to have been employed with yeasts. The presence of acid and alkaline phosphatases in yeasts is well known[2,3,4]; but the location of these enzymes in the cell has not previously been described. We have applied the Gomori technique to preparations of *Saccharomyces cerevisiæ* (strain 'Yeast foam', Carlsberg No. 237). Cells were grown in pure culture in 10 ml. of 8 per cent Pilsner wort in Freudenreich flasks at 25° C. for 24 hr. At the end of this time the medium was poured off and 10 ml. of sterilized distilled water was added to the cells sedimented at the bottom of the flask. The cells were suspended in the water by shaking, and drops of the suspension placed on microscope slides. The cells were allowed to dry in air for 10–30 min. and then incubated in one of the several phosphate compound substrates in a veronal buffer solution containing magnesium and calcium at pH 9·2 for 16–40 hr. at 37° C. The cobalt sulphide method of staining[1] was then applied.

Under these conditions we found phosphatase reactivity was shown by a general darkening, and also by more intense localization as a dark spot within the cell (Fig. 1). This spot localization was obtained with hexose diphosphate, sodium glycerophosphate, and sodium pyrophosphate as substrates. With sodium hexametaphosphate as substrate, the spot did not appear; but the reaction resulted in a more intense general darkening and in the appearance of some granules, located in the peripheral layers (see Fig. 2). No spot or darkening was obtaine in the controls (no substrate) or after heating th cells (for 3 min. in boiling water). Fig. 3 shows th negative reaction after heating. In the absence magnesium, there was some decrease in activit detectable with sodium glycerophosphate and hexos diphosphate, and almost no activity with sodiu pyrophosphate or sodium hexametaphosphate substrates.

Concerning the spot localization, there is som independent evidence that such a structure exis as a morphological entity. This evidence was obtaine by use of the Feulgen stain (Feulgen-positive boc observed in an approximately similar position) an by observation of living cells in the phase-contra microscope. It is not unlikely that this spot can b interpreted as the nucleus of the yeast cell. The boc observed by us agrees well with the cytological pictu of the yeast nucleus as presented by Nagel[5]. Sh demonstrated in the yeast cell the presence of tw distinct bodies which she labelled 'parvicorp' (nucle of most earlier authors) and 'companion body'. W have also encountered a structure comparable to th 'companion body'. This was a smaller and light area adjacent to the darker area of the spot. Wit hexose diphosphate, sodium glycerophosphate, an sodium pyrophosphate, it seems that alkaline pho phatase activity is localized with a Feulgen-positi structure and thus may be associated with desox ribose nucleic acid. (However, ribose nucleic aci may also be present.) This finding of phosphatas within the Feulgen-positive material is in accord wit those for the localization of alkaline phosphatas activity on the salivary gland chromosomes *Drosophila*[6,7], and for the general association phosphatase activity with desoxyribose nucleic ac as discussed by Jeener[8].

The general darkening within the cell suggests possible association of enzyme activity with ribo nucleic acid. Such an association has been describ previously for other tissues[9]. We treated cells wi ribonuclease (10 mgm. per cent) as employed b Brachet[10] and Brachet and Jeener[11] for the remov of ribose nucleic acid from the yeast cells. Th reagent was used as an aqueous solution on wash air-dried films of cells. Yeast cells were allowed remain in contact with the enzyme solutions

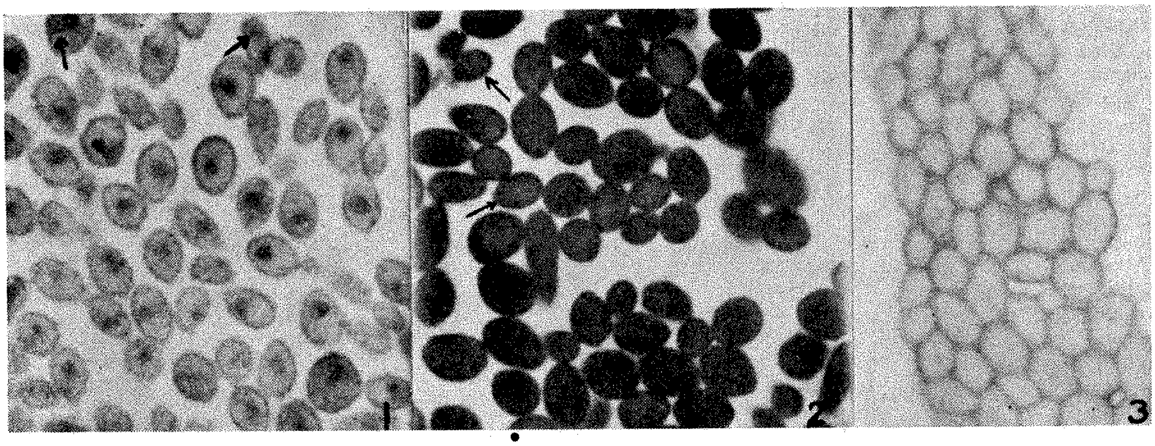

Fig. 1. Yeast cells exhibiting dark precipitate obtained by the Gomori phosphatase reaction using pyrophosphate as a substrate. Magnification, × 900; arrows to 'companion body'

Fig. 2. Yeast cells after the Gomori phosphatase reaction using hexametaphosphate as substrate. Magnification, × 900; arrows to ● cells with peripheral granules

Fig. 3. Yeast cells heated for 3 min. before incubation with pyrophosphate as substrate. Magnification, × 900

0° C. and 35° C. for several hours, during which ime samples were taken at intervals and examined r phosphatase activity with each substrate. There as a decrease in the general darkening; but a shrink-ge of the cytoplasm within the cell made cytological valuation very difficult. The usual homogeneous ark Gram staining reaction of yeast thus treated ith ribonuclease was reduced to stippled surface reas, and a fair proportion of the cells were Gram-egative. Henry and Stacey[12] have shown that the roperty of Gram positivity is associated with surface agnesium ribonucleate. This might be interpreted s indicating that in addition to the Feulgen-positive calization some alkaline phosphatase in yeast may lso be associated with ribonucleic acid at the cell rface. Recent investigations[13] on P^{32} exchange by east implicate a surface nucleic acid – riboflavin mplex in the uptake of inorganic phosphate by lls from the medium. Furthermore, Brachet and eener[14] and Chantrenne[15] have established that dimentable cytoplasmic granules in mammalian lls comprise an association of ribonucleic acid, hosphatase, and other enzymes. Brachet[16] and rugelis[17] find that there is a correlation between e localization of ribonucleic acid and alkaline hosphatase activity in the developing embryo amphibians. The surface darkening and the anulation obtained with hexametaphosphate sug-est the possibility of another enzymatic reaction, though we are aware of the protein precipitant ature of metaphosphate and the possibility of an tefact being produced during the reaction. The ependency on magnesium ion and heat lability of is reaction are in favour of its being enzymatic; ith this substrate we have also used a reaction mperature of 20° C. in view of the apparent in-tability of the hexametaphosphate under our con-itions at 37° C. This reaction with metaphosphate, enzymatic, may be involved with ribose nucleic cid, since Macfarlane[18] has isolated metaphosphate om yeast as an iron – nucleic acid complex.

One more line of evidence points to the association ggested above of nucleic acid and alkaline phos-hatase in yeasts. Cells raised in a medium deficient magnesium ions were stated by Henry and Stacey[12] exhibit greatly reduced Gram positivity. We ew yeast in a synthetic medium with known low oncentrations of magnesium and ferrous ions nedium first purified by 8-hydroxyquinoline-chloro-rm extraction following Waring and Werkman[19] and e ions afterwards added). Cells grown in this edium exhibited the lessened Gram staining roperties described above and showed a reduced arkening of the phosphatase reaction, accompanied y obvious changes in the general morphology of e cell.

The positive cytochemical reaction obtained with yrophosphate and the monophosphate esters as ubstrates suggests the presence of two enzymes (a yrophosphatase and a phosphomonoesterase) local-ed in the spot or nucleus of the yeast cell and resent more diffusely in the cytoplasm as well. The xtreme dependency of the pyrophosphatase activity n magnesium ions as contrasted with a lesser depend-ncy of the phosphomonoesterase activity strengthens he contention that two different enzymes may be resent. The literature contains convincing chemical vidence[20,21,22] for the existence of a pyrophosphatase istinct from a phosphomonoesterase, although the wo are often associated together in a variety of lant forms. The appearance of a somewhat different localization of the reaction with hexametaphosphate as substrate may mean a third enzyme, for which there is some evidence from the work of Schäffner and Krumey[2].

APPLICATION OF DYNAMIC SIMILARITY TO METAL STRUCTURES WITH ELASTIC AND PLASTIC FLOW

By M. W. THRING
British Iron and Steel Research Association

IN the attempt to attain dynamic similarity for fluid flow systems, different dimensionless criteria appear according to whether momentum and viscosity, or momentum and gravity, are the dominant factors in deciding the flow pattern. The purpose of this communication is to show that a similar argument applied to the attempt to attain dynamic similarity for the flow of a metal structure gives also two alternative dimensionless criteria according to whether momentum and elasticity or elasticity and plasticity are the dominant factors.

For the purpose of dimensional analysis, it is sufficient to consider one dimensional movement, and the fundamental equation governing the motion of an element of the metal structure can be written in the simplified form

$$m\,\frac{\partial v}{\partial t} = P_x + \frac{\partial}{\partial x}\left\{f\left(\varepsilon, \frac{d\varepsilon}{dt}, \int_{\theta=\infty}^{\theta=t} K(t-\theta)\,.\,\sigma(\theta)\,.\,d\theta\right)\right\}, \qquad (1)$$

where m is mass of metal per unit length (gm./cm.); v is velocity of movement of volume element (this is related to ε, but it is not necessary to express the relation for the purposes of dimensional analysis) (cm./sec).; P_x is external force acting on unit length of metal (dynes/cm.^{2}); ε is normal strain (dimensionless); θ is parameter expressing the previous time at which a stress $\sigma(\theta)$ was applied (sec.); $K(t)$ is 'remembrance function' expressing the effect upon the present strength of previous application of stress[1].

The expression in the bracket on the right-hand side represents the difference between the stress acting upon the element of volume and the internal forces (elastic and plastic) resisting this stress. Its exact form is open to doubt; as expressed here it is equivalent to the assumption that these internal forces depend on the extent of the deformation, the rate of the deformation and on previous history. Orowan[2] has pointed out that even an equation of this form cannot express fully the behaviour of a metal, since it is possible to wipe out the entire influence of the past by a sudden extension of a few per cent. Even this statement implies, however, that the past history affects the present strength in a definite way although difficult to express mathematically. It is possible, therefore, for dimensional purposes to write equation (1) in the form

$$m\frac{dv}{dt} = P_x + \frac{d}{dx}\left\{E\varepsilon + \eta\dot{\varepsilon}\right\}, \qquad (2)$$

where both E (the instantaneous value of Young's modulus) and η (the instantaneous 'viscosity') are to be regarded as complex but definite functions of past history, having the dimensions of dynes/cm.^{2} and dyne-sec./cm.^{2} respectively.

When dimensional analysis is applied to equation (2), the condition for static similarity is the usual one; $N_1 = P/E$ must be the same in model and original, so that the forces per unit area in model and original must be the same if the same material is used (same value of E).

In flow systems where the inertia of the material itself and the elastic forces are the important factors, for example, in elastic oscillations of a clamped bar or in impact testing, the condition for dynamic similarity is that

$$N_2 = \rho\,\frac{V}{T}\Big/\frac{E}{L} = \frac{\rho}{E}\cdot V^2 \text{ or } \frac{\rho}{e}\cdot\frac{L^2}{T^2}.$$

Hence when the same material is used in model and original, the usual similarity condition applies, that velocities must be kept constant, that is, the time-scale must be shortened in proportion to the reduction of linear dimensions.

Where, however, plastic or viscous forces are important as well as elastic forces but the inertia of the material can be neglected, a different criterion for dynamic similarity appears. In general, it is now essential to use the same material for model as for original, and it then follows that the condition for similarity is that *the time-scale is the same in the model as in the original.* It follows that it is not possible to obtain dynamic similarity on a reduced scale where both inertial and rate-dependent plastic forces are important.

In the general case it is not possible to construct a suitable dimensionless criterion for this condition —if a Kelvin solid[3] could be found for which E and η of equation (2) were definite fixed quantities one could define a Kelvin Number:

$$N_K = \frac{\eta}{T}\Big/E = \frac{\eta}{E.T}.$$

The condition of equality of time-scale implies that the material of the model has been carried through the same past treatment of stress and heating on the same time-scale as the material of the original. The fundamental assumptions on which similarity is based when this condition is satisfied are those implied in the presentation of most experimental data on the engineering properties of metals, namely, (1) σ and ε are connected in the same way for specimens of different sizes; (2) if the metal is subjected to the same treatment over the same length of time internal condition is changed in the same way; which must be added the condition which separa the use of K_K from N_2; (3) the inertial forces m be negligible compared with the rheological ones

These three conditions enable the limits of app ability of the plastic criterion of dynamic similar to be defined as in the case of the R_e and F_r crite for fluid flow. Brittle fracture[4] and fatigue do satisfy the first condition because there is an absol scale of size inherent in each of these processes, that no similarity is possible with scale chan Fibrous fracture may in some cases not satisfy third condition and impact testing certainly d not. On the other hand, most cases of creep, inter damping, rate of loading effects, elastic after-effe and plastic flow in the work-hardening range sati the three conditions. In such cases similarity can attained even though external forces are of the imp type, provided the latter are suitably scaled as Similarly, in studying the effect of self-oscillations a structure upon permanent set, external loadi of the model structure to give the same period oscillation satisfies the conditions. The reproducti of joints in a structure on the model scale necessar gives rise to failures of similarity[5], which mak unsuitable the use of models of systems where t flow primarily takes place at joints.

This similarity criterion is very much easier satisfy than that of the Reynolds number, where t use of the same material implies that the time-sc must be shortened by n^2 if the length-sc is reduced by $1/n$; and may therefore have use applications in connexion with the laboratory stu of rate of loading and damping effects in such stru tures as wire ropes, ship or car hulls and girders.

CHOLINESTERASES

By Dr. KLAS-BERTIL AUGUSTINSSON
Biochemical Institute, University of Stockholm

IT is known that the cholinesterases from vario animal tissues are not identical, and it has bee proposed that two types of acetylcholine-splitti enzymes exist. This 'type theory' does not expla fully some of my recent observations[1].

Substrate specificity depends probably on the pr tein character of the enzyme molecule, which m vary from tissue to tissue. In blood serum, t enzyme is probably an albumin; in the red bloc cells, where it has been shown to be bound to t cell membrane, it is probably a lipoprotein. This also true for the cholinesterase of the nervo system, where the enzyme is bound to the ce structure. Hence, the red-cell esterase would expected to be related to the nerve esterase rath than the serum esterase, and this has, in fact, bee demonstrated. The enzymes from brain and re cells are said to be 'specific' cholinesterases, and i addition a 'non-specific' cholinesterase is said t exist, for example, in human serum, which hydrolyse etylcholine as well as aliphatic esters, for example, ibutyrin.

The use of acetyl-β-methylcholine and benzoyl- oline for distinguishing between these two types cholinesterase may sometimes be of value, but it not sufficient for a classification of these enzymes. comparing the activities of an esterase towards rious esters, the substrate concentrations must be nsidered. For example, the 'specific' cholinesterase lits both acetyl-β-methylcholine and acetylsalicyl- oline at a lower rate than acetylcholine at low sub- rate concentrations, but at a higher rate when bstrate concentrations are high. Bodansky[2] has own that the red-cell esterase acts on triacetin, d I find that this enzyme hydrolyses the acetyl- ter linkage in acetylsalicylcholine; the term pecific' is therefore not adequate.

In agreement with Richter and Croft[3] and with odansky[2], I regard the cholinesterases as a 'family' related enzymes with widely divergent properties. he following classification is based on the activity- bstrate concentration relationship for acetylcholine substrate. This classification leads me to distin- uish two groups. Group I contains enzymes which e inhibited at high concentrations of acetylcholine ptimum at $3 \times 10^{-3} M$). The enzymes of Group II llow the Michaelis–Menten formulation, which eans that the maximum rate occurs with infinite bstrate concentrations. Enzymes within each oup differ in certain other respects. There is no bsolute specificity to choline esters in either group.

Group I includes the cholinesterases of the nervous stem, of red blood cells, of *Helix* blood and of *epia* 'liver'. The red-cell and brain esterases are entical, but differ from the *Helix*-blood and *Sepia*- iver' esterases. Differences are seen in the action inhibitors such as choline, caffeine and quinine, d in the ability to split various esters. For ex- mple, the *Helix*-blood esterase is characterized by s high activity with acetylaneurine as substrate. he cholinesterase of shark plasma also belongs to is group.

Group II includes the cholinesterases of certain ra (for example, man, horse) and of the dart sac *Helix pomatia*. The serum esterases show inhibition y excess of benzoylcholine (optimum concentration $\cdot 0 \times 10^{-3} M$); this is not the case with the dart- c esterase, which hydrolyses benzoylcholine rather owly. The serum esterases are competitively in- ibited by choline, but not the dart-sac esterase.

Acetylcholine is the only choline ester found in nimal tissues, and this is why I define as a cholin- sterase an esterase which, under conditions optimal r the hydrolysis of acetylcholine, splits this ester ore rapidly than any other ester. Consequently e rapid hydrolysis of benzoylcholine by guinea pig ver is not due to a cholinesterase; this reaction not due to specific 'benzoyl-choline esterase'.

The optimum substrate concentration is increased the presence of the strongly basic clupein. The egatively charged gum arabic is known to have the pposite effect[4]. I was unable to confirm the finding Mendel and Rudney[5] that the addition of potassium loride caused a shift of the optimum substrate con- ntration. The affinity of the positively charged etylcholine ion for cholinesterase may be directly roportional to the negative charge of the enzyme. ence, with increasing negativity, optimum con- itions are shifted towards lower acetylcholine con- ntrations, that is, towards more physiological con- itions. I am inclined to think that such a change in cholinesterase activity occurs during nervous activity. In depolarization, the neuronal surface becomes more negative, and since cholinesterase is concentrated at this surface[6], enzymic activity becomes optimal at lower concentrations of acetylcholine.

CLAY MINERALS AS CATALYSTS AND ADSORBENTS

A WHOLE-DAY meeting of the Clay Minerals Group of the Mineralogical Society, held in the apartments of the Geological Society on January 23, was largely devoted to a discussion on the use of clay minerals as catalysts and industrial adsorbents; in the later part of the afternoon some general papers were also given.

Mr. R. H. S. Robertson (Glasgow) introduced the subject with a highly condensed account of the catalytic uses of clays, which could not adequately be summarized. He pointed out that so long ago as 1915, Gurwitsh studied the catalytic polymerization of unsaturated compounds by floridin, and this clay (the active element in which is attapulgite) has since been used in a wide variety of other reactions. Another clay about which much data are available is Japanese acid clay (montmorillonitic). Every type of organic reaction has been shown to be catalysed by one or other of the available types of clay.

Dr. F. E. Salt (Distillers' Co., Ltd.) described experiments on polymerization of α-methyl-styrene. This substance is not polymerized by heat alone, as styrene is; but in the presence of suitable clays it reacts at a low temperature to give low molecular weight polymers ('Polymeth') which may find uses as plasticizers or extenders, or (when mixed with castor oil) as microscope immersion media. The clays used were activated montmorillonites of German and English origin. In the discussion, Mr. Armitage (Lewis Berger and Sons) mentioned the use of such clays for polymerizing indene, coumarone and styrene.

An account of the uses of clays in cracking petroleum was given by Mr. J. N. Haresnape (Anglo-Iranian Oil Co.). Here again, activated montmorillonites are used, and they have to compete with the more effective, but more expensive, artificial products (silica–alumina gels), which were largely used during the War, when cost was a secondary consideration. The clay catalysts tend to alter during use, with production of excessive gas and carbon. This has been attributed to hydrogen sulphide adsorption, though the Anglo-Iranian workers have found that clays of high iron content show this type of activity even with low-sulphur feedstocks.

In practical operations with clay catalysts, difficulty arises from the very large quantity of catalyst which has to be put through a cycle of use and regeneration by heat. One successful practical method of doing this is the fluidizing technique, which was described by Dr. T. H. Blakeley (Esso Development Co., Ltd.), and illustrated by a film and demonstration. In this method small granules (20–40 μ) of catalyst are agitated by an upward stream of oil vapour, in which state they show many of the properties of a liquid, and may be dealt with in a continuous process. Plants working on this principle which are in use or on order (excluding the U.S.S.R.) are capable of dealing with 60,000,000 tons of feedstock per year.

In a discussion on the process of activation of montmorillonites, Dr. B. S. Emödi (Fullers' Earth Union, Ltd.) explained that, by means of acid treatment, the crystalline structure appears to be partly broken down. The improved catalytic activity may be associated with the presence of free colloidal silica, or with the greater effective surface of the mineral, or with both factors.

The afternoon session contained papers on topics connected with adsorption. It was opened by Mr. A. Ibison (W. Bibby and Sons, Ltd.), who dealt with the adsorption of colours from oils and solvents. He stressed the importance of fixed conditions of temperature, moisture, acidity, etc. Adsorption isotherms, corresponding to maximum percentage colour adsorbed at each colour concentration, are then found to be of the Langmuir type with non-activated clays, and steeper with the activated type.

Dr. G. W. Nederbragt (Bataavsch Petroleum Mij, Amsterdam) described the use of floridin for separating long-chain from branched-chain hydrocarbons. The technique used is essentially that of chromatographic analysis with pentane as the solvent. The author suggested that the selective adsorption of normal hydrocarbons is due to the channels present in the structure, as described by Bradley[1].

Experiments on the adsorption of basic dyes by calcium montmorillonite were described by Dr. Emödi. It was observed that while the dye adsorbed is nearly equivalent to the base-exchange capacity of the clay (104 m. equiv. per 100 gm.), usually only 30–80 m. equiv. of calcium are released, the discrepancy increasing with the number of benzene rings in the molecule. From calculations of the frequency of calcium ions between the montmorillonite sheets and the area of the dye molecules, the theory was advanced that the latter are adsorbed between the unit plates, but mainly near the edges, thus blocking the outlet of many exchangeable calcium ions. The clay particles thus become positively charged and can adsorb negative ions.

Dr. D. M. C. MacEwan (Rothamsted Experimental Station) suggested that the mechanism of formation of organic complexes by montmorillonite may be closely connected with surface adsorption on such minerals as mica, the tendency of the clay mineral sheets to gather one or more adsorbed layers of molecules providing a repulsive force between them, while the balancing attractive force may be electrostatic in nature. Using Bangham's data[2] on mica adsorption, it is possible to get a potential curve for methanol showing a minimum in the right position.

Two general papers, descriptive of work done under a programme of research for the British Iron and Steel Research Association, were given by Dr. J. White and collaborators of the University of Sheffield. The substance of the paper by B. Vassiliou has already appeared in *Nature*[3]. The second (with P. Murray) dealt with an attempt to measure reaction constants and activation energies for the thermal dissociation of structural water in different types of clay, using both constant and steadily increasing heating rates. Good results were obtained with kaolinitic and micaceous clays enabling the form of thermal analysis peaks to be reproduced from the calculated data; but with a montmorillonitic clay the values obtained for the constants depended on the conditions of heatin a point which is now being investigated.

Comparison of the papers given in the mornin and afternoon sessions suggested that phenomena adsorption tend to be better correlated with what known of the clay mineral structures than those catalysis. Meetings such as this should therefo serve a useful purpose by bringing together cla mineralogists with chemists working on the proble of catalysis, and enabling them to exchange inform ation.

D. M. C. MacEwan

ELM DISEASE

ELM disease has been a serious pest in Britai during the last score of years. The Forestr Commission has issued Leaflet No. 19 (London H.M. Stationery Office, 1947), which is an up-to-dat account of what is known at present about thi disease, the life-histories of the associated bar beetles, and control measures.

The attack in most parts of England and Wales i by now pretty well known, and the trees eithe die down from the top, or they may die from th top down one side. Usually the cause of the die back is the fungus *Ceratostomella ulmi* Buism. workin in association with *Scolytus* elm bark beetles. Whe this disease was first discussed, it was known as th Dutch elm disease, having come into Britain from, i was thought, Holland. Its connexion at that tim with the bark beetle was not generally appreciate The fungus is a member of the *Ascomycetes*. It exist in the tree mainly in the form of small yeast-lik bodies, which multiply rapidly by budding, and ar carried along in the water-conducting vessels wit the sap. The fungus produces a toxic substanc which not only poisons the affected branch, but als stimulates the vessel walls to produce gum-containin bodies. These tend to block the vessels and thus lea to death from lack of water, as well as from direc poisoning.

As is well known, bark beetles are especiall dangerous to a tree when anything has occurred t stop or to lessen the upward flow of sap. In the cas of elm disease, when the sap flow becomes restricte the well-known elm bark beetles, *Scolytus scolytu* (*destructor*) and *Scolytus multistriatus*, can make thei breeding grounds in the bark with comparative eas The grubs hatching from the eggs thus have a cam bium layer, with a restricted flow of sap but sufficien to keep it fresh, upon which they feed.

The fungus can only produce its minute an delicate fructifications in very sheltered situation such as under loosened bark or in the beetle gallerie The fructifications are of two kinds, black flask shaped bodies (asci) and thin black stalks (coremia) both are about 1 mm. in length, and both bea microscopic spores at the top in round drops c mucilage. Although they are visible to the naked ey when produced in mass, they are hard to find, an of little value, therefore, in early diagnosis.

Ceratostomella ulmi is not the only cause of diseas in elms; but in the south of England, at any rat it outweighs all other diseases in importance. I Scotland the wych elm is subject to a dieback les rapid and usually less severe than that caused by true elm disease; the cause is as yet unexplained. Elms in towns may be killed by gas leakages, and those in unfavourable situations are often injured by drought or excessive water in the soil; but these causes of death are easily distinguished from the elm disease proper.

Bull. 841, Cornell University Agricultural Experiment Station (September 1947) also deals with elm disease; it is entitled "Log Treatments for Bark Beetle Control in connection with the Dutch Elm Disease". The bulletin is devoted to the assembly of the principal data from a series of long-treatment experiments carried out at the Dutch elm disease esearch laboratory of the New York State College of Agriculture. The War stopped a number of the experiments which were in hand, and others which had been planned were not begun. It was therefore decided to publish all the results of the work so far arried on, so that this information might be available for the continuation of research, and the determination of control programmes.

The fungus is the same as that mentioned above, but the beetles working in conjunction with the fungus in the United States are *Scolytus multistriatus* and *Hylurgopinus rufipes*. The disease organism is described as harbouring in bark beetle galleries made in wood from healthy trees, as well as from diseased rees, and is carried out and distributed by the beetles which emerge. The proper disposal of dead and dying elm wood which is suitable for bark beetle breeding, even if it is not from diseased trees, is herefore an essential feature of a local Dutch elm disease programme.

It is not possible to deal more closely with the ontents of this most interesting bulletin, which is well worth studying, with its interesting illustrations. t is, however, a matter of considerable interest that the so-called Dutch elm disease has now become very widespread, and it certainly requires intensive investigation. The present writer has himself been watching infested trees of his own during the past twenty years, and as one outcome of the observations carried out, considers it does not follow that a tree attacked will die, for it may throw off the disease. In this there is possibly some connexion between the vigorous state of the tree, and the fact that the *Scolytus* beetles do not get the upper hand; in fact, quite possibly they are unable to make their reeding galleries, owing to the flow of sap being too strong.

E. P. STEBBING

NATIONAL INSTITUTE OF ECONOMIC AND SOCIAL RESEARCH

THE annual report of the National Institute of Economic and Social Research for 1946–47 records no change in the financial situation; grants rom the Rockefeller Foundation, the Leverhulme Trustees and the Nuffield Foundation continuing to e the mainstay of the Institute's finances, and a pecial grant of £1,000 was made by the Nuffield Foundation for the support of a book to be published under the title "Lessons of the British War Economy", which is intended to form a professional symposium on British war economics. With funds of the Garton Foundation, transferred to the Institute in 1942, it has been decided to establish an annual Garton Prize, probably of the value of 100 guineas, which was to be offered for competition in 1948. It is intended to publish the prize-winning essay in a special Garton Monograph Series. Experience with the Senior Research Fellowship scheme which terminated during the year showed the value of the scheme in assisting university research during the transition period; but the increased funds becoming available for research in the social sciences in the universities of Great Britain have diminished the need for special awards for experienced research workers, and there is already difficulty in finding persons of sufficient maturity and experience for the programmes planned.

A grant was made to Bedford College in support of the research project entitled "An Enquiry into the Social Factors Determining Earned Income" being carried out by Mrs. Barbara Wootton, another to the Department of Applied Economics, University of Cambridge, for a senior research worker for the output section of the inquiry into expenditure, output and income, 1920–38, and another to provide Prof. E. Victor Morgan, at University College, Swansea, with part-time research assistance for the project "Studies in British Financial Policy, 1914–25". It was expected that the report of the Joint Advisory Sub-Committee with the Institute of Chartered Accountants on the meanings and uses of terms commonly employed by both accountants and economists would be ready for submission to the Joint Exploratory Committee early in 1948. The Institute has also agreed to co-operate in the provision of bibliographical service with the International Association for Research in Income and Wealth.

The fourth issue of the "Register of Research in the Social Sciences" was circulated in the spring of 1947, and the "Register" is in future to be published as an annual available on a subscription basis only. In regard to research programmes, the major task of fact-collecting for the "Distribution Enquiry" has been completed, and work on each of the three main parts of the "Building Enquiry" progressed steadily. Work has continued on the "National Expenditure, Output and Income, 1920–38, Enquiry", and a new investigation, to be called "The Social Accounts of Local Authorities", has developed out of work on the Public Authority section. The report on international comparisons of productivity in British and American manufacturing industry has been circulated privately to a limited number of research centres, Government departments and other organisations.

The contribution of the independent research institute is discussed at some length in the report, which points out that such organisations are the natural complement of the universities, with which, and Government departments, the report of the Clapham Committee was solely concerned. They can undertake investigations which are unlikely to be developed under university conditions, and apart from providing a common meeting-place for representatives of different interests and different approaches to the social sciences, they can take risks in opening new ground or trying expensive new methods which an individual scholar or university might not be able to afford. Among the ancillary functions of the independent research institute, special emphasis is laid upon that of providing a clearing house for information.

The Institute in March 1947 called an informal conference of some forty persons responsible for the conduct or organisation of research. As a result of this conference, a report was published entitled "Social and Economic Research and Government Departments" which has been given a wide circulation. The conclusions of the conference are embodied in a set of practical proposals which go far towards providing means for unravelling the difficulties of the research worker in the social sciences in his dependence on official sources of data. For example, the conference urged that it is a matter of first importance that general principles governing the confidential character of official material should be formulated. It also recommended that in drawing up the departmental schedules governing the preservation and destruction of records, outside experts should be consulted. Other pressing problems such as the automatic release of certain collections, the setting of time-limits to the inaccessibility of documents, the publication of material by Government departments in signed articles, the development of research bulletins and the need for outside expert advice on new collections of data were also considered by the conference ; an appendix to the report lists twenty-four major collections, tabulations and analyses of data known to exist in Government departments or which can readily be compiled and are of basic importance to research workers. The report, however, is only a first step, and the conference can be convened again when there is work for it to do.

APPOINTMENTS VACANT

APPLICATIONS are invited for the following appointments on or before the dates mentioned :

CHIEF ANIMAL HUSBANDRY OFFICER, Department of Agriculture and Lands, Southern Rhodesia—The Secretary, Rhodesia House, 429 Strand, London, W.C.2 (August 5).

SENIOR CHEMISTS to take charge of small research teams on physical and chemical problems of coal tar and its processing, an ANALYST to take charge of Analytical Department, RESEARCH CHEMISTS to work on the constitution of coal tar and refining processes, an INTELLIGENCE OFFICER AND LIBRARIAN to take charge of a Technical Library, etc., and ABSTRACTORS (male or female graduates in chemistry with a working knowledge of French and/or German)—The Director of Research, Coal Tar Research Association, 9 Harley Street, London, W.1 (August 7).

RESEARCH AWARD IN THE DEPARTMENT OF ZOOLOGY—The Registrar, University College, Hull (August 7).

ASSISTANT LECTURER (Grade III) IN GEOGRAPHY—The Secretary, The University, Edmund Street, Birmingham 3 (August 7).

ASSISTANT ADVISORY OFFICER IN AGRICULTURAL BOTANY—The Secretary, Edinburgh and East of Scotland College of Agriculture, 13 George Square, Edinburgh 8 (August 7).

LECTURER IN ELECTRICAL ENGINEERING—The Principal, Royal Aircraft Establishment Technical College, Farnborough, Hants (August 10).

EXPERIMENTAL OFFICER at the Forest Products Research Laboratory, Princes Risborough, to assist in research work in connexion with woodworking machinery and sawmill problems—The Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2206 (August 11).

HEAD OF THE HORTICULTURAL DEPARTMENT of the Kent Farm Institute, Sittingbourne, and a LECTURER IN HORTICULTURE AND RURAL STUDIES at the Kent Horticultural Institute, Swanley—The County Education Officer, Kent Education Committee, Springfield, Maidstone (August 14).

RESEARCH ASSISTANT IN THE DEPARTMENT OF MINING—The Registrar, The University, Sheffield (August 14).

LECTURER with special qualifications IN PURE MATHEMATICS (or ASSISTANT LECTURER)—The Registrar, University College, Hull (August 14).

SENIOR LECTURER (temporary) and LECTURERS (2) IN MATHEMATICS at Auckland University College, Auckland, New Zealand—The Secretary, Universities Bureau of the British Empire, 8 Park Street, London, W.1 (August 15).

LECTURER IN THE DEPARTMENT OF METALLURGY—The Registrar, The University, Liverpool (August 23).

SENIOR LECTURER IN PRODUCTION ENGINEERING—The Registrar, College of Aeronautics, Cranfield, Bletchley, Bucks, endorsed 'Senior Lecturer in Production Engineering' (August 23).

CHEMISTS (men and women) for unestablished appointments in the grades of SCIENTIFIC OFFICER Class and EXPERIMENTAL OFFICER Class, for analytical work in connexion with atomic energy development—The Ministry of Labour and National Service, Technical and Scientific Register, K Section, York House, Kingsway, London, W.C.2, quoting F.78/48A/2 (August 24).

ENGINEERING INSPECTOR IN THE FIRE SERVICE DEPARTMENT of the Home Office—The Secretary, Civil Service Commission, Scientific Branch, 27 Grosvenor Square, London, W.1, quoting No. 2208 (August 24).

SENIOR PROFESSIONAL OFFICER FOR CERAMIC AND REFRACTOR RESEARCH, Government Metallurgical Laboratory, University of th Witwatersrand, Johannesburg—The Director, Government Meta lurgical Laboratory, c/o Victor Reid, South Africa House, Trafalg Square, London, W.C.2 (August 31).

LECTURER IN THE DEPARTMENT OF PURE MATHEMATICS, Universit of the Witwatersrand, Johannesburg—The Secretary, Universiti Bureau of the British Empire, 8 Park Street, London, W.1 (Augu 31).

PROFESSORSHIP OF ECONOMIC AND MINING GEOLOGY in the Un versity of Adelaide—The Secretary, Universities Bureau of the Britis Empire, 8 Park Street, London, W.1 (August 31).

READERSHIP IN BIOCHEMISTRY at the Royal Cancer Hospital-The Academic Registrar, University of London, Senate House, Londo W.C.1 (September 1).

RESEARCH FELLOWSHIP and a RESEARCH ASSISTANT IN THE DEPAR MENT OF ECONOMICS of Natal University College—The Secretar Universities Bureau of the British Empire, 8 Park Street, London, W (September 1).

ASSISTANT LECTURER IN THE DEPARTMENT OF PHYSICS, Universit College of the West Indies, Jamaica—The Secretary, Inter-Universit Council for Higher Education in the Colonies, 8 Park Street, Londo W.1 (September 15).

PROFESSOR OF ZOOLOGY at Makerere College, Kampala, Uganda-The Secretary, Inter-University Council for Higher Education in t Colonies, 8 Park Street, London, W.1 (September 15).

LABORATORY STEWARD IN THE DEPARTMENT OF SCIENCE AN TECHNOLOGY—The Principal, Cambridgeshire Technical Colleg Collier Road, Cambridge.

LECTURER IN BOTANY, and a DEMONSTRATOR IN GEOLOGY—Th Registrar, University College, Exeter.

ASSISTANT LABORATORY STEWARD IN THE DEPARTMENT OF ZOOLOG —The Head of the Department of Zoology, University College, Hul

DIRECTOR OF THE WEST AFRICAN FISHERIES RESEARCH INSTITUT Sierra Leone—The Under-Secretary of State, Colonial Office, Researc Department, Sanctuary Buildings, Great Smith Street, London, S.W.

LECTURER IN THE MATHEMATICS DEPARTMENT—The Principa Northampton Polytechnic, St. John Street, London, E.C.1.

LABORATORY ASSISTANT (woman) at Aylwin School, Southwar Park Road, S.E.16—The Education Officer (Estab. 2), London Count Council, The County Hall, London, S.E.1.

LECTURER IN PHYSIOLOGY up to B.Sc. standard—The Clerk to th Governors, Chelsea Polytechnic, Manresa Road, London, S.W.3.

ENTOMOLOGIST IN THE RESEARCH DIVISION of the Department Agriculture and Forests, Sudan Government—The Sudan Agent London, Wellington House, Buckingham Gate, London, S.W.1, endorsed 'Entomologist Agriculture'.

CHIEF MECHANIC to take charge of workshop attached to medic research unit—The Director, Radiotherapeutic Research Unit, Medic Research Council, Hammersmith Hospital, Ducane Road, Londo W.12.

PHOTOGRAPHIC TECHNICIAN with experience in photo-micrography for M.R.C. Biophysics Research Unit—Prof. J. T. Randall, King College, Strand, London, W.C.2.

TECHNICIAN (with considerable experience in routine investigatio IN THE DEPARTMENT OF CHEMICAL PATHOLOGY, and a TECHNICIA to be responsible for preparation of teaching classes in Organic Chemistry, Biochemistry and Chemical Pathology—The Secretary, Charin Cross Hospital Medical School, 62 Chandos Place, London, W.C.2.

SENIOR SCIENTIFIC OFFICER (G. 224/48A) to take charge of Biolog and Chemistry Section, a SENIOR SCIENTIFIC OFFICER (A.185/48A) t take charge of Physics and Electronics Section, a SCIENTIFIC OFFICE (F.429/48A) for investigation of deterioration of materials and complete equipment exposed under tropical conditions, a SENIOR EXPER MENTAL OFFICER (A.186/48A) to lead a team working on Electronic EXPERIMENTAL OFFICERS AND ASSISTANT EXPERIMENTAL OFFICE for work in the following Sections : Chemistry (F.430/48A), Biolog (G.225/48A), Physics and Electronics (A.187/48A), General Engineeri (C.415/48A), at the Ministry of Supply Tropical Testing Establis ment, Port Harcourt, Nigeria—The Ministry of Labour and Nation Service, Technical and Scientific Register (K), York House, Kingswa London, W.C.2, quoting the appropriate Ref. No.

METALLURGIST to work in the Mechanical Testing Section—T Secretary, British Non-Ferrous Metals Research Association, 81- Euston Street, London, N.W.1.

SENIOR LABORATORY ASSISTANT—The Headmistress, Maidsto Grammar School for Girls, Maidstone.

THEORETICAL PHYSICIST or MATHEMATICIAN (preferably with knowledge of matrix and tensor calculus), and an EXPERIMENTAL PHYSICI (if possible with some experience in instrument design) for researc on the rheological properties of materials, an ELECTRONICS PHYSICI for fundamental research in applications of microwaves, and PHYSICIST with experience of high vacuum and interferometry techniques—The Secretary, British Rayon Research Association, Bridg water House, 58 Whitworth Street, Manchester 1.

ANALYST IN THE DEPARTMENT OF CHEMISTRY of the School Agriculture, Sutton Bonington, Loughborough—The Registra University College, Nottingham.

ASSISTANT LECTURER IN GEOGRAPHY, a LECTURER IN PHARMACOLOGY, a DEMONSTRATOR IN PHARMACOLOGY, an ASSISTANT LECTUR IN PHARMACEUTICS, and a DEMONSTRATOR IN PHARMACEUTICS—T Registrar, University College, Nottingham.

PHYSIOLOGIST to obtain experience for from 1 to 2 years in Americ teaching and research—Prof. H. C. Bazett, Department of Physiolog University of Pennsylvania, Philadelphia, Pa., U.S.A. (write by a mail).

PHYSICIST—The House Governor, Royal Hospital, Wolverhampto

ASSISTANT GAME WARDEN—The Sudan Agent in London, Wellin ton House, Buckingham Gate, London, S.W.1, endorsed 'Assista Game Warden'.

ASSISTANT LECTURER (temporary) IN MATHEMATICS—The Registra University College, Singleton Park, Swansea.

INSPECTOR OF AGRICULTURE, Department of Agriculture and Forest Sudan Government—The Sudan Agent in London, Wellington Hous Buckingham Gate, London, S.W.1, endorsed 'Inspector of Ag culture'.

DISTRIBUTION OF SCIENTIFIC MAN-POWER

FROM the national point of view, a proper balance must be struck between productive effort and research effort, as in any successful private business ; it is the task of management to secure that the appropriate balance is achieved, and that it is achieved without diverting too many creative and fertile minds to the equally essential task of administration. This is the point of view from which the present organisation of scientific and industrial research in Great Britain must be considered. As Sir John Anderson rightly said in his lecture to the Society of Chemical Industry when he received the Messel Medal on July 14, Great Britain has been a pioneer among the nations in the organisation of scientific research ; but nevertheless we must have the organisation of science in the public service constantly under review. In particular, it is essential that we should consider whether, by any changes in the existing organisation or by more careful use of our limited scientific man-power, we can rectify admitted weaknesses in the development of research results, and in the supply of trained scientific men and technologists.

It seems clear from its first report that the Advisory Council on Scientific Policy is concerning itself with this broad question ; but it is equally important that the scientific and industrial world should be provided with adequate data on which to base a sound and independent judgment of the correctness of Government organisation and policy. That is the fundamental reason why early resumption of the publication of full reports from the Department of Scientific and Industrial Research is so important. Moreover, since a sound judgment cannot reasonably be made on the results of any one year, it is the more important that there should be available as early as possible a full account of the war effort, and especially before the Department is irretrievably committed to any schemes of expansion which involve large drains on man-power or equipment.

Admirably as the recent report from the Chemistry Research Board (see p. 228 of this issue) fills the need from one point of view—and there can be nothing but praise for much of the work done and also for the special attention being given to the development of new techniques for the benefit of both industry and science—a striking feature of the report illustrates the necessity for completing the picture. This is the way in which the work of the Chemical Research Laboratory is linked up with that of other Government institutions and departments. The Corrosion of Metals Section, for example, has collaborated with the Light Division of the National Physical Laboratory and with the British Iron and Steel Research Association, as well as with the Water Pollution Research Laboratory, the British Cast Iron Research Association and the British Non-Ferrous Metals Research Association, and has carried out work for the Ministry of Supply and the Ministry of Works. The High Polymers and Plastics Section has worked with the Engineering Division of the National Physical Laboratory and the Forests Products Research Laboratory, and the Coal Tar Section with the Heat Section of the Physics Division and the Metrology Division of the National Physical Laboratory. The Chemistry Research Board itself directs attention to contacts maintained with other departments and to field trials by the Colonial Office on the control of nagana in Africa by the use of phenanthridinium compounds prepared in the Laboratory, as well as the development of the production of food yeast in Jamaica.

There can be no question as to the value of such collaboration in achieving economy of effort and equipment, and whatever doubts are entertained as to the value of the research association movement, there are *a priori* reasons for believing that the work of such institutions as the Chemical Research Laboratory is thoroughly sound, and that under the Chemistry Research Board it is making an important, and possibly a vital, contribution to the advancement of science and to industrial development, apart from the study of the specific scientific problems which arise in the public service. The very way in which it is interlocked with the work of other bodies, however, makes it important that we should consider the Government organisation of research as a whole. Otherwise there is danger that justifiable expansion at one point may have serious and undesirable repercussions on activities elsewhere which it is vital to maintain or even expand.

It was noticeable that, in his address at Edinburgh, Sir John Anderson was purely descriptive and neither commended nor condemned what he described, though those who followed his survey closely might perhaps have gained from his inflexions some idea of the general trend of Sir John's own mind. Neither can it be said that the Advisory Council on Scientific Policy has in its first report addressed itself to the broadest aspects of the question. The Council was asked by the Government to make recommendations on the specific questions, *inter alia*, of the appropriate organisation for scientific research within the Government, with special reference to research on building and on fuel and power, and the appropriate form of research effort to assist the maximum increase in national productivity during the coming decade. In regard to the former of these problems, the Advisory Council was asked to consider, in particular, what should be the respective functions of Government departments, of the research councils and of outside bodies (including the boards of socialized industries) in carrying out research.

The Advisory Council recognizes that on one hand research of the highest quality depends on a freedom which is difficult to reconcile with the normal conditions of Government work, and on the other hand, that close contact between the research worker and the user of the results of applied research is essential in order that the results obtained may be of practical value and supply data and a satisfactory foundation for the research itself. It therefore devoted considerable time at the outset to discussion of the general principles which should apply to the organisation of Government research and its applicatio and as a result reached agreement on two genera principles. First, the executive department shoul be responsible for identifying problems requirin research, settling their order of priority, decidin where the various investigations should be carrie out and applying their results. Secondly, the researc councils, and particularly the various branches of th Department of Scientific and Industrial Researc should continue to be free to initiate backgroun research where they think fit, free from administrativ control of the executive departments and consequently from considerations of day-to-day expediency

Like Sir John Anderson in his lecture, the Advisor Council rejects the idea of a Ministry of Science an agrees that no attempt should be made to concentrate responsibility for carrying out all Governmen scientific research on the Lord President of th Council. It considers that this would intensify rathe than diminish the old cleavage between science administration and policy; although the Lor President should assume a particular concern fo such branches of scientific research as have a wide application than to the problems of a particula department.

While there will probably be much general suppor for these views, it will be noted that the Advisor Council does not discuss in the present report th effectiveness or adequacy of the general structure, o whether its disposition as between Government an industry could be improved with advantage to th public welfare. This is the more important in vie of the next conclusion, that if the executive departments are to discharge their considerable scientifi and technical responsibilities thus defined, they wi require to employ considerable scientific staff corresponding to the operational research unit attached to the Service Ministries and Command during the War. The appointment of a 'chief scientifi officer' by the departments, provided with an adequat staff, however admirable in principle, may well b open to question on practical grounds at the presen juncture. Can we really afford to withdraw suc men from production while we are still awaiting th increase in scientific and technological man-powe recommended by the Barlow Report ?

The recommendation, it is true, is in line with th observations in the report of the Select Committe on Estimates, which in its third report for th Session 1946–47, dealing with expenditure on researc and development, referred to the absence of sufficien provision for the identification of scientific problem in day-to-day administration as one of the greates weaknesses in the Government organisation. Th Select Committee itself recommended the appoin ment in all executive departments of scientifi advisers who should have a high standing and direc access to the policy-forming level. There can only b welcome for any proposal which will give the scientifi man more influence in guiding the formulation a well as the administration of policy, and for th recommendation that executive departments to th work of which science can contribute should assum a more positive role than hitherto in the organisatio and direction of research required for their own purposes and in supervising the application of its esults. Nevertheless, however urgent and essential may be the appointment of chief scientific officers or the planning of the present Government research programme in the best way to meet national needs, the question must still be asked where the men are to be found, and whether there are not other activities which could be curtailed or discontinued to release men for such work.

These recommendations were submitted by the Advisory Council in a general report on May 22, 947, and two such appointments have since been made, to the Ministry of Food and to the Home Office respectively. The same principles have been applied to the Council's consideration of the special requirements of building research. Here it recommends that the Department of Scientific and Industrial Research should retain full responsibility for scientific research and initial development in building, as well as its freedom to initiate research and undertake investigations at the direct proposal of the building industry. The Ministry of Works should retain the broad responsibilities indicated for executive departments in general, including that of keeping the technical development of the building industry under review, promoting the final stages of development, and encouraging the use by industry of the results of research. For the discharge of these scientific functions the Advisory Council recommends, in addition to the appointment of a 'chief scientific officer', a scientific advisory council of scientific men and representatives of the building industry in equal proportions, and such a Council on Building and Civil Engineering and Development was established on December 8, 1947. Under these proposals, the responsibility for identifying the problems requiring research and determining their priority, as well as for initiating research in the sociological or economic field, rests with the Ministry of Works. In like manner he Advisory Council recommended that the scientific and engineering staff of the Ministry of Fuel and Power should be substantially strengthened, and that a 'chief scientific officer' should be appointed with adequate status and with responsibility for making a broad strategic survey of the problems on which to base a general research problem for the fuel and power industries. He would be assisted by an advisory council including not only scientific men but also economists, administrators and men of wide practical experience in the nationalized industries. The Advisory Council has rejected a suggestion to transfer he Fuel Research Station to the Ministry of Fuel and Power; but advised that the Station should continue to act as an agent in carrying out such research as the Ministry may decide to allocate o it.

There can be no doubt that, under its terms of eference, the Advisory Council on Scientific Policy is discharging important functions not hitherto provided for, and its first report encourages the hope hat the Council will go much more closely into such mportant questions as the appropriate pattern for he scientific organisation of Government departments in general as well as that of the general structure of the organisation of scientific and industrial research in Britain, the principles on which research in the nationalized industries should be organised and the overall requirements of scientific man-power and the appropriate measures for its recruitment and training. Meanwhile, its report should reassure those who fear that the conduct of scientific research by Government departments or the research councils will be over-planned. Its pronouncements on the status of 'chief scientific officers' will be welcomed by those who have urged, as has been done in these columns for many years, that the scientific man should be given the status which will enable him to make his voice heard effectively in the determination of policy where scientific factors are involved; and that the possession of scientific qualifications should not constitute a bar to advancement to positions of the highest administrative responsibility when the requisite administrative talent is joined to such qualifications.

Nevertheless, the report will inevitably cause some misgivings. As is rightly emphasized, to meet the urgent requirements of the economic situation the direction in which scientific research and development should be promoted cannot be determined solely from the point of view of science itself; and its gravity makes it essential to develop quicker and more efficient application of the results of fundamental research, demanding in turn an efficient scientific organisation in executive departments and a better supply of the type of technologist who can effectively apply the results of fundamental research. It is no easy task to strike the right balance between long-term and short-term interests, between the needs of academic and industrial research, between the requirements of science and Government; and however valuable the Advisory Council may prove in future in deciding such issues in terms of an overall scientific and economic policy, the present report will not satisfy those who believe that an excessive proportion of the general as well as the scientific man-power of Britain is being diverted from productive to non-productive occupations.

This is not to suggest that research is non-productive; but as we have already stressed, if too large a proportion of scientific workers is employed on research or the dissemination of its results, there will not be enough available to apply those results. The Advisory Council does not entirely ignore this question of production; but the special Committee on Research and Productivity appointed by the Advisory Council, with Sir Claud Gibb as chairman, and the functions of which have now been transferred to a new and independent Committee on Industrial Productivity, was concerned more especially with the human factor in production, and such matters as nutrition and production and the improvement of technical information services. The fundamental question of the proper distribution of the scientific man-power of Britain between defence and civil requirements is only touched upon in that part of the Advisory Council's report which deals with scientific man-power, and even here the vital issue of the distribution between productive industry and other civil requirements, including services of all kinds, is not adequately examined. This, however, is really the most important section of the Advisory Council's report, and requires fuller discussion in the light of the revised estimates of university expansion and the prospective demand for scientific man-power which have appeared since the Barlow Committee reported in 1946.

CHEMICAL SYNTHESIS MADE EASY

Synthetic Methods of Organic Chemistry

A Thesaurus. By W. Theilheimer. Vol. 1: 1942–1944. Translated from the German by Hans Wynberg. Pp. x + 254. (New York and London: Interscience Publishers, Inc., 1948.) 30*s*.

THIS is a new type of organic chemical publication. The volume under review is a translation of a German version published in Basle in 1946, and purports to cover the original literature of the period 1942–44. In fact, references to earlier publications are frequently given. Volume 2, covering the literature of 1945–46, has now been published in German, and presumably an English translation of this will appear in due course. If there is to be a series of volumes appearing at two-year intervals, then steps should be taken to reduce this time-lag between publication of the original Swiss edition and the appearance of its translation. The work is described as a "Thesaurus", a word which is defined by the Shorter Oxford English Dictionary as meaning a 'treasury' or 'storehouse' of knowledge. This savours somewhat of grandiosity, and it remains to be seen whether organic chemists will regard the work so highly as the description implies. For the present, they will be content to accept the commendation of Prof. Reichstein in the foreword which he contributes, and to give the volume a conspicuous place on their shelves of reference works.

The author's intentions are admirable. The present volume summarizes more than seven hundred reactions, with literature references, and the information collected will be of value not only to those who are interested in synthetic methods but also to those who have a general interest in organic reactions and their current applications. As Prof. Reichstein points out in his foreword, the actual methods of organic chemistry are not classified and recorded in such a highly systematic way as are new compounds. Until recently the best available reference book for methods was "Houben", which is now a little out of date, and although there are excellent newer books on methods, such as "Organic Reactions" and "Newer Methods of Preparative Organic Chemistry", these deal only with reactions in strictly circumscribed fields.

Dr. Theilheimer has attempted to give a systematic survey of reactions likely to be of value in organic synthesis. This has of necessity meant making a selection, based on personal preference. The supreme difficulty of the project has been to devise a system of classification sufficiently simple to enable the entries relating to the desired reactions to be found readily; and sufficiently elastic to allow for an increase in the range of reactions to be included in future volumes. To meet this difficulty the author has devised a new form of symbolism, based on the system of classification used by C. Weygand in his "Organisch-chemische Experimentierkunst" (also available in an
English translation). Probably familiarity with
system will enable the user to find at once the ref
ences to the reaction in which he is interested ;
until he has acquired this familiarity the novice
be inclined to flounder rather helplessly, and
probably tend to rely on the index which, althou
good, is by no means perfect. It would have been
assistance if a table of contents could have be
included, with page numbers of the main headin
such as "Formation of C–C Bond".

For the most part, the methods enumerated do
appear to be new, but are examples of reactio
already known, taken from the literature of t
period under review. It is doubtful whether the ide
system of classification has been found. The syste
used results : (*a*) in the grouping together of reactio
which have very little in common except the natu
of the linkage which appears in the product, and (*b*)
the wide dispersal of very similar reactions. As
example of the latter we find that reactions number
652 and 768 are of precisely the same type, namel
union of aromatic nuclei by elimination of hydrog
halide by means of potassium hydroxide. There a
some inconsistencies. Aromatic rings are sometim
shown with Kekulé double bonds and sometimes no
it is curious to find potassium alcoholate listed in o
place as a reagent for the preparation of α-*iso*nitros
ketones and in another place sodium nitrite. Also,
is a little odd to find acetic acid and sulphuric ac
among the reagents used for nitration. The formul
appear to have been transcribed exactly from th
Swiss edition, even to the errors which have bee
detected in the formulæ given under numbers 192 an
695. In some cases translation has been accompanie
by the appearance of new errors. Thus, in sectio
No. 147 the name of an author is spelt incorrectl
and in section No. 152 2-acetylfluorene is erroneousl
given as 8-acetylfluorene. These, however, are mino
matters, and the author is to be congratulated on
courageous attempt to fill a serious gap in the literature of organic chemistry.

J. W. COOK

BIOLOGICAL STANDARDIZATION OF VITAMINS

The Biological Standardisation of the Vitamins

By Dr. Katharine H. Coward. Second edition. Pp
vii+224. (London: Baillière, Tindall and Cox
1947.) 16*s*. net.

SINCE the early 1930's, Dr. Katharine Coward ha
worked untiringly to popularize sound method
of biological standardization of vitamins. The firs
edition of her book appeared in 1938. In bringin
out the second she has the satisfaction of preachin
to the almost converted. The last ten years hav
seen no spectacular change in the principles o
biological assay of vitamins, but much refinement o
technique and broadening of scope. Dr. Coward ha
catered for both, but has followed her original pla
of discussing only those tests of which she has per
sonal experience and only those vitamins for whic
international standards are available. This strictl
orthodox approach is perhaps too harshly restrictive
of the whole gamut of the B vitamins now known i
the pure form, vitamin B_1 is the only one considered
a mention of riboflavin, pyridoxin and pantotheni
acid, for which reliable tests are available, would
certainly have been useful.

The presentation of the statistical methods has been considerably revised and improved. The treatment is very sound and comprehensive, though perhaps, for a beginner, some parts are too condensed, and scarcely enough stress is laid on criteria of significance.

Dr. Coward might well consider amplifying some of these useful statistical chapters; she could gain space for it by cutting out unnecessary repetition in he description of biological technique. To quote only one example of redundancy, the formula of one salt mixture is given in full no less than three times, on pp. 32, 135 and 155.

Most misprints of the first edition have been corrected; but by a strange fluke 'ingestation' has again escaped unscathed, to appear repeatedly on pp. 17–19.

In too many branches of science the standard monograph is a dry-as-dust compilation by scissors and paste. Vitamin workers in the field of biological standardization are fortunate to have in Dr. Coward a mentor who knows and loves the land through which she guides them. We wish her well in the task of charting for her third edition the discoveries of the next ten years.

P. White

VEGETATION OF THE ARGENTINE

La vegetación de la Argentina

By Profs. L. Hauman, A. Burkart, L. R. Parodi, and A. L. Cabrera. (Geografía de la República Argentina, Vol. 8.) Pp. 350. (Buenos Aires: Gaea, Sociedad Argentina de Estudios Geográficos, 1947.)

Up to the present, the botanist or agriculturist desiring information on the plant cover of the Argentine has been obliged to seek it among a large number of scattered publications, some in rather obscure periodicals, many out of print. Assistance has been given in recent years by Castellanos and Perez-Moreau's valuable classified bibliography of South American botany, published in *Lilloa*, volumes 6 and 7, 1941, and by the reprinting of some of the older works, such as, for example, Hieronymus' "Observations on the Vegetation of the Province of Tucumán", 1874, republished in 1945 by the University of Tucumán; but no compact account of the plant resources of this extremely varied country has yet been available. The appearance of the volume now published by the Argentine Society of Geographical Studies and written by botanists of authoritative position is, therefore, much to be welcomed. It is concise and so far as possible complete, although as Cabrera, writing of the Patagonian shrub steppe, notes, there is still much room for botanical and sociological investigation. The material was ready for publication in 1939; but printing had to be deferred until 1947.

The work has a geographical bias, and the subject-matter is arranged in accordance with the natural regions into which the Argentine is divisible. These are mapped by Parodi. Hauman, the senior author, has written the introduction and the sections which deal with the forests of Misiones and those of the 700-km. long narrow strip running from north to south through the provinces of Salta, Jujuy and Tucumán; with the Gran Chaco; with the enormous scrub or thorn woodland area known as the *Monte*; and with the sub-Antarctic forests and the Andean regions. Burkart describes the Mesopotamian region lying between the Rivers Paraná and Uruguay, in which forest alternates with savannah, the latter predominating. L. R. Parodi contributes the account of the great grass steppe of the pampas, and A. L. Cabrera that of the Patagonian shrub steppe.

The reader is impressed by the wealth of plant resources of the Argentine and by the great diversity of the material described. The influence of cultivation and stock-raising is perceptible principally in the pampas, not always to the detriment of the plant cover. Where, however, the exploitation of light lands in dry, wind-swept areas is excessive or even is practised at all, there is grave risk of wind erosion. This is so in a very large part of the middle west, where shifting sand dunes 30–40 m. in height, practically denuded of all vegetation, are to be seen.

G. M. Roseveare

GUSTAV FECHNER

Religion of a Scientist

Selections from Gustav Th. Fechner. Edited and translated by Walter Lowrie. Pp. 281. (London: Kegan Paul and Co., Ltd.; New York: Pantheon Books, Inc., 1946.) 17*s*. 6*d*. net.

Dr. Lowrie's biography of Fechner and selections from his writings make an interesting book. Fechner was a remarkable and most unusual kind of man, as unlike the standard nineteenth-century German professor as can be imagined; a poet, humorist and above all a Romantic. He is remembered chiefly in connexion with the Weber–Fechner law. His work was certainly a landmark in the study of sensory response. But the range of validity of the Fechner law is restricted; it states the value of a ratio between two physical quantities (total stimulus and least discernible increment), and what it signifies psychologically is doubtful. The assertion on the dust cover of this book, that through Fechner "psychology developed into an 'exact' science susceptible of mathematical treatment", is, to put it mildly, misleading. Dr. Lowrie himself says nothing of the sort.

There is a legend that Fechner was a physicist who was afflicted in middle life by an illness which affected his sight and probably his reason, and he thereafter gave up science and took to religious mysticism. Dr. Lowrie's narrative explodes the legend. Fechner's best-known religious work, "Life after Death", was published four years before his illness, and the work on Fechner's law was done several years after. All his life he found the mechanistic view of physical science intellectually stifling, and fought against it; first with parodies and jokes, afterwards more seriously and constructively. He took a pan-psychic or pan-theistic view of the natural world rather characteristic of the Romantics of his period. Unlike most of them, however, he did not turn his back on science; instead he tried to enlarge the scientific insight.

Fechner was rash in speculation and perhaps entirely mistaken in thinking that scientific thought could transcend its traditional limits. The mistake was not that of a man who is just stupid or ill-informed. The illness he had still remains mysterious, but does seem to have originated in mental conflict of some kind. Physiologists should note the strange diet of raw lean ham soaked in wine and lemon juice which initiated Fechner's recovery from his digestive troubles (p. 38).

A. D. R.

PHYSICAL AND CHEMICAL ASPECTS OF RUBBER TECHNOLOGY

THE Rubber Technology Conference, held in London during June 23–25 under the auspices of the Institution of the Rubber Industry, provided the first opportunity since the War for scientific workers and technologists in this field from many countries to meet for a general discussion of their problems. The papers presented covered a very wide range of subjects, from purely scientific to highly technical; this short article is an attempt to review only the more scientific aspects of the matters discussed.

Physical Aspects

It has been known for a long time that natural rubber crystallizes on stretching, and it is generally supposed that this phenomenon has an important bearing on such mechanical properties as tensile strength and resistance to tearing. In a paper on the degree of crystallization in natural rubber, Dr. J. M. Goppel discussed his recent X-ray studies of the absolute amount of crystallization as a function of the degree of extension of the rubber. For a highly extended vulcanized rubber, the fraction of crystalline material was found to be only 29 per cent, which is very much lower than figures given by the earlier work of Field (60–80 per cent). Correspondingly low figures were obtained for frozen raw rubber (unstretched), for which the degree of crystallization was found to increase with time of storage. The highest figure obtained was 38 per cent for crepe rubber which had been stored for twenty-nine years. It was shown also that estimates of crystallinity from density changes reported in the literature led to values of the same general magnitude.

Papers dealing with the design of engineering components in rubber were contributed by Mr. R. S. Rivlin, who dealt with the theoretical basis of this subject, and by Mr. H. L. Jenkins and Mr. H. D. Cooper, whose approach was from the experimental side. Mr. Rivlin referred to the inherent limitations of the classical theory of elasticity—particularly the restriction to small deformations—and gave an outline of recent developments in the theory of large elastic deformations, with particular reference to incompressible materials, that is, materials like rubber, the volume of which is substantially constant on deformation. Rivlin's theory is centred on the existence of a unique work of deformation or stored-energy function corresponding to a specified state of strain; from this stored-energy function the generalized stress-strain relations are readily derived. The theory has been applied to a number of problems of practical interest, among which shear mountings and torsional couplings were particularly considered.

From experiments on the axial compression of cylindrical blocks between lubricated plates (to allow free lateral expansion), Mr. Jenkins and Mr. Cooper showed that the properties of rubber in compression can be adequately represented by the formula derived from the statistical theory of James and Guth. This formula, which had previously been applied mainly to rubber in tension, involves only one physical constant k, which is analogous to the modulus of rigidity in the classical theory. The experimental values of k are nearly independent of the ratio of length to diameter of the cylinder. In the case of shear, the theoretical linear relation between stress and strain was found to be inadequate; but the experimental results can be represented by the use of the same constant k together with an empirical 'shape function'. It was pointed out, however, that the values of k are dependent on the time of loading or 'load history' adopted, and a machine was described which has been designed to facilitate the application of different load-history patterns.

Another aspect of the mechanical properties of rubber, the rate of retraction from the stretched state after release of the tension, was examined by Dr. B. B. S. T. Boonstra. The technique employed depends on the breaking of electrical contacts by the motion of the rubber, the time between successive breaks being measured by the fall in potential of a condenser discharging through a resistance. Differences were found both in the rates of retraction, and in the residual temporary 'set', between the various rubbers (natural and synthetic) examined. The speed of retraction did not appear to be correlated with rebound resilience; for example, butyl rubber, though showing very low rebound resilience, gave a retraction-rate only slightly below that for natural rubber.

The two sessions devoted to the discussion of compounding ingredients included a number of papers dealing with the effects of fillers, particularly carbon black, on the physical properties of rubber. Although carbon black is regarded as the outstanding 'reinforcing' filler for rubber, there appeared from the discussion to be no general agreement as to what constitutes reinforcement, though tensile strength, stiffness and abrasion resistance were the most frequently quoted criteria. In view of this lack of definition of the concept, it is not surprising to find that the mechanism of reinforcement is still but imperfectly understood. A new and interesting fundamental approach to this problem was provided by Dr. W. R. Smith and Mr. W. D. Schaeffer, who have attempted to evaluate the surface activity of various carbon blacks by measurements of the heats of adsorption of gaseous hydrocarbons. Their results reveal a marked variation in heats of adsorption with degree of surface covering (up to 1·5 molecular layers), which points to a selective adsorption at specially active sites. How far these conclusions are directly applicable to the carbon-rubber system has yet to be established; but the evidence suggests that there is a rather close correlation between the initial heats of adsorption and the reinforcing power of the black.

A general physical approach was adopted in the paper by Dr. E. Guth on the theory of filler reinforcement. Guth's theory concentrates attention on the effect of included rigid particles on the modulus of an elastic medium. This theory leads to an expression for the modulus in terms of the volume concentration of the filler which may be regarded formally as an extension of the well-known Einstein relation for the viscosity of a liquid medium containing solid particles in suspension. By means of this equation it should be possible to distinguish between approximately spherical particles, and particles possessing marked geometrical anisotropy. The experimental evidence quoted by Dr. Guth indicated that non-reinforcing fillers like calcium carbonate correspond to the case of spherical particles, while reinforcing fillers require the assumption of highly elongated particles. Since individual carbon particles are roughly spherical in shape, this is regarded as evidence for the formation of elongated chain-like agglomerates of particles, such as have frequently been observed in the examination of blacks under the electron microscope. Indeed, by a suitable modification of the theory it is possible to include the effect of non-sphericity in terms of a 'shape factor'; the shape factors thus derived are found to agree reasonably well with the shapes observed in the electron microscope. This conclusion received further support from Dr. L. H. Cohan, who presented electron microscope evidence for the existence of chain-like structures, which appear to be of characteristic form for any particular mode of preparation of the black. A large number of measurements on a particular black yielded an axial ratio of 6, and this value was found to account for the observed increase of modulus, on Guth's theory, up to 25 per cent concentration.

This theory of reinforcement, as the subsequent discussion showed, is not without its difficulties. According to Dr. L. Mullins, the stiffening effect of carbon black 'wears off' after a small number of repetitions of the extension of the rubber, and gradually reappears on resting, suggesting a breakdown of the chain structures due to stressing. This aspect was further discussed by Mr. A. F. Blanchard and Dr. D. Parkinson, who made use of measurements of electrical conductivity, which is directly related to a net structure of the carbon particles, to throw light on the breakdown and re-formation of these structures. Their conclusion is that the degree of breakdown of structure on extension is relatively of a minor character, certainly not sufficient to account for the observed reduction of stiffness, which they attribute rather to the rupture of the bonds between the carbon particles and the rubber.

A contribution to the study of the optical properties of rubber was presented by Dr. L. A. Wood and Mr. L. W. Tilton, who described an accurate method of measuring refractive indices, in which the specimen was moulded into prismatic form between glass plates. Data were obtained at five different wave-lengths, and over a range of temperature, and compared with various theoretical formulæ for optical dispersion. An interesting result which emerged is the disparity between the isoprene unit and normal mono-olefins, which suggests that the middle C—C bond may partake of the properties of a double bond. A corresponding abnormality in bond-length was found from an X-ray analysis by Jeffrey of the closely comparable low-molecular crystalline compound, geranylamine hydrochloride.

The curious luminescence which may sometimes be observed on tearing rubber in a dark room was the subject of a paper contributed by Dr. A. van Rossem. From numerous experiments it has been shown that the emission of light is related to the type of filler with which the rubber is compounded. The effect was observed only in the presence of non-reinforcing fillers. The suggestion was made that the phenomenon is due to a discharge of electricity through the vacuoles which are known to be formed in such filled rubbers under tension.

On an entirely different subject, Prof. H. W. Melville and Mr. C. R. Masson reviewed recent techniques for the measurement of very small osmotic pressures, as encountered in the determination of molecular weights of high polymers. The difficulty of such measurements arises from the length of time required for the attainment of osmotic equilibrium. It was shown that this may be greatly reduced (*a*) by the use of bacterial cellulose as a semi-permeable membrane, and (*b*) by the use of a dynamic method involving the measurement of the rate of approach to equilibrium. Another technique described was the 'osmotic balance' method, in which the diffusion of liquid into the cell is determined by weighing instead of by measurement. This method was claimed to give remarkable sensitivity, and should prove useful for the determination of molecular weights hitherto considered to be beyond the range of investigation by osmotic methods.

Among a number of papers dealing mainly with the technical evaluation of the properties of rubbers, many questions of interest to the physicist were touched on. Particular mention may be made of two papers on the resistance of rubber to tearing, by Dr. J. M. Buist and Dr. H. A. W. Nijveld, respectively, and one by Dr. J. R. Scott and Mr. R. W. Whorlow on the interpretation of plasticity measurements.

Chemical Aspects

Although most aspects of the chemistry of elastomers were implicit in the many matters discussed from a technological point of view, the actual contributions to rubber chemistry were limited to the three main topics of oxidation, vulcanization and rubber halides. There were also some subsidiary advances in chemical knowledge in the more technical discussions on synthetic rubbers and on latex.

On the subject of oxidation, papers presented by Dr. R. L. Stafford and by Dr. J. Le Bras and Mr. A. Salvetti were both primarily concerned with the mode of action of inhibitory substances. It has been suggested that in rubber chemistry the latter fall into two distinct classes, termed antioxidants and deactivators respectively, typical examples being phenyl-β-naphthylamine and mercapto-benzimidazole. The former fulfil the normal function of retarding oxygen attack, whereas the latter reduce the deleterious chain-scission reactions associated with oxidation of rubber without lessening the overall combination of oxygen. Much of the earlier work on the autoxidation of rubber and allied substances has been carried out with strong sources of light (for example, ultra-violet), thus giving a reaction which proceeds at a rate many times that of the dark reaction and which is unretarded by the usual antioxidants. No fundamental change in the nature of the reaction or of the effect of antioxidants was encountered by Dr. Stafford when the oxidation was effected with a weak light source with the object of obtaining a rate of photo-activated absorption of the same order as that of the dark thermal reaction.

However, although neither phenyl-β-naphthylamine nor mercapto-benzimidazole (the antioxidant and deactivator studied) was effective against light-activated absorption, a mixture of the two was found to possess considerable efficacy. The precise mechanism of this effect, which is in accord with earlier work of Le Bras, is still unsolved.

For the study of these oxidation effects with rubber, Dr. Le Bras has designed an improved type of manometric apparatus in which the oxygen is generated as required by electrolysis of a concentrated solution of copper sulphate.

The chief difficulty in this type of work is the fluctuation in results occasioned by the variability of composition of crude natural rubber. Assistance in this direction was given by Mr. G. Martin, who described a simplified method of preparing pure rubber hydrocarbon for oxidation studies. The method involves addition, to the ammonia-preserved latex, of a soap, which displaces the protein from the rubber particle surfaces, followed by repeated creaming, coagulation with acetic acid and extraction with acetone.

Considerable interest was shown in a paper by Dr. W. T. Chambers on the direct determination on a micro-scale of oxygen in rubbers. His method is an application of that of Unterzaucher involving reduction of the oxygenated compound with carbon, the resulting carbon monoxide being oxidized by iodine pentoxide and the liberated iodine estimated after oxidation to iodate. The ability to determine small percentages of oxygen directly, instead of by difference from the carbon and hydrogen figures, will be of great value in rubber oxidation studies. The accuracy of this method is of the order of ±0·01 in the range 0–0·5 per cent oxygen and ±0·04 in the range 1·0 to 2·0 per cent oxygen. This precision was not sufficient to show conclusively that the molecular breakdown of rubber on milling is always associated with oxidation, but Dr. Chambers was able to demonstrate this effect in one run with pale crepe rubber.

In his presidential address to the Conference, Sir Robert Robinson mentioned the advances that had been made in the knowledge of polymerization and the importance of the introduction of intermolecular cross-linking into natural and synthetic polymers. Dr. G. F. Bloomfield was able to present more evidence on the nature of the cross-links arising in the vulcanization of rubber with sulphur. In this connexion methyl iodide has proved a useful reagent for determining the type of C—S link present. Earlier work has shown that methyl iodide at 25° C. removes the sulphur from diallylic sulphides to form trimethyl sulphonium iodide, and since the latter is obtained from the reaction of methyl iodide with rubber/sulphur vulcanizates, it has in the past been assumed that diallylic groups must be present in appreciable numbers. The unreliability of this conclusion (which is, in any event, at variance with other vulcanization evidence) was made apparent by Dr. Bloomfield's demonstration of a similar formation of trimethylsulphonium iodide from compounds containing the sulphur atom between one allylic and one tertiary grouping. It is known that the reaction of polyisoprenic compounds with sulphur leads to the formation of cyclic and cross-linked sulphides, and the evidence presented in this work is consistent with the view that the allyl-tertiary sulphide grouping is a characteristic of both.

The importance of the non-hydrocarbon constituents of natural rubber in the process of vulcanization was demonstrated by Mr. G. Martin in his work on highly purified rubber. The catalytic effect of these other constituents, the absence of which was found markedly to reduce the vulcanizing efficiency of sulphur, is a subject requiring further careful investigation.

A study of the hydrochlorination of rubber in latex by Dr. G. J. van Veersen had theoretical as well as practical significance. The reaction of hydrogen chloride with rubber in solution shows an induction period, the length of which is proportional to the solubility of the hydrogen chloride in the solvent. It was suggested that a solution of rubber in dioxane (for example) represents a system of two electron donors competing for the hydrogen chloride to form co-ordination complexes. During the induction period, the speed of the reaction would be dependent on the affinity of the solvent for hydrogen chloride, but after saturation the rate would be independent of the nature of the solvent. In the reaction of hydrogen chloride with rubber latex it is necessary to prevent coagulation by reversing the charge on the rubber globule with a cationic soap. Under these conditions a ver clean addition takes place with a minimum o cyclization.

It is difficult in a substance of high molecula weight like rubber to determine the nature of artificially introduced chemical groups. A contributio to this subject was made by Dr. G. Salomon, who rea a paper by himself and Drs. C. Koningsberger an A. J. Ultée on the kinetic analysis of rubber halides The method is based on the marked differences i reactivities of the various classes of aliphatic halide with organic bases. In the case of monohalides this order is allylic>primary>tertiary (with som exceptions) > secondary > secondary monocyclic > vinylic. Polyhalides are more difficult to distinguis unambiguously, but their identification is rendere possible in many cases by comparison of the speed of reaction with various bases. Using this kineti method, evidence was found, for example, for th formation of secondary allylic chloride groupings i the chlorination of rubber under conditions favourin substitution, and of a series of polychlorides, th constitution of which has yet to be settled, b conventional chlorination.

The papers and discussion on synthetic rubber were mainly technological in nature, although ther were some points of chemical interest. Dr. R. F Dinsmore directed attention to the fact that *GR–* requires less combined sulphur than natural rubbe to give a satisfactory vulcanizate, a point that ma well be connected with the tendency of the $\Delta^{1:}$ polyene system of rubber to give cyclic sulphide which contribute little to the strengthening of th molecular network. Mention was made of some o the physical and chemical properties associated wit the characteristic structures of silicone, 'Buna-N and butyl rubbers and of condensation rubbers of th type of 'Vulcaprene' (a di-isocyanate-modified poly esteramide).

An important contribution to our knowledge o the constitution of natural rubber latex was made b Miss L. N. S. Homans and Dr. G. E. van Gils. B centrifuging fresh unammoniated latex they wer able to separate a yellow fraction which was suspension mainly of non-rubber particles and whic contained 6–8 per cent of the total solids of latex These globules (termed 'lutoids') were easily visibl under the microscope as transparent masses considerably larger than the rubber globules and wer shown to consist of 80–85 per cent of water, with th solid content made up of proteins, salts and acetone soluble substances, in the form of lipoids. Additio of ammonia brought the lutoids into solution, an dilution with water caused shrinking; but they wer quite stable towards 0·1 *N* sodium chloride in aqueou solution. Removal of the lutoids resulted in marke changes in properties of the latex; for example greater susceptibility to photoxidation, lower mechanical stability, greater thermal stability.

This new knowledge may have interesting biologic implications in that it brings the constitution of late more into line with the complexity of other physiological liquids.

A further attraction of the conference was a exhibition, arranged by the Dunlop Rubber Company which included demonstrations of some of the mor striking of the properties of rubber and methods b which they have been studied.

It is intended that the *Proceedings* of the Conference shall be published in a single volume. There is no doubt that this will prove a worthy companion to the *Proceedings* of the first conference, held in 1938, and a valuable source of reference to all interested in rubber science.

NUTRITION OF ATHLETES

A WHOLE-DAY meeting of the Nutrition Society on July 17 was devoted to the subject of the 'Nutrition of Athletes". The first papers dealt with the physiology of muscular effort, and the meeting took a more practical turn later in the morning and in the afternoon session.

The meeting opened with a paper by Dr. Philip Eggleton of Edinburgh on "The Neuromuscular Mechanism". Physiological studies, he said, fall into three clear-cut categories. The first of these is the work on animals (including dog and man) which comprises measurements of work done, respiratory measurements, urine and blood analyses, nutrition studies and so on. The second category includes work on isolated muscles and nerves, which has been carried out mainly on cold-blooded animals because of the difficulty of using such preparations from mammals. Thirdly, there is work on the muscles of marine shell-fish. These last two methods have certain disadvantages in that it is difficult to apply the results obtained from them to the mammal, and particularly to the human being. Nevertheless, results from the three fields combine to produce a picture of the neuro-muscular machine which, according to the author, comes nearest to the physiologist's ideal—a description of physiological phenomena in terms of chemistry and physics—than has been achieved in respect of any branch of physiology, save perhaps the transport of gases by the blood.

Experiments in the first field have shown a simple relation between work done and food intake required; and there is also considerable evidence that manual labourers do not choose to eat carbohydrates but prefer fat and protein. This preference for a high protein diet by both manual labourers and athletes may be a survival perhaps of sympathetic magic; yet it may have as a basis the fact that meat is a good source of some of the B complex of vitamins. The preference for fatty food is more understandable, since it is an economical source of energy.

Dr. Eggleton went on to discuss A. V. Hill's work on the oxygen consumption during exercise, and said that in Hill's experiments the consumption of oxygen was about 4 litres a minute for men engaged in running at a pace which did not give them undue respiratory distress. However, these experiments only lasted for minutes, and Eggleton pointed out that the heart cannot pump 4 litres of oxygen into the body indefinitely; if the exercise has to be maintained for some time, an oxygen consumption of 1 litre per minute is nearer the upper limit. In this connexion Dr. Eggleton remarked that an athlete can build up an oxygen debt for events such as the 100-yd. sprint, and that in this event the rate of output of energy of the runner is 10–13 horse-power, which corresponds to an oxygen intake of 23 litres a minute—six times anything the heart can achieve. This debt is financed partly by the breakdown of glycogen to lactic acid and partly by the reserve of non-oxidative energy represented by the creatin phosphate content of muscle.

Dr. Eggleton discussed some of the aspects of the evolution of the neuro-muscular mechanism, and pointed out that one of the differences between invertebrate and vertebrate muscle is the presence of arginine in the muscles of the former and of creatine in muscles of the latter. Also vertebrate muscles contain considerable amounts of two di-peptides—β-alanylhistidine and β-alanyl-methyl-histidine—which are not present in invertebrate muscle.

In conclusion, Dr. Eggleton commented upon the apparent increasing athletic abilities of the human race, which he felt were more apparent than real, and upon the view that the decreased performances of British athletes recently is due to the changes in diet and habits engendered by the War, a problem which he felt should be left to later speakers.

Dr. Dorothy Needham spoke on chemical aspects of chemical contraction. In this field, Dr. Needham said that two lines of work, followed independently for about half a century, had only recently come together. One of these was the nature of the muscle machine, and the other was the nature of the essential fuel. Dr. Needham discussed the early work of Fletcher and Hopkins and of Meyerhof on the energy liberated by the formation of lactic acid in muscle, and of Lundsgaard's work on creatine-phosphate breakdown as a source of energy. Lohman's work in 1934, she said, suggested that adenosine triphosphate hydrolysis supplied the first energy-yielding reaction in muscular contraction.

The old idea that lactic acid production is an inevitable accompaniment of contraction has had to be discarded since it has been shown that much work can go on without any lactic acid formation. The most important constituent of the muscle machinery is the protein, and the modern phase began with the work of Edsall and von Muralt in 1930. Solutions of myosin showed the property of double refraction in flow, and this suggested some relation with the anisotropic bands of myo-fibrils. It appears that the contractile fibrils of muscle consist of polypeptide chains of myosin showing the α-fold, and owe their elasticity and contractility to their power of straightening out to the fully extended chain or folding up still further. The link between the machinery and the fuel comes from the observation that myosin has adenosine triphosphatase activity, so that myosin is not only the chief structural entity of muscle but is also the enzyme catalysing the chemical processes which lead to its own contraction. Szent-Györgyi has shown that another fibrous protein, 'actin', can be extracted from muscle, and that actin and myosin may unite to form fibrils of much greater length; this compound of the two proteins is called actomyosin.

It seems possible that some of the symptoms of fatigue may be due to the breaking of inter-molecular links which hold the partly folded polypeptide chains in place. If contraction is too severe and prolonged, too great a distortion may take place and unusual breaking of links or the formation of new and inconvenient ones may take place.

There are at the moment two main views on muscular contraction. One is that the contracting fibrils are made up of actomyosin. If adenosine triphosphate comes into contact with actomyosin fibrils, there is a rapid change of the protein with loss of water. Szent-Györgyi regards this as synonymous with contraction; on the other hand, Astbury has suggested that in resting muscle the fibrils are made more rigid and stable by combination in parts with a parallel *actin*-system, and that upon stimulation this combination is loosened by the action of adenosine triphosphate. When this happens the myosin can take up a shortened form of folding.

Group Captain C. A. Rumball described the practical uses to which investigations on the neuromuscular mechanism have been put in the choice of air-crews by the R.A.F. Pulse-rates while sitting, standing and under stress gave useful information. Diastolic blood pressures of more than 90 mm. were not acceptable, though up to 90 mm. was. However, it was pointed out that fifty-five marathon runners examined in 1909 had an average diastolic pressure of 93 mm. of mercury. One test which gave information of considerable value was that designed by Flack in 1920, in which a subject was asked to sustain a 40-mm. column of mercury in a U-tube manometer by a single expiration for as long as possible, and the pulse response examined. There are four main types of pulse response to this test; but only two of them, namely, a rapid and sustained rise to 10 or more beats per 5-sec. interval and a rapid rise followed by an abrupt fall to a low figure, indicated low functional efficiency.

Nutritional aspects of muscular activity were introduced by Dr. G. H. Bourne in a paper entitled "Vitamins and Muscular Exercise". Dr. Bourne pointed out that vitamins of the B complex play an important part in the reaction chains concerned with carbohydrate metabolism, and the demand for them might be expected to be increased in muscular exercise. A figure of fifteen times the normal requirement for vitamin B in severe exercise has been quoted. This would mean a daily intake of 22·5 mgm. (based on a normal daily requirement of 1–5 mgm. of vitamin B_1). To obtain this amount of vitamin B_1, one would need to consume 6½ kilos of National wheatmeal bread, ¾ kilo of commercial wheat germ or 90 gm. of dried brewers' yeast. One should consider, therefore, if these greatly increased demands for vitamins of the B complex do exist, and if they do, whether it would be possible for an athlete to obtain them from natural foods, with the possible exception of dried yeast. Perhaps, then, an athlete's performance is limited by his vitamin B complex intake, and this is itself limited by the amount of natural food he can eat. The consumption of quantities of meat, liver, eggs, etc., by athletes may be related not to the protein content of these foods, but to the relatively high amounts of various members of the vitamin B complex they contain.

If supplementation of athletes' diets is undertaken, it should be remembered that there is some evidence that certain vitamins may have a supra-physiological or pharmacodynamical action, which may or may not be related to their normal nutritional function. Inspection of the literature on the effects of supplementing the diet with various vitamins of the B complex shows no uniformity of results; but on the average there does seem to be a bias in favour of the beneficial effect of these vitamins on muscular exercise.

Attempts to show that extra doses of vitamin C increased resistance to fatigue have also been equivocal; but there seemed to be some evidence in favour of its use.

There is little doubt that deficiency of most vitamins seriously affects muscular effort; but the difficulty is in deciding just at what level of intake deficiency exists.

Dr. Bourne felt that the subject of nutrition o athletes, with its obsession with calories and proteins is lagging considerably behind modern advances in nutritional science.

In the afternoon, Sir Adolphe Abrahams asked what indication there was for a high calorie diet fo athletes, what foodstuffs should predominate in it and thirdly, what part, if any, alcohol should play in the diet of athletes ?

On the question of calories, Sir Adolphe said tha the figures published of the calorie intake of athlete at the Berlin Olympiad in 1936, which were said to have been compiled from observations on 4,700 competitors, were extraordinary. They quoted a daily average intake of 800 gm. of meat, 150 gm. o sugar, 150 gm. of butter, 1–1½ litres of milk, vegetables and fruit *ad lib.*, making a grand total o 7,300 calories. Such an intake is really equivalent to the requirements of a 24-hr. walking race, or daily violent physical exercise of six hours duration. In fact, no athlete in training undertakes six hours violent physical exercise a day. Most athletes visi the track twice a day. The sprinter does a few bursts from the start and a run through of 150 yd. each time, and few of even the long-distance men do really hard work during their training period. Events such as the annual Oxford and Cambridge boat race only use up about 500 calories per man. Athletes, therefore, do not need vast quantities of food; but a generous diet is desirable from a psychological point of view.

Discussing the role of meat in the diet, Sir Adolphe pointed out that athletes who claimed to be vegetarians invariably consumed milk, cheese and eggs, containing animal protein. He felt that extra sugar is not of particular benefit to athletes. The men of to-day are not better physically than the men of fifty years ago, and Sir Adolphe felt that the explanation of improved records is partly due to improved technique and partly to the increasing growth of the cult of athleticism.

The final paper of the day was given by Dr. Nevil Leyton on "Some Practical Aspects of the Training of Athletes". Dr. Leyton made the important point on the difference in individual calorie requirements for the performance of the same task, and the difference in the times before events that individual athletes require to eat. The actual calories for the Oxford and Cambridge boat race may be as much as 600 per man; this figure may be compared with that for a Marathon race, when 2,000 calories may be used. A five-set tennis match may use 1,200 calories. In addition, the body may continue to expend energy at a higher rate than normal for 24–48 hours after the event. A good training diet should nourish the athlete adequately during this period and should include fruit and vegetables, the function of these being partly to provide vitamins. Some consideration must also be given to the possibility of assisting the athlete during the contest. A 20-min. all-out effort uses about an ounce of sugar. So a marathon runner may use nearly 5 oz. in a race. Four ounces of sugar may be absorbed from the gut in about two hours. Some benefit should accrue to performance if an athlete is given sugar an hour or two before an event. Even if calories can be provided in sufficient amounts, it is often difficult in Britain to-day to provide an athlete with just the food he feels he wants, and this may have an adverse psychological effect.

The day's discussions were ably summed up by the chairman, Prof. J. R. Marrack.

SHORTAGE OF SCIENTIFIC TEXT-BOOKS IN CAMBRIDGE

A SURVEY carried out in Cambridge during March–April among teaching staffs and booksellers shows that nearly half of the scientific books the average student is recommended to buy are not vailable for him to buy new. It also shows that American books cover 33 per cent of all books students re recommended to buy, as opposed to 10 per cent before the War.

Teachers from twelve scientific departments of the University supplied lists of recommended text-books nd also indicated the annual number of students kely to require each book. 145 titles were listed in ll, 97 being of British origin and 48 American. Some books were, of course, alternatives to others, but the 145 titles covered 128 separate 'topics'.

The availabilities of American and British books depend upon different factors and were, therefore, stimated by different methods. Booksellers stated that the *number* of American books demanded has pproximately doubled since 1939, whereas their average *price* has risen by about 50 per cent. Thus the current demand is about 300 per cent by value of the pre-war demand. Since permitted imports are now 200 per cent by value of pre-war imports, it is estimated that approximately two-thirds or 67 per cent of the American books now required are available. n other words, a student requiring an American book has, on the average, a two-thirds chance of obtaining it; a particular student may, of course, do better han this, either by good luck or by his own efforts. The above estimate neglects the possibility that an American book is out of print. The number of such books is small, and, in any event, should affect neither the total imports of American books nor the average availability in Great Britain. Also, no account is taken of books imported as single copies direct from the United States to the British purhaser; this factor is not thought to be important o far as students are concerned.

With the co-operation of booksellers, the British books were classified as: (1) available for immediate ale; (2) reprinting or new edition in preparation; 3) out of print. The data thus obtained referred to a particular date (early April 1948); but it seems probable that the percentage availability of a large ample of books at any one time will give a fair measure of their average availability over a period, individual fluctuations cancelling one another out. In fact, the availability found for the particular date agreed with the booksellers' own independent mpression of the general position. Further, unless major changes in policy occur, of which there is no indication, the estimates should also hold for the near future. The student may, of course, be able to get second-hand copies, but this factor also does not seem to be of major importance, especially since students now finishing their courses are stated to have a greater tendency than formerly to keep their books. The data obtained refer to a wide range of subjects, but analysis showed that the position is not signiicantly different as between (1) physical and biological sciences, (2) books required by a large number of students (more than fifty copies a year) and those required by fewer.

Of the 128 'topics' analysed, 55 were available in British books. 48 were unavailable in British books and no American alternative was mentioned (of the 48 'topics', 33 books were reprinting and 15 were out of print). For the remaining 25 'topics', only American books were in print and it was assumed that 17 of these were actually available and 8 not available (that is, a 67 per cent availability as stated in a previous paragraph). Hence only 72 (55 plus 17) out of the 128 'topics' were available in any form, that is, 56 per cent.

As stated above, 97 of the 145 titles were British, and 56 per cent of these were available. It will be noted that this compares unfavourably with the percentage availability of American books (67 per cent). It is of further interest that about 50 per cent of the American books were listed as alternatives to British books, and about 20 per cent of the British books were given with American alternatives. Both booksellers and teachers confirmed that the demand for American books has considerably increased since before the War and now represents about 33 per cent of the total demand, as opposed to 10 per cent before the War.

The survey comments that the advantage that American books have over their approximate British alternatives is due primarily to the paper shortage and other obstacles to British book production, coupled with the lack of priority as to subject-matter in the allocation of paper to British publishers. This lack of discrimination at home stands in marked contrast to the complete discrimination in favour of learned, scientific and technical books when imported from abroad. The supplies of British text-books are affected both by low production and high export. Out of a total value of more than £30 million for books of all types produced in Britain in 1947, 24·5 per cent was exported (*The Bookseller*, March 20, 1948). The proportion of British book production (all types) exported was as high as 35 per cent in 1940 and 29 per cent in 1941 (*The Bookseller*, March 20, 1948). The much-enhanced position of American scientific books in the British market dates from that time. It has not been seriously affected by the short period in which imports were cut to 100 per cent of pre-war value. American publishers are continuing to press their advantage, arising from Britain's production difficulties and her need to export.

Many of the newer American books are, of course, invaluable, and no British alternative exists. This is especially true of up-to-date scientific and technological works of reference. In this respect American books have an advantage over British ones, quite apart from Britain's immediate production difficulties and need to export. In great part, of course, the advantage arises from the larger scale of American industrial and scientific activity generally, and hence the greater number and variety of specially qualified authors. Nevertheless, there are other, less unavoidable, reasons for the relative paucity of new British advanced works. Delays in publication put British books at a disadvantage by increasing the chances that a new American book will have arrived and satisfied the demand in a subject before an already-written British book on that subject appears. Furthermore, inquiries in Cambridge indicate that new British works are not being *written* in numbers commensurate with our supply of qualified authors. An important deterrent mentioned was lack of time and (not so important) lack of financial inducement. Increased teaching pressure leaves little time for the writing of new books and makes it difficult for those who fell behind in their reading while on war-work to catch up again. The direct financial inducement to write advanced scientific works was never great; but to-day it is smaller than ever. Publishers try to share out their limited paper among the most needed titles, and the consequent small impressions mean correspondingly small royalties. The survey suggests that official encouragement should be given to the writing of new books by British specialists.

It is stated that a good case can be made out for the large percentage of book production which goes to export. It is emphasized, however, that this trade and, even more important, this reputation, are in danger unless our total volume of 'learned, scientific and technical' book production is increased both in number of copies of existing standard works and in new titles. The value of American exports of books (all types) to all countries had not in 1947 quite equalled Britain's; but 1947 was the year in which the import of America's books was artificially restricted by two of her best customers, Britain and Australia. In spite of that, American exports rose more steeply than our own. With British import restrictions relieved, American exports may be expected to surpass Britain's. Moreover, America can, as Britain cannot, increase the exported fraction of her total production without serious consequences for the home consumer. America's exported fraction was only 7 per cent of the total (in 1946) as against Britain's 25 per cent. The conclusion is drawn that it is essential that British scientific book production should be increased by giving priority in material allocation to the publication of such books, so that both the home and export markets may be better supplied.

This survey was carried out by the Cambridge Branch of the Association of Scientific Workers, and copies of the complete survey are available from the Head Office of the Association (15 Half Moon Street, Piccadilly, London, W.1).

R. Innes

NEWS and VIEWS

Physiology at the London Hospital Medical College: Dr. John L. D'Silva

Dr. John L. D'Silva, reader in physiology at St. Bartholomew's Hospital Medical College, who has been appointed to the chair of physiology at the London Hospital Medical College, was born and educated in southern India. He graduated with first-class honours in chemistry at King's College, London, in 1929, and remained there for a further three years doing research on the chemistry of disulphides. In 1932 he went over to physiology, still at King's College, carrying out investigations on the effect of adrenaline on the metabolism of potassium. After a short period with Messrs. British Drug Houses, Ltd., spent on research into the molecular distillation of fish oils in connexion with the study of vitamin A, he went in 1936 to St. Bartholomew's Hospital Medical College, where he was demonstrator in physiology and in biochemistry, and continued his work on the metabolism of adrenaline and potassium. He was awarded the degree of D.Sc. for his published work. During the Second World War, Dr. D'Silva qualified as a medical practitioner and also continued teaching. After work at St. Bartholomew's Hospital, in 1944 Dr. D'Silva was appointed to the Medical College again and has remained there since, lecturing and carrying out research on the physiology of the visual process.

Jöns Jakob Berzelius (1779–1848)

When he died a century ago on August 7, 1848, Berzelius was not only the most famous chemist of the world, but also the autocrat of the world of chemistry. The son of a schoolmaster, he was born near Linköping on August 29, 1779. After studying medicine and chemistry at Uppsala, at the age of twenty-three he was appointed assistant professor of botany and pharmacy at Stockholm, and full professor in 1807. During 1815–32 he held the chair of chemistry in the Caroline Medico-Chirurgical Institution. In 1818 he became perpetual secretary of the Stockholm Academy of Sciences, and received a title of nobility, with permission to retain his name. Seventeen years later, on the occasion of his marriage, he was made *Freiherr*. Berzelius spent some ten years determining with great accuracy the atomic and molecular weights of more than two thousand chemical substances; he isolated selenium, thorium, silicon, titanium and zirconium, and also prepared and examined many organic compounds. He devised the present system of chemical symbols. His "Lehrbuch der Chemie", begun in 1808, went through five editions and, in various translations, spread his fame over Europe. His dualistic electrochemical theory exerted a profound influence on the progress of chemistry. Though Berzelius worked in the simplest of laboratories, his reputation attracted students from many countries. In his hands the blow-pipe became the symbol of qualitative dry analysis. Distinguished in appearance, inclined to be portly, neat in attire and habits, cordial and unassuming, Berzelius was vigorous in body and mind, though essentially conservative in his outlook. Of his characteristic sayings the following may serve as a sample: "The devil may write text-books of chemistry, for every few years the whole thing changes".

Australian Journal of Scientific Research

The Australian Council for Scientific and Industrial Research, in collaboration with the Australian National Research Council, has decided to take responsibility for the establishment in Australia of a new scientific journal, the *Australian Journal of Scientific Research*, as a medium for the publication of research papers of outstanding merit. This journal is open to receive contributions from research workers, irrespective of country or of the organisation to which they are attached. Dr. N. S. Noble has been appointed as editor of the new journal. Editorial policy will be determined by an editorial board under the chairmanship of the editor and comprising as members: Prof. W. J. Dakin (Department of Zoology, University of Sydney), Prof. E. J. Hartung (Department of Chemistry, University of Melbourne), Prof. L. H. Martin (Department of Physics, University of Melbourne), and Prof. J. G. Wood (Department of Botany, University of Adelaide). The Board aims at achieving a high standard of quality in papers accepted and a strict refereeing system has been instituted. The *Journal* will be printed in two series: Series A (Physical Sciences) and Series B (Biological Sciences). Initially each series will be issued quarterly and will cost 30*s*. a year.

Birkbeck College Research Laboratory

By the aid of a gift from the Nuffield Foundation, Birkbeck College (University of London) has been enabled to equip and staff two houses in Torrington Square, London, W.C.1, as a Biomolecular Research Laboratory under the direction of Prof. J. D. Bernal. The main work of the Laboratory will be the application of physical methods, particularly X-ray analysis, to the understanding of the structures and reactions of molecules in biological systems. X-ray methods are being used in two ways, namely, the study of the mutual relations in space of virus molecules in solution and in solid phases by low-angle diffraction; and the investigation of the internal structure of the molecules themselves by high-angle diffraction. In addition to the study of molecules directly connected with proteins, others of more general biological interest are also being examined by modern X-ray analytical methods, as well as other structures chosen to develop methods of X-ray crystal analysis. To make the fullest use of existing techniques and to develop further experimental and theoretical tools for this purpose, two sections devoted to electronics and computation respectively have been added to the Laboratory. The design has already been completed of an electronic computing machine of such speed that complete analysis of complex structures by the method of 'steepest descents' can be carried out in a reasonable time. Another section of the Laboratory is working on the fundamental structure of the active constituents of Portland cement, and the nature of their reaction with water; this investigation is being financed by the Department of Scientific and Industrial Research. The work is not so isolated from the main interests of the Laboratory as may at first sight appear; for already it has been found that the properties of hydrated cements are closely related to those of many biological gels and are strongly influenced by the same long-range forces. Part of the two houses now taken over by Birkbeck College to provide for these investigations is being devoted to chemical research under Prof. W. Wardlaw and will also furnish facilities for chemical work in connexion with the biomolecular studies.

The new Laboratory was formally opened by Sir Lawrence Bragg on July 1. Sir Lawrence welcomed the initiation of a new Laboratory which is to study biomolecular substances, because such borderline subjects between physics, chemistry and biology are becoming so very important. There is always a difficulty in attracting first-rate young research workers into borderline subjects, because they tend to classify themselves as physicists, chemists or biologists and take up research accordingly. Probably the best way of overcoming this difficulty would be to provide first-rate centres of research, directed by well-known scientific workers, for such subjects.

Rubber Technology Conference

Elsewhere in this issue (p. 204) an account is given of some physical and chemical aspects of the contributions to the Rubber Technology Conference held in London during July 23–25. The Conference was attended by no less than 609 members, including 119 from abroad. This compared very favourably with the previous Conference in 1938, when 553 members attended. On the occasion of the 1938 Conference more than a hundred papers were presented, and this necessitated two simultaneous sessions. This year there were only forty-three papers spread over eight sessions running consecutively. An outstanding feature of the Conference was a demonstration of physical and chemical properties of rubber on June 23 arranged by Mr. E. F. Powell and certain members of his staff from the Dunlop Rubber Co., Ltd. The Conference closed with a dinner at the Connaught Rooms, London, on the evening of June 25; Mr. F. D. Ascoli, president of the Institution of the Rubber Industry, presided. During the evening, the Colwyn Medal of the Institution was presented to Dr. R. P. Dinsmore of the Goodyear Tyre and Rubber Co. of the United States. This is the sixteenth award of the Medal and the first time that it has gone to an American.

Earthquakes during May

During May ten strong earthquakes were registered at observatories throughout the world, and there were numerous smaller shocks and tremors. The greatest earthquake which was registered at Kew gave ground amplitudes of 110 μ at Kew on May 14 and came from a focus the epicentre of which was south of the Alaska Peninsula (lat. 54½° N., long. 161° W.). A world-shaking aftershock of this came on May 17 from a focus the epicentre of which was perhaps slightly to the north of the original. The second most intense shock of the month was the one which occurred on May 11, starting from a focus with epicentre near lat. 17° S., long 71° W. in southern Peru. The focus of this earthquake was a little deeper than normal; the instrumental strength of the shock was almost 7½, and casualties and damage were caused at Moquegua in southern Peru and at Arica and Tacua in northern Chile. The third greatest earthquake shock of the month happened on May 25 from a focus having an epicentre near lat 30° N., long. 99½ E. in Sikang Province in China. A much less intense earthquake on May 28 from a focus with epicentre at lat. 12° S., long. 77° W. did damage to property and caused the deaths of five people in Peru. The deepest focus earthquake of the month occurred on May 23 from a focus some 200 km. deep with epicentre near lat. 18° S., long. 169° E. More feeble shocks occurred on May 23, doing damage to property in both islands of New Zealand; on the morning of May 24, throwing people out of bed at Palermo in Sicily; and on May 25, off the west coast of Oregon. Data for the month have been received from the U.S. Coast and Geodetic Survey, the International Seismological Bureau at Strasbourg, and observatories at Beograd, De Bilt, Durham, Kew, Stuttgart, Toledo and Uccle.

Cleveland Seismological Observatory

In 1946 gifts from the Louis D. Beaumont Trust and the Cleveland Foundation financed the purchase of three electromagnetic seismographs of the Sprengnether type for the Cleveland Seismological Observatory, which is situated at lat. 41° 29′ 27·90″ N., long. 81° 31′ 52·22″ W. (geographic co-ordinates) at an altitude of 1,070 ft. on University Heights, Cleveland, Ohio. The geocentric latitude is 41° 18′ N. The staff at present consists of the Rev. Henry F. Birkenhauer, *S.J.* (director), Rev. Joseph S. Joliat, *S.J.* (associate director), Dr. Edward J. Walter (assistant director), Mr. Richard Becka and Miss Jeanne Carrabine. The publication of monthly teleseismic bulletins and monthly microseismic reports has already begun.

New Tropical Fungi

THE various regions of Central Africa are a territory which has not been studied mycologically in any detail. It is therefore not surprising that, in a second paper on tropical fungi, G. B. Hansford (*Trans. Linn. Soc. Lond.*, 159, pt. 1, pp. 21; 1947), in describing thirty-four species, includes no less than twenty-eight new ones. The genus *Meliola* is well represented with eight new species, and it has been found necessary to create two new genera, *Phragmodiscus* and *Dictyoasterina*, to accommodate some of the new findings. The collections are from Uganda, the Belgian Congo and Sierra Leone.

University of Leeds

THE Council of the University of Leeds has announced that the Wool Industries Surplus Cloth Corporation, Ltd., has given a sum of £40,500 for the establishment in the University of a research chair of wool textile engineering within the Department of Textile Industries. Other gifts include £10,000 from the International Wool Secretariat (in addition to a similar amount already received) for the purpose of completing the cost of equipping the new Wool Research Laboratories; 1,000 dollars from the Ella Sachs Plotz Foundation for the purchase of equipment for the Department of Biochemistry; £250 from Messrs. J. and J. Crombie of Aberdeen, for the Textile Department; £2,126, handed over by the Leeds Public Dispensary and Hospital, being the balance of the Research Appeal Account, which the Council agreed to earmark for rheumatism research; £300 a year from Sandoz Products, Ltd., of Bradford, to provide a scholarship for a male candidate to take the form of three consecutive two-year awards; 500–600 plastic mouldings for experimental research in speech training, presented to the Department of Education by Messrs. Birkby's, Ltd., of Liversedge.

University of London: Appointments

THE following appointments in the University of London have been announced: Dr. D. V. Glass, reader in demography at the London School of Economics and Political Science, to the University chair of sociology tenable at the School; Mr. E. P. Sharpey-Schafer, physician and senior lecturer at the Postgraduate Medical School of London, to the University chair of medicine tenable at St. Thomas's Hospital Medical School; Dr. D. S. Bertram, lecturer in the Department of Entomology and Parasitology in the Liverpool School of Tropical Medicine, to the University readership in entomology tenable at the London School of Hygiene and Tropical Medicine; Dr. F. L. Warren, senior lecturer in biochemistry in the Physiology Department of St. Mary's Hospital Medical School, to the University readership in biochemistry tenable at University College. All these appointments take effect on October 1, 1948.

The titles of emeritus professor in the University have been conferred on the following: Prof. A. B. Appleton, on his retirement from the chair of anatomy at St. Thomas's Hospital Medical School; Prof. O. L. V. de Wesselow, on his retirement from the chair of medicine at St. Thomas's Hospital Medical School; Prof. F. E. Fritsch, on his retirement from the chair of botany at Queen Mary College; Prof. D. T. Harris, on his retirement from the chair of physiology at the London Hospital Medical College; Prof. T. Baillie Johnston, on his retirement from the chair of anatomy at Guy's Hospital Medical School; Prof. W. Neilson Jones, on his retirement from the Hildred Carlil chair of botany at Bedford College.

The following doctorates have been conferred D.Sc.: J. R. Busvine (Imperial College of Science an Technology); D.Sc.(Eng.): D. G. Tucker (externa student).

Beit Memorial Fellowships for Medical Researc

THE following elections have been made by th Beit Memorial Trustees: *Senior Fellowship* (£900 a year): Dr. F. Sanger (Cambridge), to study the structure of proteins with special reference to insulin, a the Department of Biochemistry, University of Cambridge. *Junior Fellowships* (normal value £600 a year): D. A. Darcy (Dalhousie, Canada), to study the role of the lymphocyte and plasma cell in homo graft breakdown, at the Department of Zoology and Comparative Anatomy, Oxford; R. M. C. Dawson (London), to study biochemical changes in the brain associated with different forms of functional activity at the Biochemical Laboratories, Cardiff City Menta Hospital; F. N. Fastier (New Zealand), to study the nature of the musculotropic action of basic amidine derivatives, at the Department of Pharmacology Oxford; Dr. L. J. Haynes (London), to study the synthesis of the coenzyme, cozymase, at the University Chemical Laboratory, Cambridge; Dr. A. T. James (London), to study the relationship between structure and biological activity in naturally occurring substances, at the Lister Institute of Preventive Medicine, London; A. McCoubrey (London), to study analgesic and addictive tendencies from a chemical point of view, at the Departments of Organic Chemistry and Pharmacology, University of Leeds S. W. Stanbury (Manchester), to study the effect of changes in nervous activity, induced by narcosis and sleep, on the renal circulation and blood pressure in normal and hypertensive individuals, at the Department of Medicine, University of Manchester; D Verel (Cambridge), to study the postural hypotension which may follow prolonged rest in bed, at the Clinical Research Unit, Guy's Hospital, London.

Announcements

THE Joint Committee consisting of representative from the Royal Society of Edinburgh, the Roya Physical Society, and the Royal Scottish Geographica Society have awarded the Dr. W. S. Bruce Memorial Prize to Dr. W. A. Deer, Department of Mineralogy and Petrology, University of Cambridge, for his work in East Greenland during 1935–36, especially in regard to the petrology of the Skaergaard gabbro intrusion.

THE Faraday Society is arranging a general discussion on "The Physical Chemistry of Proces Metallurgy" to be held at Ashorne Hill, near Leamington Spa, by permission of the British Iron and Stee Federation, during September 23–25. Further particulars can be obtained from the Secretary, Faraday Society, 6 Gray's Inn Square, London, W.C.1.

THE postgraduate lectures for 1948 of the London Section of the Oil and Colour Chemists' Association will be delivered by Prof. H. J. Emeléus, on September 30, October 7 and 14 at 6.30 p.m., at the Royal Institution. Prof. Emeléus will speak on "The Impact of Radioactivity on Inorganic Chemistry". Admission will be by ticket (price 10s.) obtainable from the honorary secretary of the London Section of the Association, H. C. Worsdall, c/o Messrs. Plastanol Ltd., Crabtree Manorway, Belvedere, Kent.

Properties of a Hypothetical di-Neutron

THE question of the possibility of obtaining experimental evidence for the existence of a neutral particle of mass 2 has recently been raised by Kundu and Pool[1]. These authors suggest that certain features of nuclear transformations produced by bombardment by tritium (^{3}H) ions favour the conclusion that a di-neutron having at least transient existence may be captured as a single entity in a nuclear process of an Oppenheimer – Phillips type.

It is the object of this note to point out that the β-active species ^{6}He, though stable against the spontaneous emission of neutrons of normal mass (stable, that is, against the process $^6\text{He} \rightarrow {}^5\text{He} + {}^1n$), is unstable against the emission of a di-neutron which has more than a relatively small energy of binding, so that the presumption that a di-neutron is not, in fact, emitted by ^{6}He (based on the evidence of its 'long' life-time) sets an upper limit to the binding energy of this hypothetical particle. In deducing this limiting energy, we may consider the reactions:

$$^9\text{Be}\ (+\ h\nu) \rightarrow {}^8\text{Be} + {}^1n + Q_1$$

$$^8\text{Be} \rightarrow 2{}^4\text{He} + Q_2$$

$$^9\text{Be} + {}^1n \rightarrow {}^6\text{He} + {}^4\text{He} + Q_3.$$

Obviously we have

$$^6\text{He} \rightarrow {}^4\text{He} + 2{}^1n + Q_1 + Q_2 - Q_3\,;$$

and inserting experimental values, $Q_1 = -1 \cdot 63$ MeV.[2], $Q_2 = 0 \cdot 12$ MeV.[3], $Q_3 = -0 \cdot 8$ MeV.[4], we obtain

$$^6\text{He} \rightarrow {}^4\text{He} + 2{}^1n - 0 \cdot 7\ \text{MeV}.$$

This last figure ($0 \cdot 7 \pm 0 \cdot 2$ MeV.) is the upper limit to the binding energy in question—a very much smaller binding energy than that of the deuteron (2·17 MeV.).

In terms of these last two binding energies, we can proceed to set limits to the energy available for the β-disintegration of a quasi-stable di-neutron $({}^2_0n)$. Clearly we have

$$^2n - {}^2\text{H} + Q_4 = {}^1n - {}^1\text{H} + 2 \cdot 17\ \text{MeV.}\,;$$

where $^1n - {}^1\text{H} = 0 \cdot 76$ MeV. and, as above obtained, $0 < Q_4 < (0 \cdot 7 \pm 0 \cdot 2)$ MeV. Thus $(2 \cdot 2 \pm 0 \cdot 2) < ({}^2n - {}^2\text{H}) < 2 \cdot 93$ MeV. This estimate allows us to predict the life-time (τ) of the di-neutron on the reasonable assumption that the transition

$$^2n \xrightarrow{\beta} {}^2\text{H}$$

is super-allowed[5]. In this way we obtain $1 < \tau < 5$ sec.

From the fact that ^{6}He is sufficiently long-lived to exhibit β-activity, we have thus deduced quite narrow limits for the radioactive constants of the hypothetical di-neutron. It might be added that, if such a particle should exist, it would be expected to be produced in (^1n, ^2n) reactions over a small range of neutron bombarding energy, in each case just below the absolute threshold energy for the corresponding (n, $2n$) reaction—and even at energies somewhat above these absolute thresholds, because of the requirement that the first neutron emitted in an (n, $2n$) process shall be emitted with finite energy. But, above all, search for the di-neutron might most conveniently begin with beryllium under neutron bombardment, not only because the (n, $2n$) threshold is lowest with this element (which makes possible the use of a D—D neutron source, which is free from γ-radiation), but also because the possibility of producing ^{6}He in an excited state in this case opens the further possibility (see above) that the di-neutron may be obtained as a secondary disintegration particle following upon the reaction ^{9}Be (^1n, ^{4}He) ^{6}He*. This possibility is unique just because the mass number 5 is the only mass number for which a neutron-stable species does not exist; thus the excitation necessary to render ^{6}He unstable against the successive emission of two neutrons of normal mass is correspondingly increased.

As regards possible methods of detecting a di-neutron, it is perhaps out of place in this note to offer detailed suggestions. But apart from its spontaneous radioactivity (the half-value period of which is reasonably short) a quasi-stable di-neutron might be expected to produce nuclear transformations which in certain cases might be sufficiently characteristic to be used for its identification. Thus activities might be induced in effectively simple elements (such as ^{6}He in helium, ^{25}Na in sodium, ^{105}Rh in rhodium, ^{211}AcC in bismuth, for example) for some of which large capture cross-sections might apply. It might even be possible, investigating suitable substances under deuteron or α-particle bombardment at energies in the neighbourhood of the (d, $2n$) or (α, $2n$) thresholds, to work under conditions in which the flux of di-neutrons was comparable with the normal neutron flux. In such circumstances comparison of the pulse-size distributions due to the recoil particles in hydrogen- and deuterium-filled ionization chambers might be used to effect a clear-cut identification.

Propagation of Pulses of Second Sound in Liquid Helium II

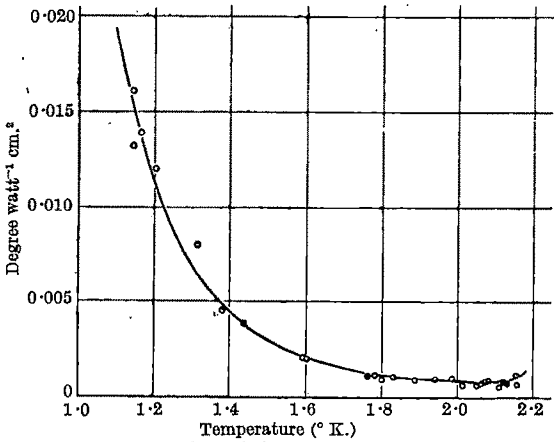
PRELIMINARY measurements of the velocity of second sound in this Laboratory using a resonator of fixed length and signals of a variable frequency have given results in good agreement with the resonance measurements of Peshkov[1] and of Lane, Fairbank and Fairbank[2]. In the course of these experiments it became apparent that if measurements were to be extended below 1° K., some method would be necessary which used a smaller mean power input. It can be shown, too, that the amplitude of temperature oscillation obtained in a resonance experiment is governed entirely by damping, and provides little information about the propagation of travelling waves in the medium.

With these considerations in view, a technique has been developed for transmitting and receiving pulses of second sound. The signals are generated by applying a direct current pulse of 0·1–1 millisecond duration to a fine wire heater. The second sound pulse travels down an ebonite tube about 5 cm. long filled with liquid helium II, and is received by a phosphor bronze resistance thermometer which carries a steady direct current. The change of resistance causes a voltage pulse to appear across the thermometer and, after suitable amplification, this is displayed on a cathode ray tube. Using standard radar techniques, it is a simple matter to time the pulse on its journey and hence to measure its velocity. The velocity results, which cover the range 1·1°–2·16° K., are in good agreement with those of earlier workers using the resonance method, and need not be reproduced here.

The more interesting feature of this method is the information which it provides about temperature amplitudes. It can be shown very simply, by considering the propagation of a unit step of temperature, that the power flow per unit area, W_1, must be connected with the temperature amplitude, T_1, by the relation

$$\frac{T_1}{W_1} = \frac{1}{\rho c u_2},$$

where ρc is the specific heat per unit volume of liquid helium and u_2 is the velocity of second sound. This relation is independent of any special theory of second sound and assumes only the propagation of a unit step without change of shape. The temperature amplitude ($\sim 10^{-3}$ ° K.) can be deduced experimentally from the size of the output signal, the gain of the amplifier and the calibration of the thermometer wire. The power fed in during the pulse ($\sim 0 \cdot 1$ watt cm.$^{-2}$) can be deduced from measurements of the voltage applied to the heater and of the heater resistance. The full line in the accompanying diagram gives $1/\rho c u_2$ (calculated from the known values of ρc and u_2) as a function of temperature, while the points are the experimental values of T_1/W_1. The agreement is well within experimental error.



Curve plotted from values of $1/\rho c u_2$; experimental points, values of T_1/W_1

Experiments are in hand to study the possible dispersion and absorption of second sound and to extend the velocity measurements to the range below 1° K. A combination of such velocity measurements with amplitude measurements may, on the basis of the above equation, provide a convenient method of determining the specific heat of liquid helium below 1° K.

Emission Schumann – Runge O_2 Bands

FOLLOWING on a recent contribution in *Nature*[1], it seems desirable to report briefly some work carried out in this laboratory and shortly to be published elsewhere in detail. Lalji Lal[1] has produced the Schumann – Runge bands of O_2 from 2450 A. to 4490 A. using a high-frequency discharge. He reports new bands which he has identified from small glass and quartz spectrograms.

I have photographed the Schumann – Runge system from 2000 A. to 5000 A. on a quartz Littrow (Hilger *E*.1) spectrograph, and this dispersion has been found sufficient for adequate resolution of the rotational structure of the bands. The spectra were excited by a high-voltage low-current arc in oxygen at atmospheric pressure. This source emits the bands so well that they occur even when the arc chamber is filled with air. In addition to the bands measured by earlier workers, the following bands have been found: (2, 22), (1, 12), (0, 11), (1, 11), (0, 10), (1, 10), (2, 10), (0, 9), (1, 9), (2, 9), (1, 8), (2, 8), (2, 7), (3, 7), (2, 6), (3, 6), (3, 5). Though some of these bands fall in the region investigated by Lalji Lal, his analysis does not correspond to that given here. However, bands of high v' will be more easily excited in the low-pressure source since collision damping will be active at high pressures, and this may account for some of the differences. The present analysis seems to give the Franck – Condon parabola suggested by previous work, whereas Lalji Lal's bands are rather widely scattered in the $v' v''$ array.

On comparing Lalji Lal's wave-numbers with those calculated from the data of previous workers, some rather large discrepancies are found. An attempt was made to identify Lalji Lal's bands both on *E*.1 and small quartz (*E*.3) spectrograms, but no good coincidences were found; the same result was obtained when examining the *E*.2 photograph obtained by Wulf and Melvin[2]. Obviously the difficulty can only be removed either by photographing the high-frequency discharge at larger dispersion for a more accurate analysis or by direct comparison of high-frequency discharge and high-voltage arc spectrograms. The heads are so weak on the present spectra that analysis has been made by identification of the rotational structure of each band, and 'heads' that seem present with small dispersion are found, with higher dispersion, to be merely due to chance overlapping of structure from several bands.

It will be seen that the present interpretation of the bands shows that Flory's[3] suggestion of predissociation for $v' > 2$ is incorrect (this also follows from Lalji Lal's analysis). In the detailed publication referred to above, Flory's arguments are critically examined, and it is found that there is no difficulty in abandoning the predissociation hypothesis.

The bands are found to be very sensitive to pressure changes and are strongly emitted only at a pressure near atmospheric, unless specially pure gas is used to allow long exposures without the appearance of impurity spectra. This may be explained by the fact that normal O_2 molecules are dissociated by electronic collisions into $O(^3P)$ and $O(^1D)$ atoms, since a Frank – Condon transition from the ground-state $(^3\Sigma_g^-)$ leads to a molecule in the $^3\Sigma_u^-$ state which is excited 3·5 volts above the dissociation limit of this state. For the emission of a band system, recombination to the excited state must occur, and this becomes more probable at high pressures where rapid diffusion is prevented. Results obtained by various authors using high-voltage arcs, ozonizers and glow discharges all support this result.

These investigations were undertaken in connexion with work in progress here on the spectrum of the night sky, and from the spectra measurements are being made which will enable the O_2 Herzberg bands, believed present in the night sky spectrum, to be more accurately predicted than previously.

I am indebted to Prof. R. W. B. Pearse for suggesting the work and for his constant advice.

A Simple Result in Quadrature

In calculating the intensity of light scattered by a transparent homogeneous medium, one comes across the infinite series[1]

$$\alpha \sum_{n=-\infty}^{+\infty} \frac{\sin^2 (n\alpha + \theta)}{(n\alpha + \theta)^2}, \qquad (1)$$

in which θ is a constant and n an integer. α is a positive number, which under the conditions under which light-scattering is generally studied is very small, and hence the sum of the above series is usually replaced by the corresponding integral

$$\int_{-\infty}^{+\infty} \frac{\sin^2 x}{x^2}\, dx, \qquad (2)$$

which evidently is equal to π.

It can be shown[1], however, that the equality of (1) and (2) holds not only in the limit when $\alpha \rightarrow 0$, but for any value of α in the range $0 < \alpha \leqslant \pi$. An obvious interpretation of this result is that the area subtended between the curve $y = \sin^2 x/x^2$ and the x-axis can be obtained by taking the sum of the ordinates at equal intervals α, $0 < \alpha \leqslant \pi$, and multiplying by α, that is, by simple rectangulation, just as well as by integration. In erecting these ordinates at equal intervals, we may start from any value θ of x.

The main purpose of this note is to direct attention to this property, namely,

$$\alpha \sum_{n=-\infty}^{+\infty} f(n\alpha + \theta) = \alpha \sum_{n=-\infty}^{+\infty} f(n\alpha) = \int_{-\infty}^{+\infty} f(x)\, dx, \qquad (3)$$

where $0 < \alpha \leqslant$ a certain constant α_0, which characterizes $f(x) = \sin^2 x/x^2$, and to show that numerous other functions can be constructed that have this property. A method of evaluating (1) given by Prof. Wiener, and quoted in the paper referred to[1], suggests the criterion by which to construct such functions.

Consider an even function $F(x)$ [$= F(-x)$] the Fourier transform of which,

$$g(v) = \frac{1}{\sqrt{(2\pi)}} \int_{-\infty}^{+\infty} F(x) \exp\,(ivx)dx, \qquad (4)$$

has non-zero values when $| v |$ is less than a certain constant v_0, and is zero otherwise. Then by Poisson's summation formula[2]

$$\alpha \sum_{n=-\infty}^{+\infty} F(n\alpha + \theta) = \sqrt{(2\pi)} \sum_{N=-\infty}^{+\infty} \exp\,[-i2\pi N\theta/\alpha] . g(2\pi N/\alpha), \qquad (5)$$

where n and N are integers and $\alpha > 0$. If now α is chosen to be $\leqslant 2\pi/v_0$, then all the terms on the right-hand side of (5) except the one corresponding to $N = 0$ vanish, and we obtain

$$\alpha \sum_{n=-\infty}^{+\infty} F(n\alpha + \theta) = \sqrt{(2\pi)}\, g\,(0),$$

which can be seen from (4) to be equal to $\int_{-\infty}^{+\infty} F(x)\, dx$; and hence the function F satisfies (3).

Since the Fourier integrals of a large number of functions have been tabulated by Campbell and Foster[3] and by others, it is easy to select, or construct, examples of functions F the Fourier transforms of which satisfy the above criterion, and which satisfy (3). $F(x) = \sin^m x/x^n$, where m and n are positive integers, $m \geqslant n$, both of them odd or both of them even, is one such function with $v_0 = m$; when $m = 1$, the range of v over which $g(v) \neq 0$ includes $v = 1$. A few other examples are given below.

$F(x)$	$\sqrt{(2\pi)} . g(v)$	v_0
$\dfrac{\sin\,[a(x^2 + \lambda^2)^{1/2}]}{(x^2 + \lambda^2)^{1/2}}$	$\pi\, J_0\,[\lambda(a^2 - v^2)^{1/2}]$	a
$\cos\,[a(x^2 + \lambda^2)^{1/2}] - \cos ax$	$-\dfrac{\pi a\lambda J_1\,[\lambda(a^2 - v^2)^{1/2}]}{(a^2 - v^2)^{1/2}}$	a
$\dfrac{1}{\Gamma(a + x)\, \Gamma(\beta - x)}$	$\dfrac{(2 \cos 1/2v)^{\alpha + \beta - 2} \{ - \frac{1}{2} \exp iv(\alpha - \beta)\}}{\Gamma(\alpha + \beta - 1)}$	π [4]

A more detailed account will be published shortly in the *Journal of the Indian Mathematical Society*.

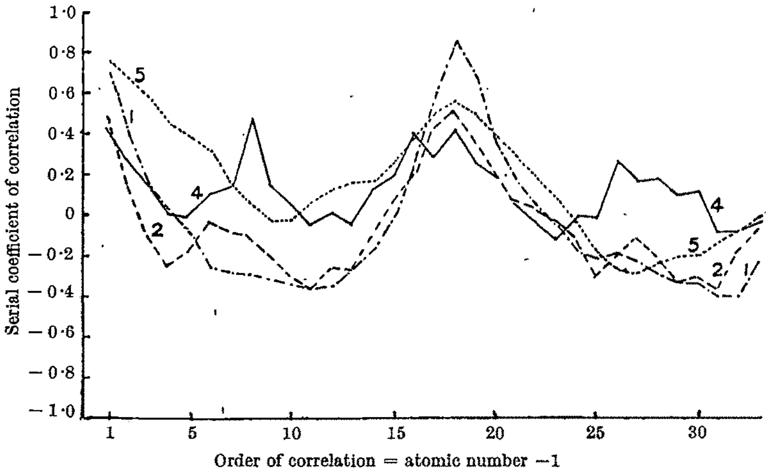
Physical Periodicity of the Periodic Table of the Elements in the Light of Statistical Theory

The periodic system of the elements, arrived at originally from the collation of facts of a chemical nature, has since been most strikingly reflected by most of the physical properties of the elements. The melting points, boiling points, coefficients of thermal expansion, atomic volumes, compressibilities, densities, ionization potentials, to mention only a few properties, undergo periodic variations with increasing atomic weight or atomic number.



1, Atomic volumes; 2, melting points; 4, ionization potentials; 5, densities

It seemed of interest to inquire whether the generating mechanism of the physical periodicity was the same for all the physical properties to which it applied, or whether there existed characteristic differences between the periodicities of different physical properties. With the view of obtaining an answer to that question, some of the series were subjected to the statistical analysis called correlogram analysis[1]. The correlogram is the plot of the serial correlation coefficient against the order of correlation. For example, in the correlogram for atomic volume, the points are the correlation coefficients between the series of atomic volumes 1, 2, 3 . . . *n* times apart in the series of the elements arranged according to their atomic numbers, plotted against the atomic number minus one.

The series subjected to the analysis were those of the atomic volumes (1), melting points (2), compressibilities (3), ionization potentials (4) and densities (5) of the first sixty elements. Series 1 to 4 are based upon Tables 2 and 16, Chapter 5 of "Physical Chemistry" by E. A. Moelwyn-Hughes; Series 5 is taken from Table 3, "Physical Chemistry" by Gucker-Meldrum, based upon the International Critical Tables, supplemented by Landolt – Börnstein tables. The first thirty-three serial correlation coefficients were calculated and plotted against the order of correlation; the curve for compressibilities has been left out of the diagram so as to avoid overcrowding.

On the basis of the correlogram it appears that what was hitherto called 'physical periodicity' has a different structure, that is, it represents sums of different cyclical components, for each of the physical characteristics under investigation. So far as the correlograms show similarities, it would seem that they can be classified into two types. The correlograms for atomic volumes, densities and compressibilities show a peak for the correlation of order 18, and a trough for that of order 10 or very near it, which corresponds to the elements 19 (potassium) and 11 (sodium) respectively, and thus reveal a period of length 18, which corresponds to twice the fundamental period of the chemical periodicity of 8, plus the first two elements of the table. The correlograms for melting points and ionization potentials, on the other hand, show, in addition to the period of length 18 (16), a smaller one with peaks at 8 and 26, or very near them, and thus a greater similarity to the chemical periodicity of the elements with its fundamental period of 8.

Since the melting points (the temperature at which the atoms begin to leave the crystal lattice) and ionization potentials (the energy needed for removing an electron from the atom) have this in common, that they both refer to the point where lattice disorder sets in, and thus to the *dynamic* properties of matter, whereas atomic volumes, densities and compressibilities are properties of the *static* atom, it would seem that this difference is faithfully portrayed in the respective types of physical periodicity as revealed by the correlogram.

Investigations of this kind may afford an indication for linking more intimately than has been done so far the mechanism of the various physical periodicities with the periodic system of the electrons constituting the shells and subshells of the atom.

X-Ray Scattering by Thermal Vibrations in Crystals

SIR C. V. RAMAN, in his letter on "X-Rays and the Eigen-Vibrations of Crystal Structure"[1], claims that the elastic vibrations cannot "give rise to any geometric diffraction pattern exhibiting an observable relationship to the structure of the crystal". The reasons given for this statement make it appear that he has fallen into Debye's original error, and supposes that the atomic vibrations are essentially independent, or are markedly dependent on the form of the crystal and on external boundary conditions. This would perhaps be the case for very small crystallites; for crystals of ordinary size the boundary conditions would involve second-order effects only, as they do in the case of Bragg reflexion. It should also be clearly understood that the change of frequency due to the X-ray 'Doppler effect' is so small that the modified wave-lengths still lie well within the width of the monochromatized $K\alpha_1$ line, assuming that to be the incident radiation; the change is of the order of 1 in 10^5.

That the elastic vibrations do indeed give rise to a geometric diffraction pattern has been most conclusively proved by the excellent agreement between theory and experiment for metals such as sodium, lead and tungsten. The theory of eigen-vibrations can offer no explanation whatever of these experimental results, whereas the elastic vibration theory predicts them correctly in every detail[2].

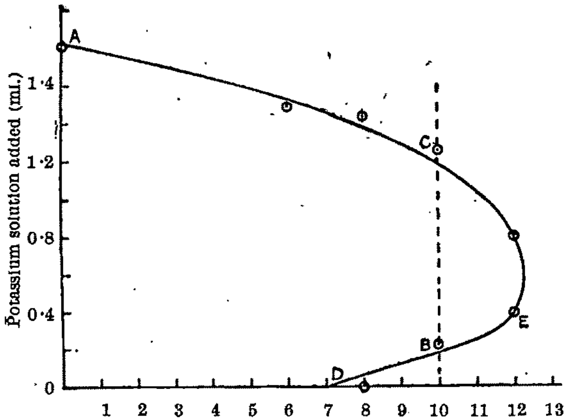
nteraction between Curare and the Potassium Ion at the Motor End Plate

IN a previous paper[1] evidence was presented that here is a relation between the curariform activity f an onium ion and the charge density on its uaternary central atom. A consideration of this heory and of the fact that the paralysing action of urare can be reversed by a fall of temperature[2] led o an investigation of the antagonism between curare nd the potassium ion[3].

By working below 30° C., it has been possible to udy the actions on the rat diaphragm[4] of potassium n concentrations which reduced neuromuscular ansmission while leaving the muscle fibres fully sponsive to direct electrical stimulation. Under ese conditions, it was possible to demonstrate a euromuscular block by high concentrations of the otassium ion alone (point *A* on graph). This block ay be similar to that produced in ganglia by high oses of potassium chloride[5]. The graph also shows at by bringing the muscle into equilibrium with creasing concentrations of curare it has been possible o demonstrate that the addition of curare reduces e concentration of potassium required to cause a 0 per cent block. When the dose of curare which uses a 50 per cent block at normal concentrations f potassium ions is exceeded, the addition of otassium ion has two opposite actions (dotted line). irst it antagonizes and decreases the block, the point B giving the potassium ion concentration which produces a 50 per cent block, and then after reducing he block still further a point is reached when more otassium sums with the curare and causes the block o increase again. The point *C* represents the 50 per ent block produced by adding excess potassium ons. The line *D*—*E* corresponds to the potassium n – curare antagonism observed earlier[3].



Relationship between *d*-tubocurarine chloride added to a 40-ml. bath and the amount of Tyrode solution containing 100 times the normal amount of potassium chloride required to maintain the neuro-muscular conduction of the preparation in a state of 50 per cent block

It appears to us that the interaction between urare and the potassium ion is an ion exchange action (cf. ref. 6 in this connexion), and that the gion of the motor end-plate contains an ion exhanger. Moreover, we would like to suggest that n normal neuromuscular transmission the onium ion roup of acetylcholine liberated by the nerve impulse acts with the exchanger, to which potassium ions re normally bound, and that the potassium ions so isplaced stimulate the muscle fibre, possibly by depolarizing it. The liberation of acetylcholine ions and their displacement of potassium ions from the ion exchanger would give rise to potentials of the liquid junction type. Moreover, the depolarization of the muscle fibre by the potassium ions would set up electrotonic and action potentials. The complexity of end-plate potentials[7,8] is therefore not unexpected. The marked similarity between the actions of potassium and acetylcholine[9] becomes easy to understand; and the continued occupation of the receptors of the ion exchanger by curare, stable choline esters and acetylcholine after eserine[10], by preventing the reoccupation of those receptors by potassium ions in preparation for the next impulse, explains the blocking action of these substances. We can represent the reaction between the receptors of the exchanger and the potassium ion briefly as follows:

$$R^- + K^+ \rightleftharpoons RK.$$

Normally, the acetylcholine liberated by a nerve impulse, by combining with free receptors and blocking the left to right part of the equilibrium, would leave the dissociation of potassium ions unopposed, with a consequent local rise in potassium concentration at the muscle fibre. If we decrease the free receptors by raising the potassium ion concentration, then acetylcholine cannot combine; hence the blocking action of excess potassium and its summation with curare when the number of free receptors is the limiting factor. Curare acting on normal muscle would decrease that potassium bound to the receptor which is available for exchange with acetylcholine. In this case, potassium ions would antagonize curare by increasing the available bound potassium.

Effect of Drugs on Actin

IN previous work from this laboratory it has been established that the polymerization of actin is influenced by various ions in different ways. In view of the possibility that the change of globular actin into fibrous actin plays an important part in the mechanism of muscle contraction, it is especially interesting that calcium and potassium (or sodium) ions show antagonistic action at some concentrations[1].

When globular actin polymerizes, the reaction-rate can be followed by the rising viscosity of the solution. The reaction is usually of an autocatalytic type; therefore the rate is best measured by the reciprocal value of the time needed to reach 50 per cent polymerization.* Such a study, using 0·001 *M* calcium chloride and varying concentration of potassium

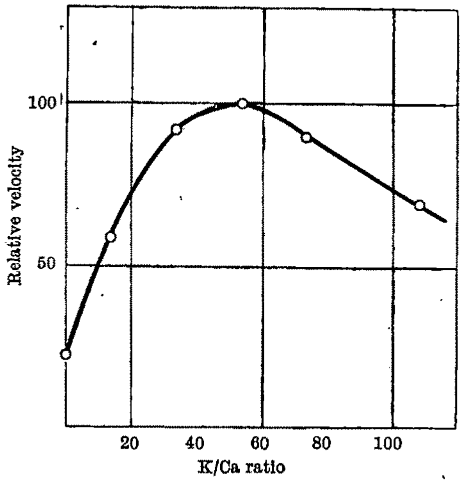

Fig. 1. Variation in the rate of polymerization of actin in presence of calcium (0·0005–0·001 *M*) and potassium (0–0·11 *M*) ions

chloride (pH 7) at 24° C., gave the results represented in Fig. 1. As the rate of polymerization of a given actin preparation is variable, the results are represented as a percentage of the rate obtained at the physiological potassium – calcium ratio. It is seen that in this type of experiment a synergistic action of calcium and potassium is observed, with an optimum at the physiological ratio.

The effect of many of the drugs which act directly on muscle is analogous, and is supposed to be related, to the action of one or other of the cations of the tissue. It was therefore of interest to study the effect of such drugs on the ion-catalysed reaction of the polymerization of actin. We have found that the rate of polymerization was greatly enhanced by adrenaline (0·1 mgm./ml.), whereas it was inhibited in presence of the same concentration of quinine, strychnine and veratrine. The study of these effects at varying potassium – calcium ratios gave the very suggestive curves of Figs. 2 and 3. In both these figures the ordinate represents percentage change in the rate of polymerization when compared with a control experiment in which actin was polymerized in presence of the same ions but without the addition of the drug.

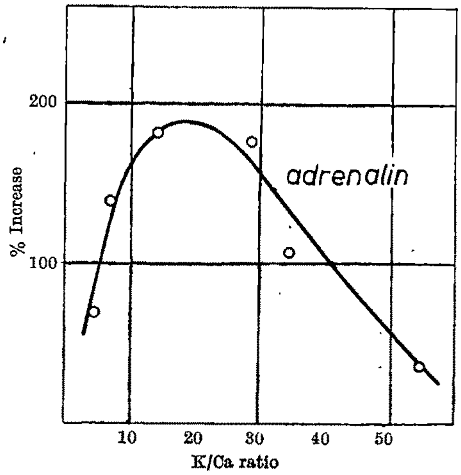

Fig. 2. Change in the rate of polymerization of actin in presence of adrenaline (0·1 mgm. per ml.) in relation to the rate of polymerization in presence of the same salt concentration but in absence of drug

A purified concentrate of the prosthetic group c actin (0·1 mgm./ml.) gave rise to effects similar t that of adrenaline.

Different preparations of actin are influenced b the above-mentioned drugs to a varying degree eve at constant ionic environment. This lends furthe support to the conception advanced in an earlie paper[1] that the process of polymerization is a serie of reactions, any one of which might be the limitin factor in a given preparation. One of these reaction can be catalysed either by the prosthetic group o actin or by calcium and adrenaline.

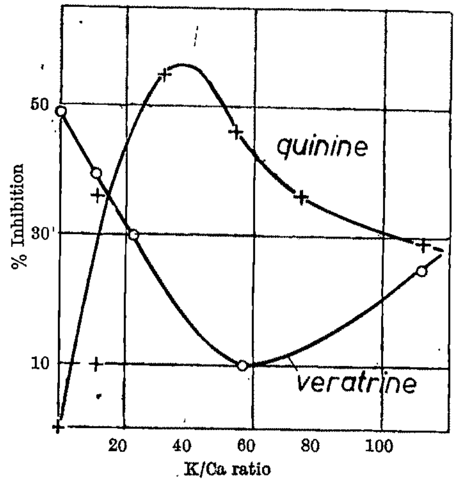

Fig. 3. Effect of quinine and veratrine (0·1 mgm. per ml.) on the polymerization of actin under the same conditions as for Fig. 2

The present results make it very probable that th molecular changes of actin are involved in the contraction mechanism.

A detailed account of this work will appear in th *Hungarica Acta Physiologica*.

Actomyosin Content of the Uterus

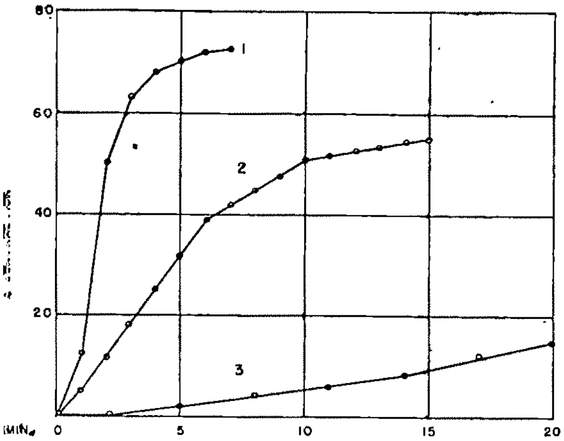
THE methods developed by the Szent-Györgyi school[1] offer a possibility of characterizing and explaining the well-known differences which exis between the pregnant and the non-pregnant uteru I have applied these methods to the study of huma and animal uteri under normal conditions, in differen stages of pregnancy and in certain pathological cases

The actomyosin of the frozen uterus was extracte with 3 volumes 0·5 mol. potassium chloride, in th presence of 2·5 mgm./gm. muscle adenosine triphosphate, by thoroughly grinding it with sand The viscosity of the actomyosin solutions with an without the addition of adenosine triphosphate, an the contraction of the actomyosin thread in th presence of adenosine triphosphate, were measured Both methods show that the extracted material i a mixture of actomyosin and myosin. The data i the accompanying table were obtained from viscosit determinations calculated according to Szent-Györgyi and Straub[2,3].

Material	Amounts of actomyosin and myosin in the solution extracted from 1 gm. material		
	Mixture	Myosin	Actomyosin
Non-pregnant human uterus	16	11	5
Human uterus during labour (Cæsarean sect.)	22	9	13
Human cross-striated muscle	44	18	26

The absolute and relative actomyosin content of he non-pregnant uterus extracts is much lower than hat of cross-striated muscle, and increases with dvancing pregnancy, rapidly reaching its maximum nmediately before parturition.

The contraction of a thread of actomyosin, followed time, clearly demonstrates the differences between ne pregnant and the non-pregnant uterus (see graph).



ntraction of actomyosin threads prepared from human uteri: (1) during labour; (2) from non-pregnant uteri; (3) from uteri after X-ray castration

These observations seem to explain many problems the physiology and even pathology of gravidity and rturition (abortion at too high, and very weak bour at too low, concentrations of actomyosin ?).

More work is planned along this line, and a detailed port will appear elsewhere.

Production of Riboflavin and Allied Substances during the Growth of *C. diphtheriæ*

While studying, by paper partition chromatoaphy[1], the utilization of amino-acids during the owth of the Park Williams No. 8 strain of *C. phtheriæ*, we noted a strong yellow fluorescence with tra-violet light of culture filtrates of the organism own on a casein hydrolysate medium prepared sentially according to the method of Mueller and iller[2]. When such culture filtrates were run on romatograms using *n*-butanol-acetic acid as the lvent[3], two strongly fluorescent yellow spots were observed when the dried paper was placed under an ultra-violet lamp. Neither of these spots gave any colour when the paper was sprayed with 0·1 per cent (w./v.) ninhydrin in chloroform. One of them was in a position approximating to that occupied by proline and the other to that occupied by the basic amino-acids.

It was suggested to us by Dr. W. A. Rawlinson that these fluorescing spots might be due to flavins, and we have since learned that Wadsworth and Crowe[4] have shown that a special strain of *C. diphtheriæ*, grown on a synthetic medium, elaborated an unidentified flavin. We found that the faster moving spot had the same R_f value as riboflavin when run with either *n*-butanol-acetic acid or collidine as solvent. Moreover, when these spots were eluted from the chromatogram, both showed riboflavin activity, as did the original culture filtrate, when examined by the usual microbiological technique using *Lactobacillus casei* E. as the test organism. The crude culture filtrate had an activity equivalent to 25 μgm. of riboflavin per ml.

We found, also, that the fluorescent material behaved chemically like riboflavin. It was resistant to the action of potassium permanganate and hydrogen peroxide, would pass through a 'Cellophane' bag, and could be adsorbed on Fuller's earth and 'Super-filtrol', from which it could be eluted with small volumes of 20 per cent (v./v.) pyridine in 2 per cent (v./v.) acetic acid solution. Such an eluate when chromatographed gave two fluorescent spots, in the same position but much more intense than those on the chromatogram of the original culture filtrate. The eluate, when evaporated to dryness and taken up in water, once again showed riboflavin activity when tested by microbiological assay methods.

Therefore there is strong presumptive evidence that the faster moving of the two fluorescent spots obtained on chromatograms of culture filtrates of the Park Williams No. 8 strain of the diphtheria bacillus is riboflavin itself, while the other may possibly be either riboflavin phosphate or flavine adenine dinucleotide, both of which have been reported by Crammer[5] as having R_f values approximating to that obtained by us for this slower moving spot.

Sex and Organ Specificity in the Response of β-Glucuronidase to Extrinsic Agents

It was considered that the correlation shown to exist between the β-glucuronidase activity of a tissue and the amount of cell proliferation in progress[1] could explain the rise in uterine glucuronidase found by Fishman and Fishman[2] to follow œstrogen administration to ovariectomized mice. In a preliminary kinetic study of the enzyme in mouse uterus, the *p*H-activity curve for the hydrolysis of phenol β-*d*-glucuronide was found to be almost symmetrical about *p*H 4·5. This is in contrast to the curves

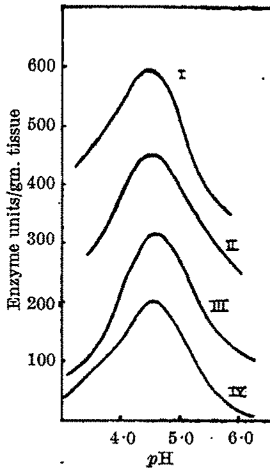

Fig. 1. *p*H-Activity curves for uterine glucuronidase
I, 10-day old mice; II, ovariectomized adults, 3 days after subcutaneous injection of 50 μgm. œstrone; III, normal adult; IV, ovariectomized adults

previously found for liver and spleen glucuronidase in the normal mouse[3], with peaks at *p*H 5·2 as well as at 4·5. Mills[4] has shown that beef spleen glucuronidase can be separated into two fractions, *A* and *B*, with slightly different *p*H optima for the hydrolysis of menthol glucuronide. Since it seemed probable that mouse uterus lacked a glucuronidase fraction present in liver and spleen, it was considered necessary to investigate the possibility that differences between *A* and *B* in distribution and response to extrinsic agents might in some way explain the selective actions of such substances as carbon tetrachloride and œstrone on liver and uterine tissue respectively.

As can be seen from Figs. 1 and 2, the *p*H activity curves for liver and uterine glucuronidase were unchanged in shape during active growth. The high figure for uterine glucuronidase in infant mice supports the view that in this organ, as in others, the activity of the enzyme is a measure of cell divisio The effect of carbon tetrachloride on liver does n suggest any selection between the glucuronida fractions. Carbon tetrachloride is known to have effect on kidney glucuronidase[5], in spite of the fa that the *p*H activity curve has been found to ha the same general shape as that shown for liver.

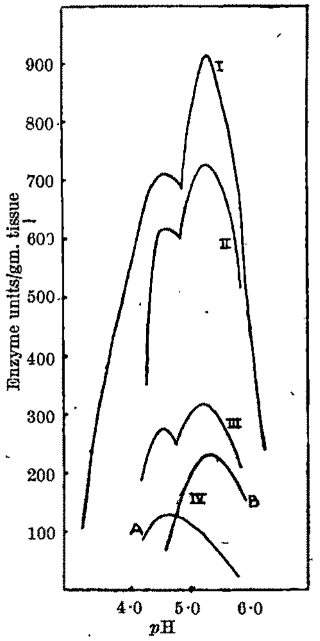

Fig. 2. *p*H-Activity curves for liver glucuronidase.
I, 6-day old mice; II, adult, 1 day after subcutaneous injection of 5 gm. chloroform/kgm.; III, normal adult; IV, the same preparation as III after separation of *A* and *B*

In further experiments, fraction *A* was precipitat by making the preparation 38·5 per cent saturat with ammonium sulphate[4] at *p*H 5·2, and the tw fractions were then determined separately. uterine enzyme was found in fraction *A*. The se aration achieved is illustrated for a liver preparati in Fig. 2. In the response of liver glucuronidase chloroform, and kidney to mercuric nitrate, *A* and were equally affected. Eschenbrenner and Mill found the production of renal necrosis in mice chloroform, seen only in males, to be prevented castration, and noted a correlation between kidn morphology and its susceptibility to chlorofor Morphological differences were confined mainly Bowman's capsule; but this was not involved the necrosis. The response of kidney glucuronida to chloroform observed in the male mouse[5] w abolished by castration. While figures for untreat females, males and castrated males did not sugge any differences in *A* or *B* corresponding to the vari tions in the structure of the kidney, the rise in kidn glucuronidase after injection of normal males wi chloroform was confined to fraction *B*. This could explained on the assumption that the two glucuro idase fractions are unevenly distributed througho the kidney. From the other results quoted abov it appears that the response by glucuronidase to a agent is independent of the 'fraction' present in t cell affected. For the comparative study of t effects of extrinsic agents on organs such as liv and kidney, it would appear adequate to determi the total enzyme activity at *p*H 5·2. The importan of determining the *p*H-activity curve for each n organ examined is, however, emphasized by the fin ings for the uterus.

Aneurin-Pyrophosphate Content of Red and White Blood Corpuscles in the Rat and in Man

WE have determined accurately the aneur pyrophosphate content of red and white blo corpuscles in the rat and in man. Rats in a we nourished condition and with slight aneurin deficien were examined, and also human subjects, bo healthy and suffering from various diseases. Deter inations were carried out in two blood fractio obtained by centrifuging, one containing a la number of red cells and very few white cells, the seco containing practically all the leucocytes of the blo sample and relatively few erythrocytes. Centrifuging must be carried out at a low rate, as at high rates the white cells agglutinate and cannot be resuspended for counting. Cell counting[1] must be performed with great care, as it is subject to much larger errors than the aneurin-pyrophosphate determination. The latter was carried out according to Westenbrink *et al.*[2].

Working with seven well-nourished male albino rats, their red cells contained 2·1 ± 0·41 γ aneurin-pyrophosphate per 10^{11} cells, the white cells 340 ± 100 γ per 10^{11} cells; so the average rat leucocyte contains about 160 times as much as an erythrocyte.

For eight normal men the average red cell content was 1·49 ± 0·08 γ aneurin-pyrophosphate per 10^{11} cells; for fourteen normal women the average was 1·28 ± 0·09 γ per 10^{11} cells. This sex difference was significant. Such a difference was not found for the white cells, their average content being 280 ± 45 γ per 10^{11} cells. So for human beings the ratio of the contents of a red and a white cell is about 1 : 200.

Although the aneurin-pyrophosphate content of erythrocytes is low, they contribute most to the aneurin-pyrophosphate of total blood, owing to their very large number.

A ration containing less than 0·15 γ aneurin a day (a rat needs about 10 γ a day) caused a significant decrease of the aneurin-pyrophosphate content of rat erythrocytes from 2·1 ± 0·41 γ to 1·0 ± 0·19 γ per 10^{11} cells in five days; the decrease of the leucocyte content was much less pronounced and only just significant, namely, from 340 ± 100 γ to 240 ± 58 γ per 10^{11} cells. The decrease of the red cell content in the avitaminotic rats runs roughly parallel to the decrease in liver, kidney and muscle, while the decrease of the white cell content is roughly proportional to that of the brain. This shows that differential determination of the aneurin-pyrophosphate content of the blood corpuscles provides conclusive information regarding the aneurin-level of the body.

When seven human subjects (six men and one woman) received an aneurin-poor diet for ten days, the average aneurin-pyrophosphate content of the red cells had decreased to about 1·15 ± 0·08 γ per 10^{11} cells, while the decrease of the white cell content, though distinct, was less pronounced. Human blood cells thus appear to be slower in losing their aneurin-pyrophosphate than rat cells.

In two cases where abnormally high values for the red cell content were found in apparently healthy subjects, this appeared to be due to the abnormally large volume of their erythrocytes, the aneurin-pyrophosphate content being normal when reduced to normal cell volume.

The aneurin pyrophosphate content of the red cells also appeared to depend upon their age; in the nucleated stage they may contain as much as 100–160 γ per 10^{11} cells.

In general, our work on pathological subjects, comprising cases of pernicious anæmia, primary liver carcinoma with extensive hæmorrhagia, erythroblastosis, lymphatic leucæmia, pyloris stenosis, myeloid leucæmia, and of aneurin deficiency, has shown that conclusions regarding the aneurin-level of the body cannot be based upon aneurin-pyrophosphate determination in total blood only. A blood count must always be made and the blood picture studied; for a reduced number of red cells can depress heavily the total content of blood even while the content of each cell may be normal or even increased. Conversely, in a case of leucæmia with a total blood content of 210 γ per 100 cm.^{3} (normal: ± 8 γ per 100 cm.^{3}), this very high value was caused by the extremely large number of white cells.

A full account of our experiments and discussion of the accuracy of the results will appear in *Biochimica et Biophysica Acta*.

This work forms part of investigations on aneurin metabolism being carried out by Prof. H. G. K. Westenbrink and collaborators.

A Hyaluronidase Unit

Despite our deficient knowledge of the physical and chemical properties of both hyaluronic acid and hyaluronidase, it seems desirable to have a hyaluronidase unit, which can be used until international standard preparations are available for comparison, in order to be able to correlate the numerous investigations being carried out with this substance. All investigations so far suggest that the viscosimetric method of estimation at present affords the best possibilities for quantitative analysis of a biological material.

By a series of investigations into the individual phases of the viscosimetric estimation, we have obtained a unit for hyaluronidase. We define this unit as the amount of enzyme which at 37° C. in the course of 300 sec., by its action on 1 litre of a solution of roughly purified hyaluronic acid from synovia of recently killed cattle with a time of flow in a special viscosimeter of about 2·5 times that for water, reduces the increase in time of flow due to hyaluronic acid to half that period. We find it more important at present that the conception of a unit should be attached to an easily accessible hyaluronic acid preparation and a viscosimeter of fixed dimensions than to provisional local standard preparations of the enzyme.

The hyaluronic acid preparation applied is prepared from synovial fluid produced by puncture of the hock of cattle immediately after killing. The synovial fluid is diluted with an equal part of distilled water, after which the hyaluronic acid is precipitated by addition by drops of glacial acetic acid. The resulting coagulum is washed with distilled water and dissolved in phosphate citric acid buffer *M*/60, *p*H 7·0 (after McIlvaine) with 3·5 per mille sodium chloride. The solution is adjusted to a relative viscosity of about 3 and *p*H 6 by addition of buffer and 4 *N* sodium hydroxide.

The viscosimeter used is U-shaped with a wide tube of internal diameter 6 mm. and a capillary tube of internal diameter 0·3–0·4 mm., forming the bend and the measurement section. On this latter is a broadened region with a volume of 0·2 ml., delimited above and below by scratch marks. The distance from the lower mark to the bend is 175 mm.

A further account of the procedure of analysis pertaining to a viscosimetric rapid method will be published in the *Acta pharmacol. et toxicol.* (Copenhagen).

Since devising this method, we have been able to examine a sample of hyaluronidase from the Treemond Company, Brooklyn, N.Y. This sample was declared to contain 100 turbidity-reducing units per mgm.; by our method this was found to be equal to 2 hyaluronidase units as defined above. We therefore expect the ratio of the turbidity-reducing unit to our hyaluronidase unit to be approximately 50.

Indicator Yellow and Retinene$_1$

In their interesting article on the "Chemistry of Visual Processes", Ball, Collins, Morton and Stubbs[1] consider that Lythgoe's indicator yellow[2] is a "fortuitous artefact having no direct relevance to visual chemistry". They base this conclusion on the fact that retinene$_1$ may be extracted from bleached retinæ or from bleached visual purple (rhodopsin) solutions by a mixture of acetone, ethanol and light petroleum ether and that "free or loosely bound retinene$_1$ (the final product of bleaching rhodopsin) may combine with any suitable protein or amino-acid which may be available"[1]. They regard this fortuitous combination as the means of production of indicator yellow in solution.

These facts do not, however, justify their conclusion. Lythgoe[2] was unable to extract retinene from bleached visual purple solutions using petroleum ether alone as solvent. Hecht[3] has pointed out that alcohol must be added to the petroleum ether in order to extract the retinene. Again, if cold acetone is added to a bleached visual purple solution, the precipitate "contains not only the protein but most of the yellow colour. The retinene must therefore still be mainly attached to the protein, since carotenoids are not easily adsorbed in the presence of high concentrations of acetone" (Hecht, *ibid.*).

The inference is plainly that, after bleaching, the altered visual purple chromophores are still attached to the parent protein (this arrangement constituting the indicator yellow molecule), unless an active reagent such as alcohol strips these altered chromophores (retinene) from the protein. Thus by using alcohol, or other active agent, in the solvent, one is extracting a substance retinene, which is *not*, in fact, "the final product of bleaching rhodopsin". The recombination of retinene with a suitable protein (perhaps, indeed, the original protein from which it was detached) to yield 'indicator yellow' could then scarcely be described as 'fortuitous' but rather the restitution of the original state of affairs.

The visual purple molecule consists of a protein 'base' to which are attached about ten chromophores[4]. It is known that when one quantum of light is absorbed one chromophore is altered[5], but there is no evidence for the statement, often occurring in the literature, that the secondary process following activation of the chromophore is a loosening, that is, a dissociation of the chromophore-protein bond. It is just as probable that activation of a visual purple chromophore by a light quantum is succeeded by chemical process resulting in an electron transfe down the conjugated carotenoid chain to the protei base and thence, *in vivo*, to the retinal end-orga to which, in all probability, the visual purple molecules are attached. This gives us a simpler pictur of the genesis of the physiological impulse than doe the usual view that the retinal end-organs are stimulated by a product of the disrupted visual purpl molecule.

The facts quoted by Dr. Dartnall do not invalidat our conclusions. If under the action of light th retinene is split off, the conditions are such that it available for recombination with any protein to forr new compounds. The spectroscopic evidence indicates that there are three materials in bleache rhodopsin solutions, retinene (or retinene + protei and the acid and alkaline forms of indicator yellow We consider that, although the same protein is concerned in all three compounds, yet the chemica evidence indicates that in indicator yellow, retinen is firmly bound while in neutral bleached rhodopsi solutions it is only weakly bound. We agree wit Dr. Dartnall's final paragraph.

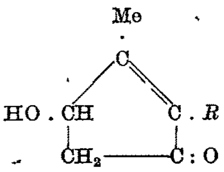
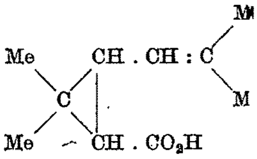
Total Synthesis of some Pyrethrins

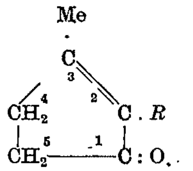
In view of recent publications in the United State it is desirable to record briefly some of the result obtained by us during the past year or so. Followin the demonstration by LaForge and Barthel[1] of th heterogeneity of 'pyrethrolone', the alcoholic component of the pyrethrins, and the revision by LaForg and Soloway[2] of the structures of the constituen alcohols to (I), where *R* is butenyl or pentadieny and the synthesis by Campbell and Harper[3] (—)-*trans*-chrysanthemum monocarboxylic acid (II the enantiomorph of the acidic component pyrethrin I, the total synthesis of various pyrethrin (that is, esters of I with II), the insecticidal constituents of pyrethrum flowers, appeared a mor favourable project than previously.



I



II



III

A convenient route to ketones of type (III) was explored by Harper[4], by the preparation of ketones, in which R = n-butyl and butenyl, the former being identical with dihydrocinerone and the latter isomers of cinerone ; and has since been extended to higher analogues, in which R = n-amyl, pentenyl, etc. If direct substitution could be effected in position 4, then subsequent condensation with chrysanthemum monocarboxylic acid would provide a convenient route to pyrethrins, in which structural and stereochemical variations could be readily made. The 4-position is analogous both to the γ-position of crotonaldehyde and crotonic esters and to the β-position of saturated esters, and might therefore be expected to undergo free radical substitution more readily than elsewhere. Developing this approach, we have been able to effect smooth substitution of bromine, using N-bromosuccinimide in carbon tetrachloride, to give what we believe to be the 4-bromoketone, though we have not yet established this unequivocally. Nevertheless, reaction with silver acetate in glacial acetic acid gives the corresponding acetoxyketone, which is saponified to the hydroxyketone, of the same series, irrespective of the absolute structure, as natural pyrethrolone and cinerolone. When R is n-butyl, the product is (±)-dihydrocinerolone, which has also been synthesized by a similar method by Soloway and LaForge[5]; and when R is n-amyl, the product is (±)-tetrahydropyrethrolone, which has also been synthesized by a similar method by Dauben and Wenkert[6] (see Table 1).

Table 1

	(I), R = n-Butyl	Dihydrocinerolone	Ref.
Alcohol	b.p. 114–117°/0·8 mm.	(+) 115–117°/1 mm.	1
	n_D 1·4946 (19°)	(+) 1·4958 (22°)	1
Semicarbazone	m.p. 184–185°	(±) 185°, 184–185°	1, 8
3:5-Dinitrobenzoate	m.p. 110–110·5°	(±) 111°	5
Acetate	b.p. 100–103°/0·75 mm.		
	97°/0·25 mm.		
	n_D 1·4788 (20°)		
	1·4772 (20°)		
Acetate 2:4-dinitrophenylhydrazone	m.p. 125–126°		
	(I), R = n-Amyl	Tetrahydropyrethrolone	
Alcohol	b.p. 127°/0·4 mm.	(+) 124°/0·6 mm.	9
	n_D 1·4882 (25°)	(±) 1·4892 (28°)	1
Semicarbazone	m.p. 169°	(±) 172–173°, 172–174°	1, 8
3:5-Dinitrobenzoate	m.p. 105–106°		
Acetate	b.p. 103°/0·4 mm.	(+) 117°/1·3 mm.	9
	n_D 1·4747 (25°)	(+) 1·4761 (20°)	9

Having established the relationship of these products to the pyrethrins, we have now submitted the bromoketone in carbon tetrachloride to reaction with the silver salt of synthetic chrysanthemum monocarboxylic acid and isolated by distillation the corresponding pyrethrin. Table 2 lists the synthetic esters we have obtained, and their stereochemistry. These esters have been tested for insecticidal properties, and are of a low order, thereby confirming the low toxicity reported by LaForge and Barthel[7] for tetrahydropyrethrin I.

Table 2

(I), R=	Stereochemistry of alcohol	Stereochemistry of acid	B.p.	n_D^{20}
n-Butyl	(±)	(±)-*trans*	115–116°/1 × 10^{-3} mm.	1·4992
n-Butyl	(±)	(±)-*cis*	117–119°/3 × 10^{-4} mm.	1·5000
n-Amyl	(±)	(±)-*trans*	96°/7·8 × 10^{-4} mm.	1·4970
n-Amyl	(±)	(±)-*cis*	120–124°/2·1 × 10^{-3} mm.	1·4980

Experiments are in progress to establish beyond doubt the position of substitution and to investigate the extension of this method to ketones in which R = butenyl, pentenyl, etc.

Alkaloids of the Australian Rutaceæ

IN certain tribes of the family Rutaceæ a relatively high proportion of species has been found to contain alkaloids. Moreover, these alkaloids vary widely in character and include representatives of several of the principal structural groups, for example, quinoline, *iso*-quinoline, carboline and imidazole derivatives.

We are examining the alkaloids of a number of Rutaceous genera of the Australian flora, particularly those of the Queensland tropical rain-forest. This work is part of a general survey of the occurrence and pharmacology of alkaloids in the Australian flora, which is being undertaken by the Council for Scientific and Industrial Research in collaboration with the departments of chemistry and physiology of several Australian universities. At least six unrecorded alkaloids have been isolated from the three rain-forest species, *Melicope fareana* F. Muell., *Evodia xanthoxyloides* F. Muell., and *Acronychia baueri* Schott. Of these, five are certainly related and exhibit a number of novel features. The bark of *Melicope fareana* contains melicopine ($C_{17}H_{15}O_5N$, pale yellow needles, m.p. 178·5–179·5°), melicopidine ($C_{17}H_{15}O_5N$, pale yellow prisms, m.p. 121–122°), melicopicine (yellow prisms, m.p. 131–132°), and acronycidine ($C_{15}H_{15}O_5N$, colourless needles, m.p. 136·5–137·5°). The leaves of this tree also contain melicopine, melicopidine and melicopicine, but acronycidine is absent. There is present, however, a small amount of another colourless alkaloid which has not yet been obtained in a pure form. The bark of *Acronychia baueri* contains acronycine ($C_{20}H_{19}O_3N$, pale yellow needles, m.p. 174–175°), melicopine, melicopidine and acronycidine, while melicopicine has been isolated from the leaves. The bark of *Evodia xanthoxyloides* contains evoxanthine ($C_{16}H_{13}O_4N$, pale yellow needles, m.p. 217–218°), and melicopidine.

Although the structural problems have not yet been completely clarified, it has been established that the five yellow alkaloids are acridine derivatives, actually N-methyl acridones. Acronycidine (colourless) is probably a quinoline derivative related to skimmianine. A number of other species belonging to the same and related genera are under examination, and it is hoped to correlate the nature of the alkaloids with the taxonomy of the groups concerned. Full details of this work will be published elsewhere.

Determination of Mixing of Gas Streams by the Infra-Red Gas Analyser

A TECHNIQUE developed by this laboratory for use in model experiments on the mixing of air and gas in the open hearth furnace has application to any problem of turbulent diffusion between streams of similar gases, in which mean concentrations of one gas in the other are to be sampled. The method used combines high sensitivity and rapidity of response with freedom from poisonous tracer substances.

The technique is at present being applied to the study of mixing in a model of a producer gas-fired open hearth furnace. Both air and fuel gas are replaced in the model by air at room temperature, and the pattern of mixing between the air from the gas port and that from the air ports is studied. This pattern is of great importance in furnace design as it determines shape of the flame and rate of burning. To obtain Reynold's similarity with a 1/12-scale model a flow rate of nearly 7 cubic metres/minute is needed, which necessitates a highly sensitive detector if the flow-rate of the tracer is to be kept low.

Originally, consideration was given to the use of a radioactive tracer such as radon, which has already been used both for full-scale furnace experiments and in the laboratory[1,2]; but the commercial production[3] of the infra-red gas analyser provides a means of obtaining sensitivity without the inconvenience of a tracer which decays with time. Using carbon dioxide, a full-scale deflexion is obtained with a concentration of 0·03 per cent, corresponding to a flow of 2 litres/minute, of pure carbon dioxide. In a well-ventilated laboratory, this may be safely run to waste. At the rate of aspiration used, the speed of response of the instrument, including delays introduced in the tubing, is better than 5 sec. for two-thirds final reading.

Precautions are necessary to eliminate the effect of changes in the concentration of carbon dioxide in the atmosphere. It has been suggested that the use of methane as a tracer would avoid this. The infra-red gas analyser can be made almost as sensitive to this gas (about 0·1 per cent for full-scale deflexion), so that waste removal should not be too difficult.
